## CHAIRMAN OF CONFERENCE

Prof. Dr. Muhittin DOĞAN Gaziantep University, Turkey

## ORGANIZING COMMITTEE

Prof. Dr. Ali Tuncay ÖZYILMAZ Mustafa Kemal University, Turkey  
Prof. Dr. Ayten NAMLI Ankara University, Turkey  
Prof. Dr. Erol ATAY Hatay Mustafa Kemal University, Turkey  
Prof. Dr. Eva URGEOVA University of Ss. Cyril and Methodius, Slovakia  
Prof. Dr. Farhat JABEEN Government College University, Pakistan  
Prof. Dr. Gülşen ALTUĞ Istanbul University, Turkey  
Prof. Dr. Hasan KÜÇÜKBAY İnönü University, Turkey  
Prof. Dr. Hüseyin ZENGİN Gaziantep University, Turkey  
Prof. Dr. Maria DAGLIA University of Naples Federico II, Italy  
Prof. Dr. Miloudi HLAIBI University of Hassan II Casablanca, Morocco  
Prof. Dr. Mustafa DJAMGOZ Imperial College London, United Kingdom  
Prof. Dr. Rosa Maria ORRIOLS International Commission Occupational Health, Spain  
Prof. Dr. Serap DERMAN Yildiz Technical University, Turkey  
Prof. Dr. Soumia KOUADRI MOUSTEFAI Hassiba Benbouali University of Chlef, Algeria  
Prof. Dr. Ümmühan ÖZDEMİR ÖZMEN Gazi University, Turkey  
Prof. Dr. William A. COETZEE New York University, USA  
Prof. Dr. Zeliha SELAMOĞLU Niğde Ömer Halisdemir University, Turkey  
Assoc. Prof. Dr. Bensaber BENSEBIA Hassiba Benbouali University of Chlef, Algeria  
Assoc. Prof. Dr. Demet DOĞAN Gaziantep University, Turkey  
Assoc. Prof. Dr. Khassanov VADIM S.Seifullin Kazakh Agro Technical Research University, Kazakhstan  
Assoc. Prof. Dr. Musfata PEHLIVAN Gaziantep University, Turkey  
Assoc. Prof. Dr. Mustafa SEVİNDİK Osmaniye Korkut Ata University, Turkey  
Assoc. Prof. Dr. S.D. SARASWATHY Bharathidasan University, India  
Assoc. Prof. Dr. Serpil KILIÇ Isparta University of Applied Sciences, Turkey  
Dr. Francesca CIGNARELLA Washington University, USA  
Dr. Ravichandran RAMASAMY New York University, USA

## INTERNATIONAL SCIENTIFIC COMMITTEE\*

Prof. Dr. Adem ÖNAL	Gaziosmanpasa University, Turkey
Prof. Dr. Adil M. ALLAHVERDİYEV	Yıldız Technical University, Turkey
Prof. Dr. Adnan AYHANCI	Eskişehir Osmangazi University, Turkey
Prof. Dr. Ahmed IMTIAJ	University of Rajshahi, Bangladesh
Prof. Dr. Ahmet AKSOY	Akdeniz University, Turkey
Prof. Dr. Ahmet ASAN	Trakya University, Turkey
Prof. Dr. Ahmet KARADAG	Bartın University, Turkey
Prof. Dr. Aida SAHMUROVA	Okan University, Turkey
Prof. Dr. Ali BİLGİLİ	Ankara University, Turkey
Prof. Dr. Alime Ebru AYDIN	Hatay Mustafa Kemal University, Turkey
Prof. Dr. Alpaslan DAYANGAÇ	Osmaniye Korkut Ata University, Turkey
Prof. Dr. Arife Alev KARAGÖZLER	Aydın Adnan Menderes University, Turkey
Prof. Dr. Atila YILDIZ	Ankara University, Turkey
Prof. Dr. Aycan TOSUNOĞLU	Bursa Uludağ University, Turkey
Prof. Dr. Aygül KÜÇÜKGÜLMEZ YANDIM	Cukurova University, Turkey
Prof. Dr. Ayla BALABAN GUNDUZALP	Gazi University, Turkey
Prof. Dr. Ayşe Dilek ÖZŞAHİN KİREÇCİ	Bitlis Eren University, Turkey
Prof. Dr. Ayşe Gül MUTLU	Mehmet Akif Ersoy University, Turkey
Prof. Dr. Başak HANEDAN	Atatürk University, Turkey
Prof. Dr. Belgin GÖZMEN SÖNMEZ	Mersin University, Turkey
Prof. Dr. Belma ASLIM	Gazi University, Turkey
Prof. Dr. Bülent KAYA	Akdeniz University, Turkey
Prof. Dr. Dilek DEMİREZEN YILMAZ	Erciyes University, Turkey
Prof. Dr. Ebru AKTAN	Gazi University, Turkey
Prof. Dr. Ebru Gül ASLAN	Süleyman Demirel University, Turkey
Prof. Dr. Ebru GÜREL-GÜREVİN	İstanbul University, Turkey
Prof. Dr. E. Sümer ARAS	Ankara University, Turkey
Prof. Dr. Elif Damla ARISAN	Gebze Technical University, Turkey
Prof. Dr. Elif ÖZTETİK	Eskisehir Technical University, Turkey
Prof. Dr. Elif Şahin IŞGIN	Dokuz Eylül University, Turkey
Prof. Dr. Emin SARIPINAR	Erciyes University, Turkey
Prof. Dr. Emine ARSLAN	Selçuk University, Turkey

Prof. Dr. Emir Baki DENKBAŞ	Başkent University, Turkey
Prof. Dr. Engin TİLKAT	Batman University, Turkey
Prof. Dr. Erdal BALCAN	Celal Bayar University, Turkey
Prof. Dr. Erdoğan ÇİÇEK	Nevsehir Hacı Bektaş Veli University, Turkey
Prof. Dr. Erol AKPINAR	Abant İzzet Baysal University, Turkey
Prof. Dr. Eva URGEOVA	University of Ss. Cyril and Methodius, Slovakia
Prof. Dr. F. Zehra KÜÇÜKBAY	İnönü University, Turkey
Prof. Dr. Fatma Jale GÜLEN	Yıldız Technical University, Turkey
Prof. Dr. Farhat JABEEN	Government College University, Pakistan
Prof. Dr. Fatma ÜNAL	Gazi University, Turkey
Prof. Dr. Ferda CANDAN	Cumhuriyet University, Turkey
Prof. Dr. Gamal BADR	Assiut University, Egypt
Prof. Dr. Gizem DINLER DOGANAY	Istanbul Technical University, Turkey
Prof. Dr. Gönül DÖNMEZ	Ankara University, Turkey
Prof. Dr. Gül ÖZYILMAZ	Hatay Mustafa Kemal University, Turkey
Prof. Dr. Gülay BAYRAMOĞLU	Gazi University, Turkey
Prof. Dr. Gülay ÖZCENGİZ	Middle East Technical University, Turkey
Prof. Dr. Gülay ZENGİN	Gaziantep University, Turkey
Prof. Dr. Güldeniz SELMANOĞLU	Hacettepe University, Turkey
Prof. Dr. Gülşen ASMAN	Gazi University, Turkey
Prof. Dr. Güray UYAR	Ankara Hacı Bayram Veli University, Turkey
Prof. Dr. Handan UYSAL	Atatürk University, Turkey
Prof. Dr. Hasan Basri İLA	Cukurova University, Turkey
Prof. Dr. Hasan Hüseyin DOĞAN	Selçuk University, Turkey
Prof. Dr. Hasan KÜÇÜKBAY	İnönü University, Turkey
Prof. Dr. Hayati TÜRKMEN	Ege University, Turkey
Prof. Dr. Hikmet Yeter ÇOĞUN	Cukurova University, Turkey
Prof. Dr. Hülya ÖLÇER FOOTITT	Dumlupınar University, Turkey
Prof. Dr. Hüseyin GÜHER	Trakya University, Turkey
Prof. Dr. İlgaz AKATA	Ankara University, Turkey
Prof. Dr. Işık PERÇİN DEMİRÇELİK	Hacettepe University, Turkey
Prof. Dr. İbrahim Çağatay KARAASLAN	Hacettepe University, Turkey
Prof. Dr. İbrahim ÖRÜN	Aksaray University, Turkey

Prof. Dr. İhsan AKYURT	Giresun University, Turkey
Prof. Dr. İsmail AYDIN	İstanbul University-Cerrahpaşa, Turkey
Prof. Dr. Jitendra PANWAR	Birla Institute of Technology & Science (BITS), India
Prof. Dr. Kadir YURDAKOÇ	Dokuz Eylül University, Turkey
Prof. Dr. Kamil KOÇ	Celal Bayar University, Turkey
Prof. Dr. Kemal BÜYÜKGÜZEL	Zonguldak Bülent Ecevit University, Turkey
Prof. Dr. Maria DAGLIA	University of Naples Federico II, Italy
Prof. Dr. M. Burcu IRMAK YAZICIOĞLU	Istanbul Atlas University, Turkey
Prof. Dr. Mehmet GÖNEN	Süleyman Demirel University, Turkey
Prof. Dr. Mehtap TEKŞEN	Aksaray University, Turkey
Prof. Dr. Mikail AKBULUT	Erciyes University, Turkey
Prof. Dr. Miloudi HLAIBI	University of Hassan II Casablanca, Morocco
Prof. Dr. Muhammet GAFFAROĞLU	Ahi Evran Üniversitesi University, Turkey
Prof. Dr. Murat ÇELİK	Atatürk University, Turkey
Prof. Dr. Mustafa ATEŞ	Ege University, Turkey
Prof. Dr. Mustafa BOGA	Nigde Omer Halisdemir University, Turkey
Prof. Dr. Mustafa DJAMGOZ	Imperial College London, United Kingdom
Prof. Dr. Mustafa ÖZCAN	Istanbul Technical University, Turkey
Prof. Dr. Mustafa TÜRKMEN	Giresun University, Turkey
Prof. Dr. Naime Funda TAY	Eskişehir Osmangazi University, Turkey
Prof. Dr. Nazime MERCAN DOĞAN	Pamukkale University, Turkey
Prof. Dr. Nilgün ÖZPOZAN	Erciyes University, Turkey
Prof. Dr. Noor Hasima NAGOOR	University of Malaya, Malaysia
Prof. Dr. Numan HODA	Akdeniz University, Turkey
Prof. Dr. Nursel PEKEL BAYRAMGİL	Hacettepe University, Turkey
Prof. Dr. Oktay ARSLAN	Balıkesir University, Turkey
Prof. Dr. Osman DUMAN	Akdeniz University, Turkey
Prof. Dr. Ömer IŞILDAK	Gaziosmanpasa University, Turkey
Prof. Dr. Ömer KOZ	Bursa Technical University, Turkey
Prof. Dr. Ömür BAYSAL	Mugla Sıtkı Koçman University, Turkey
Prof. Dr. Özcan YALÇINKAYA	Gazi University, Turkey
Prof. Dr. Özlem ÇETİN ERDOĞAN	Trakya University, Turkey
Prof. Dr. Özlem ÖZBEK	Hitit University, Turkey

Prof. Dr. Pınar ÇAMURLU	Akdeniz University, Turkey
Prof. Dr. Ramazan ERENLER	Gaziosmanpasa University, Turkey
Prof. Dr. Ramazan SOLMAZ	Bingöl University, Turkey
Prof. Dr. Remziye DEVECİ	Ege University, Turkey
Prof. Dr. Rıdvan ŞEŞEN	Dicle University, Turkey
Prof. Dr. Rosa Maria ORRIOLS	International Commission Occupational Health, Spain
Prof. Dr. Sadık DINCER	Cukurova University, Turkey
Prof. Dr. Saliha ALYAR	Çankırı Karatekin University, Turkey
Prof. Dr. Sait Aykut AYTAÇ	Hacettepe University, Turkey
Prof. Dr. Salih DOĞAN	Erzincan University, Turkey
Prof. Dr. Sema İŞİSAĞ ÜÇÜNCÜ	Ege University, Turkey
Prof. Dr. Serap YALÇIN AZARKAN	Ahi Evran University, Turkey
Prof. Dr. Serpil YENİSOY KARAKAŞ	Abant İzzet Baysal University, Turkey
Prof. Dr. Sevda KIRBAĞ	Fırat University, Turkey
Prof. Dr. Sevgi SEVSAY	Erzincan Binali Yıldırım University, Turkey
Prof. Dr. Sevil TOROGLU	Kahramanmaraş Sutcu Imam University, Turkey
Prof. Dr. Sevim AKYÜZ	İstanbul Kültür University, Turkey
Prof. Dr. Sibel AKAR	Eskişehir Osmangazi University, Turkey
Prof. Dr. Sinem GÖKTÜRK	Marmara University, Turkey
Prof. Dr. Soumia KOUADRI MOUSTEFAI	Hassiba Benbouali University of Chlef, Algeria
Prof. Dr. Süheyla KIRMIZIGÜL	Ege University, Turkey
Prof. Dr. Şenay ÇETİNUS	Cumhuriyet University, Turkey
Prof. Dr. Şengül ALPAY KARAOĞLU	Recep Tayyip Erdoğan University, Turkey
Prof. Dr. Şule BARAN	Sakarya University, Turkey
Prof. Dr. Şule Coşkun CEVHER	Gazi University, Turkey
Prof. Dr. Talat OZPOZAN	Erciyes University, Turkey
Prof. Dr. Tamer AKAR	Eskişehir Osmangazi University, Turkey
Prof. Dr. Tülin ASKUN	Balıkesir University, Turkey
Prof. Dr. Tülin AYDEMİR	Celal Bayar University, Turkey
Prof. Dr. Ümmühan ÖZDEMİR ÖZMEN	Gazi University, Turkey

## FOREWORD

6<sup>th</sup> International Eurasian Conference on Biological and Chemical Sciences (EurasianBioChem 2023) was successfully held on October 11-13, 2023 with participation from many countries.

The objective of *EurasianBioChem 2023* was to bring leading academicians, researchers, scholars as well as industrial professionals together from all over the world to exchange and share their experiences and research results about all aspects of biological and chemical sciences and to discuss the practical challenges encountered and the solutions adopted. In this context, we welcomed precious scientists and the greatest appreciation goes to all participants whose contributions have made this conference a success. I would like to thank the organizing committee and the scientific committee for providing this intense and high quality scientific environment.

I believe that the *EurasianBioChem 2023* has made important contributions to you at large and hope to see you at the 7<sup>th</sup> International Eurasian Conference on Biological and Chemical Sciences (*EurasianBioChem 2024*).

**Prof. Dr. Muhittin DOĞAN**  
Chairman of *EurasianBioChem 2023*

## Contents

<b>1. ORAL PRESENTATIONS</b> .....	<b>2</b>
<b>1.1. ABSTRACTS</b> .....	<b>4</b>
Doped manganese perovskites for room-temperature magnetic refrigeration applications: Synthesis and characterization .....	7
Impact of sodium doping on the magnetic characteristics of manganite-based materials .....	8
Microbial contamination of skin care product due to its using method.....	9
In-silico predictions of novel isoxazole-piperazine hybrids as anticancer agents inhibiting liver cancer stem cells.....	10
Study of environmental state and microplastics as potential pollutants in Albanian coast .....	11
Knowledge of Monkeypox virus and disease at the University of Tlemcen.....	12
The excess molar volume of liquid mixtures 1,2-dichloroethane with ethers experimental study and application of flory's theory .....	13
Analyzing kinetics and adsorption isotherms of anionic dye by a low cost material.....	14
Synthesis and Characterization of Amine Functionalized Graphene Oxide and its Preliminary Adsorption Study towards Methyl Orange Dye.....	15
Physicochemical analysis and microbiological quality of industrial and Algerian traditional cheese .....	16
Phytochemical study and antimicrobial effect of the hydro-alcoholic extract of <i>Calamintha nepeta</i> from western Algeria .....	17
Chronic oxycarbonism in active and passive smokers in Algeria .....	18
Aging-related changes in the diversity of scalp microbiome – preliminary studies .....	19
Hepatotoxicity of <i>Ecballium elaterium</i> Following Traditional Therapeutic Use (Phytotherapy) .....	20
Risk factors and biochemical complications of hypertension in pregnant women: Study from west Algeria .....	21
In silico investigation of effective antiviral compounds of natural origin for the treatment of COVID-19 .....	22
Essential oils of three hemp ( <i>Cannabis sativa</i> L.) cultivars in Rif Mountains (Northern Morocco) .....	23
Worldwide potential insect vectors of <i>Xylella fastidiosa</i> and assessment of their importance with a focus on Morocco.....	24
Starvation effect against ionizing radiation damages .....	25
Biodiversity and Ecology of <i>Juniperus phoenicea</i> Litter Mesofauna in the Djebel Anoual Forest in the Tebessa Region.....	26
Earthworms affect the microbial community during vermicomposting.....	27
An Overview: The Botanical Extract Produced with SC -CO <sub>2</sub> Extraction for the Determination of Flavonoids and Terpenoids in Albanian Medicinal Plants .....	28
A new approach to preparation methodology of Polydopamine-Containing Systems .....	29

Immunomodulatory Properties of Mesenchymal Stem Cell.....	30
Investigation of vascular damage in liver-cancer-on-chip model.....	31
Synthesis of the Anthracene Sulfonyl Hydrazone Compound for Investigation of Biosensor Properties: Characterization, Electrochemical Measurements, and Theoretical Calculations. ....	32
The Role of Fullerene C <sub>60</sub> Nanoparticle against Lung Tissue Damage on Caspase-3, HO-1 and p53 Gene Expressions.....	33
Development and efficacy of collagen suppressing peptide nanofibers .....	34
Synthesis, Characterization and Determination of Antimicrobial Properties of New Intragenic Antimicrobial Peptide Derivative: GV-13.....	35
Synthesis of New Hydrazone-Hydrazone Derived from Etophenamate and Investigation of Their Antimicrobial Activity .....	36
Investigation of the Effect of Different Extracts of <i>Fumaria officinalis</i> on Phenolic Content and Bioactivities .....	37
Exploring the Theoretical Framework of Cobalt-Pentapyridyl Molecular Catalyst: A Deeper Dive into the EECC Water Reduction Mechanism.....	38
Phycobiliprotein content and growth profile of <i>Spirulina platensis</i> in airlift photobioreactor .....	39
Pre-sowing treatment with seaweed extracts improve early growth of wheat.....	40
Enhancement of the activity and stability of Porcine Pancreatic lipase by physical adsorption immobilization onto Zeolitic Imidazolate Frame (ZIF-67) .....	41
Modulation of <i>in vitro</i> pollen germination and tube elongation of kiwi ( <i>Actinidia deliciosa</i> ) by spermidine .....	42
Investigation of the presence of tetracycline antibiotic residues and total aerob mesophilic bacteria in some foods consumed in Ankara .....	43
Green synthesis of ZnO nanoparticles using plant wastes: Antimicrobial and cytotoxic activities.....	44
Synthesis, aggregation behaviour, fluorescence, singlet oxygen generation and photodegradation studies of pyrazoline substituted axial silicon, alpha ( $\alpha$ ) and beta ( $\beta$ ) zinc phthalocyanines .....	45
Two-dimensional WSe <sub>2</sub> nanosheets-based electrochemical sensor for simultaneous detection of epinephrine and dopamine .....	46
Green synthesis of Ag-doped on CuO from pomegranate and its antibacterial and photocatalytic activities application.....	47
DNA binding and nuclease properties of magnesium (II) phthalocyanines .....	48
The Investigation of Epistatic Associations of Two SNPs in the NRG1 and ERBB4 Genes with Schizophrenia .....	49
Investigation of mesenchymal stem cells on drug-induced liver injury by using liver on a chip system. ....	50
A novel tool for regenerative medicine: OoC platforms meet MSCs .....	51
Exploring anti-cancer drug activities by 3-dimensional liver cancer on a chip .....	52
Evaluation of cholinesterases inhibitory effects of someazole derivatives .....	53

The Role of lncRNA H19 in the Resistance of Ovarian Cancer Cells to Cisplatin Therapy .....	54
Investigation of Electrical Conductivity of Polyselenophene/MnO Hybrid Composites .....	55
Synthesis and antimicrobial activity of some new thiosemicarbazone derivatives containing benzothiophen moiety .....	56
Immobilization of Urease onto Titanium (IV) Oxide Nanoparticles with Different Spacer Arms .....	57
Synthesis of Benzimidazole Derivatives and of Their Anticancer Properties .....	58
Synthesis of Benzimidazole Derivatives as New Anticancer Compounds .....	59
Consumption of High-Fructose Corn Syrup Delays Puberty in Female Rats .....	60
Sublethal exposure to aconifen induces alteration in biochemical indices in serum of juvenile <i>Oncorhynchus mykiss</i> .....	61
Lipid peroxidation promoted inhibition of membrane-bound enzymes in tissues of juvenile <i>Oncorhynchus mykiss</i> following spirotetramate application.....	62
<i>In silico</i> studies on possible Topoisomerase II $\alpha$ inhibitors.....	63
Production, characterization and antioxidant activity evaluation of green synthesized iron oxide nanoparticles.....	64
Production of wound dressings including the metal complex of phenylboronic acid-functionalized 4,5-diazafluorene.....	65
The effect of hydroglycerolic extraction on biofunctional characteristics of yarrow ( <i>Achillea millefolium</i> L.) flowers: An optimization study using simplex lattice mixture design approach .....	66
Lyophilization of <i>Dicentrarchus labrax</i> and Investigation of the Effect of Ultrasonic Pretreatment.....	67
Drying of Blue Mussels by Freeze Drying Technique and Investigating the Effect of Ultrasonic Pretreatment.....	68
Comparative Growth of Green Basil and Purple Basil in Deep Water Culture vs. Peat.....	69
Evaluation of biochar obtained via gasification of oak wood waste as a soil amendment and plant growth promoter .....	70
Biodegradation of Microplastics with <i>Aspergillus flavus</i> and <i>Aspergillus versicolor</i> .....	71
Size-dependent potential toxicological effects of iron oxide nanoparticles (Fe <sub>3</sub> O <sub>4</sub> NPs) .....	72
Determination of the contents of naringin, myricetin and rutin in <i>Centaurea kurdica</i> Reichardt (Asteraceae) by HPLC.....	73
Artificial Neural Network (ANN) for Estimating Growth Model of Turkish Crayfish ( <i>Pontastacus leptodactylus</i> ) in Yenice Reservoir (Çanakkale, Türkiye).....	74
Determination of radiation absorption properties of composite used in dental applications by Monte Carlo method.....	75
The effect of the use of different stocking volumes on the development of blue crab (m.j. rathbun <i>Callinectes sapidus</i> ) broodstocks.....	76
Design, synthesis and characterization of a novel series of isoxazole-containing thiourea .....	77

Insulinoma INS-1 cells undergo both cell death and cell proliferation with Dinutuximab beta treatment under different conditions.....	78
Türkiye’deki SARS-CoV-2 Genomik Sürveyansı Stratejisi: Filogenetik Analiz Sonuçları .....	79
Tekstil Endüstrisi Atıksularının Ters Osmoz Membranları ile Arıtımı Sonucu Oluşan Konsantre Akımından Organik Madde Gideriminde Farklı Elektro-Fenton Proseslerin Etkisinin Araştırılması .....	80
Preparation and characterization of decellularized tendon extracellular matrix-halloysite biocomposite scaffold for bone tissue engineering applications .....	81
Gelincik çiçeği ( <i>Papaver rhoaes</i> L.) ekstraktının renk maddesi olarak kullanım olanakları.....	82
Zr-MOF ile tetrasiklin antibiyotiklerinin sulu ortamdan giderimi .....	83
Zeytinyağının oleuropeini alzheimer hastalığı için umut olabilir mi? .....	84
Irisin levels in schizophrenia and psychosis: Unraveling the hormonal link.....	85
Development of a novel pro-angiogenic and antimicrobial synthetic skin graft.....	86
Development of bioactive wound dressings from 2-deoxy-D-ribose (2dDR) loaded decellularized plant leaves.....	87
Which one is a healthier option for parsley: eating it or using it as a tissue-engineered vascular graft? .....	88
Biogas, hydrochar and biochemical production from spent coffee grounds with biorefinery approach integrating hydrothermal carbonization and anaerobic digestion .....	89
Investigation of the antioxidant and antibacterial effects of fermented <i>Cornus mas</i> and <i>Rubus sanctus</i> fruits.....	90
The key roles of mTOR and p53 during cell fate decision: Senescence or quiescence?.....	91
Synthesis and Characterization of Fluorine-Contained Dental Composites .....	92
Biyoprimer tekniği ve stres toleransı üzerine etkisi .....	93
The impact of antitranspirants on grain yield and photosynthetic characteristics of two wheat cultivars during water deficit stress.....	94
Combined treatment of sprouting and high intensity ultrasound to produce functionalized hemp protein .....	95
Evaluation of the Cytotoxic Effects of Epigallocatechin Gallate and Cetuximab in Lung Cancer Cells.....	96
Design and synthesis of a new chemiluminogenic sensor .....	97
Kepek otu bitkisinden ( <i>Paronychia sp.</i> ) Tip I ribozom inaktive edici proteinin (RIP I) saflaştırılması ve karakterizasyonu.....	98
Evaluation of antimicrobial and antioxidant activities of propolis samples prepared with different solvents.....	99
The Effect of Lead on Some Ecophysiological and Molecular Parameters of <i>Cucurbita moschata</i> Duch. ....	100
Chemistry of Michael adducts of nitroolefins: Unexpected <i>N</i> -acetylation products .....	101
Methylene blue adsorption on sodium dodecyl sulfate modified chalcopyrite.....	102
Assessing the environmental impact of functional foods.....	103

Catalytic effect of Zr loaded ZSM-5 doped Beta zeolite catalyst on the transalkylation of 1-methylnaphthalene with toluene for 2,6-DMN and p-xylene synthesis .....	104
<i>Lathyrus annuus</i> L., <i>L. hierosolymitanus</i> Boiss. ve <i>L. hirsutus</i> L. türlerinin toplam fenolik ve flavonoid içerikleri ve antioksidan özellikleri .....	105
Synthesis, characterization and <i>in silico</i> studies of some new compounds bearing thiadiazole ring .....	106
Development and application of a new electrochemical herbicide sensor based on molecular imprinting .....	107
GENZPRO Development Kit Used in GENZPRO® Mini Chip Auto Device Working with Capillary ELISA Technique, Providing Development of Rapid Protein Tests.....	108
Green synthesis of zinc oxide and manganese oxide nanoparticles from <i>Brassica oleracea</i> and <i>Triticum monococcum</i> extracts and their hybrid advanced oxidation applications of Rhodamine B dye removal .....	109
Determination of the suitable cell count in flow-cytometrical analyzes of frozen bull semen .....	110
<i>In silico</i> Analysis of Elucidating MicroRNAs in Secondary Metabolite Production in Medicinally Important Plants.....	111
Explant Culture of Cartilage Tissue and Multi Differentiation of Derived Cells .....	112
Çoklu Aromatik Organik Bileşiklerin Sentezi ve Biyofilm Engelleyici Etkilerinin İncelenmesi.....	113
Investigation of synthesis, characterization and <i>in vitro</i> drug release of <i>Ferula assafoetida</i> fabricated Fe <sub>3</sub> O <sub>4</sub> @chitosan magnetic nanoparticles .....	114
Etanol İntoksikasyonu Vakalarında Kandaki Alkol Konsantrasyonu ile Etil Glukronid ve Etil Sülfat arasındaki ilişkinin araştırılması .....	115
Monoamine oxidase inhibition and toxicity evaluation of phenylurea-bearing hydrazones .....	116
Setup a Sensor Network for Multiple Measurement by the Fiber Loop Ringdown Spectroscopy (FLRDS) Technique .....	117
Ciprofloxacin in combination with quercetin and curcumin act strong synergistically to inhibit proliferation of colon carcinoma cells .....	118
Koyunlarda reproduktif organlarda Doppler ultrasonografinin kullanım alanları.....	119
Impact of chiral dopant concentration on frequency dependent dielectric properties of nematic liquid crystal.....	120
Enzymatic Lactate Detection by Nanorod Modified Electrodes.....	121
Rizosferik <i>Trichoderma</i> İzolatlarının Domateste Fusarium Kök ve Kök boğazı Çürüklüğü Hastalık Etmeneinin Miseliyal Gelişimine Etkisi .....	122
Synthesis and Investigation of Aggregation Properties of Water-Soluble Octa-Substituted Manganese(III) Phthalocyanines Bearing Pyridine Groups .....	123
Compatibilizer synthesis and characterization to be used in the preparation of polyal® and polyolefin masterbatches obtained from composite packaging wastes.....	124
Cyanogenic Glycosides as Potential Anticancer Agents: Molecular Docking, and ADME Study .....	125

Eco-friendly synthesis of graphene/ZnO nanocomposites with visible light-driven photocatalytic activity for water remediation: A preliminary study.....	126
The effect of boron solution application on mycotoxin amount.....	127
Production of antioxidant cream from vegetable and fruit peel residues within the scope of protecting nature and sustainability .....	128
Anti-apoptotic and anti-inflammatory effects of dexpanthenol against nicotine-induced liver injury in rats .....	129
The Role of Aurora Kinases in Human Colorectal Cancer.....	130
Exploring the Impact of Pan-AURKs and Selective AURKB Inhibitors on Non-Small Cell Lung Cancer..	131
Electroactive Hydrogel Preparation, Characterization and Investigation of Drug Release Potential by Electrical Stimulation.....	132
Exfoliation of Graphite in PVA/PVP Aqueous Solution and Production of Silver Nanoparticle/Multilayer Graphene/PVA/PVP Nanocomposites.....	133
Utilizing Active and Passive Fungal Cell Immobilization to Create an Eco-Friendly Biocomposite for Acidic Dye Biodecolorization .....	134
Assessing the Impact of Shoc2 on Hair Growth Cycle .....	135
İstatistik destekli Yalın Altı Sigma ile uygulanan teknik tarım desteğinin hayvancılık işletmelerinde verime etkisi.....	136
Yemli uzaktan sualtı video kayıt sistemleri (BRUVs) ile balık topluluk yapılarının incelenmesi.....	137
Optimization of Alkaline Pectinase Production By <i>Bacillus</i> Sp. VGA7 Isolate .....	138
Hasat Sonrası Melatonin ve Modifiye Atmosfer Paketleme Uygulamalarının Kiraz Meyvelerinin Muhafazası Üzerine Etkileri.....	139
Contrasting and Assessing Genome-Wide Association Studies and Marker-Assisted Selection Applications in Animal Breeding.....	140
Electrochemical sensor based on Ag-doped ZnO nanocomposite modified pencil graphite electrode for uric acid determination .....	141
ctDNA' nın Kanser Tanısında Kullanımında Yeni Yaklaşımlar ve Teknolojiler .....	142
Sensing behavior of the Al-doped graphene structure toward ethylene and 1-methylcylopropen (1-MCP) molecules: A DFT study .....	143
Taşıyıcı Sistem Olarak Kullanılan Cr-MOF-Aljinat Hidrojellerinden Sefaleksinin <i>in vitro</i> İlaç Salm Özelliklerinin Araştırılması.....	144
Aspir ( <i>Carthamus tinctorius</i> L.) bitkisi kullanılarak yeşil sentez yoluyla TiO <sub>2</sub> ve SiO <sub>2</sub> nanoparçacıklarının sentezi ve karakterizasyonu .....	145
Afinite kromotagrafiyi uygulamalarına yönelik Fe <sup>+3</sup> ile çapraz bağlanmış alginat mikroküreler içeren p(HEMA) esaslı kriyojel membranların üretilmesi ve karakterizasyonu .....	146
Yeni bir Fonksiyonlaştırılmış Manyetik Grafen Oksit Kullanarak Enzim İmmobilizasyonu ve Atık Sulardaki Boyaların Uzaklaştırılması.....	147
Preparation of probiotic-prebiotic formulations for the development of synbiotic products.....	148

Meldrum's Acid-based Chain Extenders for PET Recycling.....	149
Isolation, Characterization, and Three-Dimensional Culture of Gemcitabine-Resistant CD326+CD133+CD44+ Lung Cancer Stem Cells Derived from A549 Cancer Cell Line .....	150
Endotel hücre fonksiyonu devamlılığı için karvakrol ve/veya naringin kullanılabilir mi? .....	151
Assessment of measurement uncertainty of blood lipid parameters according to ISO/TS 20914 guidance .....	152
Extraction of bioactive compounds from food waste using deep eutectic solvents .....	153
Kurak koşullarda yapılan bağcılıkta yağmur suyu hasadının etkinliği.....	154
Toprak havuzlarda deniz balıkları üreten işletmelerde bir üretim periyodunda sedimentte meydana gelen element miktarı değişimi.....	155
Synthesis, spectral characterization and molecular docking studies on new metal complexes of a schiff base derived from 3,5-dibromo-4-methoxysalicylaldehyde .....	156
Synthesis and spectroscopic studies of a new schiff base and its metal complexes.....	157
PARP-1 Levels in Breast Cancer Patients .....	158
Synthesis, Characterization of Gallic acid Nanoflowers and Anticancer Activity on MCF7, A549 cell line .....	159
Effects of medical ozone therapy against fluoxetine induced DNA damage .....	160
Kırgızistan'ın Kırmızı Kitap'ında yer alan tıbbi bitkilerin Türkiye'deki yakın türler ile karşılaştırılması .....	161
18-25 yaş arası yurttan kalan kız öğrencilerin uyku kalitesinin beslenme davranışlarına etkisi.....	162
An Indispensable Method from Separation to Determination: Adsorption.....	163
Trend Analysis of Some Economic Fishes in the Mediterranean Sea .....	164
The Phe19, Leu22, and Trp23 residues of p53 play a role in efficient Ser15 phosphorylation by DNA-PK .....	165
Balık yağından çoklu emülsiyon üretimi ve bazı özelliklerinin araştırılması .....	166
Biogenic amines indexes used to determine the quality of seafood .....	167
Synthesis of Ag(I)-DpNap and its antiproliferative effect on glioblastoma cells .....	168
Determination of TGF- $\beta$ and CXCL12 signaling pathway changes after mesenchymal stem cell-cancer cell co-culture.....	169
Evaluation of <i>in vitro</i> Genotoxicity of Midazolam .....	170
Artemisinin and Cancer: A Molecular Docking Analysis Perspective .....	171
Investigating the potential of baicalein: an <i>in silico</i> assessment for breast cancer.....	172
Synthesis and Characterisation of Egg white/Polyacrylamide Hydrogels via UV Curing.....	173
Arka Çapraz Bağ Kesen Total Diz Artroplastisinde Orta Dönem Sonuçlarımız.....	174
Chloroplast genome targeted phylogenetic analysis in Cucurbitaceae family .....	175
Mini-prep protocol for simplified RNase A extraction.....	176

A Novel Composite Structure for Electrochemical Uric Acid Sensor with SWCNT and Pyrene-Substituted-Anthracene $\pi$ - $\pi$ Interaction .....	177
Karyology of monkey goby .....	178
Biosynthesis of high value-added carotenoids by engineered microorganisms.....	179
Investigation of Wastewater Remediation Performance of Cost Effective Graphene Supported Photo Catalyst .....	180
Investigation of Photocatalytic Dye Removal Performance of Activated Carbon-Polymeric Composites Modified by Phosphoric acid <sup>1</sup> .....	181
Controlled electrode potential as a way towards more rapid and homogeneous deposition of self-assembled monolayers.....	182
Steroida Konjugatların Biyolojik Aktiviteleri: Antimikrobiyal ve Antiproliferatif Özelliklerin İncelenmesi ve Moleküler Bağlanma Çalışmaları .....	183
Kemik doku mühendisliği uygulamaları için kalsiyum fosfat esaslı biyoseramiklerden doku iskelesi üretimi ve ürün performanslarının karşılaştırılması .....	184
Turbidity Removal by Adsorption of Coal-Based Powder Activated Carbon (CBPAC) from Regular Landfill Leachate and Evaluation of Experimental Parameters.....	185
Potential AHAS enzyme inhibitor containing sulfone and tetrazole groups: Synthesis, Characterization, Molecular Docking and ADME Investigations .....	186
Immunofluorescence investigation on follicular dendritic cells resident in the pyloric tonsil of turkey ( <i>Meleagris gallopavo</i> ).....	187
Importance of cellular mitophagy (mitochondrial autophagy) and the role of mitochondrial dysfunction in the occurrence of several diseases.....	188
Synthesis, Characterization and <i>In Silico</i> ADME Screening of Some New 1,3,4-Thiadizole Derivatives.	189
Investigation of glucose-related changes of connection channels between pancreatic beta cells and their role in oscillation recovery.....	190
Multi-Faceted Analysis of a Novel Sulfonylurea for Potent Herbicidal Activity: Synthesis, Characterization, ADME, Conformational Analysis, Molecular Docking, and Induced Fit Docking.....	191
Pet bird diseases admitted to Ankara University Small Animal Hospital: A retrospective evaluation of 276 visits.....	192
İyonik sıvı ve bakır nanopartiküller ile modifiye edilmiş kalem grafit elektrotların elektrokimyasal karakterizasyonu.....	193
Metal complexes based on substituted salicylidene: synthesis and characterization.....	194
Tıbbi cihazların ve ürünlerinin değerlendirilmesinde mikrobiyolojik testlerin önemi.....	195
Investigation of the Effect of Oxidative Stress on Autophagic Gene Expressions in Gastric Cancer.....	196
Effective Removal of Trypan Blue From Aqueous Solutions by Using Cu-Vanadate.....	197
Immobilization of La-ZnFe LDH on polydimethylsiloxane sponge for photocatalytic degradation of antibiotic .....	198

Investigation of the effects of acute caffeine intake on oxidative stress in the brain and depression-like behaviors in ovariectomized mice .....	199
Habitat Preferences of Anatolian Water Frog Lineages (Genus: <i>Pelophylax</i> ).....	200
Comparison of Phenolic Content and Antioxidant Activity of Two Different White Honey Samples .....	201
Serotonin ve Melatonin Uygulanmış Meme Kanseri Hücrelerinde MT-1 ve MT-2 Gen Ekspresyon Seviyelerinin İncelenmesi.....	202
Does different concentration of high fructose corn syrup impact some hematological parameters in broilers?.....	203
Mide Kanseri Hücrelerinde Oksidatif Stresin VEGF Gen Ekspresyonu Üzerindeki Etkisi.....	204
Pharmaceutical Preparation and Characterizations of Anti-Hypertensive Nanocrystals Using Anti-Solvent Re-crystallization Methods.....	205
Synthesis of Di-cationic Surfactant Containing Pyridinium Ion as Positively Charged Nitrogen Atom and Inhibition Efficiency Against Metal Oxidation in 1.0 M HCl.....	206
Kemik doku mühendisliğine yönelik farklı ajanlarla modifiye edilmiş montmorillonit katkılı nanokompozit filmlerin geliştirilmesi .....	207
Novel Asymmetric Bisthiocarbohydrazone and Its Mixed Ligand Ni(II) Complex: Synthesis, Characterization and Antioxidant Property.....	208
Dondurma üretiminde üvez pulpu kullanılmasının dondurmanın ilk damla süresine etkisi .....	209
The effect of co-administration of Rosmarinic Acid and Carvacrol on wound tissue nitric oxide and protein carbonyl levels in diabetic rats .....	210
Investigation of biosorption properties of <i>Pyracantha coccinea</i> L. for color removal .....	211
L-Fenilalanin Esterinde Türeyen Tiyosemikarbazit Türevlerinin Sentezi ve Yapı Aydınlatılması.....	212
Protective roles of fullerene C <sub>60</sub> nanoparticle against chromium-induced oxidative damage in <i>Saccharomyces cerevisiae</i> .....	213
Presence of aquatic insects in freshwater areas of the Mediterranean region (Antalya and Mersin provinces) at the family level and their distribution on the map.....	214
Evaluation of <i>in vitro</i> anticancer activity of Silver Nanoparticles Biosynthesized from <i>Cistus salviifolius</i> L. and <i>Ferula communis</i> L. in MCF-7 and HT-29 cells.....	215
Investigation of the usability of <i>T. molitor</i> chitins for the removal of textile industry dyestuffs.....	216
Impacts of zinc fertilization on <i>Ocimum basilicum</i> L. under water stress: Alterations in essential oil composition .....	217
Normal vücut ağırlığındaki kadınlarda şeker tüketim sıklığı ile yaşam kalitesi arasındaki ilişkinin değerlendirilmesi .....	218
Yetişkin kadınlarda Covid-19 geçirme durumunun beslenme davranışı ile ilişkisinin değerlendirilmesi .....	219
Development of waste biomass-based activated carbon-coated carbon fibers for potential applications in multifunctional structural supercapacitors .....	220
Synthesis and Antimicrobial Activities of Some Phenyl-Substituted Azaheterocyclic Compounds .....	221

Assessing pesticide biodegradability through predictive tools and databases.....	222
Kökene bilinen belirli bir çeşit buğdaydan elde edilen kepeğin mikrobiyal biyoproses yoluyla modifikasyonu ve modifiye kepek kullanılarak ekmeğin üretimi.....	223
Removal of Crystal Violet using sawdust adsorbent prepared from wood wastes: isotherm, kinetic and thermodynamic studies .....	224
Prediction of current and future distributions of <i>Chalcophora detrita</i> (Coleoptera: Buprestidae) under climate change scenarios .....	225
The role of apocynin against the effects of chloroquine-enhanced radiotherapy on healthy tissues.....	226
Niche Partitioning between Two Sympatric Lizards in Mediterranean Biodiversity Hotspot .....	227
Detection and characterization of thermophilic bacilli associated with pasteurized milk in markets and determination of their biofilm production properties.....	228
The effects of meteorological factors and atmospheric pollutants on <i>Acer</i> pollen loads in urban area .....	229
Microbial Inactivation of Foodborne Pathogens by Ultrasound Technology .....	230
A Novel Approach in Poultry Carcass Decontamination: Ultrasound Technology .....	231
Synthesis and application of thiourea-modified cellulose as an organocatalyst in asymmetric Mannich reaction.....	232
Ag <sub>2</sub> O Np Katkılı PVA Yapılı İlaç Salım Sistemlerinin Hazırlanması ve Karakterizasyonu.....	233
3 Boyutlu Biyoyazıcı Tasarımı .....	234
Fermented marine algae source in aquaculture.....	235
Bazı pirimidin türevlerinin antioksidan kapasitelerinin belirlenmesi, glutatyon s-transferaz enzimi üzerine inhibisyon etkilerinin incelenmesi ve moleküler docking yöntemiyle enzim-inhibitör etkileşimlerinin araştırılması.....	236
Phytochemical Study on <i>Gypsophila venusta</i> .....	237
SDS Sedimentasyon analizinde SDS çözelti miktarı ve analiz süresinin değişiminin sonuçlar üzerine etkisinin değerlendirilmesi. ....	238
Removal of methyl orange (MO) and reactive blue 4 (RB4) from aqueous solution by CTAB-modified coffee waste-based activated carbon .....	239
HPLC-DAD phenolic content investigation, antioxidant, and antimicrobial activities of <i>Polygonum cognatum</i> Meissn.....	240
Microbial conversion of dehydroepiandrosterone and pregnenolone by two <i>Penicillium</i> species .....	241
Some important fungal diseases in rice ( <i>Oryza sativa</i> L.) fields in the Thrace region in Turkey.....	242
Oligodendrosit hasarı ve bağırsak mikrobiyom çeşitliliği arasındaki ilişkinin araştırılması.....	243
Evaluation of the anticancer effects of maleic anhydride/N-vinyl caprolactam copolymer and copolymer/organo-MMT nanocomposites.....	244
Isolation and Structural Determination of Secondary Metabolites from <i>Moringa oleifera</i> Plant .....	245
Molecular investigation of the role of papillomaviruses in the etiology of transmissible venereal tumors (CTVT) in dogs.....	246

Ahşap koruyucu kimyasallar ile yapılan emprenye işleminin uygunluğuna ilişkin yapılan testler ve yorumlanması.....	247
Yüksek fruktoz diyetinin neden olduğu metabolik ve hepatik değişikliklerde Mirsetin'in potansiyel etkilerinin araştırılması.....	248
Catalytic performance of lipase-inorganic hybrid nanoflowers (L@ihNFs) in the presence of commercial oils/waste oils and detergents/surfactants .....	249
Detection of Heparanase Enzyme Activity with the Colorimetric Assays.....	250
<i>Colletotrichum fiorinae</i> 'nin neden olduğu antraknoz meyve çürüklüğüne karşı Türkiye'deki bazı zeytin çeşitlerinin duyarlılık gruplarının belirlenmesi .....	251
Zeytinde yaprak testleri ile <i>Colletotrichum fiorinae</i> 'ye karşı duyarlı ve dayanıklı çeşitlerin belirlenmesi .....	252
Determination of optimum modification conditions of glassy carbon electrode with Pt/CNT for HCOOH dehydrogenation .....	253
Evaluation of the land use/land cover (LULC) change effects on land surface temperature (LST): A case study of Kağıthane Watershed.....	254
Aromatik sülfonik asit katalizörler varlığında levülinik asit üretimine biyokütle içeriğinin etkisi.....	255
Synthesis and characterization of poly ( $\epsilon$ -caprolactone- <i>b</i> -4-vinyl benzyl- <i>g</i> -ethylene glycol) block-graft copolymers using reversible addition/fragmentation chain transfer polymerization (RAFT), ring opening polymerization (ROP) and "click" chemistry methods .....	256
Removal of heavy metals from wastewater using activated carbon synthesized from coffee silverskin .....	257
Should chitosan films be referred to as natural or semi-synthetic?.....	258
Relationship of Diabetes Mellitus and Cancer .....	259
Simple and green colorimetric method for Iron (III) determination using <i>Helichrysum arenarium</i> Infusion .....	260
Antioxidant activity and total phenolic and flavonoid content of <i>Pistacia khinjuk</i> Stocks ethanolic extract .....	261
Mikrodizi Verilerinde Eksik Veri Atama ve Normalizasyon Sıralamasının Sınıflama Performansına Etkisi .....	262
Green synthesis of silver, zinc, and calcium nanoparticles from a psychrophilic bacterium .....	263
Bilecik İli Küre ve Çaltı Köyleri Florası İçin Ön Çalışmalar .....	264
Biyoaktif bileşiklerin glikasyon ürünleri üzerine etkisi .....	265
The effect of caffeic acid phenethyl ester (CAPE) on the viability, apoptosis, and vascular endothelial growth factor (VEGF)-A and VEGF-B gene expression in human umbilical vein endothelial cells.....	266
Exploring the Function of a Candidate Calcium-Binding Protein in Cilio-biogenesis in <i>C. elegans</i> .....	267
<i>In vitro</i> biological activity studies of <i>Bilacunaria scabra</i> (Fenzl) Pimenov et V.N.Tikhom .....	268
A novel fluorometric chemosensor for the selective, qualitative and quantitative detection of cyanide ions in water samples.....	269

Synthesis route of smart halloysite nanocontainers and their use in anti-corrosion coatings.....	270
Pollen diversity in the <i>Iberis simplex</i> species complex.....	271
Echinodermata Filumunun Türkiye’deki Gelişimi (2003-2023), Bibliyometrik Bir Analiz .....	272
Effect of modification with surfactant on organic dye adsorption capacity of char based adsorbents...273	
Novel 2D Cu (II) coordination polymer based on the flexible 3, 3'-dimethylglutaric acid and 4,4'-bipyridine: Hydrothermal synthesis and crystal structure .....	274
Excitation energy transfer between bodipy dyes on the same cyclotriphosphazene platform.....	275
<i>Capnodis tenebricosa</i> (Olivier, 1790) (Coleoptera: Buprestidae)’da dişi üreme sisteminin morfolojisi.276	
<i>In vitro</i> inhibition effects of Acai berry extracts on human AChE .....	277
<i>Capnodis tenebricosa</i> (Olivier, 1790) (Coleoptera: Buprestidae)’da arka bağırsağın ultrastüktürel yapısı .....	278
Türkiye akar faunası için yeni bir tür kaydı; <i>Erythraeus (E.) opilionoides</i> (C. L. Koch, 1837) (Acari: Erythraeidae).....	279
Evaluating microplastic administration methods for honeybees in controlled cage experiments.....	280
A new Sulfonylamide compound containing 4-methoxy cinnamaldehyde with potential bioactivity: Synthesis, characterization, and detailed theoretical calculations.....	281
The Entomofauna Visiting <i>Salvia cryptantha</i> Flowers.....	282
Üç fazlı üç boyutlu elektro oksidasyon sisteminde degradasyon.....	283
Nanolif yapıları çok katmanlı yara örtüsü sentezi, karakterizasyonu ve antibakteriyel etkisi.....	284
Türkiye’deki Akdeniz midyesi ( <i>Mytilus galloprovincialis</i> Lamarck, 1819) yetiştiricilik sektörünün mevcut durumu .....	285
Synthesis of a New Quinaldinium-Based Sensor and Investigation of Its Fluorescence Properties Towards Specific Metals .....	286
Effect of temperature and salt applications on kojic acid production in <i>Aspergillus flavus</i> .....	287
Metilen Mavisini Boyar Maddesinin Hibrit Nanokompozit ile Atık Sulardan Gideriminin Yanıt Yüzey Yöntemi ile Modellenmesi .....	288
Luteolin alleviates genotoxicity by attenuating micronucleus formation and cellular damage in acrylamide-exposed embryonic fibroblast cells.....	289
DFT Studies of A Salicylaldehyde Based Hydrazone Ligand .....	290
Investigation of the effects of the phenolic extracts obtained from the different industrial food wastes on the gelatin modification .....	291
Unrevealing the EECC Water Reduction Mechanism of Cobalt based Planar Catalyst: Insights from Ab-initio Molecular Dynamics and Density Functional Theory .....	292
Farklı pişirici sistemlerle çapraz bağlanan floroelastomerlerin (FKM) gerilim-gevşeme özellikleri .....	293
Synthesis of novel carvacrol-triazole conjugates as anticancer agents .....	294
Bioadsorption of Lead (II) on Teff Seeds.....	295
Quantification of Sulforaphane from <i>Raphanus sativus</i> species by Reverse Phase HPLC.....	296

Chymotrypsin, trypsin, urease inhibitory and antioxidant activities of <i>Centaurea helenioides</i> Boiss. & Hausskn.....	297
Karbazolil ve benzildiamino pendant kolları içeren (N/N)dispirosiklotrifosfazen türevlerinin sentezi: spektral, kristallografik, fotofiziksel, stereojenik özelliklerinin ve biyolojik aktivitelerinin incelenmesi .....	298
Valorization of de-oiled <i>Botryococcus braunii</i> biomass for bioethanol production .....	300
Expression, Purification, and Characterization of Intracellular Xylanase from <i>Anoxybacillus caldiproteolyticus</i> .....	301
Analysis of Blood Chemistry Changes after Systemic SHOC2 Inactivation in Adult Mice .....	302
Determination of Biological Activities of DMSO Extracts Obtained from Sesame and Black Cumin Seed Oils .....	303
Determination of total antioxidant capacity and GC-MS content of <i>Malus floribunda coccinella</i> fruit ....	304
Comparison of the Effects of Lead Toxicity on Chlorophyll Content in Some Wheat Varieties with Classical and Modern Methods.....	305
Graft copolymer hydrogel synthesis and characterization via controlled/living radical polymerization techniques and investigation of hydrogel properties .....	306
Vincristin ile indüklenen bağırsak toksisitesinde quercetin'in koruyucu etkilerinin incelenmesi.....	307
Synthesis and characterization of some new coumarin-perimidine hybrid compounds .....	308
Fabrication and characterization of hydrogels from bovine achilles tendon collagen and human hair keratin.....	309
Enjeksiyonluk bir ürün için liyofilizasyon prosesi geliştirilmesi ve ölçek büyütmesi.....	310
Serotonin Treatment Decreases miR21 Expression And Cell Proliferation Of SAOS-2 Human Osteogenic Sarcoma Cells .....	311
Preparation and Characterization of Biomaterial-based Antibacterial Wound Dressing.....	312
Kasporfungin liyofilize toz için elementel impürite metodu geliştirilmesi ve validasyonu.....	313
Colorimetric determination of organic and inorganic pollutants in different environmental and biological samples.....	314
Harnessing the potential of quince seed extracts to enhance <i>Chlamydomonas reinhartii</i> cultivation.....	315
Establishment of single barcode-harboring chemotherapy-resistant HCT116 cell lines via limiting dilution approach .....	316
Immunohistochemical Expression of Matrix Metalloproteinase-9 (MMP-9) and Tissue Inhibitors of Matrix Metalloproteinases-1 ( <i>TIMP-1</i> ) in Natural Canine Parvoviral Enteritis Infection.....	317
Design and evaluation of methionine-bearing 1,2,4-triazole-3-thione derivatives as potential SARS-CoV-2 RdRp inhibitors .....	318
The antibacterial property of silver nanoparticles embedded cryogel .....	319
The Cytotoxic Effect of Royal Jelly Produced in Ardahan and Ordu Regions on Lung and Colon Cancer Cell Lines.....	320
Comparison of Antimicrobial Effects of Ethanol Extracts of Some Medicinal Aromatic Plants.....	321

Cloning and sequencing of <i>Bacillus mojavensis</i> TH309 phytase gene.....	322
Recombinant Production, Purification and Activity of Microbial Hyaluronidase Enzyme.....	323
Determination of adhesion properties of lactic acid bacteria isolated from traditional food products.	324
Determination of pH Value Using Conventional pH Strips by Image Processing .....	325
Investigation of the effect of metformin on epithelial-mesenchymal transition in MCF-7 and MDA-MB-231 breast cancer cells with increased expression of miR-506.....	326
Antiulcerative effect of Apilarnil on ethanol-induced gastric injury model in rats .....	327
Immunohistochemical Investigation of the Relationship Between the Disease and Apoptosis in Dogs Naturally Infected with Parvoviral Enteritis.....	328
Differential Effects of Natural p-Menthan-3,8-diol Synthesized by Green Chemistry Method and N, N-Diethyl-meta-toluamide on Developing Zebrafish Embryos.....	329
Investigation of apoptotic effects of organosulfur compounds as multitarget directed ligands.....	330
Kuru ceviz yapraklarından biyochar üretimi ve piroliz kinetiği parametrelerinin belirlenmesi .....	331
Dopamin, ürik asit ve askorbik asit eşzamanlı deteksiyonu için güncel elektrokimyasal sensör çalışmaları: Kısa inceleme .....	332
Comparative Effects of Natural Cosmetic Preservative Synthesized by Green Chemistry Method and Synthetic Cosmetic Preservative on Developing Zebrafish Embryos.....	333
Efficacy of the spectrotaxonomic method in the classification of female individuals of the species belonging to the genus <i>Laccophilus</i> (Coleoptera, Dytiscidae).....	334
Atık su arıtımında biyoteknoloji: <i>Tetrahymena thermophila</i> giderim performansı ve gelecek beklentileri .....	335
Synthesis of aerogel materials from biowaste: comparison of supercritical carbon dioxide drying with atmospheric drying .....	336
Rheological characterization of the tiger nut ( <i>Cyperus esculentus</i> L.) oil-beeswax oleogels prepared with some flavors.....	337
Platinum(II) complexes with 2-/3-/4-(benzimidazol-2-yl)phenol: Synthesis, characterization and <i>in vitro</i> cytotoxic activities .....	338
Sudaki boron kirliliği'ne karşı alternatif bir biyoremediasyon yöntemi.....	339
Anti-apoptotik Bcl-2 proteinlerinin yaşlanma üzerindeki koruyucu etkilerinin maya modelinde araştırılması.....	340
Antimikrobiyal maddeler için lipozomal formülasyon.....	341
Üleksit'in insan periferik lenfositlerinde genotoksik ve hidrojen peroksit (H <sub>2</sub> O <sub>2</sub> )'e karşı antigenotoksik potansiyelinin komet testi ile değerlendirilmesi .....	342
Borik asitin hidrojen peroksit ve bakır oksit nanopartikülüne karşı antigenotoksik potansiyelinin komet testi ile incelenmesi .....	343
Innovative Strategies in KRAS Inhibitor Development: Integrating Pharmacophore-Based Virtual Screening, Molecular Docking, and AI-Powered ADMET Insights .....	344
Farklı habitatlardan izole edilen bazı aktinobakterilerin antimikrobiyal aktivitelerinin taranması.....	345

Evaluation of black elderberry tea samples in the market and grown with organic farming in terms of European Pharmacopoeia and analysis of their phenolic contents by RP- HPLC technique.....	346
The investigation of the anticancer effects of royal jelly on A549 lung cancer cell line and BEAS-2B normal human bronchial epithelial cells .....	347
Alzheimer's Alchemy: Unveiling the Dual-Inhibitory Potential of Tacrine-Donepezil Hybrids .....	348
Green syntesis of rGO-NiO-CuO nanocomposite for photocatalytic aplications .....	349
AI-Guided ADMET Analysis and Molecular Docking in the Discovery of Novel LIM Kinase 1 Inhibitors: A Pharmacophore-Based Virtual Screening Approach.....	350
Vücut sıcaklığının düzenlenmesinde UCP1'in fonksiyonu .....	351
Investigation of antibiotic resistance and transferable resistance gene profiles of <i>Stenotrophomonas maltophilia</i> strains isolated from ready-to-eat foods.....	352
Production of urease enzyme by <i>Proteus app.</i> immobilized cryogel .....	353
<i>In silico</i> identification of potential miRNAs that target <i>Avr</i> genes in <i>Fusarium oxysporum</i> f. sp. <i>lycopersici</i> .....	354
Are nanoparticle-hydrogel combinations the next generation of control strategies against plant diseases? .....	355
Removal of Nitrate (NO <sub>3</sub> <sup>-</sup> ) from Aqueous Solution by Shallow Shell resin.....	356
Evaluation of Eber Lake (Afyonkarahisar) Macrophytes in Terms of Restoration Ecology .....	357
Degradation and mineralization of methyl orange by advanced oxidation processes.....	358
Effect of the cathode material on the efficiency of the electro-Fenton process for the electrocatalytic destruction of azo dye methyl orange .....	359
Akdeniz'de Nesli Tükenme Tehlikesiyle Karşı Karşıya Olan <i>Pinna nobilis</i> 'in Korunmasına ve Rehabilitasyonuna Yönelik Yapılan Uygulamalar.....	360
Adölesanların hedonik açlık durumunun uyku kalitesi, diyet kalitesi ve beslenme durumu ile ilişkisinin değerlendirilmesi .....	361
Investigation of individual variation in <i>Macrovipera lebetinus</i> venom by Fourier transform infrared (FTIR) spectroscopy.....	362
Akuakültür Yoluyla Akdeniz Midyesi ( <i>Mytilus galloprovincialis</i> Lamarck, 1819) Üretiminin Sağlık Açısından Önemi.....	363
Synthesis, Characterization and Antioxidant Activities of Ni(II) and Cu(II) Complexes of Salicylaldehyde-N(4)-phenyl Thiosemicarbazone.....	364
Prebiotics in Aquatic Animals .....	365
Herbal Anaesthetics in Aquaculture.....	366
Biostimulant effect of brown algae extracts on soil grown broccoli.....	367
Membrane Cholesterol Affects P2X7-Mediated Permeability Pathways Differently .....	368
EC Effect on Growth, Quality, and Nutrient Uptake of Hydroponic Lettuce.....	369
Kurna Köyü (Burdur) ve Çevresindeki Bazı Tıbbi Bitkiler.....	370

The New Trend in Nutrition: Edible Flowers .....	371
Mangiferin: Değerli bir Antioksidan .....	372
Phytic acid immobilized cryogels: Studying the effect on the L929 cell proliferation for biomedical applications.....	373
Meme Kanseri Hücre Hatlarında WISP-1 Gen Ekspresyonu .....	374
Aromataz inhibitörlerinin hayvanlarda reproduktif amaçlı kullanımı .....	375
Reproductive Evaluation of Two Different Progesterone Assisted Sexual Stimulation Methods in Acyclic Simmental Breed Heifers .....	376
Biyoinformatik araçlar kullanılarak TAOK1 genindeki tek nükleotid varyasyonların (SNV'lerin) değerlendirilmesi .....	377
Boron-complexed polyipoic acid as metal-free self-healing polymer.....	378
In terms of biological activity: Carob .....	379
Biological Activities of Edible Girolle Mushrooms.....	380
A compilation on the biological activities of gum tree.....	381
Biological activities of Hawthorn, an important fruit.....	382
A review on the biological activities of Raspberry.....	383
Biological activity of Silverberry.....	384
Strict-branch Coral Mushrooms and Biological Activities.....	385
Wolf grapes in terms of antioxidant, antimicrobial and other activities.....	386
Silsesquioxane-based nanoadsorbent for the wastewater treatment.....	387
Assessing Generation-Specific Chemical Profiles of Calliphora Adult Flies .....	389
Protected fatty acid feeding influences production parameters and rumen digestibility in mid and late lactation dairy cows .....	390
Sağlık profesyonellerinin genetik ve genetik uygulamalara yönelik tutum ve anlayışlarının belirlenmesi .....	391
In silico comparison of the binding energies of some antiviral plant compounds to non-structural proteins of SARS-COV-2 virus.....	392
Removal of Copper (II) from Mining Waste Water by Adsorption onto Activated Carbons Produced from Hazelnut Shell .....	393
Eye-on-chip technology and potential use in ophthalmology .....	394
Relationship between metabolizable protein supply with production, performance and health parameters in early-lactation dairy cows .....	395
Green synthesis and biomedical applications of selenium nanoparticles via <i>Rosa damascene</i> Herrm. leaf extract .....	396
Sustainable cultivation of <i>Anacamptis coriophora</i> plant in Turkey: Antioxidant properties.....	397
Au/Fe <sub>2</sub> O <sub>3</sub> Catalyst for propargylamines synthesis under Irradiation.....	398

Characterization of bio-char samples obtained from biomass lignite co-gasification.....	399
Analysis of Monosodium Glutamate in Flavors, Spices and Seasonings by RP-HPLC Method.....	400
Phosphorous acid application on chestnut saplings against chestnut canker caused by <i>Cryphonectria parasitica</i> .....	401
<i>In vitro</i> effects of newly synthesized propane sulfonyl hydrazone derivatives on rat myometrial contractions.....	402
Scale-up expression of <i>E. coli</i> for the production of recombinant super folder green fluorescent protein (sfGFP) using inducible system.....	403
Designing novel inhibitors targeting Nsp16 protein for SARS-CoV-2.....	404
Protected viticulture for sustainable grape production to cope with the adverse effects of climate change.....	405
Investigation of biotransformation of a chalcone derivative by <i>Aspergillus glaucus</i> .....	406
Biotransformation of (E)-1-phenyl-3-(p-tolyl)prop-2-en-1-one by <i>Aspergillus glaucus</i> .....	407
Production and characterization composite films composed of chitosan/silk sericin/silver nanoparticles for potential antibacterial applications.....	408
Darbepoetin alpha has a potent anxiolytic effect on the neuroinflammation-induced rat model.....	409
High-intensity exercise effect on self care-related grooming behaviors in rat splash test.....	410
Pd-modified waste based activated carbon materials as a catalyst in hydrodeoxygenation reaction....	411
Accelerated solvent extraction of rosehip seeds and determination of antioxidant capacity, total phenolic and flavonoid content.....	412
<i>Aurelia aurita</i> türü denizanası venomu yüklü ZrO <sub>2</sub> kaplı MnFe <sub>2</sub> O <sub>4</sub> /aljinat kompozitler: Venom salım kinetiklerinin belirlenmesi.....	413
Bisfenol-A giderimi için lakkaz yüklenmiş manyetik CuFe <sub>2</sub> O <sub>4</sub> /aljinat boncukların sentezi ve karakterizasyonu.....	414
Invertebrate iridescent virus 6 (IIV6)'ya ait helikaz geninin kodon kullanım eğilimi analizi.....	415
Tıp fakültesi öğrencilerinin genetik okuryazarlık konularına yönelik tutumlarının incelenmesi.....	416
Determination of oxidative stress levels (malondialdehyde), and some antioxidant activities (superoxide dismutase, glutathione peroxidase and reduced glutathione) in unoperated breast cancer patients....	417
HMG2 Proteini inhibitörlerinin ilaç yeniden konumlandırma sistemi ile araştırılması.....	418
Surface characterization of the newly developed ion-selective electrodes.....	419
Fishery Cooperatives in Çanakkale.....	420
The Atherton-Todd reaction for functionalization of DOPO-derivatives.....	421
Antalya doğal florasından toplanan kocayemiş ( <i>Arbutus unedo</i> L.) ve sandal ( <i>Arbutus andrachne</i> L.)'ın, bazı fiziksel ve kimyasal özelliklerinin belirlenmesi.....	422
Binding of breast milk-derived exosomes to the amniotic membrane.....	423
The effect of myrtle extract added to drinking water on performance, hematological and biochemical parameters in rats.....	424

A voltammetric study on the interaction of (E)-1-((2-chloro-4-nitrophenylimino)methyl)naphthalen-2-ol with Human Serum Albumin at physiological pH.....	425
Sıçanlarda gentamisin kaynaklı nefrotoksisite üzerinde D vitamininin etkileri.....	426
<i>In silico</i> identification of newly designed potent class I and class IIb histone deacetylase enzyme inhibitors .....	427
Development of Electromagnetic Field Exposure System in Zebrafish Embryos .....	428
Molecular Substrates of COVID-19 and Pulmonary Arterial Hypertension Identified Through Signalling Network Construction.....	429
Investigation of the corrosion performance of aluminum 7075 alloy used as submarine material in the Sea of Marmara environments.....	430
Suda ve Yağda Eriyen Vitaminlerin Nörona Farklılaştırılmış SH-SY5Y Hücrelerinde Apoptoz Koşullarına Karşı Koruyucu Etkilerinin İncelenmesi.....	431
Synthesis, Characterization, and Enzyme Activity of a New Series Schiff Base Metal Complex.....	432
Penetration Possibility of K <sup>+</sup> Channel Blocker Antiarrhythmia Drugs of CNS and Their Potential Results .....	433
Expression Analysis of Salinity-associated miRNAs in Gamma-induced Salinity Tolerant Rice ( <i>Oryza sativa</i> ) Mutants.....	434
Effect of alumina source on the final properties of cordierite ceramics .....	435
Sinop İli Ayancık ve Erfelek ormanlık alanlarında tuzak kamera kayıtları ile büyük memeli türlerinin belirlenmesi.....	436
Effect of reboxetine treatment on the cognitive parameters and the hippocampal BDNF levels of the scopolamine-induced amnesic rats.....	437
Synthesis and antifungal activity studies of azole derivative compounds .....	438
The Role of FASL (-844 T/C) Gene Polymorphism in Covid-19.....	439
Investigation of photocatalytic degradation and disinfection activity characteristics of one-dimensional TiO <sub>2</sub> nanorods decorated potato peel derived carbon dot (P-CD/TiO <sub>2</sub> NRs).....	440
Cisplatin and Ethacrynic Acid Combination Treatment Inhibits Cell Proliferation of Cholangiocarcinoma Cells .....	441
Türkiye’den iki <i>Asplenium</i> L. (Aspleniaceae) türünün spor morfolojisi .....	442
Gümüş nanoparçacık (nanoAg) katkılı içi boş antibakteriyel nanolif yapıların üretimi ve karakterizasyonu .....	443
Investigation of the Effect of Cyanidine-3-Glucoside and Metformin in Pancreatic Cancer Cells.....	444
Synthesis and Characterization of P- and S-Containing Polymers in the Main Chain.....	445
Meat quality characteristics of Central Anatolian Merino and Ramlic lambs .....	446
Evaluation of lomefloxacin as a cholinesterase enzyme inhibitor: An <i>in vitro</i> and <i>in silico</i> analysis.....	447
Oğuzeli ve Karkamış (Gaziantep) ilçelerinde yayılış gösteren Asteraceae ve Lamiaceae taksonlarının etnobotanik özellikleri .....	448

Theranostics: past, present and future.....	449
Synthesis, characterization and theoretical calculations of Schiff base derived from 3-amino-1,2,4-triazole-5-thiol as potent antimicrobial agent.....	450
4-methoxybenzaldehydesulfisoxazole derived from Sulfa drug: Synthesis, characterization, theoretical calculations and antimicrobial studies.....	451
<b>1.2. FULL-TEXTS .....</b>	<b>454</b>
Phosphate adsorption study on activated Albanian montmorillonite .....	457
Determining the Change of hTERT and PTEN Protein, Total mRNA and Transcript Variant Levels in YKG-1 and HUVEC Upon Capsaicin Treatment.....	465
Pharmacological effect of juice and extract fruits of Algerian <i>Ecballium elaterium</i> (L) on Phenylhydrazine induced hyperbilirubinemia in rats.....	477
Recent advances in wound healing using silk fibroin-based microparticles.....	482
The innovation of the student's portfolio in the competency-based curriculum, an instrument measuring the level of students' knowledge, as well as their self-esteem in the subject of biology .....	488
Physico-chemical quality of some honeys produced in the region of Beni Mellal-Khenifra in Morocco	493
Yem börülcesi ( <i>Vigna unguiculata</i> (L.) Walp.) genotiplerinin bazı morfolojik ve tarımsal özelliklerinin karşılaştırılması .....	498
Yapıştırıcı Kimyasal Üretim Atık Sularının Ardışık Koagülasyon-Elektrokimyasal/ Fotokimyasal Proseslerle Arıtımının Araştırılması .....	504
Kardiyovasküler hastalıklarda yeni biyobelirteçler .....	514
Su ve Atıksulardan Kirletici Gideriminde Uygulanan Üç Boyutlu Elektrokimyasal Proseslerde Kullanılan Parçacık/Partiküler Elektrot Türlerinin İncelenmesi.....	519
Co <sub>3</sub> O <sub>4</sub> ve Fe <sub>3</sub> O <sub>4</sub> nanokatalizörlerin NaBH <sub>4</sub> hidroliziyle hidrojen üretimlerinin karşılaştırılması .....	531
Hydrobiology and ecology in the context of climate change: the future of aquatic ecosystems .....	539
Cr(VI)'nın sulu çözeltilerden FIBAN AK-22-1 anyon değiştirici fiber ile uzaklaştırılması.....	546
Atık Kırmızı Çamur Katkılı Nano Gözenekli Polimerik Kompozit Membranların Hazırlanması ve Membran Performanslarının İncelenmesi.....	556
Karkamış Baraj Gölü (Gaziantep) Mavi-Yeşil Algleri.....	568
Covid-19 pandemi döneminde yeme davranış bozuklukları ile akdeniz diyeti bağlılık düzeyinin değerlendirilmesi .....	575
Mehmet Akif Ersoy Üniversitesi Öğrencilerinde Beden Memnuniyeti ve Duygusal İştahın Yeme Farkındalığı Üzerindeki Etkisi.....	583
Cloning of GM-CSF gene into the pVAX1 DNA vaccine vector.....	592
CYP1A1 Geni m1(T>C) ve m2 (A>G) Polimorfizminin Prostat Kanseri Olası Rolünün Araştırılması .....	597
Balıkçı teknelerinde tekne ve makine sigortası.....	611
Üzümsü meyvelerin antioksidan kapasitesinin Diabetes Mellitus hastalığına etkisi .....	617

İrritabl bağırsak sendromunda (IBS) besin ve beslenme çözümü.....	624
Characterization of TALE genes in the sugar beet ( <i>Beta vulgaris</i> L.) genome by bioinformatics methods .....	629
Characterization of expansin genes in alfalfa ( <i>Medicago truncatula</i> ) genome by bioinformatics methods .....	637
Utilization of Non-Wood Forest Products (NWFPs) as a Food in Turkey and World.....	644
Remifentanil Genotoxicity Assessment via Comet Assay .....	651
Hidrazin-Borandan Hidrojen Üretimi İçin MIL-53(Al) Yapısına Dekore Edilen Palladyum Nanokümelerinin Geliştirilmesi ve Tepkime Kinetiğinin İncelenmesi .....	657
Zirkonyum (IV) Oksit Nanotozu Kararlı Palladyum Nanokümelerinin Hazırlanması ve Metilamin-Boranın Hidrolizindeki Katalitik Performanslarının Araştırılması.....	663
Rh/ZIF-67 Nanokatalizörünün Tepkime-İçi Sentezi, Tanımlanması ve Nitrofenollerin Aminofenollere İndirgenmesindeki Katalitik Performansının İncelenmesi*.....	669
Dimetilamin-Borandan Hidroliz Yoluyla Hidrojen Üretimi için Amin Fonksiyonel Silika Destekli Rutenyum Nanokümelerinin Hazırlanması*.....	676
Grafen Oksit Katkılı Metal Oksit Esaslı Katı Destek Yapısında Kararlılaştırılmış Manyetik Rutenyum (0) Nanokümelerinin Hidrazin-Boran Metanolizinden Hidrojen Üretiminde Katalitik Performanslarının İncelenmesi.....	682
Polivinilpirolidon Kararlı Tek veya İki Metalli Nanokümeler: Hazırlanması, Karakterizasyonu ve Etilendiamin-Bisboran'dan Hidrojen Üretiminde Katalizör Etkilerinin Araştırılması*.....	688
MIL-101 Yapısında Kararlılaştırılmış Altın (0) Nanokümelerinin Hazırlanması, Karakterizasyonu ve Nitrofenol Türevlerinin İndirgenmesinde Katalitik Performanslarının Araştırılması* .....	695
The determination of genetic diversity for insecticide resistance management strategies in major agricultural pests: the case of <i>Ceratitis capitata</i> .....	703
Pleopod Üzerinde İnkübasyona Tabi Tutulan Kerevit ( <i>Astacus leptodactylus</i> Eschscholtz, 1823) Yumurtalarının Açılma Oranı Üzerine Etkileri.....	711
Peynir ve peynir teknolojisinde yeni uygulamalar.....	715
Morphological and molecular systematics of <i>Anopheles</i> (Diptera: Culicidae) species sampled from Çanakkale and Muğla provinces.....	723
Mucizevi meyve: Hünnap ( <i>Ziziphus jujuba</i> Mill.).....	730
Referans serum panellerinin oluşturulmasının önemi.....	735
Example of sustainable approach in the textile industry: Olive mill wastewater .....	739
Predatör akar <i>Neoseiulus californicus</i> (mcgregor) (Acari:Phytoseiidae)'da tebufenpyrad direnci ile bazı detoksifikasyon enzimleri arasındaki ilişki.....	747
Growing of stem cells and extarcting their signssling molecules in a three dimensinal cellulose environment extracted from <i>Musa</i> sp.....	756
Effect of temperature on rheologic properties of pasteurized cow's milk.....	763

Maviyemiş ( <i>Vaccinium corymbosum</i> L.) odun çeliklerinin köklenmesi üzerine IBA (Indole-3-Butyric Asit) uygulamalarının etkisi.....	769
Klimbazolyum tuzları ve onların paladyum komplekslerinin sentezi: Antimikrobiyal aktivite çalışmaları .....	776
Different techniques used for the recovery of pesticides in organic farming .....	780
Effect of progesterone on the physiological and molecular responses of tomato seedlings under drought and salt stress .....	789
Investigating Effects of <i>Chenopodium album</i> L. Extracts on Alanine and Aspartate Aminotransferase Levels in Acute Gentamicin Toxicity.....	795
Exercise model for experimental animals.....	800
A step beyond probiotics as new concept: postbiotic .....	804
Türkiye kıyılarında dağılım gösteren zargana <i>Belone svetovidovi</i> (Collette ve Parin, 1970) popülasyonlarının morfolojisi.....	809
Effect of dopamine on the physiological and molecular responses of tomato seedlings under drought and salt stress .....	816
Dual therapies combined with magnetic hyperthermia in cancer treatments.....	823
Investigation of phenolic compounds and elicited by jasmonate derivatives on <i>in vitro</i> samples of <i>Hypericum perforatum</i> L.....	828
Effect on Electrochemical Performance of Polyaniline-based CZTS nanocomposite.....	833
Covid-19 Hastalığında Bazı Sitokinlerin Rollerini .....	841
Obezite patogeneğinde MAPK ve PI3K/AKT sinyal yolları .....	847
Investigation of Biochemical Changes in Mice Exposed to Monocrotaline .....	852
Climate Change's Effects on the Sustainable Food Biosecurity.....	858
Biosorption, an efficient process for removing heavy metals from wastewater: A mini review .....	864
Investigation of physical and chemical properties of carbon dots doped with metal ions .....	870
Rett sendromunda nöronal hücre farklılaşmasını etkileyebilecek hedef genlerin <i>in silico</i> analizi .....	875
Aromaterapide kullanılan <i>Laurus nobilis</i> L. (defne) bitkisinin uçucu yağ içeriği, toprak yapısı ve bitki elementlerine çevresel koşulların etkisinin araştırılması.....	880
Antalya ili nar üreticilerinin bitki koruma uygulamaları.....	887
Combined efforts in tissue engineering and organ-on-chips to study cancer metastasis.....	894
Steroid Hormonlarından Östrojenin Kontrollü Salımı İçin Biyoyumlu İmplantın Hazırlanması Ve Salım Profilinin Çıkartılması .....	900
Kinoa ve Gıda Endüstrisinde Kullanım Alanları .....	907
Investigation of the Existence and Seroprevalence of Canine Herpesvirus-1 (CHV-1) in Türkiye: A PCR and ELISA-Based Study.....	923
Study of environmental state in Vlora Bay, Albanian coast.....	930
Çet koyunlarında DGAT1/AluI gen polimorfizminin belirlenmesi.....	939

Avokadonun ( <i>Persea americana</i> ) bakırın asidik ortamdaki korozyonuna etkisinin araştırılması .....	942
Artificial Neural Network Modeling for Drying Kinetics of <i>Mentha piperita</i> L. ....	949
Yabani yulku atında ön ve arka ayak parmaklarının morfometrisi .....	953
Obtaining modified activated carbon from <i>Kochia scoparia</i> L. plant.....	960
Sustainable nanobubble water technology for dyeing of cotton fabrics.....	963
Kuşlarda tüylerin yaratıcı ve ilginç kullanımı.....	969
Effectiveness of tannic acid and ascorbic acid on the synthesis process of silver nanoparticles .....	975
An evaluation to examine the change in average temperature and precipitation in the Mersin region.	981
Thermal conductivity of sodium alginate cement pastes .....	991
Synthetic food colorants and their health effects: A critical review.....	996
Biberiye (Rosemary) Yağının Diyabetik Sıçanlarda Beyin ve Testis Kolesterol ve Total Trigliserit Değerleri Üzerine Etkisi .....	1002
Sağlıkta mesleki iyonlaştırıcı radyasyona maruz kalma ile tiroid bezi.....	1009
Lise 9. sınıf öğrencilerine verilen ilk yardım ve KBRN eğitiminin öğrencilerin bilgi düzeylerine etkisi .....	1015
Sensory analysis of hamburger patties enriched with psyllium.....	1020
<i>Eremogone</i> Fenzl (Caryophyllaceae) cinsi üzerine taksonomik incelemeler .....	1028
Akdeniz midyesinden ( <i>Mytilus galloprovincialis</i> ) üretilen midye sosunun antioksidan aktivitesinin belirlenmesi .....	1038
Hidrojellerin biyomedikal alanda kullanımları.....	1043
Yara teşhis ve bakımında hidrojeller .....	1049
Kuşburnunun Biyoaktif Bileşenleri ve Sağlık Üzerine Etkileri.....	1054
Elektroeğirme ve Solvent Döküm Yöntemleri ile Üretilen Polikaprolakton (PCL) Fiber ve Filmlerin Özellikleri.....	1062
Akdeniz midyesinden ( <i>Mytilus galloprovincialis</i> ) üretilen pilakilerin mikrobiyolojik kalitelerinin belirlenmesi .....	1068
Control of pre-slaughter and slaughter stress procedures that dromedaries undergo in Moroccan slaughterhouses .....	1072
Vollastonitin doğal kauçuk karışımlarındaki yapışma ve mekanik özelliklere etkisi.....	1075
ZnO-poli(indol-4aminokinaldin) elektrodun H <sub>2</sub> O <sub>2</sub> tayininde sensör olarak performansının incelenmesi .....	1084
İmidaklopride maruz kalan <i>Melanopsis praemorsa</i> (Gastropoda:Prosobranchia)'nın ayak dokusundaki histopatolojik değişiklikler.....	1090
Preliminary Results on Pentose Phosphate Pathway Changes in Experimental Allergic Encephalomyelitis Mice .....	1095
Makromantarların kozmetik endüstrisinde kullanım olanakları.....	1101

<i>Hypsizygus ulmarius</i> mantarı üretiminde yarfıstığı kabuklarının substrat olarak kullanımının mantar verimi ve şapka boyutlarına etkisi .....	1111
Alpha-tocopherol ameliorates hydrogen peroxide-induced apoptosis in human dental pulp stem cells .....	1120
Integrating Carbon Dots into Upconverting Nanoparticles Using <i>In-Situ</i> Solvothermal Method .....	1125
Comparison of two different doxorubicin dosages used for cardiotoxicity model.....	1131
A research on the determination of some bioactive properties of <i>Helichrysum arenarium (L.)</i> oil obtained by maseration method .....	1138
Evaluation of Hydrothermal Production of Magnesium Borate Samples in the Treatment of Industrial Dyes from Wastewater.....	1145
Koyun ve keçilerde meme sağlığı ve hastalıkları .....	1151
Production of high-value biomaterials from <i>Chlorella vulgaris</i> utilizing airlift photobioreactor cultivation .....	1160
<i>Cinnamomum cassia</i> kabuğundan hazırlanan farklı ekstraktlerin antioksidan özellikleri ve fenolik/flavon içeriği üzerine bir araştırma .....	1166
Preparation and <i>in vitro</i> evaluation of topical cream formulation containing <i>Oleum rosmarini</i> for use in the treatment of rheumatism .....	1173
Mandalarda üreme ve üreme sorunları .....	1177
Türkiye Piyasasında Bulunan Chia ( <i>Salvia hispanica L.</i> ) Tohumu Yağı İçeren Yumuşak Jelatin Kapsüller Üzerinde Kalite Kontrol Çalışmaları.....	1185
Examining the effectiveness of <i>Tilia vulgaris</i> leaves in removing the cationic dye basic yellow 28 from aqueous environments.....	1192
Adsorption of Basic Blue 3 Dye from Colored Effluents Using Mulberry Leaves ( <i>Morus nigra L.</i> ) as a Low-Cost Adsorbent.....	1197
Cytotoxic activity of the root ethyl acetate extract of <i>Heptaptera cilicica</i> (Boiss. & Balansa) Tutin on renal cancer cell lines .....	1202
Rüzgâr atlası analizi ve uygulama programı yardımıyla Sivas ili rüzgâr enerjisi potansiyelinin analizi .....	1206
Determination of electrokinetic properties of nitrite reductase (NirB) enzyme by protein film voltammetry (PFV).....	1214
Nano Silisyum Uygulamasının Biberin ( <i>Capsicum annum L.</i> ) Tuza Toleransı Üzerindeki Etkisi .....	1219
Impedance Spectroscopy Analysis of an Electrochemical Cell Chamber for Diagnostics .....	1227
Doğal taşların bina enerji performansını destekleyebilirliği .....	1233
<i>Cryptodrassus</i> ve <i>Drassyllus</i> (Araneae: Gnaphosidae) cinsi yer örümceklerinin seta morfolojilerinin karşılaştırılması .....	1241
Falcarinol'ün Elektronik, Yapısal ve Farmakokinetik Karakterizasyonu: DFT, Moleküler Yerleştirme ve ADMET Çalışmaları.....	1245

Ağır metaller ile kirletilmiş topraklarda yetişen semizotu bitkisinin fitoremediasyon potansiyeli üzerine bir ön çalışma.....	1253
Enfeksiyon hastalıklarında bakteriyofaj aracılı tedavilere güncel bir bakış .....	1260
Analysis of <i>nDart1-0</i> DNA transposon by qRT-PCR in rice cultivars under drought stress.....	1266
Decomposition of Jerusalem Artichoke using HNO <sub>3</sub> as catalyst.....	1271
Innovative Functional Probiotic Food Products.....	1276
Effect of drought stress on plant species in Karaman with terrestrial climate .....	1280
Comparative Biochemical Analysis of Brown And Green Pea Genotypes Grown Locally in Türkiye....	1291
Investigation of methods used in fruit thinning in apple species .....	1295
Investigation of the genetic defect of Cholesterol deficiency and Brachyspina syndrome in Holstein breed cattle breed in Eskisehir .....	1302
Indoor PM <sub>10</sub> concentrations in a private gym .....	1307
Lifestyle and risk for insulin resistance .....	1314
Manyetik alan duyarlı veya çoklu uyaran duyarlı elektroegirilmiş nanofiberlerin kanser tedavisinde kullanımı .....	1321
Comparison of propofol alone and different doses of ketofol combinations on systolic, diastolic, and mean arterial pressures in dogs .....	1327
<i>Spirulina platensis</i> ilavesi ile üretilen klasik ve probiyotik yoğurdun duyuşal nitelikleri .....	1333
<i>Salvia officinalis</i> bitkisinin GC/MS yöntemi ile fitokimyasal olarak aydınlatılması ve <i>in silico</i> antioksidan aktivitesinin değerlendirilmesi .....	1341
Erciyes Dağı (Kayseri) yer örümcekleri (Araneae: Gnaphosidae) faunası.....	1348
Investigation of the Effect of Temperature on pH in Kombucha Fermentation.....	1353
Transcriptional and Translational Approaches in Spiders with Different Ecological Niche.....	1356
<i>In vitro</i> biological effects of some antagonist bacteria against potato common scab disease.....	1360
Producing Cellulose from a Green Seaweed, <i>Ulva lactuca</i> , for Paper and Bioplastic Production .....	1365
Lipid-rich Microalgae for Sustainable and Renewable Bio-fuel Production.....	1369
Seaweed Biorefinery.....	1374
Production of Natural and Functional Pigments in <i>Dunaliella viridis</i> (Chlorophyceae) cultivated in Laboratory Conditions .....	1383
Yenilenebilir kaynaklardan doymamış poliüretanların sentezi ve karakterizasyonu .....	1394
Synthesis and characterization of cationic derivatives of plant oil triglycerides .....	1398
Investigation of <i>Arenaria kotschyana</i> 's Biological Activity .....	1402
Bilişsel gelişim ve laktasyon .....	1406
Comparison of Various miRNA Expression Levels in the MJ Mycosis Fungoides Cell Line.....	1410
Utilization of Agrobacterium-Mediated Transformation Protocol for Enhanced Genetic Improvement of Tomato ( <i>Solanum lycopersicum</i> L.) .....	1415

Analysis of food preservatives in phyllo, bread, and lavash samples by a novel HS-GC-MS method ....	1422
Anti-inflammatory activity of some brown algae .....	1427
Retinal and Choroidal Mean Gray Value, Skewness and Kurtosis in Different Regions.....	1432
Random Segment ve Blok Formda Poliimid Siloksan Kopolimer Sentezi .....	1439
Farelerde yaşlanmaya bağlı mesane fonksiyon bozukluğunda L-sistein/hidrojen sülfür yolağının rolü .....	1444
<i>Tortula lingulata</i> Lindb. (Bryophyta)'nın Türkiye'den ikinci kaydı.....	1448
The enzyme activity potentials of <i>Gladiolus halophilus</i> and <i>Gypsophila lepidioides</i> plant species growing in cypiferous soils of Eastern Anatolia against some enzymes (tyrosinase and $\alpha$ -glycosidase).....	1453
Molecular docking studies of Quercimetrin (Quercetin 7-O-D-glucoside) from <i>Centaurea paphlagonica</i> (Bornm.) Wagenitz .....	1458
<b>2. POSTER PRESENTATIONS .....</b>	<b>1465</b>
<b>2.1. ABSTRACTS.....</b>	<b>1465</b>
Covid-19 progression in North Africa.....	1468
Impact of empirical antibiotic therapy on the management of native valve infective endocarditis with negative blood cultures : analysis of 45 cases .....	1469
Synthesis of iron copper phosphate catalyst for CC coupling reaction.....	1470
Inclusion complexes study of a series of molecules with different Cyclodextrins.....	1471
Valorization of urban wastewater treatment sludge in the construction field .....	1472
Synthesis and assesment of antioxydant activity of spent coffee grounds chemically activated with potassium hydroxide .....	1473
Epidemiology and resistance to antibiotics of Enterobacteriaceae isolated from urinary tract infections in hospital.....	1474
Case report of incidence correlation of aspergillosis and multiple antibiotic-resistant <i>Escherichia coli</i> in free-range poultry.....	1475
Protective properties of some plant extracts against cellular damages induced by ionizing radiation .....	1476
Development of rapid chemiluminescent enzyme immunoassay for determination of nonylphenol in drinking water .....	1477
IgY antibodies targeting snake venom PLA <sub>2</sub> epitopes as potential Viper venom neutralizers.....	1478
Kinetic and thermodynamic study of paracetamol elimination by a food residu biosorbant.....	1479
Validation of RP-HPLC method for simultaneous determination of Thiamin and Pyridoxin in pharmaceutical tablet.....	1480
Study, development and application of a new materials in A3 coupling synthesis.....	1481
Root-Associated Endophytes in Five Co-Occurring Orchid Species: Isolation and Molecular Identification .....	1482
Sustainable food alternatives .....	1483

BAP1 mutations in Glioblastoma .....	1484
Syntheses, Characterizations and Anticancer Studies of Ni(II) and Cd(II) Heterobimetallic Ferrocenyldithiophosphonato Complexes.....	1485
Investigation of Sulfur-resistant Nickel-based catalysts in the dry reforming reaction of biogas: Effect of Yuttrium, Cerium, and Magnesium incorporation.....	1486
Components used as sugar substitute in cakes.....	1487
Bioinformatics analysis of miRNA expression profile according to gender in Relapsing-Remitting Multiple Sclerosis patients.....	1488
Exploring Axolotl Regeneration: Bioinformatic Insights into the Wnt/ $\beta$ -Catenin Pathway and Protein-Vitamin Interactions for Advancing Regenerative Medicine .....	1489
Yenilenebilir kaynaklı poliamid sentezi ve poliamid 6 ile karışımlarının karakterizasyonları.....	1490
Hasat Sonrası Yenilebilir Kaplama (Candelya) Uygulamasının 0900 Ziraat Kiraz Çeşidinin Muhafazasına Etkisi .....	1491
Immobilization of $\alpha$ -amylase on clear-epoxy-based photo-curable polymer for industrial use.....	1492
The bovine <i>MYOD1</i> p.Gly190Ser polymorphism (rs110708239) and its association with carcass traits in East Anatolian Red cattle and Holstein x Turkish native breeds.....	1493
An Iminium Salt, The Berberine Molecule and Possible Aldehyde Form: A DFT Study.....	1494
Osteosarkomada uzun kodlamayan RNA TUG1'in post-transkripsiyonel düzenlenmesinde rol oynayan miRNA'ların belirlenmesi.....	1495
Life cycle assessment (LCA) case study on cement-bonded particle board produced by using construction demolition waste wood.....	1496
Impact of incorporating waste glass in cement-based composite boards.....	1497
Tip 2 diabetes mellitus hastalarında FTO ve PPARG genlerinin metilasyon profillerinin belirlenmesi .....	1498
Silika esaslı ilaç taşıyıcı sistemlerin geliştirilmesi.....	1499
Salçalarda Raf Ömrünün Arttırılması için Sinnamaldehit Enkapsülasyonu ve Antifungal Aktivitesi ...	1500
Cyclotetraphosphazene-based Hg(II) and Zn(II) coordination compounds .....	1501
Bioremediation of Toxic Textile Dyes with Mixed Microalgal and Cyanobacterial Culture .....	1502
Scale-Up Approaches in Electrospinning Method.....	1503
Zeytin yapraklarından ekstrakte edilen toplam fenolik bileşiklerin miktarına kurutma ve ekstraksiyon parametrelerinin etkisi.....	1504
Taze gül ( <i>Rosa damascena</i> ) ve posasının toplam fenolik bileşiklerinin miktarına hasat döneminin etkisi .....	1505
Synthesis and Characterization of Tadpole-Like Single-Chain Nanoparticles as Polymer-Drug Conjugates .....	1506
Fermentative melanin production with <i>Corynebacterium glutamicum</i> .....	1507
Binary bioremediation of Toxic Textile Dyes and heavy metals with Mixed bacterial Cultures.....	1508

Antimicrobial and Antifungal Borophene .....	1509
Akrilik / maleik kopolimer sentezi ve proses optimizasyonu .....	1510
Determination of some quality criteria in non-alcoholic beverages.....	1511
Utilization of agro-waste as a feedstock for L-Tyrosine production with <i>Corynebacterium glutamicum</i> .....	1512
Anti-microbial effects of lung microbiota-derived postbiotics against lung infections .....	1513
Erken Gebelikte D vitamini EksikliĐinin Ovaryum Üzerindeki Etkileri.....	1514
Kuarsetin ve krizinin paladyum(II) komplekslerinin sentezi ve karakterizasyonu, DPPH radikal süpürme aktivitelerinin incelenmesi.....	1515
Electrochemical activity of mesoporous carbon supported and unsupported Fe-S and Ni-S catalysts for hydrogen evolution reaction .....	1516
Farklı çözücülerle ekstrakte edilen <i>Calliergonella cuspidata</i> (Hedw.) Loeske'nın biyokimyasal içeriĐinin belirlenmesi .....	1517
Effects of ketamine treatment in an animal model of levodopa-induced dyskinesia: a pilot study.....	1518
Elektroaktif Hidrojellerin Sentezi, Karakterizasyonu ve Kontrollü İlaç Salım Davranışlarının İncelenmesi .....	1519
Kumarin temelli kolorimetrik amonyak sensörü.....	1520
<i>Homalothecium philippeanum</i> (Spruce) Schimp.'in farklı çözücülerle elde edilen ekstraktlarının biyokimyasal içeriĐinin belirlenmesi .....	1521
Cutting edge technology with mesenchymal stromal cells in 3D platform.....	1522
İlaça dirençli epilepsisi olan çocuklarda besin alımı ile yaşam kalitesi ve nöbet sayısı ilişkisi .....	1523
Improving the Sensitivity of Polymer Strain Sensors through Dielectric Enhancement.....	1524
Adli Bir Vakada Elde Edilen Liflerin FTIR ve SEM Yöntemleri Kullanılarak İncelenmesi.....	1525
Inherently Antibacterial Polymeric Micelles for Antibacterial Agent Delivery .....	1526
Manufacture of an anti-ulcer food supplement in capsule form based on "cystoseira sensu lato" brown algae .....	1527
Nutritional Profile And Prevalence Of Polycystic Ovary Syndrome Among Female Students Of The University Of Tlemcen , Algeria.....	1528
Analysis of the chemical composition of <i>Leucojum aestivum</i> L. seed coats.....	1529
Modelling Temperature and Moisture Profile of Carrot Under Different Storage Conditions.....	1530

#### Abstract

This study is primarily focused on investigating how the introduction of dopants influences the properties of a manganese perovskite material intended for use in room-temperature magnetic refrigeration applications. The synthesis of these materials employed the flash combustion technique, a highly regarded method renowned for its swift and precise synthesis process. After the synthesis process, the materials were subjected to analysis through X-ray Diffraction (XRD), Scanning Electron Microscopy (SEM), and magnetic analysis. XRD analysis played a key role in providing crucial information on the crystal structure, phase composition, and lattice parameters of both materials. Our investigation revealed that both compounds exhibited a rhombohedral  $R\bar{3}c$  structure. SEM analysis, meanwhile, provided intrinsically detailed information on the structure, composition, and surface morphology of the samples, affirming the high homogeneity of both compounds. Magnetic analysis, using a superconducting quantum interference device (SQUID) magnetometer, facilitated the characterization of the materials' magnetic properties. It will cover the Curie temperatures, the nature of the phase transitions, their order, the variation of the magnetic entropy, and the magnetocaloric properties of the samples examined.

**Keywords:** Flash combustion, Magnetic refrigeration, Magnetocaloric materials.

#### Abstract

Given their substantial magnetocaloric effect, substituted lanthanum manganites have attracted considerable attention and are considered an essential class of materials for magnetic refrigeration applications. This study investigates the thermal, structural, and magnetic characteristics of nanopowders composed of sodium-doped lanthanum manganite. The nanopowder was carefully prepared by the flash combustion method and then subjected to calcination. To understand its thermal properties, thermogravimetric and differential thermal analyses were carried out. In addition, X-ray diffraction analysis revealed that the nanomaterial exhibited a single-phase structure with no discernible secondary phase, adhering to the rhombohedral structure in the  $R\bar{3}c$  space group. To further investigate the ferromagnetic-paramagnetic phase transition and unveil the magnetic entropy variations within the sample, we used SQUID (Superconducting Quantum Interference Device) magnetometry in our study.

**Keywords:** Magnetocaloric effect, Magnetic refrigeration.

#### Abstract

Cosmetics are preparations that are used extensively in everyday life. During their use as well as their manufacture, contamination with potentially pathogenic microorganisms may occur, which may endanger human life and health. Factors affecting the microbiological purity of cosmetics include excessive heat, number of users of the cosmetic, length of use and type of packaging. Preservatives, which have an antimicrobial effect, have a significant impact on microbiological purity. The aim of the study was to evaluate what differences will be observed if face skin care product will be used by hand or via plastic spatula and what kind of bacteria and/or fungi will be isolated. Baird – Parker Agar, MacConkey Agar, Cetrimide Agar, Sabouraud Dextrose Agar and TSA Agar were used for *Staphylococcus aureus*, bacteria from *Enterobacteriaceae* family, *Pseudomonas aeruginosa*, *Candida albicans* and other mesophilic, aerobic bacteria isolation. The cream was applied twice a day for 4 weeks. Samples of skin care product were analyzed three times: at the beginning, immediately after opening the products, during using (2 weeks after opening) and last time, after 4 weeks. Results showed that despite of different methods of using skin care product there was no significant differences in quality and quantity of microorganisms.

**Key words:** microorganisms, skin care products, contamination

<sup>3</sup> Sultan Moulay Slimane University, EST Khenifra, Beni Mellal, Morocco

#### Abstract

This current research based on the computational examination of novel isoxazole derivatives to investigate a new anti-cancer agent. The study began with the construction of 3D-QSAR models, which resulted in 6 candidate agents that were more active than the marketed anti-cancer agent Sorafenib (SOR), which was chosen as a reference. Evaluation of the synthetic accessibility coefficient and Lipinski properties of 6 newly designed drug candidates indicate that only three of these compounds (P1-P3) meet the criteria. This drug behavior was related to the Lipinski and Veber rules as they can be synthesized. In-silico evaluation of ADMETox properties of these three compounds, shows satisfactory results. According to Molecular Docking, the drug candidate P2 is the most stable in the target receptors (PDB code: 1E31, 1QX3, and 2AR9) comparable to Sorafenib. The Molecular Dynamics study allowed us to confirm the previous results obtained by Molecular Docking. A computational analysis using the CaverDock software allows us to study the release of the drug candidate Pr2 and Sorafenib, through the different tunnels present in the receptors (PDB ID: 1E31, 1QX3, and 2AR9), as well as the corresponding energies during transport.

**Keywords:** 3D-QSAR, ADMETox, Molecular Docking, Molecular Dynamics, Metadynamics.

### Study of environmental state and microplastics as potential pollutants in Albanian coast

Vanela Prifti<sup>1\*</sup>, Sonila Kane<sup>2</sup>, Pranvera Lazo<sup>2</sup>

<sup>1</sup> National Environmental Agency, Sector of Sampling and Laboratory Analyses, Tirana, Albania.

<sup>2</sup> University of Tirana, Faculty of Natural Sciences, Department of Chemistry, Tirana, Albania.

#### Abstract

This research presents the monitoring data of seawater parameters linked to the seawater quality of Vlora Bay, Albania. Vlora Bay is the most attractive and frequented tourist area in the south of Albania. The chemical status of the coastal area has been determined in accordance with the Water Framework Directive. Three monitoring sites positioned at a distance of 10 m from the coastal line, one site positioned at the delta of the Vjosa River estuary discharging site, and a control site positioned 100 m away from the coastal line have been selected to assess the water quality of the Vlora Bay estuary. Seawater samples were collected in December 2022. Seawater quality is assessed based on physicochemical parameters such as water temperature, pH, alkalinity, salinity, total suspended solids, electric conductivity, dissolved oxygen, COD, and BOD<sub>5</sub>, and nutrient content such as nitrite, nitrate, ammonia, total phosphorous, and orthophosphate. The observed data were compared with the Albanian Standard DCM 177, dated March 31, 2005, "The Permitted Values of Liquid Discharges and Zoning Criteria of the Water Receiving Environment." It revealed that the measured parameters did not go above the allowed limits. The water quality classification for the Vjosa estuary is done according to Water Framework Directive (WFD) 2000/60/EC of the European Parliament and the Council of October 23, 2000. The monitoring data, compared to the requirements of WFD for the nutrients, classifies the Vjosa estuary sample as in a good status (Class I).

**Keywords:** Seawater; physical-chemical parameters; nutrients content; chemical status; Water Framework Directive, Vlora Bay

#### Abstract

A new emerging virus named Monkeypox Virus (MPXV) reappeared and captured all of the attention, while spreading panic among people by threatening their health, expecting at any moment a COVID-19 scenario, if not worse. Our study aims to evaluate knowledge about this virus and its disease and raise consciousness among the Faculty of Natural and Life Sciences and Earth and Universe Sciences at the University of Tlemcen. We launched an online web-based survey for a twenty days period that contained sociodemographic and perceptiveness questions about the emergent virus, its disease, and vaccination, and that was later on analyzed using SPSS and Excel. Results showed that most of our study's respondents were students that belonged to the Department of Biology, and the participants have proven their satisfactory level of knowledge about this emerging virus and its disease. Moreover, most participants showed a positive attitude towards the vaccine, considering it the best preventive means to fight against MPX disease. Although the MPXV may not become a pandemic, knowing the various ways that contribute to its spread is essential to avoid any possibility of a new outbreak, especially in Algeria.

<sup>3</sup>Laboratory for the study and development of traetment and purification techniques water and environmental Management. Higher Normal School, Kouba.

#### Abstract

Knowledge of the physico-chemical properties of liquid materials in the industrial field, in general, and in that of the chemical industries, in particular, constitutes a prerequisite for the design of equipment, the resolution of specific problems (related to the techniques of purification and separation, risks in the transport of certain materials, etc.) and, consequently, at the production stage.

Chloroalkanes, ethers constitute chemical families having an industrial, theoretical and environmental interest. For example, these compounds are involved in various applications in the chemical and pharmaceutical industries. In addition, they contribute to the particular thermodynamic behavior (deviation from ideality, association, etc.) of certain mixtures which constitute a severe test for predictive theoretical models. Finally, due to the degradation of the environment in the world, a renewed interest is observed for ethers, because some of their physico-chemical properties could contribute to reducing pollution (ethers would be used as additives in fuels ).

This work is a thermodynamic, experimental and theoretical study of the volumetric properties of liquid binary systems formed of compounds belonging to the chemical families of chloroalkanes, ethers, having an industrial, theoretical and environmental interest.

The experimental determination of the densities and excess volumes of the systems studied, at different temperatures located in the interval [278.15-333.15] K and at atmospheric pressure, using an Anton-Paar type DMA5000 vibrating tube densimeter. This contribution of experimental data, on the volumetric properties of liquid binary mixtures of 1,2-dichloroethane with an ether, supplemented by an application of the theoretical model of Prigogine-Flory-Patterson PFP, will probably contribute to the enrichment of the database. thermodynamics and the further development of Flory's theory in its Prigogine-Flory-Patterson (PFP) version, with a view to a better understanding of the thermodynamic behavior of these liquid binary mixtures.

<sup>3</sup> Higher School of Saharan Agriculture – Adrar, Algeria

#### Abstract

The pollution of water by organic matter such as dyes requires the use of very efficient processes. Among the solutions proposed, adsorption techniques on less expensive adsorbent materials concretely from plant waste . In this work, we study the elimination of organic dye (Malachite Green) by an activated carbon. A series of experiments was carried out in order to study the influence on the adsorption capacity of certain parameters such as the mass of the adsorbent, the pH, the contact time, the initial concentration of the dyes and the temperature. All the results obtained show that the adsorption kinetics of the dye on the material is well described by the pseudo second order model with a correlation coefficient  $R^2 > 0.99$ . The adsorption isotherms of the adsorbent/adsorbate systems studied are satisfactorily described by the mathematical model of Langmuir and Freundlich. The pH of the solution has little influence on the bleaching performance. On the other hand, the thermodynamic study revealed that the adsorption is spontaneous and endothermic for the material used.

**Keywords:** Malachite Green, activated carbon, adsorption, adsorption isotherms, adsorption kinetics

### Synthesis and Characterization of Amine Functionalized Graphene Oxide and its Preliminary Adsorption Study towards Methyl Orange Dye.

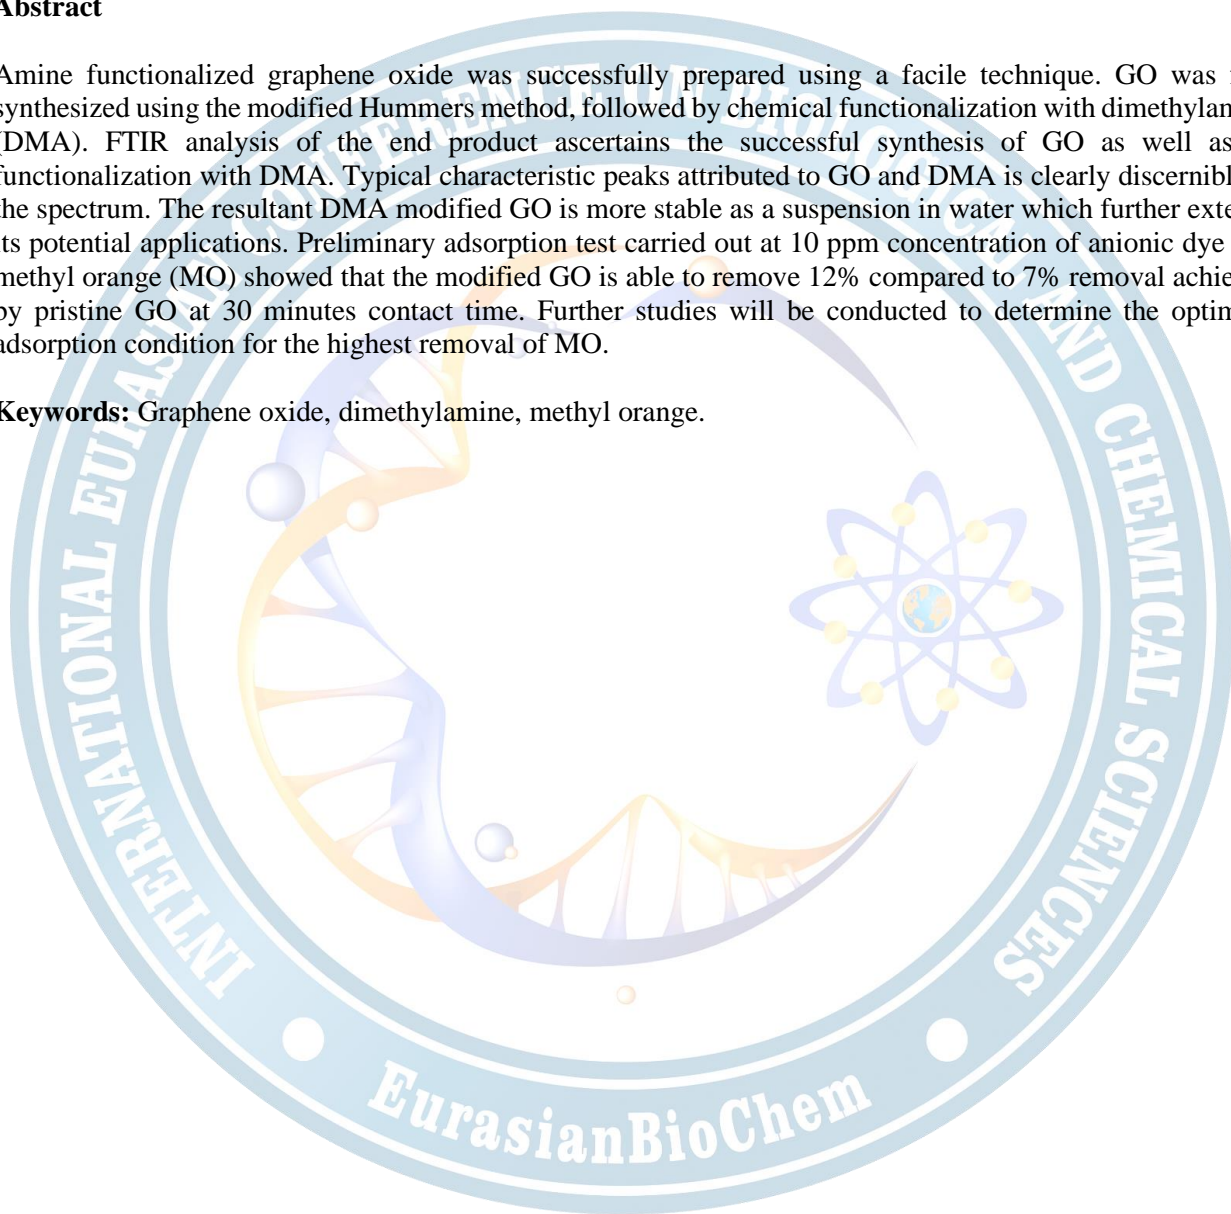

Mohd Haniff Wahid<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-2721-8697>),  
Noor Nazihah Bahrudin<sup>1</sup> (ORCID: <https://orcid.org/0000-0001-9302-6741>)

<sup>1</sup>Universiti Putra Malaysia, Faculty of Science, Department of Chemistry, Serdang, Selangor, Malaysia.

#### Abstract

Amine functionalized graphene oxide was successfully prepared using a facile technique. GO was first synthesized using the modified Hummers method, followed by chemical functionalization with dimethylamine (DMA). FTIR analysis of the end product ascertains the successful synthesis of GO as well as its functionalization with DMA. Typical characteristic peaks attributed to GO and DMA is clearly discernible in the spectrum. The resultant DMA modified GO is more stable as a suspension in water which further extends its potential applications. Preliminary adsorption test carried out at 10 ppm concentration of anionic dye i.e.; methyl orange (MO) showed that the modified GO is able to remove 12% compared to 7% removal achieved by pristine GO at 30 minutes contact time. Further studies will be conducted to determine the optimum adsorption condition for the highest removal of MO.

**Keywords:** Graphene oxide, dimethylamine, methyl orange.

#### Abstract

Cheese is a dairy food produced from coagulated milk. There is a wide variety of cheese around the world, each with its own characteristics and manufacturing methods. Our study focused on the characterization of three types of cheese [one traditional fresh cheese (Jben) and two industrial cheeses (T and P)] by determining their physicochemical and microbiological properties. Physicochemical analyses indicated a pH value of 7.18 for the two type of industrial cheese. For the traditional cheese, the pH was acidic 4.47. Our results showed a high percentage of fat, dry matter and chloride for industrial cheese compared to traditional cheese: 19.5% > 6.83%, 39.75% > 20.61%, 1.01% > 0.47% respectively.

The microbiological study showed satisfactory microbiological quality in all three products with a total absence of pathogenic germs such as *E. coli*, *Listeria*, *Salmonella* and *Staphylococcus aureus*. In the light of these results, we conclude that all three type of cheese are of good microbiological and physicochemical quality.

**Keywords:** Raw milk, industrial cheese, traditional cheese, microbiological quality, physicochemical quality.

### Phytochemical study and antimicrobial effect of the hydro-alcoholic extract of *Calamintha nepeta* from western Algeria

Chiali Fatima Zohra<sup>1</sup>, Merzouk Hafida<sup>2</sup>, Bahri Youcef<sup>3</sup>

<sup>1</sup>Laboratory of physiology physiopathology and biochemistry of nutrition, University of Tlemcen-department Biology –university of Mostaganem-Algéria.

<sup>2</sup>Laboratory of physiology physiopathology and biochemistry of nutrition, University of Tlemcen

<sup>3</sup>Laboratory of microbiology, University of Mostaganem

#### Abstract

Plants constitute an enormous reservoir of potential new molecules that can be the source of new active ingredients and lead to drugs. Our study consists in researching the antimicrobial activity of a plant, *Calamintha nepeta* belonging to the Lamiaceae family. Results & Discussion: The yield of *Calamintha nepeta* leaves in crude hydroethanolic extract is 12.33%. Phytochemical screening of *Calamintha nepeta* leaves show the presence of phenols, flavonoids, tannins, coumarins, saponins, alkaloids, proteins and terpenoids and the total absence of carbohydrates, quinones and anthraquinones. The content of polyphenols, flavonoids and tannins is 138.66mg/mL, 34.03mg/mL and 0.017mg/mL respectively. The sensitivity of the microbial strains tested to standard antimicrobial agents varies between 7 and 30 mm. The antibiotics that gave the largest zones of inhibition are: pristinamycin (PT15), chloramphenicol (C), nalidixic acid (NA), spiramicin (SP), gentamicin (GM) and neomycin (N). The hydroethanolic extract of *Calamintha nepeta* exerted an antimicrobial power against the microbial strains tested, the diameters of the zones of inhibition vary between 8 and 29 mm. The most sensitive strains are *C. albicans* ATCC 10231, *P. mirabilis* ATCC 35659 and *Proteus vulgaris* ATCC 6380 with inhibition zone diameters of 29, 19 and 17 mm respectively. The hydroethanolic extract of *Calamintha nepeta* exerted activity against the microbial strains tested, the values obtained range from 0.781 to 3.125 µl/mL for the CMI and from 3.125 to 50 µl/mL for the CMB and the CMF. Conclusion: Indeed, the hydroethanolic extract showed bacteriostatic activity on the majority of microbial strains tested. The hydroethanolic extract of *Calamintha nepeta* showed better activity against Gram-negative strains than Gram-positive strains. This result is important since gram-negative bacteria are more resistant to antimicrobial agents than gram-positive bacteria.

**Keywords:** *Calamintha nepeta*, hydroethanolic extract, nosocomial infections, antimicrobial activity

### Chronic oxycarbonism in active and passive smokers in Algeria

Boudemagh Kenza <sup>1</sup>, Belmahi Mohamed Habib<sup>1</sup>

<sup>1</sup>Constantine 3 University, Faculty of Medicine, Department of Pharmacy, Toxicology Laboratory, Algeria

#### Abstract

Smoking is a global scourge, leading to significant morbidity and mortality. In Algeria, tobacco kills 15,000 of its regular consumers, imposing a substantial burden in terms of diseases, disabilities, and suffering, with an extremely negative impact on family incomes and the national economy. One of the consequences of smoking is chronic oxycarbonism, which has multiple and potentially severe sequelae. Our study aimed to evaluate chronic oxycarbonism, among active and passive smokers. Carboxyhemoglobin levels were measured using the WOLFF method at the Ibn Badis Constantine University Hospital Toxicology Department from March to May 2023, involving 94 volunteers. The average carboxyhemoglobin concentration among active smokers in our study was  $7.69\% \pm 4.02\%$ . The highest carboxyhemoglobin values ( $3.10 \pm 2.04\%$ ) were recorded among active smokers aged 60 to 85. For a tobacco consumption duration of more than 10 years, the average carboxyhemoglobin level was  $8.54 \pm 4.15\%$ . The mean carboxyhemoglobin level among passive smokers in our study was  $2.53\% \pm 1.81\%$ . Interestingly, 42% of passive smokers studied had carboxyhemoglobin concentrations within normal limits despite their exposure to tobacco smoke. The fight against tobacco is a social responsibility of all healthcare personnel, including pharmacists. It is crucial to raise awareness among the population about the harmful effects of tobacco, particularly the issue of chronic oxycarbonism.

**Keywords:** Smoking, active smokers, passive smokers, oxycarbonism.

## ORAL PRESENTATION

### Aging-related changes in the diversity of scalp microbiome – preliminary studies

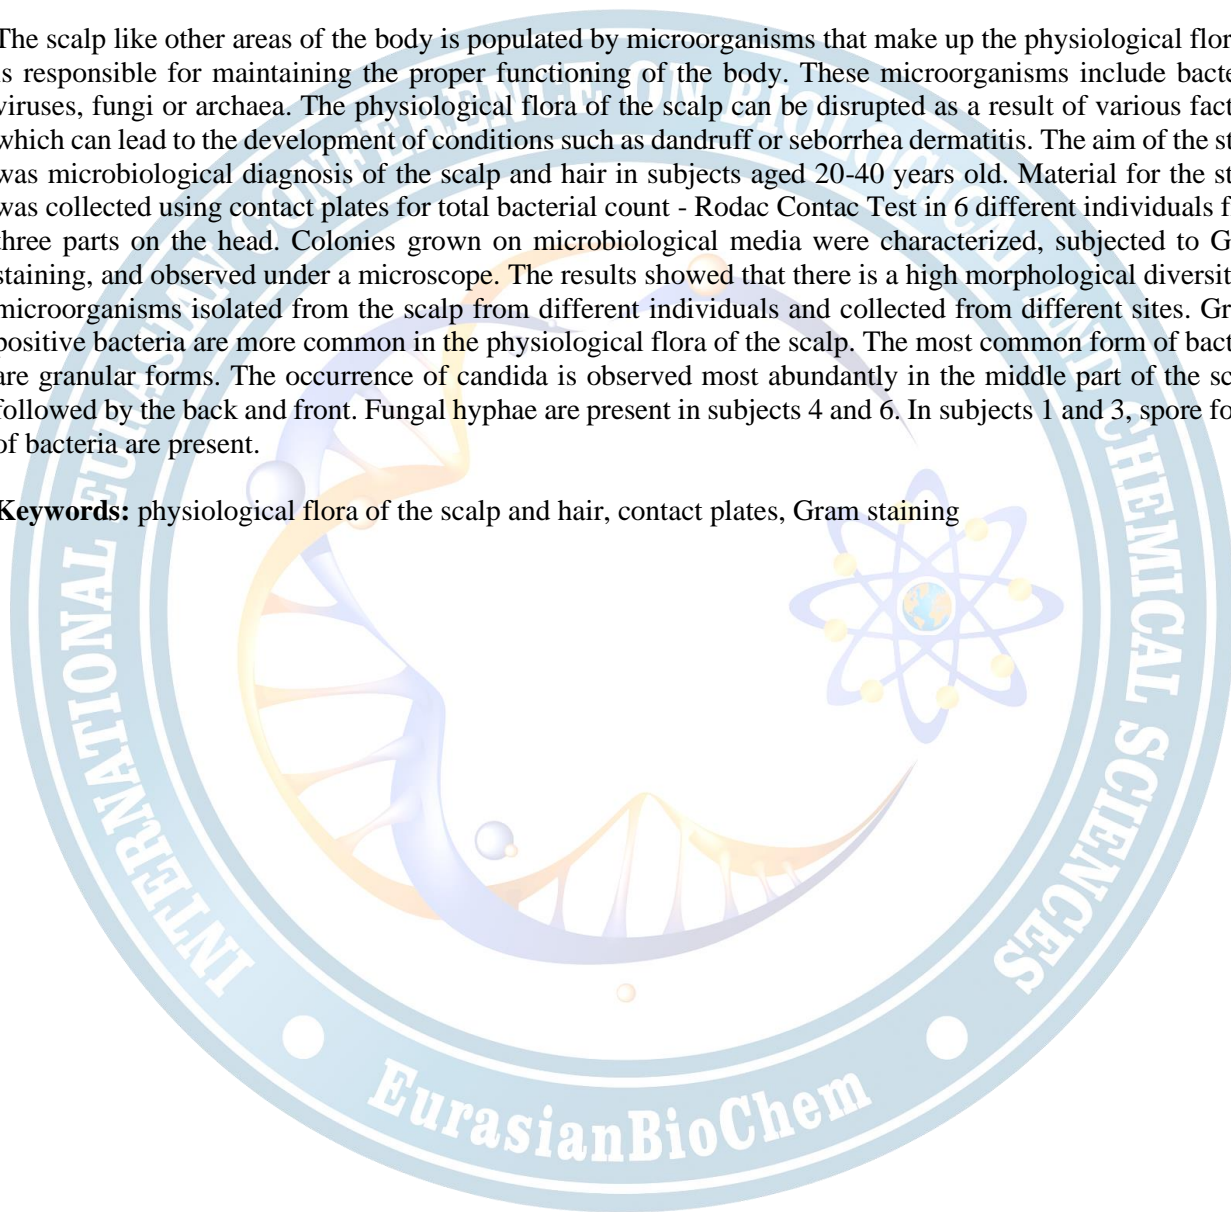

Karolina Oleś<sup>1</sup> (<https://orcid.org/0009-0000-9708-5298>),  
Katarzyna Duda-Grychtoł<sup>1</sup> (<https://orcid.org/0009-0008-7306-9611>)

<sup>1</sup>Silesian College of Medicine, Health Department in Katowice, Poland

#### Abstract

The scalp like other areas of the body is populated by microorganisms that make up the physiological flora. It is responsible for maintaining the proper functioning of the body. These microorganisms include bacteria, viruses, fungi or archaea. The physiological flora of the scalp can be disrupted as a result of various factors, which can lead to the development of conditions such as dandruff or seborrhea dermatitis. The aim of the study was microbiological diagnosis of the scalp and hair in subjects aged 20-40 years old. Material for the study was collected using contact plates for total bacterial count - Rodac Contac Test in 6 different individuals from three parts on the head. Colonies grown on microbiological media were characterized, subjected to Gram staining, and observed under a microscope. The results showed that there is a high morphological diversity of microorganisms isolated from the scalp from different individuals and collected from different sites. Gram-positive bacteria are more common in the physiological flora of the scalp. The most common form of bacteria are granular forms. The occurrence of candida is observed most abundantly in the middle part of the scalp, followed by the back and front. Fungal hyphae are present in subjects 4 and 6. In subjects 1 and 3, spore forms of bacteria are present.

**Keywords:** physiological flora of the scalp and hair, contact plates, Gram staining

## ORAL PRESENTATION

### Hepatotoxicity of *Ecballium elaterium* Following Traditional Therapeutic Use (Phytotherapy)

Mohamed Habib Belmahi, Kenza Boudemagh, Imane Mecheri

Toxicology Laboratory - Department of Pharmacy - Constantine3 University

#### Abstract

Phytotherapy holds a significant place among the medicinal practices in our society. However, the underestimated risks associated with its use raise substantial health concerns. Hepatotoxicity is one of the major adverse effects of medicinal plants, given the physiological importance of the liver and the diversity of plants that can affect it. Our study aims to catalog several Algerian plants used in traditional therapy that carry hepatotoxic risks and contain various toxic compounds such as cucurbitacins. Our practical investigation focused on the plant "*Ecballium elaterium*." An epidemiological survey revealed widespread usage of this plant in two forms: the juice of the fruit and maceration. Administration to mice resulted in the development of hepatic lesions and disruptions in reduced glutathione (GSH) concentrations. This leads us to conclude that *Ecballium elaterium* indeed exhibits a genuine potential for hepatotoxicity.

**Keywords:** *Ecballium elaterium*, squirting cucumber, phytotherapy, traditional use, hepatotoxicity, oxidative stress.

#### Abstract

Hypertension is the most common medical complication during pregnancy. It is one of the leading causes of maternal, fetal and neonatal morbidity and mortality. We aimed to investigate the risk factors for hypertension and its related complications in west Algerian pregnant women with the determination of their biochemical profile. Our population included 30 pregnant women (15 hypertensive women vs. 15 healthy women). A questionnaire containing 23 items was used to determine the main characteristics of the studied population. The biochemical profile was estimated by the determination of blood glucose, urea, creatinine, transaminases (TGO and TGP), prothrombin, quick time, TCK and proteinuria. In our study, 60 % of hypertensive pregnant women were in the age group of 30-40 years. Multiparity (73.33%), A blood group (60%), obesity (50%), stillbirth (40%) and diabetes (33.33%) were the main risk factors and complications observed among hypertensive women during pregnancy. Biochemical profile abnormalities were mainly presented by hyperglycemia, an increase in the level of TGO and TCK ( $p < 0.001$ ). During pregnancy, high blood pressure increased the risk of maternal and fetal morbidity and mortality.

**Keywords:** Biochemical profile, Complications, High blood pressure, Pregnancy, Risk factors

#### Abstract

In molecular docking studies, a series of natural compounds investigated as inhibitors for the SARS-CoV-2 main protease (PDB ID: 6lu7) protein, the new strain of coronavirus, showed binding energy values with scores ranging from -7.99 to -7.62 kcal/mol. This study identified two compounds, h85 and h87, with high binding affinity, favorable pharmacokinetic characteristics, and minimal toxicity. Molecular dynamics (MD) simulation was also used to study the structural stability and dynamics of the two lead compounds inside the active site of 3CLpro; MD simulations revealed stable trajectories (RMSD and RMSF) and molecular properties with a rational interaction profile. It was established that these two lead molecules seemed to have the potential to function as attractive therapeutic candidates and would be of interest as starting points for SARS-CoV-2-targeting medicines.

**Keywords:** SARS-CoV-2, Natural compounds, Molecular docking, ADMET, Molecular dynamics.

### Essential oils of three hemp (*Cannabis sativa* L.) cultivars in Rif Mountains (Northern Morocco)

EL BAKALI Ismail <sup>1\*</sup> (<https://orcid.org/0000-0002-3013-534X>)

<sup>\*1</sup>Abdelmalek Essaâdi University, Faculty of Sciences, Department of Biology, Tetuan, Morocco

#### Abstract

Hemp known botanically as *Cannabis sativa* L. (CS) is an important industrial crop. A huge literature was devoted to its biology owing to its numerous health-healing properties and biotechnological applications. However, little is known about essential oil (CSEO) chemical composition in the cultivars grown in Morocco. In this research work, we aimed at investigating CSEO chemical composition of three cultivars namely: 'Beldiya', 'Mexicana', and 'Critical Plus'. CSEOs were isolated from dried inflorescences using hydrodistillation and then subjected to chemical analysis using GC-MS. Our results showed that CSEOs yield and chemical composition varied significantly among cultivars. 'Critical Plus' showed the greatest record of CSEO yield (0.688%), while 'Mexicana' had the lowest value (0.330%). However, 'Critical Plus' presented the smallest values for the most of major compounds. Chemical composition showed an important phytochemical richness especially terpenoids. The most abundant compounds found in CSEOs were the following:  $\beta$ -caryophellene (13.39–25.32%),  $\beta$ -myrcene (10.03–20.09),  $\alpha$ -humulene (4.88–8.73%), caryophellene oxide (1.46–6.07%), decane (1.41–4.46%), and  $\alpha$ -pinene (1.91–3.66%). The highest records of these compounds were reported in 'Beldiya' ( $\beta$ -caryophellene, caryophellene oxide, and decane) and 'Mexicana' ( $\beta$ -myrcene,  $\alpha$ -humulene, and  $\alpha$ -pinene). Principal component analysis allowed a good separation of the three investigated cultivars based on their essential oil major compounds. It could be concluded that, the studied cultivars were caryophellene chemotypes, the local cultivar 'Beldiya' along with 'Mexicana' performed better in terms of essential oil yield and major phytochemicals over 'Critical Plus'.

#### Abstract

Spittlebugs and sharpshooter leafhoppers, treehoppers and Cicadas are the main potential vectors of the bacterium *Xylella fastidiosa* (*Xf*) in the world. This study aims to give current data and analyze the occurrence and interaction between the potential insect vectors with *Xf* around the world, including America, Europe, Asia and North Africa, and in comparison, with Morocco. Citrus, olive, almond and grapevine, forest agroecosystems and oleander are considered the main susceptible host species to *Xf* and present in Morocco. This suggest the importance of the monitoring the potential insect vectors of this bacterium, including *P. tesselatus*, and the use the scientific tools to detect quickly the first bacteria inoculums of *Xf*, that could be introduced in the near future.

**Key words:** *Xylella fastidiosa*, potential vectors, *Philaneus tesselatus*, spittlebugs.

#### Abstract

The aim of this work was to highlight the effect of starvation against ionizing radiation damages using *Tetrahymena pyriformis* as a cellular model. Ionizing radiation has an indirect effect: the radiolysis of water which causes the generation of harmful molecules such as reactive oxygen species (ROS). Cellular detoxification processes involve the activation of antioxidant enzymes leading to the elimination of ROS. Numerous studies reveal that starvation has a beneficial impact on longevity, cell survival, and antioxidant effects. To evaluate the starvation effect on ionizing radiation damages, we exposed *T. pyriformis* cells, suspended in non-nutrient and nutrient media, to a cobalt source for 24h. Control cells were taken in the same conditions without irradiation. We monitored the cell number and the activity of some metabolic enzymes such as glyceraldehyde-3-phosphate dehydrogenase (GAPDH) and aldehyde dehydrogenase (ALDH) as well as some antioxidant markers such as catalase, superoxide dismutase and lipid peroxidation. Our results showed that the decrease in cell number after exposure to ionizing radiation was more important in non-starved cells than in starved ones. The decreases in the enzymatic activities of GAPDH and ALDH recorded after ionizing radiation exposure were greater in the case of non-starved cells compared to starved cells. The level of antioxidant markers remains relatively high after exposure to ionizing radiation in cells re-suspended in the non-nutrient medium compared to those re-suspended in the nutrient medium.

<sup>3</sup>ENSV National School of Veterinary Sciences, El Harrache, Algeria

#### Abstract

*Juniperus phoenicea* L.1753 is a tree or shrub adapted to the arid Mediterranean climate, it belongs to the cupressaceae family, the aim of our study is to contribute to the knowledge and identification of the mesofauna of the litter of this species (*Juniperusphoenicea*) during the winter, spring and summer seasons of the year 2023 as well as its distribution in the different points selected sampling sites in the study site, The methodology consists of recovering *Juniperusphoenicea* litter from five (05) stations in the Djebel Anoual forest and placing it in the extractor device (Berlese-Tullgren) to extract the specimens, which are identified and then counted by the magnifying glass binocular, The results obtained showed the presence of differences in the composition of the mesofauna of the litter of this forest species during the three seasons (winter, summer and spring), thus in summer 14 species, 12 families and 05 orders of the single class of insects are inventoried, where the order *Diptera* and the family Muscidae are the most diverse taxa (28.57%, 21.43%), *Bradysia* sp. is the most represented species during this season, on the other hand, 40 species, 28 families, 15 classes, 04 orders are identified in winter where, *Sarcoptiforma* (*Arachnida*), Acaridae are the most diversified taxa with respectively 22.5%, 10%, 90.27%. *Ceratophysellaarmata* is the species the most represented during this season, Only 13 species, 09 families, 07 orders and 03 classes are noted in spring where *Entomobryomorpha* (16.67%) and *Poduromorpha* 16.67% are the most diverse orders as well as families and the most diverse family is *Sminthuridae* 15, 38%% and *Formicidae* 15.38%. and *entomobryidae* 15.38%. *Ceratophysellaarmata* is the most represented species during this season, so the seasonal factor affects the diversity and dominance of the litter mesofauna of this forest species.

**Key words:** *Juniperus phoenicea*, Djebel Anoual, mesofauna, litter

<sup>b</sup> Department of Soil Science and Plant Nutrition, Faculty of Agriculture, Ataturk University, 25000, Erzurum, Turkey.

#### Abstract

Earthworms, characterized as "ecosystem engineers", impact the soil microbial population and function by boosting micro-habitat, increasing the surface area of organic compounds, feeding and transporting microorganisms, and increasing the surface area of organic compounds. The multiscale holes produced by earthworm activities increase soil porosity and aeration, hence supporting the development and reproduction of microorganisms. In addition, earthworms transform complex organic components into microbe-accessible nutrients by feeding on, compacting, and mixing the soil. This increases decomposition and the cycling of key soil constituents such as carbon, nitrogen, and phosphorus, so enhancing the biological productivity of the soil. Vermicomposting is the process through which earthworms and microorganism's breakdown organic waste. Recent research emphasizes the significance of the earthworm gut as a significant influencer on microbial ecosystems. It has been demonstrated that the addition of these microbial communities to fresh organic matter modifies the activity level and functional diversity of microbial populations in vermicomposting systems. The involvement of microbial activity in the gut and cast of earthworms and soil is crucial for the decomposition of organic wastes. Therefore, our review paper examined how the microbial population changes during vermicomposting in order to provide a better understanding of the role of vermicompost as an additive to improve the quality of soil.

#### Abstract

Flavonoids are a group of substances with various phenolic structures found in foods such as fruits, vegetables, grains, flowers, tea, wine and other naturally occurring foods. These organic substances exhibit beneficial health properties, which is why researchers are working to isolate them from their natural sources, including medicinal plants. The aim of this study was to examine the presence of these compounds and terpenoids in medicinal plants that grow in Albania

After using the SC-CO<sub>2</sub> extraction technique, we were able to identify flavonoids present in approximately more than 10 distinct plants using our state-of-the-art method. With the support of GC-FID, the chemical profile was examined with a focus on identifying the 14 distinct terpenoids (carvacrol, citronellal, geraniol, linalool, linalyl acetate, piperitone, menthol and thymol) of these plants. With the use of HPLC, it was possible to identify the flavonoids. *Mentha piperita* (10.2 mg/g extract) is the medical plant with the lowest flavonoid content, while *Cistus incanus* (650 mg/g extract) and *Melissa officinalis* (480 mg/g extract) are the plants with the highest quantity. *Citrus aurantium* extract is the only plant with the highest concentration of terpenoids, containing 38.41% linalool, 4.95% geraniol and 11.7% linalyl acetate, followed by *Origanum Vulgaris* and *Origanum heracleoticum*, which contains higher concentrations of carvacrol at 76.94%.

#### Abstract

Polydopamine (PDA) is an appealing material used for extensive scientific purposes, including light-to-thermal energy conversion, due to its numerous advantages. Properly integrating PDA into a composite system is vital to benefit from the PDA content to a maximum level. The PDA-containing systems can be produced by following the two main preparation methods: coating the surfaces of a targeted substrate with a PDA layer or preparing PDA nanoparticles in aqua media. In many different composite designs containing PDA chemistry, the emulsion/dispersion polymer latex systems should be considered from another perspective. From a general viewpoint, preparing hybrid systems possessing the PDA content with the polymer latex material, either the targeted composite product should be obtained after the water content is evaporated, followed by coating its surface with the PDA layer via a further reaction, or the PDA nanoparticles should be synthesized separately, and added in a polymer/water dispersion medium, producing the final product after the water part is evaporated. However, the composite systems designed with these methodologies are all in multicomponent and possibly inhomogeneous forms, which may need to be improved in fabrication, ecofriendliness, cost-effectiveness, and ease of applicability.

With this perspective, in this study group, a one-component, monolithic polymer matrix was produced by coating the surfaces of each polymer particle with the PDA layer while they were in the dispersion state. The new hybrid material preparation methodology was tested with polystyrene nanospheres synthesized by emulsion polymerization, and waterborne polyurethane systems. The comparative studies were evaluated in terms of the contribution of the method on the light-to-thermal energy conversion performance of PDA content in the hybrid materials as well as fundamental material characteristics and thermal energy storage.

#### Abstract

Cellular therapy is one of the treatment methods for immunological diseases, and mesenchymal stem cells (MSCs), which are widely used in this therapy, are special cells that can self-renew without differentiation and differentiate into different cell types in the body. MSCs can be obtained from different tissues, including adult tissue and fetuses. In the literature, it has been shown that MSCs have a role in the regulation of the immune system and can be used in the treatment of immunological diseases. In immunological diseases, the sudden and acute increase in the level of pro-inflammatory cytokines in the circulation, which is called the cytokines storm, is mortal, as it happened during the COVID-19 pandemic. Preclinical studies with MSC paved the way for the clinical phase and the use of MSC for the treatment of GvHD. The aim of these preclinical studies is to analyze the immunosuppressive activity of hWJ-MSC on T cells. This study was planned in vitro, and instead of using high-cost autologous MSC as a high-tech product, MSC obtained from Wharton jelly of the umbilical cord, which is obtained from a fetal source and has stronger stemness because it is closer to the embryonic period, is used. In this study, the immunosuppressive effect of WJ-MSCs on T cells with respect to T cell anti- and pro-inflammatory cytokines, regulatory T cells (Tregs), some T cell marker gene expressions, T cell viability, proliferation, apoptosis, and cell cycle changes after co-culture have been examined. The initial findings of this study showed that hWJ-MSCs, as a universal and more potent source of MSCs allowing allogeneic applications, are at least as immunosuppressive as bone marrow-derived MSC.

**Keywords:** Wharton Jelly, MSCs, Immunosuppression, T cells.

#### Abstract

The functional liver sinusoid consists of microvessels and can be modelled on a microscopic level in a three-dimensional (3D) *in vitro* environment using the liver on-chip model due to its early, quick, sensitive, and instant ability to detect clinical diagnoses of drug-induced injury, which is regarded as the most trustworthy microphysiological system in drug screening studies. Despite being successful against cancer drugs also impact healthy cells, which results in harmful consequences in numerous organs, including vascular tissue. Our study focused on the cytotoxicity and vascular damage effects of an anti-cancer drug on endothelial cells in a 3D microfluidic liver cancer model.

The PDMS-based microfluidic chip, which was fabricated by photolithography, consists of two microchannels: The parenchymal upper and the vascular bottom channels. Liver cancer cells were seeded on the upper side of the porous membrane, followed by seeding endothelial cells on the bottom side of the membrane for recapitulation of the liver sinusoidal capillary. The injury was created after administration of the anti-cancer drug to each microchannel at predetermined doses in our study, and then assessed by flow cytometry analysis with vascular damage biomarker and Live/Dead staining under fluorescence microscopy. According to Live/Dead images, the cell viability was lower in higher drug doses in 24 hours of chip culture. In addition, a higher vascular damage biomarker expression was detected after drug-treatment compared to the control (without drug treatment) in flow cytometry. The biomarker used in this study was found very effective to study vascular damage in chip systems such as tumor vasculature and other organ vasculature, which is shown for the first time in our chip system. In this study, liver cancer cell platforms, which are of great importance in both drug development and disease modelling, will enable the early detection of drug-related diseases such as cardiovascular damage.

#### Abstract

Thanks to the stability that conjugated double bonds in the structure of anthracene add to the molecule, their potential for use in sensors is very high. They are used in many different sensors, especially biosensors and chemosensors. Anthracene-like molecules with polycyclic structures (such as pyrene, and phthalocyanine) and their derivatives are known to be used for the immobilization of biomolecules on carbon nanotubes (CNT). Accordingly, anthracene derivatives have been used as binding agents for non-covalent immobilization. In this study, since the importance of S, N, and O atoms in compounds with known biosensor properties is emphasized in the literature, a new anthracene sulfonyl hydrazone compound containing sulfone and hydrazine was designed and anthracene ethanesulfonylhydrazone (Antesh) compound was synthesized. The excess hydrazine monohydrate used in the synthesis of sulfonylhydrazone compounds should be removed from the synthesized product due to its high cost and toxicity. The synthesis of Antesh has been handled in an environmentally friendly approach by using less amount of hydrazine monohydrate with solvent and mild reaction conditions suitable for green chemistry. The characterization of the compound (Antesh) was carried out by elemental analysis and spectroscopic methods (FT-IR, <sup>1</sup>H-NMR, and <sup>13</sup>C-NMR). Since Antesh is intended to accelerate electron transfer, electrochemical measurements by cyclic voltammetry and impedance spectroscopy were investigated. In this direction, within the scope of the project, graphene, gold nanoparticles, and transition metals were doped on the bare electrode surface together with Antesh, and a new interface was obtained. In addition, the molecular structure of Antesh was determined by computational studies (Gaussian 09 package program). The HOMO-LUMO energies, chemical reactivity descriptors, and molecular electrostatic potential (MEP) map of Antesh optimized by DFT/B3LYP method and 6-31+G(d,p) basis set were investigated.

#### Abstract

In this study, the treatment effect of fullerene C<sub>60</sub> nanoparticle against lung tissue damage caused by 7,12-dimethylbenz[a]anthracene (DMBA) in Wistar albino female rats was investigated. The animal experiments part of this study was conducted in the Firat University Experimental Animal Research Center (FUDAM) with the permission of the Firat University Animal Experiments Ethics Committee dated 27.01.2021 and numbered 2021/02. In this study, 60 Wistar albino female rats (n = 60, 8 weeks old) were used. These rats were divided into 4 groups. Groups: (1) Control; (2) Fullerene C<sub>60</sub>; (3) DMBA; (4) Fullerene C<sub>60</sub> + DMBA. Expression levels of caspase-3, HO-1 and p53 proteins in lung tissue were determined by western blotting technique. Comparing the groups given Fullerene C<sub>60</sub> to the groups given DMBA, it was found that the expression levels of the proteins caspase-3, HO-1, and p53 were much higher in the groups given Fullerene C<sub>60</sub>. According to the results, it was determined that fullerene C<sub>60</sub> has a therapeutic effect by reducing lung tissue damage.

**Keywords:** Caspase-3, HO-1, Lung, p53

### Development and efficacy of collagen suppressing peptide nanofibers

Deniz SEZLEV BILECEN (<https://orcid.org/0000-0002-5708-2276>)

Konya Food and Agriculture University, Dept of Molecular Biology and Genetics, Konya, Turkey

deniz.bilecen@gidatarim.edu.tr

#### Abstract

Peptide amphiphiles are monomers, having a hydrophobic core and an ionic segment thus have the ability to self-assemble into nanofiber structures. During their self-assembly process, they can encapsulate small molecules into their structure, becoming nano structured vehicles for cellular transport. Antisense oligonucleotides are 12-25 nucleotides long single stranded nucleic acid sequences which can inhibit target gene expression within the cells thus they are considered as nucleotide based therapeutic agents. One major drawback of antisense oligonucleotide delivery is their susceptibility to nucleases in the extracellular and intracellular environments. This obstacle might be overcome by using a vehicle for protection of the oligonucleotide in both sites. In this study, a ten amino-acid peptide with antifibrotic properties were modified to form the peptide amphiphiles (PA). These PAs were then used to form nanofibers which were used to encapsulate a GapmeR (antisense oligonucleotide) sequence, targeted towards a cytokine (Connective Tissue Growth Factor – CTGF) that is involved in excessive collagen synthesis. A variety of nanofiber formulations were studied, and the most stable form was administered to fibroblasts. The efficacy of the nanofibers was examined by tracking the collagen levels within the cells. The most stable nanofiber had the ratio of 100:1 and this nanofiber significantly reduced the collagen levels in the cells. In conclusion, the nanofibers may be an alternative therapeutic agent for the treatment of diseases with elevated extracellular matrix production is observed such as skin fibrosis.

**Keywords:** Nanofibers, antisense oligonucleotide, collagen

#### Abstract

Antibiotic resistance has become one of the most critical health problems today. New antimicrobial molecules should be developed due to the inadequacy of existing antibiotics. In this study, we aimed to determine for the first time the characterization and antimicrobial properties of synthetic antimicrobial peptide, GV-13, which we derived from human HS02 intragenic antimicrobial peptide by using database filtering technology. For this purpose, we first performed the solid phase peptide synthesis of the peptides, followed by their characterization by fourier transform infrared (FTIR) and circular dichroism (CD) spectroscopy. Finally, the minimum inhibition value (MIC), motility and antibiofilm activity against *Staphylococcus aureus* (ATCC 43300) and *Pseudomonas aeruginosa* (PAO1) pathogen strains in vitro conditions were revealed. According to our results, it was revealed that GV-13, which we determined to have  $\alpha$ -helix structure, exhibited MIC values of 64 and 128  $\mu\text{g/mL}$  against *S. aureus* and *P. aeruginosa*, respectively. It provides biofilm inhibition and degradation of the formed biofilm at increasing concentrations. In line with these results, it has been determined that GV-13 is a potential antimicrobial peptide candidate and can be used against antibiotic resistance. This work is supported by TUBITAK Project 122Z741.

#### Abstract

Recently since the emerging resistant strains to antimicrobial agents, the development of original antimicrobial agents in pharmaceutical chemistry has gained great importance. Antibiotic resistance is accepted as one of the greatest threats against health worldwide. Since 1950s to now it is known that hydrazone-hydrazones have antimicrobial, anticancer, antitubercular, anticonvulsant etc., biological spectrum and biological activity (Polovic et al., 2019). Hydrazone derivatives are used in treatment and involved in the structure of many drugs such as nifuroxazide, nitrofurazone, bisanthren, budralazine, and levosimendan. Etopenamate was chosen as the starting compound to synthesis of 16 novel hydrazone-hydrazones. All of these derivatives were investigated in order to determine their antimicrobial activities. The structures of the synthesized compounds were characterized by IR, <sup>1</sup>H-NMR, <sup>13</sup>C-NMR, mass spectroscopy and elemental analysis. In this study, the antimicrobial activity of 16 hydrazone-hydrazone derivatives to 4 standard bacterial strains (*Staphylococcus aureus* ATCC 25923, *Escherichia coli* ATCC 25922, *Pseudomonas aeruginosa* ATCC 27853, *Enterococcus faecalis* ATCC 29212) and 4 standard yeast strains (*Candida albicans* ATCC 90028, *Candida glabrata* ATCC 90030, *Candida parapsilosis* ATCC 90018, *Candida tropicalis* KUEN 1021) was examined by the microdilution method in accordance with the Clinical and Laboratory Standards Institute (CLSI) standards, and the Minimal Inhibitory Concentration (MIC) values of these derivatives were determined. It was found that among these derivatives, **2c** (725-0.35µg/ml) and **2p** (1000-0.5µg/ml) possessed antimicrobial activity against all of the 8 standard microorganism strains.

#### Abstract

*Fumaria officinalis* which belong to the Fumariaceae family is represented by about 15 genera including the genus *Fumaria*, which encompasses about 40 species [1]. These species are herbaceous annuals [2] with a wide distribution in temperate areas of Europe and North Africa as well as in India, Pakistan, and West Asia [3,4]. It has been reported that the plant can be used for gastrointestinal disorders, as a laxative, anthelmintic, cholagogue or sedative as well as in the treatment of skin diseases, conjunctivitis and rashes, rheumatism, and high blood pressure [4]. The antioxidant activities of *Fumaria officinalis* aerial parts were determined by taking ethyl acetate (FO1), methanol (FO2) and aqueous ethanol (FO3) extracts, DPPH radical removal and ABTS cation removal activity, CUPRAC activity method,  $\beta$ -carotene-linoleic acid color bleaching activity methods, spectroscopic and *in vitro*. The phenolic content concentrations of the extracts in different polarities were determined by HPLC-DAD. Also, we tested anticholinesterase inhibition activity and tyrosinase inhibition activity in all extract. In conclusion, this study evaluated the bioactivities and chemical content of *Fumaria officinalis*, which grows in our country. It was determined that FO3 extract better results than other extracts in all antioxidant tests.

**Keywords:** *Fumaria officinalis*, Antioxidant Activity, Anticholinesterase Activity, Tyrosinase Activity, HPLC-DAD

#### Abstract

Natural sources of the remarkable energy carrier hydrogen (H<sub>2</sub>) include biomass, water, and hydrocarbons. The most abundant energy source is solar energy, which plants use naturally to fuel their photosynthetic processes. Utilizing cobalt-based photocatalysts, researchers have recently studied photocatalytic water reduction, which was inspired by the natural photosynthesis mechanism. Different transition metals have been used to simulate the water reduction mechanism of photosynthesis. However, in terms of price/performance ratio, no appropriate solution could be discovered. In this context, we explore the water reduction, commonly known as H<sub>2</sub> production, process of Co-based polypyridyl catalyst possessing perfect octahedral coordination using Ab-initio Molecular Dynamics (AIMD), Density Functional Theory (DFT), and Free Energy Perturbation Theory. Our goal is to understand how the perfect coordination around the Co center affects the EECC reaction pathway. Two reduction and two protonation steps of the water reduction cycle have been simulated using AIMD simulations and allowed spin states as well as solvent response around the reaction center of the catalyst have been determined. Electronic structures of each intermediate steps have been further examined applying hybrid density functional framework of DFT. Marcus's theory of electron transfer has been used to compute the first and the second reduction free energies.

**Keywords:** H<sub>2</sub> production, water reduction, ab-initio molecular dynamics, density functional theory

#### Abstract

Microalgae are organisms that can easily adapt to different environmental conditions, allowing them to increase their biomass and produce metabolites. They are widely utilized in various industries due to their biochemical content and rapid growth rate. Cultivation of microalgae cells occurs in different systems at various scales and methods, including photobioreactors and open ponds. Among numerous microalgae, *Spirulina platensis* is a commonly preferred species in industry. It is one of the most important commercial producers of phycobiliproteins, which are characteristic bioactive materials found in blue-green algae. Phycocyanin produced from *S. platensis* also holds high added value. This study reports on the production of phycocyanin from *S. platensis* using an airlift photobioreactor. The airlift photobioreactor provides several advantages, including the absence of additional mixing components and the ability to replace O<sub>2</sub> and CO<sub>2</sub> with aeration gas and medium. The growth rate of *S. platensis* was found as  $0.28 \pm 0.01 \text{ day}^{-1}$  and the doubling time was  $2.47 \pm 0.09 \text{ day}$ . The phycobiliprotein contents were obtained as  $1.03 \pm 0.001 \text{ mg/L}$  for phycoerythrin,  $10.37 \pm 0.08 \text{ mg/L}$  for phycocyanin,  $6.29 \pm 0.24 \text{ mg/L}$  for allophycocyanin, and  $17.71 \pm 1.76 \text{ mg/L}$  for total phycobiliprotein. Given the benefits of an airlift photobioreactor, cultivating *S. platensis*, a commercial microalgae, in such a reactor can result in significant potential for producing biomass and bioactive material.

**Keywords:** *Spirulina platensis*, phycobiliprotein, phycocyanin, airlift photobioreactor

#### Abstract

To ensure better crop yields and produce vigor seedlings, each seed must be healthy and germinate quickly, which is very important for agricultural production. However, seeds may deteriorate over time and lose their germination capacity, viability, and vitality. In such cases, the pre-sowing application of biostimulants as growth-promoting agents is one of the most promising approaches in agricultural practices. With these applications, improved plant metabolism and performance can be observed both before and after germination. It is well recognized that seaweed-based formulations that contain rich bioactive compounds are used as biostimulants in crop production and the effects of pre-sowing treatment with seaweed extracts on germination, growth, and early plant development have been the subject of various studies in the literature. This study used two different application methods (seed or substrate applications) on wheat (*Triticum durum* cv. Saricanak-98) seeds to investigate the biostimulant effect of several extracts (hot water, alkali, acidic) from *Cystoseira barbata* (*C. barbata*), a brown seaweed species that is prevalent throughout the Mediterranean coasts. In this investigation, the effects of seaweed extracts on wheat seedling growth characteristics, root system morphology, and mineral concentrations were assessed. The results demonstrate that seaweed extracts can improve the performance of wheat seedlings and have a positive impact on several growth parameters. Moreover, the findings showed that seaweed extracts were more effective at enhancing seedling performance when added to the growing medium than when applied directly to seeds. *C. barbata* extracts can be used as promising agents in sustainable agriculture as they are highly efficient, eco-friendly, and safe products. Therefore, this research reveals the potential of our country's economic resources such as *C. barbata* to be transformed into high-value goods that can contribute to the country's economy.

#### Abstract

Zeolitic imidazolate frames (ZIFs), which are composed of metal sources such as Zn and Co and organic ligands such as imidazole or imidazole derivatives, are hybrid structured materials with unique features such as designable surface area, pore size, chemical and thermal stability. The free lipase is known as the most used in industrial biotechnology and microbiology. Although free lipases are frequently used in industry, their stability is poor and their conformational structures are disrupted when exposed to high temperatures. In order to overcome these disadvantages and improve a strong biocatalyst, immobilization of enzymes on solid supports is believed one of the most efficient methods to get better their activity, affinity, selectivity and stability. ZIFs are thought to be the perfect support materials to protect the conformational structure of enzymes against adverse environments and to enhanced their activity and stability due to their special properties. One of the strategies for immobilizing the enzyme on the surface of zeolites is adsorption. Adsorption-based techniques are superior to other methods due to their economical, high performance, easy applicability, suitability for a wide range of concentrations, and ease of installation. In this study, ZIF-67, a new support material was prepared for physical adsorption of *Porcine Pancreatic* lipase (PPL). The ZIF-67@PPL was characterized by using techniques such as SEM, XRD, and FT-IR. Furthermore, pH, thermal stability, storage time, and the reusability of immobilized lipase were determined and compared to free lipase. It was determined that ZIF-67@PPL still retained 61% of its activity after 5 times reuse. The Free PPL retained its catalytic activity of 25% at 60 °C after 120 min, while ZIF-67@PPL retained 49 % of its catalytic activity at the end of 120 min.

#### Abstract

The aim of this study is to investigate whether possible to modulate the *in vitro* pollen germination and tube elongation of kiwi (*Actinidia deliciosa*) by spermidine treatment. For this purpose, pollen grains were germinated for 3 hours in pollen germination media containing spermidine at different concentrations (0.01 mM, 0.025 mM, 0.05 mM, 0.1 mM, 0.25 mM, 0.5 mM). First, pollen germination rates and pollen tube lengths were determined and then pollen germination rates and pollen tube lengths results were evaluated cumulatively. The results showed that spermidine treatments did not generate a significant change in pollen germination rates when compared to the control. Pollen tube lengths were significantly increased by 13,85% after 0,01 mM spermidine treatment. However, pollen tube lengths were significantly decreased by 24,60% after 0,025 mM, by 22,97% after 0,05 mM, by 24,62 after 0,1 mM, by 21,65% after 0,25 and by 25,92% after 0,5 mM spermidine treatment, compared to the control. According to cumulative stress response index results, 0,01 mM spermidine stimulated pollen germination and tube elongation while the other concentrations decreased. As a result, spermidine could be used for modulating the pollen germination and tube length and these findings could be useful for artificial pollination practices.

#### Abstract

Antibiotics are used in poultry to promote growth, increase feed efficiency, and reduce diseases. One of the most used antibiotics on farms is tetracycline. However, excessive use of tetracycline in food-producing animals can lead to residues that may adversely affect public health. Regarding food safety and human health, it is significant to check for the presence of antibiotics in animal foods and to calculate the total aerob mesophilic bacteria (TAMB) counts. This study aimed to determine whether certain foods consumed in Ankara, Turkey, contained TAMB and tetracycline antibiotic residues. For this purpose, the enzyme-linked immunosorbent assay (ELISA) technique was used to analyze a total of 82 food samples (chicken meat, eggs, pasteurized milk and unpackaged raw milk). Additionally, the existence of TAMB was analyzed using classical culture methods. According to our findings, tetracycline was found in 9 (10.98%) of 82 food samples at concentrations ranging from 0.90-11.24 ppb ( $\mu\text{g}/\text{kg}$ ,  $\mu\text{g}/\text{L}$ ). Tetracycline was not detected in the egg samples. The mean value ( $\pm$ S.E) of positive chicken meat and milk samples for tetracycline were determined to be 1.59  $\mu\text{g}/\text{kg}$  and 6.40 $\pm$ 1.68  $\mu\text{g}/\text{L}$ , respectively. The TAMB values of the chicken samples for the firms A, B, and C were 4.78 $\pm$ 0.09, 5.68 $\pm$ 0.17, and 4.38 $\pm$ 0.11 log cfu/g, respectively. Additionally, TAMB scores for pasteurized milk samples from the firms F, G, H and raw milk were 3.40 $\pm$  0.22; 4.09 $\pm$  0.20; 3.11 $\pm$  0.23; 6.64 $\pm$  0.13 log cfu/mL, respectively. Our data showed that the levels of tetracycline detected in all samples were within the limits set by Turkish Food Codex. Finally, the present study highlights the importance of antibiotic detection and microbiological analysis not only for food control but also for human health.

#### Abstract

In recent years, biological molecules such as proteins, vitamins and phenols have been frequently used in the synthesis of metallic nanoparticles due to their reducing and stabilizing properties. The avocado seed, with its valuable components could be an important source for the food and/or pharmaceutical industry. Within the scope of this study, ZnO nanoparticles (ZnONPs) were synthesized at room temperature using MeOH-H<sub>2</sub>O extract of avocado seed. Different concentrations of avocado seed 1, 3, and 5 mg/mL were used in the green synthesis of ZnONPs. Results of XRD, ATR-FTIR, DLS, SEM analysis, and UV-Vis spectroscopy showed that crystalline ZnONPs can be produced in the presence of avocado seed extract at all concentrations. The crystallite sizes of nanoparticles with hexagonal crystalline structures ranged from 17 to 20 nm. SEM images of ZnONP agglomerates revealed flower-like formations. ZnONPs-3 was found to have the most uniform size distribution according to DLS analysis. Minimal inhibitory concentrations were determined between 7.81 - 125 µg/mL, for ZnONPs. Human normal skin (BJ) and brain glioblastoma cancer (T98G) cell lines were used to investigate the cytotoxicity of ZnONPs-3. The IC<sub>50</sub> concentrations for BJ and T98G cells were found to be 36.05 µg/mL and 23.60 µg/mL, respectively, at 24 hours. These numbers decreased to 31.07 µg/mL and 18.05 µg/mL at 48 hours. ZnONPs-3 showed toxicity against cancer cells at concentrations which were non-toxic for normal cells. Results of this study reveal that ZnONPs produced in the presence of avocado seed extract can be considered as a valuable active material that can be used in biomedical applications.

#### Abstract

Photodynamic therapy (PDT) is a clinically proven cancer treatment method with fewer side effects and a two-stage treatment designed to destroy cancerous or precancerous cells after mild activation of a photosensitizer (PS). Light-activated PSs of a specific wavelength are responsible for the conversion of molecular oxygen to cytotoxic singlet oxygen ( $^1\text{O}_2$ ) in the targeted tissue [1,2]. Phthalocyanines (Pc), used as photoactive drugs in PDT, are second generation photosensitizers due to their chemical stability, sufficient fluorescent emissions and singlet oxygen activities [3]. In this study, pyrazoline substituted axial silicon, peripheral ( $\beta$ ) and non-peripheral ( $\alpha$ ) zinc phthalocyanines were synthesized and their photophysical properties were investigated. When the results are examined, it is thought that silicon phthalocyanine shows the highest singlet oxygen production in DMSO and can be a candidate photosensitizer for PDT [4].

Figure 1. Silicon phthalocyanine compound, photosensitizing candidate for PDT

#### Abstract

Transition metal dichalcogenides (TMDs) possess unique properties that make them highly suitable candidate materials for sensing applications. Tungsten diselenide (WSe<sub>2</sub>), as a remarkable member of TMDs, has emerged as a promising material for the development of advanced electrochemical sensors [1-2]. WSe<sub>2</sub> has exceptional electronic, optical, and chemical properties, combined with its high surface-to-volume ratio and large specific surface area, contribute to its exceptional sensing performance. Furthermore, the facile functionalization of WSe<sub>2</sub> surfaces allows for tailored sensor designs, enabling the detection of a wide range of molecules. The electrochemical sensor design incorporates 2D-TMD nanomaterials as the sensing platform due to their large surface area, high electrical conductivity, and exceptional electrocatalytic properties [3]. The selective detection of dopamine (DA) and epinephrine (EPI) is of significant importance in clinical diagnostics and neurochemical research, as these neurotransmitters play crucial roles in various physiological processes and are associated with numerous neurological disorders. In this work, we focused on the preparation of 2D-WSe<sub>2</sub> nanosheets for application in electrochemical sensors for determination of EP and DA. WSe<sub>2</sub> nanosheets were prepared via a facile hydrothermal method. The surface morphology and composition of the WSe<sub>2</sub> were characterized by using X-ray diffraction (XRD), scanning electron microscopy (SEM) coupled with energy-dispersive X-ray spectroscopy (EDX), and transmission electron microscopy (TEM). The as-prepared WSe<sub>2</sub> were coated on a glassy carbon electrode (GCE) to fabricate an electrochemical sensor for simultaneous detection of DA and EP. Cyclic voltammetry (CV) and electrochemical impedance spectroscopy (EIS) methods were performed to determine the electrochemical behaviours of the WSe<sub>2</sub>-modified electrodes. Performance parameters of the developed sensor were obtained from the differential pulse voltammetry (DPV) measurements. It was found that WSe<sub>2</sub>-based electrochemical sensor exhibited wide linear detection ranges with low detection limits for DA and EP.

**Keywords:** Two-dimensional nanomaterials, transition metal dichalcogenides, tungsten diselenide, electrochemical sensor, dopamine, epinephrine.

#### Abstract

In recent years, plants have been used extensively for nanoparticle (NP) synthesis due to the presence of many useful phytochemicals used as reducing and stabilizing agents in their extracts [1]. Green synthesis of nanoparticles using plant extracts is an emerging research area and has advantages over chemical synthesis as it reduces the elaborate process and can also afford large-scale production [2, 3]. Metal oxide nanoparticles have many notable applications such as cell line studies, antimicrobial and dye degradation [4-5]. Copper oxide (CuO) nanoparticles have outstanding properties that make them essential for a variety of applications such as sensors, catalysts, and super-strong materials [4,5]. Despite the high availability and application of CuO NPs in multiple organs/systems, few studies have been conducted to examine their immunotoxic effects. The toxicity of CuO NPs on human lymphocytes remains to be investigated [4,5]. Antimicrobial mechanisms of nanomaterials can be investigated to study the specific binding of microorganisms to their surfaces and their metabolism in microorganisms [6].

In this study, the first goal is the preparation of copper oxide nanoparticles using the green synthesis method using pomegranate fruit and the doping of silver nanoparticles on copper oxide nanoparticles. Secondly, the antibacterial effect of the prepared nanoparticles against both gram positive (*Staphylococcus aureus*) and gram negative (*Escherichia coli*) bacteria and the photocatalytic activity have been examined.

**Keywords:** green synthesis, CuO, antibacterial activity, photocatalytic.

#### Abstract

Photodynamic therapy (PDT) is an alternative cancer treatment method based on the dynamic interaction between a photosensitizer that provides selective destruction of the target tissue, light of a certain wavelength, and molecular oxygen, and the free radicals formed as a result of this interaction destroy the cancerous tissue. PDT is triggered by the application of photosensitizer that selectively accumulates in the tumor tissue, followed by exposure of light of a suitable wavelength to the applied area. It transfers energy from light to molecular oxygen to form reactive oxygen species, such as singlet oxygen, superoxide radical, hydroxyl radical and hydrogen peroxide. These cytotoxic photoproducts initiate a series of biochemical events that can cause damage and death in the target tissue. Phthalocyanines are one of the photosensitizers used in photodynamic therapy. In this project, the DNA interactions of water-soluble non-peripheral and peripheral tetra-({6-[3-(diethylammonium)phenoxy]hexyl}oxy substituted magnesium (II) phthalocyanine (n-DE-C6-MgQ and DE-C6-MgQ) compounds were investigated. This study aimed was to examine the therapeutic potential of the compounds against cancer. The ct-DNA binding properties of the compounds were investigated using UV-Vis spectroscopy (UV-Vis absorption and competitive ethidium bromide binding studies) and the electrophoretic method. Then, plasmid DNA nuclease activities of the compounds (hydrolytic cleavage, photocleavage, oxidative cleavage, oxidative photocleavage) were investigated using the electrophoretic method. The results showed that n-DE-C6-MgQ and DE-C6-MgQ interacted to ct-DNA via intercalation. In agarose electrophoresis studies indicated that the compounds did not show any nuclease effect without irradiation, whereas they had photonuclease activity with light irradiation via a singlet oxygen pathway. The results revealed that the non- n-DE-C6-MgQ had a stronger DNA photodamage potential than DE-C6-MgQ due to their solubility properties.

**Keywords:** DNA binding, magnesium, phthalocyanine, plasmid DNA.

#### Abstract

The variants of NRG1 and ERBB4 genes are listed in the earliest genetic factors associated with schizophrenia. We analyzed the epistatic interactions between the alleles of NRG1 SNP rs10503929 and ERBB4 SNP rs1026882 to see if they have effects on schizophrenia. We screened the SNPs in a case-control group (96 schizophrenia patients and 100 controls) living in Malatya-Turkey. None of these SNPs were associated with the disease at single SNP levels. To find potential epistatic associations, we determined the combinations of SNP genotypes and predicted the epistatic structures in each individual. Following this, we compared two groups for the distributions of these epistatic structures.

We determined eight potential epistatic structures. Statistical tests indicated there were no significant differences between the two groups for the distribution of any structures we have determined. Even though one combination was seen in six patients, but only one normal control sample, these numbers were too low to make a reliable comment. Even if there is a positive association between the disease and this epistatic structure, our relatively small sample size and the limited geographic area may have prevented us from finding clear evidence. Screening new samples from more populations in larger groups may help to understand the connection between schizophrenia and these SNPs.

#### Abstract

Drug-induced liver injury (DILI) is now a major medical issue that affects both the pharmaceutical business and the general public health on a global scale. DILI refers to both clinically visible and silent liver damage. In regenerative medicine, mesenchymal stem cells (MSCs) have been used for treatment for many years. On the other hand, the shortcomings of present tools utilized in cell cultures, animal models, and drug research have brought to light the need for a novel new strategy. However, there is a large gap between in vitro and in vivo approaches and their applications in clinical practice. Thus, organ-on-a chip technology (OoC) has been utilized recently as one of these methods. OoC microfluidic devices coated with live cells cultured under fluid media can recapitulate organ-level physiology. Therefore, in the present study, it is aimed to form a hepatotoxicity model on the liver on a chip platform and investigate the effect of MSCs. For this purpose, initially, static co-cultures are used to determine the effect of a hepatotoxic drug with the effect of mesenchymal stem cells including parenchymal and nonparenchymal liver cells. As a result, the MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) test was used to determine the effect of the hepatotoxic drug dosages on cell survival and to optimize the number of MSCs. Depending on the time and the quantity of MSCs, it has been found that MSCs therapy can be an effective in cytotoxic doses of the drug by using on a chip platform. As a result, a novel model of liver on a chip for examining the effects of hepatotoxicity and MSCs can be a therapeutic strategy for the liver treatment.

#### Abstract

Regenerative medicine is an interdisciplinary field and a modern branch of medicine that deals with the restoration of body tissues damaged by disease, injury or age-related changes. Mesenchymal stem cells (MSCs) are among the most promising stem cell groups in regenerative medicine due to their wide clinical use potential. MSCs play an important role in the repair of damaged tissues and suppression of inflammation due to their differentiation potential; growth factor, cytokine, chemokine secretion; migration to the injury site and immunomodulatory effects. In addition, MSCs have an antifibrotic effect on fibrotic processes such as liver cirrhosis as well as they have a strong anti-inflammatory effect. Through paracrine pathways in particular, they can differentiate into hepatocytes, stimulate liver regeneration, prevent liver fibrosis, and induce liver apoptosis. Thus, stem cell therapy has a therapeutic importance in liver diseases. On the other hand, today the technology known as "Organ-on-a-Chip (OoC)" is frequently utilized as a common tool to simulate microengineered and biomimetic systems that mimic the structural and functional properties of human tissue. Besides, culturing the stem cells alone or together with other cells and differentiating the stem cells in the desired cell types, which has attracted the attention of regenerative medicine, have begun to be studied in OoC systems. Therefore, in the present study, studies covering the effect of MSC treatment on drug-induced hepatotoxicity were reviewed using keywords such as "MSCs therapy for liver diseases; MSCs therapy in liver regeneration; DILI on liver-on-a-chip and MSC therapy in DILI" in search engines such as Pubmed, ScienceDirect, Google Academic and Scopus. Finally, it has been demonstrated by clinical studies that MSCs therapy has an important position in the treatment of liver diseases. The generation of MSCs therapy protocols, which specifically in regeneration of damaged cells and support the host tissue, can be facilitated by OoC platforms with increased output metrics.

**Keywords:** MSCs therapy, Regenerative medicine, Organ-on-a-chip (OoC), Drug-induced liver injury (DILI).

#### Abstract

Organ on a chip (OOC) is a dynamic culturing system that mimics cells and tissues closer to their in-vivo environment. OOC devices are more ethical and cost-effective than animal models, which are also time-consuming and frequently fail to predict therapeutic effectiveness and toxicity in people. Furthermore, OOC devices that create a more realistic and regulated microenvironment are less expensive because they require fewer sample quantities, expensive reagents and equipment. Cancer-on-a-chip models based on microfluidics are also an effective tool for researching the tumor microenvironment and its involvement in metastasis, as well as fast assessing the efficacy of cancer medicines. Therefore, in this study, a liver cancer model was formed as a liver cancer on-a-chip platforms and the effect of a chemotherapeutic agent was investigated. For this purpose, WST-8 analysis was used to determine different doses of the chemo applied in static co-culture as a control to compare with the microfluidic setup. In order to mimic liver cancer on the chip model, both surfaces of the membrane integrated into the chip system were coated with extracellular matrix (ECM). Then, the liver cancer and endothelial cells were seeded on a coated membrane oppositely and incubated in a culture incubator at 37°C under an atmosphere of 5% CO<sub>2</sub>. The cell viability and apoptotic effects of the drug on the cells were investigated by injecting the chemotherapeutic agent in both channels at a constant flow rate for 24 hours using a peristaltic pump. Afterward, the cell viability on the membrane was determined by the Live/Dead staining. Thus, it has been demonstrated that cell viability is reduced significantly with the effect of the chemotherapeutic agent at the administered dose. Finally, we demonstrated that liver cancer-on-chip can have a potential to investigate anti-cancer drug activities which are closer to *in vivo* models in a faster and a more accurately manner.

#### Abstract

Alzheimer's disease (AD) is a neurological disorder that is usually seen in elderly individuals and causes memory loss, cognitive impairment, behavioral changes and loss of functionality over time. This disease occurs as a result of the death of brain cells over time and the deterioration of their communication. The cholinergic hypothesis is a theory that attempts to explain the effects of AD on acetylcholine, the neurotransmitter system. Acetylcholine is a chemical messenger (neurotransmitter) that enables communication between nerve cells. In AD, the nerve cells that produce acetylcholine in the brain are damaged, leading to decreased acetylcholine levels. According to the cholinergic hypothesis, cognitive symptoms of AD occur due to acetylcholine deficiency. The azole ring has a five-membered ring structure and contains one or more nitrogen atoms. Such compounds may have various biological activities in pharmaceutical, agricultural, chemical and other industrial fields. In this study, it was aimed to determine acetylcholinesterase (AChE) and butyrylcholinesterase (BuChE) inhibitory properties of some azole compounds were investigated using spectroscopic method. Moreover, Lineweaver-Burk and Dixon plots were performed to determine kinetic parameters (inhibitory type and constant ( $K_i$ ) values) of the compounds against AChE and BuChE. Among tested compounds, **13** showed the best inhibitory effect on BuChE with an  $IC_{50}$  value of  $18.41 \pm 1.55 \mu M$ . Also, Compound **13** was more potent than galantamine ( $40.48 \pm 0.06 \mu M$ ). These results showed that compound **13** had an important potential for anti-AD drug due to their cholinesterase inhibitory properties.

**Keywords:** azoles, acetylcholinesterase, butyrylcholinesterase, kinetic analysis.

#### Abstract

Epithelial ovarian cancer, often diagnosed at an advanced stage, possesses one of the highest mortality rates among gynecological malignancies. The standard treatment regimen combines surgery with chemotherapy, mainly platinum-based therapies. Regrettably, the effectiveness of this approach is compromised by the emergence of chemoresistance. Recent research has illuminated the role of long non-coding RNAs (lncRNAs) in chemoresistance, offering potential insights into this clinical challenge. lncRNAs wield substantial influence over various aspects of cancer biology, including cell survival, apoptosis, and responsiveness to chemotherapy. Among these, lncRNA H19 emerges as a pivotal player in the initiation, progression, and recurrence of diverse human cancers. This study aimed to investigate the correlation between lncRNA H19 expression and cisplatin resistance in ovarian cancer cells, a widely employed platinum-based chemotherapy agent. The study cohort comprised ovarian cancer patients subjected to cisplatin treatment. Formalin-fixed, paraffin-embedded ovarian tissue specimens were collected from these individuals. Stratifying the samples into two categories based on treatment response, Group 1 represented patients exhibiting sensitivity to cisplatin therapy with subsequent recovery, while Group 2 encompassed patients who remained resistant to cisplatin treatment without improvement. RNA isolation was performed on all tissue samples using a specialized RNA isolation kit, followed by cDNA synthesis using a cDNA synthesis kit. The resulting cDNAs served as templates for precise quantification of lncRNA H19 gene expression through Real-Time PCR. The expression levels between the two groups were compared using the T-test and a regression model mediated by SPSS. In our comparative analysis of the resistant and sensitive groups, our investigation revealed a statistically significant increase in lncRNA H19 expression within the resistant group. This finding underscores the potential implication of lncRNA H19 in the development of cisplatin resistance in ovarian cancer, shedding light on a novel avenue for further exploration and therapeutic intervention.

#### Abstract

The polymer chain of conducting polymers contains alternating single and double bonds that present delocalized electrons that serve as charge carriers. Conducting polymers are considered promising semiconductor materials due to their distinct electrical properties, relative simplicity of processing, and mechanical flexibility. Hybrid composites of conductive polymers attract great attention from researchers due to their unique electrical and optical properties, as well as their many applications in sectors such as sensors, electronics, nanotechnology and biotechnology. Since these systems have a wide variety of applications, much research is being done on hybrid composites of conducting polymers with transition metal oxides. In this study, polyselenophene (PSe), a conducting polymer, was synthesized by chemical oxidative polymerization. Manganese oxide (MnO) were synthesized from manganese salts. Then, PSe/MnO hybrid composites containing different amounts of MnO were synthesized by in situ oxidative polymerization. Their electrical conductivity was measured in the range of approximately  $10^4$ - $10^5$  S/cm with the four-point probe technique. Characterization of PSe and PSe/MnO hybrid composites was performed by FTIR-ATR, UV-Vis spectroscopy, XRD and SEM.

**Keywords:** Polyselenophene, manganese oxide, electrical conductivity, composite.

#### Abstract

The thiosemicarbazones (TSCs) are extensively investigated not only because of the interesting aspects of their binding and structure, but also because of the potential biological activities they acquire due to their ability to chelate metals. TSCs have numerous applications like antitumor, antibacterial, antiviral, antifungal, anticancer and other biological activities. Although there are studies in the literature on the activities of TSC ligands based on thiophenes and their complexes with transition metals, benzothiophene-based TSCs and their metal complexes have not been investigated sufficiently [1-4]. In this sense, TSC compounds and their antimicrobial activities were investigated in this study. A series of thiosemicarbazones (TSCs) (**L<sup>1-5</sup>**) containing benzothiophen moiety were prepared with appropriate thiosemicarbazides. Structures of the newly synthesized compounds were confirmed by elemental analysis and spectral data from FT-IR, <sup>1</sup>H NMR, MALDI-TOF and single crystal X-Ray diffraction techniques. These compounds were researched for their antibacterial activity against Gram-positive bacteria (*Enterococcus faecalis* and *Staphylococcus aureus*), Gram-negative bacteria (*Escherichia coli*, *Pseudomonas aeruginosa* and *Serratia marcescens*) and antifungal activity against a yeast species *Candida albicans*.

#### Abstract

In this study, urease was immobilized onto titanium (IV) oxide (TiO<sub>2</sub>) nanoparticles (490 nm) carrier. Firstly, the carrier was modified with Piranha solution to generate terminal hydroxyl groups on the carrier surface (Alptekin, 2022). Then the carrier was treated with 3-aminopropyl triethoxysilane (APTES) solution (Tükel and Alptekin, 2004). After this step carrier was modified with different spacer arms such as glutaraldehyde (CA) Bis(3-aminopropyl)amine (CB), 1,2 Bis(3-aminopropylamino)ethane (CC), polyethyleneimine (CD), Bis(3-aminopropyl)amine and glutaraldehyde (CBA), 1,2 Bis(3-aminopropylamino)ethane and glutaraldehyde (CCA), and polyethyleneimine and glutaraldehyde (CDA). After various modifications were made to TiO<sub>2</sub> nanoparticles, urease was immobilized onto modified carriers. Urease samples immobilized to the surface of carriers CB, CC, and CD by the ionic adsorption method are expressed as IU<sub>CB</sub>, IU<sub>CC</sub> and IU<sub>CD</sub>, and urease samples covalently immobilized to the surfaces of carriers CA, CBA, CCA, and CDA are expressed as IU<sub>CA</sub>, IU<sub>CBA</sub>, IU<sub>CCA</sub>, and IU<sub>CDA</sub>, respectively. In order to determine the high activity of immobilized urease preparation, immobilization was performed at a concentration of 1 mg/mL urease prepared in 50 mM HEPES buffer (pH 7.0) for 30, 60, 90, and 120 min immobilization time. The percentage of bound urease amount and the relative activities of the immobilized urease preparations were determined depending on the immobilization time. The bound amount of urease was found to be between 90% and 95%. The highest immobilized urease activity was obtained from IU<sub>CD</sub>. Among all tested carriers, modified with polyethylenimin (CD) is a more suitable spacer arm for urease immobilization.

#### Abstract

In this study, new benzimidazole derived Schiff bases were synthesized. The anticancer activities of the synthesized compounds were investigated against HT29 (Human colon adenocarcinoma) and A549 (Human non-small cell lung cancer) cancer cell lines. *in silico* analyzes of all compounds were performed. The hybrid anticancer drug approach is an innovative synthetic strategy that involves either the merging or blending of hepatophoric moieties of different drugs in a new molecular structure or combining two or more potential anticancer pharmacophores directly through cleavable/non-cleavable linkages [1,2]. On the other hand, synthetic approaches and technological developments have been progressing, combinatorial chemistry, coupled with traditional chemistry and *in silico* drug design, is expected to lead to a number of new drug molecules in the future. So all synthesized compounds were confirmed anticancer activities. And we studied this molecules *in silico* properties.

#### Abstract

In this study, novel benzimidazole-Schiff base derivatives starting from the commercially available 1*H*-benzo[d]imidazole-2-amine were synthesized. The anticancer activities of the synthesized compounds were investigated against HT29 (Human colon adenocarcinoma) and A549 (Human non-small cell lung cancer) cancer cell lines using xCELLigence real-time cell analysis. Additionally, all compounds demonstrated favorable pharmacokinetics properties compared to Paclitaxel (reference compound).

Our approach in this study was to combine benzimidazole ring and *N*-acylhydrazone moiety, which are two important pharmacophores in medicinal chemistry. For this purpose, benzimidazole was converted to ester and hydrazide compounds. The anticancer activities of the synthesized molecules were investigated against HT29 and A549 cancer cell lines. all compounds demonstrated favorable pharmacokinetics properties compared to Paclitaxel (reference compound) [1,2]

#### Abstract

High-fructose corn syrup (HFCS) consumption, which has increased, especially among children and adolescents, is recognized as a major contributor to the development of metabolic diseases. However, the effects of a fructose-rich diet during the prepubertal period on pubertal maturation in female rats have not been sufficiently investigated. The aim of this study was to investigate the effects of HFCS consumption on pubertal maturation. Sprague-Dawley female rats were used in the study. Rats were selected to have an average body weight of  $35 \pm 2$  grams on the 21st day after weaning. Rats were divided into control and HFCS-55 groups (n = 10 in each group). Daily measurements of food and liquid intake, as well as body weights, were recorded. Vaginal opening was monitored daily, starting on the 30th day to determine the onset of puberty in rats from both the HFCS and control groups. Estrogen levels in serum samples after decapitation were measured using the ELISA method. When comparing changes in body weight, no significant difference was observed in the HFCS group. However, an increase in liquid consumption and a significant decrease in food consumption were observed in the HFCS group ( $p < 0.001$ ). When comparing the onset of puberty between the control and HFCS groups, it was found that HFCS application significantly delayed the onset of puberty ( $p < 0.05$ ), although it did not affect pubertal body weights. HFCS application was found to cause a non-significant increase in serum estrogen levels in female rats. Our findings suggest that HFCS consumption in prepubertal female rats is responsible for abnormalities that delay the onset of adolescence. Additional research is required to determine the underlying mechanisms via which HFCS influences the process of pubertal development.

#### Abstract

Aclonifen, diphenylether herbicide, is used in the pre-emergence control of broad leaves and grass weeds throughout the world. Herbicides are introduced into aquatic environment during direct spraying or later through rainfall and air drift and pose threat to non-target organisms. Therefore this investigation was conducted to evaluate the toxic effects of aclonifen on oxidative stress biomarkers and biochemical indices of serum in juvenile *Oncorhynchus mykiss* following 24, 48, 72 and 96 hours of application to sublethal concentrations of 12.7, 63.5 and 127 µg/L. There was no visible change in protein level and ALP activity. Pesticide treatment caused prominent elevation in the levels of serum glucose level showing increase in liver glycogenolysis, the conversion of glycogen stored in hepatocytes to glucose, in order to compensate the high energy demand to handle the stressful situation. Marked induction was observed in the activities of ALT and AST reflecting hepatotoxic potential of aclonifen. Also determined decline in cholesterol level evidences the involvement of aclonifen in lipid metabolism. Considering the changes, it can be concluded that aclonifen has hepatotoxic potential and the application resulted in adaptive responses in juvenile *O. mykiss* as manifested in altered levels of glucose and cholesterol.

**Keywords:** Herbicide, Aclonifen, *O. mykiss*, biochemical indices

#### Abstract

Spirotetramat, an acetyl-CoA carboxylase inhibitor, is an insecticide used to increase crop productivity in agriculture. Data related to its sublethal effects on *Oncorhynchus mykiss* is unavailable. Therefore this study was performed to evaluate toxic effects of spirotetramat on brain, muscle, gill and kidney of juvenile *O. mykiss* following 24, 48, 72 and 96h of exposure to 0.0254, 0.0508 and 0.254 mg/L concentrations. Insecticide treatment caused marked decrease in AChE activity in muscle while there was no significant change in brain tissue. A remarkable decline in Na<sup>+</sup>, K<sup>+</sup>-ATPase activity was observed for gill and kidney tissues. An ascending trend was observed in TBARS levels in all tissues being more pronounced at high concentrations with prolonged exposure. Statistically significant and negative relationship was confirmed between TBARS, AChE and Na<sup>+</sup>, K<sup>+</sup>-ATPase in all tissues except for brain. The findings clearly indicates the anticholinesterase activity of spirotetramat and its disruptive effect on osmoregulation as demonstrated with the inhibition of AChE and Na<sup>+</sup>-K-ATPase, respectively. The direct action of spirotetramat and/or lipid peroxidation triggered loss of membrane integrity may be suggested as underlying mechanisms of this effect. Considering the ecologically relevant consequences of these markers on behavior, growth, reproduction and survival, outcomes of this investigation presents the risk spirotetramat may pose at ecosystem by causing adverse effects at population level.

**Keywords:** Spirotetramat, *O. mykiss*, neurotoxicity, osmoregulation and lipid peroxidation

#### Abstract

Cancer is a group of fatal diseases characterized by the proliferation of cells that do not have a normal structure beyond their limits due to disruption of the cell cycle. According to World Health Organization data, it is expected that there will be 28.9 million cancer cases in 20 years. There are active pharmaceutical ingredients against many types of cancer, but most of them have side effects that limit their use. For this reason, the need for targeted treatment with minimal side effects at minimum doses is increasing day by day<sup>1,2,3,4,5</sup>. DNA topoisomerases are one of the most important enzyme groups that manage topological problems in DNA structure. Inhibitors have been identified that act at several different steps of the topoisomerase II catalytic cycle, including DNA binding, ATP binding, ATP hydrolysis, and DNA cleavage. Etoposide is a podophyllotoxin derivative that inhibits DNA topoisomerase II, resulting in DNA chain breaks and induction of cytotoxic and apoptotic cell death<sup>6</sup>. It is used as a reference inhibitor compound into *in silico* studies of the molecule to be analyzed in many literatures. The benzoxazole ring is one of the important heterocyclic ring systems in drug design due to its structural similarity to adenine and guanine bases. Today, there are drugs that are derivatives of benzoxazole and its analogues and are actively used in treatment for various purposes. In our study, we examined *in silico* molecular modeling data and ADME/Tox properties of new 2-substituted phenyl-5-chloro-6-nitro-benzo[d]oxazole derivatives targeting the topoisomerase II $\alpha$  (Topo II $\alpha$ ) enzyme. It is predicted that all of the compounds we designed will have good pharmacokinetic properties and therefore good bioavailability.

#### Abstract

Nanotechnology is the efficient production of materials by controlling matter at the nanometer scale and taking advantage of new properties and phenomena developed at this scale. Today, the production of nanoparticles has been investigated for use in the effective treatment and diagnosis of many diseases, including cancer. Metallic nanoparticles are one of the easiest protocols to process and synthesize due to metal oxides found in large amounts in nature. Iron nanoparticles, which are member of metallic nanoparticles, are preferred due to their suitable electrical, magnetic, and optical properties, their ability to have various shapes and structures, and their toxicity limitations. The green synthesis method, which is environmentally friendly, cost-effective and ensures that nanoparticles remain stable in solution, has become a preferred method in recent years. Contained in plants; Substances such as phenolic acid, flavonoid, tannin, terpene, coumarin, lycopene, vitamin, carotenoid, and anthocyanin are natural agents that can reduce metal ions. In this study, iron oxide (Fe<sub>2</sub>O<sub>3</sub>) nanoparticles were synthesized by green synthesis, a biological method, using plant extract, which was discovered to have anti-inflammatory, antimicrobial, antioxidant and anticancer properties. The produced nanoparticles were physically and chemically characterized by Fourier transform infrared spectrophotometry, UV-Vis spectrophotometry and Zetasizer. Antioxidant activities were determined using the 2,2-Diphenyl-1-picrylhydrazyl (DPPH) method. As a result, it was confirmed that the iron nanoparticles were successfully synthesized with the color change during synthesis and the peaks obtained in FT-IR and UV-Vis spectrophotometers. In the continuation of the study, it is planned to use the cancer cell line and evaluate its cytotoxic activity on these cancer cells by the MTT method. It is aimed to develop the data obtained for use in cancer treatment.

#### Abstract

Wound healing is complex process consisting of hemostasis, inflammation, proliferation and re-modelling. Recently, innovative approaches in the field of wound care have led to the development of nanofiber-based wound dressings. Additionally, boronic acid based active substances are increasingly being utilized in wound dressings<sup>1-2</sup>.

In this study, metal complexes were synthesized with a phenylboronic acid-functionalized 4,5-diazafluorene ligand<sup>3</sup>. The ligand and its metal complexes were characterized utilizing Fourier-transform infrared, mass, and UV-Vis spectrophotometry. Their free radical scavenging activities were determined using the 2,2-Diphenyl-1-picrylhydrazyl (DPPH) method. Then, the ligand and its metal complexes were loaded onto polymeric electrospun membranes. Experiments were carried out to determine the loading efficiency, release rates, and swelling properties of the wound dressing materials<sup>3</sup>. As a result, the successful synthesis of the ligand and its metal complexes was confirmed through spectroscopic analyses. It was observed that the formation of complexes between the ligand and metals increased antioxidant activity. In the release study, it was found that the substances were released slowly from the nanofibers over a period of 11-14 days. And, the swelling study demonstrates that the produced wound dressing may offer advantages in terms of usage for highly exudative wounds. Thus, it is believed that an antioxidant, and high-swelling capacity drug delivery system has been developed. In future studies, a detailed characterization of the active substance-loaded nanofibers is planned.

#### Abstract

Yarrow is a flowering plant in the family of Asteraceae and it is considered one of the oldest medicinal plants. Yarrow extracts are used as a remedy for some diseases in phototherapy because of its high bioactivity. It contains many bioactive constituents and it shows high antioxidant capacity. In this research, hydroglycerolic extraction was performed to produce green extract and its some bioactive properties were characterized. For this purpose, three different solvents namely ethanol, glycerol and water were used in the extraction and simplex lattice mixture design was used to determine the effects of the sole or mixed solvent effects on the studied parameters such as total phenolic and flavonoid, antiradical and antioxidant activities. Total phenolic content of sole water, ethanol and glycerol extracts was determined as 12.81, 2.92 and 9.17 mg GAE/g, respectively while the total flavonoid content ranged between 3.76-19.35 mg QE/g. The linear effects of the used solvent were determined to be significant ( $p < 0.05$ ) on both total phenolic and flavonoid contents. The constructed regression equations for total phenolic and flavonoid contents showed good fitting ability with quite high coefficient of determination ( $R^2 > 0.850$ ). The solvent effects on studied antioxidant and antiradical activities were also significant. The optimization procedure of the mixture design revealed that the highest total phenolic content (19.64 mg GAE/g) would be obtained by the extraction of water, ethanol and glycerol mixture at 52.58, 6.35 and 41.04% while the minimum levels would be observed by sole ethanol (2.42 mg GAE/g). The recorded results showed that the yarrow could be extracted by the mixture of water and glycerol and hydroglycerolic extraction of yarrow samples showed superior bioactive properties.

**Keywords:** yarrow, glycerol, bioactivity, simplex lattice mixture design, optimization

#### Abstract

It is known that seafood contains high protein, as well as various vitamins, minerals and healthy fats. Like many sea creatures, fish contain high levels of moisture. Problems such as microbial spoilage, taste and color changes may occur due to high moisture content until the fish are ready for consumption. For these reasons, various preservation methods are being developed in order to ensure a long shelf life, preserve its quality, taste and nutritional values, and deliver it to the consumer more safely. With the freeze drying method, drying occurs by direct sublimation of the moisture in the food. With this method, color change, loss of nutritional content and deformities in foods are prevented. In this study, sea bass (*Dicentrarchus labrax*) was dried by the lyophilization (freeze drying) method. Approximately 5 grams of sea bass samples, 1.5 cm thick, 1 cm long and 1 cm wide, were examined without pre-treatment and by applying ultrasonic pre-treatment, and the effect of pre-treatment on the drying behavior was examined. Sea bass, which contains approximately 70% moisture, was dried until it reached 5% moisture content. The drying process continued for 7 hours to ensure the desired humidity rate and weight measurements were taken every hour. Before starting the drying process, the moisture content for sea bass was calculated as 2.1778 kg water/kg dry matter. The lyophilization process continued until the samples reached a content of 0.0767 kg water/kg dry matter with unpretreated samples, 0.1354 kg water/kg dry matter with 1 minute ultrasonic pretreatment and 0.2034 kg water/kg dry matter with 5 minutes ultrasonic pretreatment. As a result of the data obtained, effective moisture diffusions were calculated as  $3.90 \times 10^{-10}$ ,  $3.32 \times 10^{-10}$  and  $2.99 \times 10^{-10}$  m<sup>2</sup>/s for unpretreatment, 1 min ultrasonic and 5 min ultrasonic, respectively.

#### Abstract

Seafood has become an important part of a balanced and healthy diet with its diverse nutritional content such as high-quality proteins, omega-3 fatty acids, vitamins and minerals. They can deteriorate very easily due to the moisture they contain. For this reason, it is necessary to obtain quality products by extending the shelf life through various processes while preserving them. In recent years, studies on drying foods to ensure long shelf life and preserve nutritional values have been increasing. The drying process is carried out by removing the moisture contained in the food by using drying methods. In the freeze drying technique, the moisture in the frozen product is removed from the food by sublimation. In this study, blue mussels were dried with modern freeze drying (lyophilization) technique. Samples were prepared unpretreated and with ultrasonic pretreatment of 1 minute and 5 minutes, and the effect of pretreatment on the drying rate was examined. Samples with a moisture content of approximately 74% were subjected to freeze drying until a moisture content of 7% was reached. Before starting the drying process, the moisture content was calculated as 2.5577 kg water / kg dry matter for mussels. Samples were freeze-dried to a content of 0.1700 kg water/kg dry matter without a pretreatment, 0.1956 kg water/kg dry matter with 1 min ultrasonic pre-treatment, and 0.2069 kg water/kg dry matter with 5 min ultrasonic pre-treatment. The drying process was carried out in 420 minutes. Effective moisture diffusions were calculated as  $3.79 \times 10^{-10}$ ,  $3.72 \times 10^{-10}$  and  $3.72 \times 10^{-10}$  m<sup>2</sup>/s for unpretreated samples, 1 min ultrasonic and 5 min ultrasonic pretreatment, respectively.

#### Abstract

Basil (*Ocimum L.*) is a diverse genus in the Lamiaceae family, grown in home gardens as well as commercial farms. Next to lettuce, basil is one of the most commonly grown high-value leafy greens in soilless greenhouses and indoor farms. In addition to its use as a spice in both fresh and dry form, it serves as a source of essential oils for food, cosmetics, and pharmaceutical sectors. As a medicinal herb, it is prized for its rich essential oils and phenolic compounds. Phenolic acids in basil are valued for their potential to combat various health issues, including cardiovascular diseases. In this study, green and purple basil plants were grown for six weeks in peat or deep water culture under the same artificial light by using the Vahaa Smart Garden system. To assess the nutritional quality various mineral and metabolite concentrations were determined by ICP-OES and UV-Vis spectrophotometer. The fresh weights of green and purple basil grown in deep water culture were higher than those grown in peat, by approximately 100%. Chlorophyll and carotenoid concentrations of plants grown in Vahaa system were significantly higher than those grown in peat. Vitamin C concentrations of plants grown in deep water culture were also enhanced when compared to their peat grown counterparts. Protein concentration, antioxidant capacity, and total phenolic content of green and purple basil grown in deep water culture were dramatically higher than those grown in peat. Based on these results, it is documented that deep water culture can be a good growing technique both for high yielding and high-quality basil production.

**Keywords:** basil, purple basil, peat, nutritional quality, hydroponic, smart garden, deep water culture, soilless agriculture

#### Abstract

Biochar, a carbon-rich byproduct of pyrolysis, is recently attracting more interest in the context of sustainable agriculture due to its potential to improve soil quality and promote plant growth. It has been used in agriculture to manage soil acidity, improve soil fertility, increase organic matter and water availability, and enhance crop yield. The aim of this study was to investigate the effect of biochar application on the growth and nutrition of alfalfa (*Medicago sativa* cv. Sunter) and lettuce (*Lactuca sativa* var. *crispa* cv. Levistro). The biochar used to conduct the experiments was a byproduct of energy generation via the gasification process of waste oak wood biomass that was unsuitable for further uses. In the experiments, plants were grown in two different soils with different pH levels (acidic: 5.0; alkaline: 8.0) and two levels of biochar were applied in the form of powder or granules. The results of the study demonstrated that particle size and soil pH had a significant impact on how plants responded to growth stimuli. In acidic soil, biochar treatment in powder form significantly increased lettuce yield. In both soils, the highest alfalfa yield was obtained in soils treated with the higher level of biochar in powder form. Alfalfa and lettuce both had notable changes in their macro- and micronutrient concentrations. The results of these studies suggested that using biochar obtained as a byproduct of evaluating waste biomass as a feedstock for energy generation has considerable promise in terms of improving barren soils and enhancing agricultural yield in a sustainable manner.

**Keywords:** Biochar, plant growth promoter, lettuce, alfalfa, soil pH, plant nutrition.

#### Abstract

Microplastics (MPs) have indeed become a significant concern due to their widespread presence and potential adverse effects on both the environment and human health. This review sheds light on the critical aspects of MPs, including their sources, migration behavior, and the potential of bioremediation as an effective strategy for their removal. Microplastics originate from various sources, including fragmentation of larger plastics, microbeads in personal care products, fibers from textiles, industrial pellets, and microplastic-containing products. These sources contribute to the ubiquity of microplastics in terrestrial and aquatic environments. Microplastics originate from various sources, including fragmentation of larger plastics, microbeads in personal care products, fibers from textiles, industrial pellets, and microplastic-containing products. These sources contribute to the ubiquity of microplastics in terrestrial and aquatic environments.

In this study, the biological degradation process of *Aspergillus flavus* and *Aspergillus versicolor* fungi has been observed for three different types of microplastics, namely Polypropylene (PP), Polyethylene (PE), and Polystyrene (PS). As a result of the experiments, removal efficiencies of *A. flavus* and *A. versicolor* were calculated. Based on the data from the 10th week of using two different types of fungi, it was observed that *A. flavus* has a removal efficiency of 18.33% for PE, 6.83% for PP, and 1.90% for PS. *A. versicolor*, on the other hand, provided removal efficiencies of 6.68% for PE, 5.11% for PP, and 3.25% for PS. It was determined that *A. flavus* and *A. versicolor* were most effective in biodegrading microplastic polyethylene and least effective in microplastic Polystyrene.

**Keywords:** *Aspergillus versicolor*, *Aspergillus flavus*, Biodegradation, Polyethylene, Polystyrene, Polypropylene.

#### Abstract

In recent years, researchers have focused on nanomaterials in order to increase their widespread use mostly in medicine, imaging systems and medical fields for diagnostic and treatment of diseases. Nanoparticles can be designed by modified their physico-chemical properties depending on application areas. Due to their unique characteristic features such as size, morphology and large surface areas, it allows easy penetration through tissues and cells which requires a potential risk assessment of these materials. Iron Oxide nanoparticles (Fe<sub>3</sub>O<sub>4</sub> NPs) have attracted attention as vaccine adjuvants, as well as their common use, especially in the biomedical field.

The aim of the study is to investigate hemolytic activity and irritation effects of iron oxide nanoparticles (Fe<sub>3</sub>O<sub>4</sub> NPs) with dimensions of 18-28 nm and 50-100 nm by hemolysis and HET-CAM tests. As a result of the assays, there is no hemolytic activity in applied doses of different sizes iron oxide nanoparticles and also according to evaluation in terms of hemorrhage, lysis and coagulation parameters, no irritant effects were observed in both size ranges. Although this is a preliminary study shows that the particle does not have a toxic effect in both size ranges, its size-dependent mechanism needs to be elucidated with further in vitro tests.

**Keywords:** iron oxide nanoparticles (Fe<sub>3</sub>O<sub>4</sub> NPs), hemolysis, HET-CAM

#### Abstract

Phenolics are a group of biologically active compounds containing one or more hydroxyl groups and one or more aromatic rings. Phenolic compounds and their subclasses are found in many plant species and belong to the class of secondary metabolites involved in defense against ultraviolet radiation or pathogens. HPLC is widely used for the analysis of these compounds. The species of genus *Centaurea* are important plant species used alone or with other plants for antidiabetic, antidiarrheal, antirheumatic, anti-inflammatory, cholagogue, choleric, digestive, stomachic, diuretic, astringent, hypotensive, antipyretic, cytotoxic, antibacterial purposes. *Centaurea kurdica* Reichardt species is an endemic species and its Turkish name is Cottonthorn. In this study, as a result of HPLC separation of *C. kurdica* extract, the amounts of naringin, myricetin and rutin compounds (according to peak area and peak height) were found to be 975-610, 1920-1860, and 760-650  $\mu\text{g}_{(\text{component})}/\text{g}_{(\text{extract})}$ , respectively. As a result of the studies conducted on *C. kurdica* methanol extract, the concentration of total phenolic components was calculated to be 25.635  $\text{mg}_{(\text{GAE})}/\text{g}_{(\text{extract})}$ .

**Keywords:** *Centaurea kurdica* Reichardt, HPLC, myricetin, naringin, rutin

#### Abstract

This study aimed to suggest an artificial neural network model as a new alternative method for estimating the growth model of the Turkish crayfish (*Pontastacus leptodactylus*) in Yenice Reservoir, Çanakkale, Türkiye. Specimens were collected monthly between July 2007 and June 2008 by using fyke nets (34 mm mesh size). Total length (TL) and total weight (TW) values were measured, and the relationship between TL and TW was presented with the equation of the traditional length-weight relationship (LWR) and artificial neural network (ANN). Subsequently, both the traditional LWR equation and the ANN approach were assessed for estimating the growth of Turkish crayfish in Yenice Reservoir. The results showed that artificial neural networks can be used as a novel approach for estimating the growth of Turkish crayfish. It can be clearly stated that the ANN approach would provide useful information for sustainable and successful fisheries management.

**Keywords:** Artificial neural networks, Crayfish, Length-Weight relationship, Growth models.

#### Abstract

The purpose of this study is to compute and compare the linear attenuation coefficients of a composite material used in dental applications using the Monte Carlo method. Using Gamos 6.2 software, a simple geometry consisting of a focused point photon source (monoenergetic between 1 keV and 20 MeV) and NaI detector in parallel with the absorber material was used in the simulation part of the research. The experiment was carried out with a gamma spectrometer system containing NaI(Tl) and gamma rays with energies of 662, 1173, and 1332 keV. Additionally, parameters such as half value layer (HVL), tenth value layer (TVL), and mean free path (MFP) were determined, which are utilized for assessing a material's radiation absorption properties. When the values obtained by both methods are compared to the theoretical values obtained by XCOM in the energy range of,1 keV-20 MeV, the results are found to be compatible ( $R^2 = 0.93$ ). Uncertainties caused by poor geometry conditions in the experimental setup can account for acceptable differences between test and simulation results.

The Monte Carlo method has been demonstrated to be a viable option for calculating linear absorption coefficients at the desired gamma energy, particularly in the investigation of physically difficult to produce samples.

**Keywords:** Monte Carlo, linear attenuation coefficients, composites, NaI (Tl), gamma spectrometry, Gamos 6.2

#### Abstract

Crabs are an aquatic product that has found a very high price in developed countries in terms of edible meat quality and economic value. Blue crab broodstocks are among the most important crab species that are commercially dec in the world and in Turkey. There have been no studies on the impact of *C. sapidus* broodstocks on survival and growth and development. The aim of this study is to determine the effect of different stocking volumes on the survival and growth, development of blue crab (*C. sapidus*) broodstocks. Pearson correlation test has been used in the study. In the study, 0.70 liter tanks with three different stocking densities have been used, including 15, 10 and 5 main ones. The results showed that the mortality rate due to eating each other was high in the first session, while it has been found to be lower in the third session. There were significant differences in broodstock cultivation survival rates in three different sessions ( $p < 0.05$ ). Survival rates have been found to be lower at higher stocking densities. According to these results, it seems that increasing the broodstock density significantly reduces the survival rate. Statistical differences have been found in the development rates of broodstocks ( $p < 0.05$ ) and it has been noted that there is lower development at higher stocking densities. If it is desired to calculate the optimal stock density for mass production purposes, less density is advantageous from the point of view of both survival and growth rate.

**Keywords:** Blue crab broodstocks, stocking volume, development, survival rate

#### Abstract

Cancer is one of the leading cause of deaths globally, and can be classified as a multifactorial disease, which is diligently orchestrated by a combination of genetic and environmental factors working together towards the progression of tumours. In this respect, one of the most constantly growing derivatives was the investigation of the antitumor properties of compounds containing isoxazole core structure. Cancer is one of the leading cause of deaths globally, and can be classified as a multifactorial disease, which is diligently orchestrated by a combination of genetic, epigenetic, and environmental factors working together towards the progression of tumours. In this study, to the synthesis of new derivative isoxazole compounds; It was started  $\beta$ -ketoester derivative. For this was reacted 4-bromoacetophenone with diethyl oxalate in the presence of ethanolic solution of sodium ethoxide. After, to the solution of  $\beta$ -ketoester was reacted with hydroxylamine hydrochloride to form the isoxazol ring. Afterwards, after the compound containing isoxazole was hydrated with hydrazine hydrate, it was reacted with five different thioisocyanate derivatives to obtain new derivative isoxazole-containing thiourea derivatives. The chemical structures of the synthesized compounds were ascertained with FTIR, <sup>1</sup>H NMR and <sup>13</sup>C NMR spectrum. (This work was supported by Çanakkale Onsekiz Mart University The Scientific Research Coordination Unit, Project number: FBA-2022-3950)

**Keywords:** Isoxazole, thiourea,  $\beta$ -ketoester

### Insulinoma INS-1 cells undergo both cell death and cell proliferation with Dinutuximab beta treatment under different conditions

Ayşe Karatug Kacar (ORCID: <https://orcid.org/0000-0001-6032-470X>)

Department of Biology, Faculty of Science, Istanbul University, Istanbul, Turkey

\*Corresponding Author: Ayşe Karatug Kacar, e-mail: [akaratug@istanbul.edu.tr](mailto:akaratug@istanbul.edu.tr)

#### Abstract

Insulinoma is a gastroenteropancreatic neuroendocrine tumor. This tumor occurs by the uncontrolled proliferation of pancreatic  $\beta$  cells. Dinutuximab beta is a monoclonal antibody. DB is used to treat neuroblastoma. This antibody binds to the GD2 receptor. Treatment with DB takes place through the destruction of tumor cells by their own immune system. The aim of this study is to investigate cell death and cell proliferation at the molecular level as a result of the effects of DB on pancreatic beta-cell tumors. Insulinoma INS-1 cells were used in the study. DB (Qarziba®) was obtained from EUSA Pharma and used in the experiments. Streptozotocin (STZ) was used to induce cell cytotoxicity. DB was applied to cells before or after cytotoxicity. Protein levels of PERK, CHOP, HSP90, p-c-Jun, p-Atf2, and p-Elk1 were analyzed by simple WES. While PERK, CHOP, and p-Elk1 levels decreased, HSP90 levels increased in DB application after cytotoxicity. CHOP, p-Akt-2, and p-c-Jun levels increased in the DB group compared to the control group. As a result, INS-1 cells go to cell death by means of Elk-1 transcription factor without ER stress in DB application after cytotoxicity. In contrast, cells proliferate with the effect of Atf2 and c-Jun transcription factors as a result of only DB application to cells. CHOP may also be effective in this proliferation. DB has shown positive results for the treatment of insulinoma as a result of *in vitro* experiments. The study should be supported by *in vivo* studies.

## Özet

Coronavirüs (COVID19) hastalığına sebep olan Severe acute respiratory syndrome coronavirus-2 (SARS-CoV-2), 11 Mart 2020 tarihinde pandemi ilan edilmesine neden olmuştur. SARS-CoV-2'ye ait genetik değişikliklerinin ve virüsün moleküler yöntemler kullanılarak zaman içerisindeki gelişimini incelemek amacıyla dünyada genomik sürveyans çalışmaları geniş bir kullanım alanı bulmuştur. Bu kapsamda Türkiye'de de bir genomik sürveyans stratejisi oluşturulmuş ve hızlı bir şekilde uygulamaya konulmuştur. Bu çalışmada, genomik sürveyans kapsamında dizilemesi yapılan genomlardan yüksek kalitede olan 235 kadarı seçilerek metaveriler ile de ilişkilendirilerek filogenetik analizlerinin yapılması amaçlanmıştır.

Bu çalışmada, genomik dizilemesi Halk Sağlığı Genel Müdürlüğü, Ulusal Moleküler Mikrobiyoloji Referans Laboratuvarı'nda (UMMRL) gerçekleştirilen ve uluslararası bir platform olan GISAID veritabanına yüklenen 235 yüksek kaliteli (Coverage ve bütünlük) genom GISAID'den FASTA formatında indirildi. İndirilen 235 genom MEGA X programında MUSCLE (Gap open: -2,90, gap extend: 0, cluster method: UPGMA) algoritması kullanılarak hizalandı ve sonrasında da ağaç çizimi tamamlandı. Dış grup için referans genom NC\_045512.2 (NCBI) kullanıldı. Çizilen filogenetik ağacın görsel açıdan düzenlenmesi Microreact (<https://microreact.org/>) aracı kullanılarak yapıldı. Filogenetik ağaç için kullanılan örnekler ait metaveriler UMMRL veritabanlarından elde edilmiş ve filogenetik ağaç verileri ile ilişkilendirilmiştir.

Yapılan hizalama ve ağaç çizimi sonucuna göre çalışma kapsamında yer alan genomlar ile ilgili SARS-CoV-2 virüsüne ait Türkiye'nin belirli bölgelerindeki güncel durumu kapsamlı şekilde değerlendirilebildi. Yapılan filogenetik analizler sayesinde etkenin bulaşma yolları, kaynak takibi ve halk sağlığı politikaları oluşturmak için gerekli diğer bilgilerin de elde edilebildiği ve genomik sürveyansa ait süreçlerinin daha da kapsamlı, hızlı ve sistematik olması gerektiği görüldü. Buna bir örnek olarak şehirlerarası virüs dolaşımı ve mutasyonel değişikliklerin izlenebildiği görüldü. Sonuç olarak filogenetik analizlerin metaveriler ile de birleştirilerek halk sağlığı politikalarının oluşturulması adına genomik sürveyans stratejilerinin ileride yaşanabilecek pandemilere de önlem olması açısından büyük önem arz ettiği ortaya konmuş oldu.

**Anahtar Kelimeler:** SARS-CoV-2, COVID19, Filogenetik Analiz, Genomik Sürveyans.

\*Sorumlu yazar e-mail:[gamze.canbakal@std.yildiz.edu.tr](mailto:gamze.canbakal@std.yildiz.edu.tr)

## Özet

Tekstil endüstrisi boyama, durulama, ağartma, sonlandırma gibi ürünü işleme alan ve su tüketimi odaklı aşamalardan oluşmaktadır. Tüm bu proseslerden farklı karakterizasyonlarda ve yüksek hacimlerde atıksular meydana gelmektedir. Tekstil endüstrisi atıksuları, yüksek konsantrasyonlarda organik madde içeren, yüksek renkli, kompleks bileşenler, reaktif boya ve kimyasal kalıntıları ile büyük ölçüde değişen bileşenlere sahiptir. Alıcı ortama arıtılmadan deşarj edildiğinde sudaki organizmaların ihtiyaç duyduğu ışığın geçişine engel olan bu renkli sular, ekosistemde bir dengesizliğe yol açarak fotosentezi engelleyebilir. Bu nedenle toksisiteyi, kirliliği en aza indirmek ve çevreyi korumak için tekstil endüstrisi atıksularının deşarjdan önce arıtılması önemlidir. Bu tür atıksular toksisitesi ve dirençli kirleticiler içermesi nedeniyle konvansiyonel ve biyolojik arıtma prosesleri ile etkili şekilde arıtılamamaktadır. Yüksek hacimlerde ortaya çıkan bu atıksuların yeniden üretim aşamalarında kullanımı için geri kazanımını hedefleyen ters osmoz (TO) membran sistemler tercih edilmektedir. Ancak, membran sistemlerde ortaya çıkan konsantre akımı yüksek miktarda kirlilik yüküne sahip ve düşük hacimli bir atıksu olup, konvansiyonel yöntemler ile arıtımı mümkün değildir. Bu çalışmada, toksik içeriği ve kirlilik konsantrasyonu yüksek ve renkli olan ters osmoz konsantresi atıksularından organik madde gideriminde farklı türde Elektro-Fenton (EF) proseslerin performansları incelenmiştir. Bu amaçla, belirli koşullar altında Peroksi-Koagülasyon (PK), Elektrokimyasal-Peroksidasyon (EPO), Fered-Fenton (FF) ve EF prosesleri uygulanarak kimyasal oksijen ihtiyacı (KOİ) giderim verimleri karşılaştırılmıştır. Fenton reaktiflerinin dışarıdan ilavesi ya da yerinde üretimine bağlı olarak değişen bu prosesler PK, EPO, FF ve EF için sırasıyla KOİ giderim verimleri %70.4, %78.9, %72.3 ve %55.6 elde edilmiştir. KOİ giderim verimlerine bağlı olarak birinci mertebeden reaksiyon kinetikleri hesaplanmış ve PK, EPO, FF ve EF prosesler için sırasıyla 0.0132, 0.0168, 0.0143 ve 0.0085 1/dk olarak belirlenmiştir. Tüm bu elektrokimyasal proseslerin organik madde gideriminde etkin bir yöntem olduğu görülmüştür. Proses şartlarının optimizasyonu ile TO konsantre atıksularının üretim proseslerinde yeniden kullanımı mümkün olabilir.

**Anahtar Kelimeler:** Tekstil Endüstrisi Atıksuları, Membran Konsantresi, Peroksi-Koagülasyon, Elektrokimyasal-Peroksidasyon, Fered-Fenton, Elektro-Fenton.

#### Abstract

The aim of bone tissue engineering (BTE) is to treat bone defects resulting from various bone diseases, tumors or fracture with alternative approaches. The basic principle of BTE approach is to design and develop threedimensional, functional biological systems specific to the targeted tissue and/or organ by combining the cell, biomaterial and various bioactive molecules. One of the most important factors that ensure successful achievement of the goal is the development of the most ideal biocompatible and biodegradable threedimensional (3D) biomaterials that will mimic the "artificial culture medium" for cells. In recent years, natural extracellular matrix (ECM) structures obtained from different tissues or organs and halloysite (HNT) have been started to be used in tissue engineering applications due to their biological advantages. In light of this information, the aim of this study is to develop and characterize bone tissue engineering scaffolds by using dECM and HNT and to evaluate their usability for bone tissue engineering. For this purpose, the dt-ECM structure was obtained by decellularization of bovine tendon tissue. Following the decellulation process, the dt-ECM was digested with pepsin solution. At the end of the digestion procedure, the pH of the flowable viscous solution was adjusted to pH 7.4 with ice-cold 0.1 N NaOH. In the next step, different concentrations of HNT were added separately to the neutralized dtECM pre-gel solution, and the suspensions were mixed at 4 °C by using a mechanical stirrer until a homogeneous solution was obtained. In the last step, the obtained composite suspensions were poured into the molds and kept at 37 °C to complete gelation. Nanocomposite scaffolds were obtained by freezing and then lyophilizing the gelled samples at -80 °C. While the physical and chemical properties of the obtained scaffolds were examined by different analysis methods, the potential for use in biological applications was evaluated by blood compatibility and in-vitro cytotoxicity tests. The obtained results showed that the composite scaffold as a prospective candidate for bone tissue engineering.

## Özet

Paketli gıdalarda tüketiciyi ilk cezbeden özellikler renk ve görünüşdür. Bu nedenle, renk maddeleri hem tüketici beğenisine uygun olmalı hem de yapay renk maddeleri gibi kanserojenik, alerjik reaksiyonlar ve nörolojik etkiler gibi olumsuz sağlık problemlerine neden olmamalıdır. Gıdalarda kullanılan renk maddeleri asıl amaçlarının yanı sıra ürünleri tatlandırmak, korumak ve fonksiyonel özelliklerini geliştirmek amacıyla da kullanılabilir. Gelincik (*Papaver rhoas* L.) *Papaveraceae* familyasında bulunan, dünyanın pek çok yerinde yetişen, tek yıllık otsu bir bitkidir ve geleneksel olarak kırmızı taç yaprakları gelincik şerbeti yapımında kullanılmaktadır. Gelincik bitkisinin antikarsinojenik, antiinflamatuvar, antimutajenik ve antigenotoksik etkilere sahip olduğu bilinmekte ve öksürük, uyku problemleri ve anksiyete durumlarında kullanılabileceği ileri sürülmektedir. Literatürde daha çok gelincik bitkisinin medikal alanda kullanımı üzerine çalışmalara rastlanmıştır. Bu araştırma ile gelincik bitkisinin kırmızı taç yapraklarından elde edilen ekstraktın renk maddesi olarak değerlendirilebilme potansiyeli ve bu ekstraktın fizikokimyasal özellikleri ve fonksiyonel özellikleri tespit edilmeye çalışılmıştır. Etanol ile ekstrakte edilen ekstraktın pH, % kuru madde ve % kül değerleri sırasıyla  $0.58 \pm 0.01$ ,  $1.03 \pm 0.12$  ve  $0.11 \pm 0.00$  olarak belirlenmiştir. Toplam fenolik madde içeriği  $3772 \pm 70.71$  mg gallik asit eşdeğeri (GAE)/ L olarak tespit edilirken toplam antosiyanin içeriği  $1427.76 \pm 47.23$  mg siyanidin-3-glukozit/ L olarak bulunmuştur. Ekstraktın termal stabilitesini belirlemek amacıyla sitrat tamponu ile hazırlanan örnekler 1 saat boyunca 60, 80 ve 100°C sıcaklığa maruz bırakılmış bunun sonucunda total antosiyanin içeriklerinde sırasıyla %4.88, 6.37 ve 15.49 oranında bir azalma meydana gelmiştir. Oksidatif stabiliteyi belirlemek için 9.31mM, 18.61mM ve 27.92 mM hidrojen peroksit ile muamelem edilen ekstraktların toplam antosiyanin içerikleri ise sırasıyla %11.21, 12.90 ve 16.28 oranında azalma göstermiştir. Ekstraktın pH'a bağlı renk değişimi incelendiğinde kırmızı rengi pH 5' e kadar koruyabildiği sonucuna varılmıştır. Ekstrakt sodyum, potasyum, fosfor ve demir mineralleri bakımından oldukça zengin bulunmuştur. Ayrıca bu ekstraktın ayırt edici düzeyde kuarsetin ve prokateşik asit içerdiği tespit edilmiştir.

**Anahtar Kelimeler:** Gelincik çiçeği (*Papaver rhoas* L.), renk maddesi, fenolik profil, mineral madde.

\*Sorumlu yazar e-mail: [tugba.alp@dpu.edu.tr](mailto:tugba.alp@dpu.edu.tr)

## Özet

Antibiyotikler, son yıllarda tıp, hayvan hastalıklarının önlenmesi, su ürünleri yetiştiriciliği ve hayvancılık alanlarında yaygın olarak kullanılmaktadır. Tetrasiklinler (TC), dünya çapında en çok üretilen ikinci antibiyotik grubu olarak bilinmektedir [1]. Bu antibiyotik türü bakteriyel enfeksiyonlarla savaşmak için tarım ve hayvancılıkta yaygın olarak kullanılmaktadır. TC'nin çevreye salınımının ana kaynağının (%69-86) insan ve hayvanların idrarı ve dışkısı olduğu bildirilmektedir [2]. TC'nin sularda yüksek derişimlerde bulunması bu ortamlardaki sucul canlıların yaşamında toksik etki oluşturmakta, bakteri ve mikroorganizmaların bu antibiyotiğe karşı direnç kazanmalarına sebep olmaktadır. Sulu ortamdan farmasötik kirleticilerin gideriminde pek çok geleneksel arıtım yöntemi kullanılmasına rağmen adsorpsiyon, ekonomik, kolay uygulanabilir oluşu ve toksik yan ürün oluşturmama özelliği nedeniyle oldukça avantajlıdır. Metal organik kafes yapıların (MOF) bu yöntemde, geniş yüzey alanı, termal kararlılığı, ultra yüksek gözenekliliği ve ayarlanabilir gözenek boyutları gibi dikkate değer avantajları nedeniyle adsorpsiyon yetenekleri incelenmektedir.

Bu çalışmada, amid grubu içeren Zr-MOF,  $[Zr_6O_4(OH)_8(H_2O)_4(TCPP)_4] \cdot 9DMF \cdot 3.5H_2O$ , yapısı sentezlenmiş ve karakterize edilmiştir [3]. Zr-MOF sulu ortamdan TC gideriminde adsorban olarak kullanılmıştır. Adsorpsiyona, pH, adsorban miktarı ve temas süresinin etkileri araştırılarak optimum adsorpsiyon koşulları belirlenmiştir. MOF'un üç boyutlu (3D) yapısı Şekil 1'de verilmiştir. MOF kullanılarak TC'nin %84 verimle sulu ortamdan uzaklaştırıldığı sonucuna ulaşılmıştır.

**Anahtar Kelimeler:** Adsorpsiyon, Kinetik, Tetrasiklin, Zr-MOF

Şekil 1. Zr-MOF'un 3D yapısı

### Özet

Alzheimer hastalığı (AH) 65 yaş ve üzerindeki insanlarda görülen ilerleyici ve ölümcül demans vakalarının dörtte üçünden sorumludur. Dünya çapında yaklaşık 50 milyon insan demansdan mustarıdır. 2050 yılına kadar bu sayının 152 milyona çıkması öngörülmektedir. Maalesef, günümüzde halen AH'nin tedavisi tamamen semptomatik olarak yapılmaktadır. Ayrıca, güncel tedavide kullanılan kolinesteraz inhibitörü ilaçların yan etkilerinin fazlalığı hastalar için ciddi sorunlar yaratmaktadır. AH'nin oluşması ve ilerleyişinde oksidatif stres ve nöroinflamasyonun etkili olduğu düşünülmektedir. Zeytinyağı bileşenleri içerisinde büyük yer kaplayan oleuropein, güçlü antioksidan etkileri ile bilinmektedir. Bir çalışmada oleuropein ile 7 günlük tedavinin reaktif oksijen türlerinin seviyelerini düşürdüğü, lipid peroksidasyonu azalttığı, süperoksit dismutaz ve katalaz aktivitelerini arttırdığı gösterilmiştir. Ayrıca oleuropein, oksidatif stres nedeniyle oluşan heterosiklik aminlere bağlı DNA hasarına karşı da koruma sağlamaktadır. Ek olarak eozinofil ve makrofaj infiltrasyonunu önleyerek IL-4'e maruz kalan epitel hücrelerinde inflamasyonu azalttığı da bildirilmiştir. Oleuropeinin nöroprotektif rolü için, apoptoz ve otofajinin indüklenmesi, proinflamatuvar sitokinlerin ve kemokinlerin gereksiz salınımını azaltarak nöroinflamasyonu önleme başta olmak üzere çeşitli mekanizmalar öne sürülmektedir. Düzenli oleuropein alımı AH, Parkinson, inme, depresyon, anksiyete, epilepsi gibi nöral bozuklukların azalmasıyla ilişkili görülmektedir. Ancak randomize kontrollü çalışmalarla kanıtlanmış veriler bulunmamaktadır. Oleuropeinin metabolik yollardaki etkileri, biyoyararlanımı ve gen ekspresyonu gibi farklı konulardaki etkinliklerinin belirlenmesi bilişsel bozulmayla olan savaşımızda yeni ve kuvvetli bir savunma hattı olabilir. Ülkemizde bolca bulunan oleuropeinden zengin, zeytin ve zeytinyağı ürünlerinin korunma ve tedavide etkili bir strateji haline gelebilmesi için daha fazla araştırma yapılması, ülkemize de bir katma değer olarak katkı sağlayacaktır.

**Anahtar Kelimeler:** Alzheimer, antioksidan, oleuropein.

<sup>2</sup> Van Yüzüncü Yıl University, Faculty of Medicine, Department of Basic Medical Sciences, Van, Turkey

\* Corresponding author e-mail: edincer@beu.edu.tr

#### Abstract

**Introduction:** Irisin, recently identified as a hormone classified as both a myokine and an adipokine, has emerged as a significant factor in promoting the conversion of white adipose tissue to brown adipose tissue. This process, known as "browning," is associated with increased energy expenditure and calorie burning. Moreover, irisin has been linked to several beneficial outcomes of regular exercise, contributing to improved metabolism and overall well-being. Despite the growing understanding of irisin's role in metabolism and its potential therapeutic implications, the exact pathophysiology of schizophrenia and psychosis remains incompletely understood, particularly concerning their connections with hormonal regulation. Further investigations and research are needed to unravel the intricate interplay between irisin and the development or progression of these complex psychiatric conditions. Gaining a deeper comprehension of these relationships could open the door to novel therapeutic strategies and shed light on the potential impact of irisin in managing these disorders.

**Objective:** The main objective of this study was to investigate potential differences in irisin hormone levels between individuals diagnosed with schizophrenia, psychosis, and healthy individuals without these conditions. Additionally, the study aimed to evaluate the potential of irisin hormone as a diagnostic marker for individuals with schizophrenia and psychosis.

**Materials and Methods:** The study included a total of 80 participants, consisting of 30 individuals diagnosed with schizophrenia, 20 with psychosis, and 30 healthy individuals. Blood samples were collected from all participants between 08:00-10:00 in the morning after an overnight fasting period. The levels of irisin in the collected blood samples were measured using the ELISA method with commercially available kits.

**Results:** The study identified significant variations in irisin hormone levels among the groups analyzed. Specifically, the irisin level in schizophrenia patients ( $544 \pm 28$  pg/ml) was notably lower than that in both psychosis patients ( $643 \pm 23$  pg/ml) and the control group ( $735 \pm 28$  pg/ml) ( $p < 0.05$ ). Additionally, the irisin level in psychotic patients ( $643 \pm 23$  pg/ml) was found to be significantly lower than in the control group ( $735 \pm 28$  pg/ml) ( $p < 0.05$ ).

**Conclusion:** Based on these findings, it is evident that irisin hormone plays a critical role in the pathophysiological mechanisms of schizophrenia and psychosis. Furthermore, it is suggested that irisin holds substantial potential as a noteworthy diagnostic marker for these disorders, offering possibilities for prognostic value. Consequently, irisin emerges as a subject of considerable interest in the pursuit of a deeper understanding and enhanced management of schizophrenia and psychosis. Nevertheless, to gain a more comprehensive comprehension of the precise role of irisin hormone in the treatment processes of these conditions, further research and clinical studies are warranted.

#### Abstract

Every year, between 9.1 and 26.1 million diabetic patients worldwide face foot ulcers that do not heal on their own. Approximately 15-25% of all diabetic patients develop ulcers that do not necessarily heal on their own throughout their lives and require bioactive treatments. Similarly, when examining deep burns, which constitute a significant part of the wounds that do not heal completely, approximately 50000 of the 1.1 million burns requiring medical intervention each year in the USA require hospitalization, and 20000 of them are suffering from non-self-healing major burns, which cover up to 25% of their total body surfaces and waiting for treatment.

Biomaterials and tissue engineering offers promising approaches for healing wounds that cannot follow the ordinary wound healing process and do not heal on their own. Non-healing wounds could be acute wounds, such as multilayer wounds and deep burns, as well as chronic wounds, such as diabetic ulcers or venous ulcers. The treatment of such difficult-to-heal or non-self-healing wounds requires more than the use of traditional wound dressings that only provide moisture, control exudate and odour, and protect the wound from external factors. Skin substitutes, one of the most important clinical approaches of biomaterials science and tissue engineering, play a key role in the treatment of these wounds.

In the scope of this study, a bioactive and antimicrobial bilayer polycaprolactone (PCL) skin substitute was developed combining electrospinning and emulsion templating. 2-deoxy-D-ribose (2DDR) was incorporated into PCL electrospun layer to induce angiogenesis whereas PCL PolyHIPE layer was conjugated with antimicrobial peptide sequences to control wound infection. To date, we have manufactured and characterised both layers individually *in vitro* and successfully combined them together. This study was financially supported by a grant from The Scientific and Technological Research Council of Türkiye (TÜBİTAK) (Grant No. 221S594).

#### Abstract

Wound treatment requires the use of dressing materials that will ensure a safe barrier for the coverage of wounds as well as the preservation of the moist environment. Traditional wound dressings are cost-effective and provide some of the abovementioned properties. However, they lack bioactivity and do not contribute to the wound healing process. A bioactive wound dressing is required to manage challenging wounds.

2-deoxy-D-ribose (2dDR) is a novel, cost-effective and safe-to-use pro-angiogenic agent to promote angiogenesis and accelerate wound healing. It can easily be introduced into biomaterials and will be eventually released to show its effect. We have recently discovered its potential to promote angiogenesis and accelerate wound healing when released from several biomaterials in vitro and in vivo.

Lately, the use of decellularized biological constructs has become an emerging strategy to produce physiologically compatible tissue engineering scaffolds for use in both preclinical studies and clinical applications. The main principle of decellularization can be summarized as the removal of the native genetic material of the tissue or organ while preserving the basic ECM elements. The use of decellularized plant tissues as TE scaffolds is a promising alternative to animal sourced tissues and organs. Plant tissues are readily available, cost-effective, and clinically safe. Thus, turning plants into clinical biomaterials brought a new and unique perspective into the field of tissue engineering.

Accordingly, in this study, we developed a bioactive wound dressing from 2dDR-loaded decellularized spinach leaves and investigated its potential to promote angiogenesis in vitro. Our results demonstrated that a cellulose-based biomaterial can be developed from spinach leaves which can then be used as a potential drug delivery system. It showed great potential as a bioactive dressing to promote angiogenesis in vitro when it is loaded with 2dDR. This study was supported by IZTECH Research Foundation (Grant no: 2021İYTE-1-0057).

#### Abstract

With 17.9 million deaths annually, cardiovascular diseases (CVDs) are the most common cause of death worldwide. Over 80% of CVD deaths are caused by strokes or heart attacks, and 1/3 of these deaths are among adults below the age of 70.

A harmed blood vessel must be replaced/bypassed or repaired to eliminate the blockage. Vascular grafts play a significant part in today's care of a variety of clinical problems. For small-diameter arterial grafts, autologous tissue, such as the internal thoracic artery or saphenous vein, is frequently the initial option. However, earlier operations and other medical problems may constrain the availability of a patient's own vessels, and their collection may be linked with high morbidity. Synthetic grafts have demonstrated good long-term outcomes and patency for managing the aorta and other big arteries, but their usage for bypassing small-diameter vessels has been linked to worse-than-ideal outcomes.

In this study, we successfully developed a tissue-engineered vascular graft using decellularized parsley stems, characterized it, demonstrated its mechanical durability under flow conditions, and assessed its cytotoxicity. Then, we evaluated the potential of decellularized parsley stems to support fibroblast and endothelial cell growth in the lumen structure to create a potential tissue-engineered vascular graft. From the clinical point-of-view, to shorten the time of vascularization upon implantation, we loaded parsley stems with a pro-angiogenic agent (2-deoxy-D-ribose (2dDR)) and showed its release over 48 hours to promote vascularization. Finally, we sutured decellularized parsley tubes to an artery isolated from a goat, ex vivo and evaluated its mechanical durability under flow conditions. This study was financially supported by IZTECH Research Foundation (Grant no: 2022İYTE-3-0002).

#### Abstract

As a biorefinery approach, combining thermochemical (hydrothermal carbonization, HTC) and biological (anaerobic digestion, AD) processes for valorization of spent coffee grounds (SCGs) can pave the new ways for renewable energy production, when the annual coffee consumption in the world and its lignocellulosic wastes were considered. The aim of this study was to produce biofuel and biochemicals via biorefinery approach involving AD of the hydrochars obtained after HTC of SCGs, and investigate the optimum conditions for maximizing methane-rich biogas yield. HTC was conducted at 180, 220 and 260°C with 1 h residence time and biomass to water ratio as 0.2. Hydrochar efficiencies were found as 57.46%, 47.48% and 44.90% for 180, 220 and 260°C, respectively. While waste sludge (WS) obtained from AD tanks of a yeast plant was used as inoculum, SCGs, hydrochar and process water formed during HTC were used as substrate in AD at mesophilic condition (37°C). Within 50 days of AD and with VS ratio of 3.6, maximum cumulative biogas and biomethane content was reached to 182.8 mL/g TVS and 125.1 mL CH<sub>4</sub>/g TVS by using hydrochars obtained at 180°C, while it was 278.6 mL/g TVS and 180.5 mL CH<sub>4</sub>/g TVS for SCG, respectively. Carboxylic acids (acetic acid, propionic acid, butyric-isobutyric acids, glycolic acid and formic acid), furfurals (MF, 5-HMF), phenols (phenol and o-m-p-cresols) and ketones (3-methyl-2-cyclopenten-1-one and 2-cyclopenten-1-one) analyzed in liquid phase that obtained at the end of integrated process. Volatile fatty acid (VFA) content in the liquid phase obtained at the end of AD of SCGs and hydrochars was found suitable for a stable AD, while it was found unfavorable for process water samples because of unbalanced C/N ratio. Hydrochars were characterized for surface morphology, thermal degradation properties, functional groups, elemental composition by SEM, SDT (TGA+DSC), FT-IR, elemental analyzer (ICP-OES), respectively.

#### Abstract

In this study antioxidant and antibacterial activities of fermented *Cornus Mas* and *Rubus Sanctus* berries collected from province of Bartın in the Western Black Sea region of Türkiye were analyzed. Prior to fermentation with *Saccharomyces cerevisiae*, the fruits were tested for 58 pesticides such as Dicloran and Quintozene and none of the pesticides were detected. The presence of ascorbic acid in the fruits, which is a nutrient needed by the body, was also detected by FTIR. Then the pesticide free berries were crushed, and the samples were fermented separately. Testing after the fermentation process revealed the samples contained ethyl alcohol. Antioxidant activities of fermented samples were analyzed using CUPRAC, DPPH and Folin Ciocalteu methods. The results suggest high antioxidant contents of the fermented samples. Evaluation of antimicrobial activity was done through disk diffusion method using *Pseudomonas aeruginosa* and *Staphylococcus aureus* suggesting that these samples do not suppress these bacteria for the studied concentrations. Furthermore, the growth of *Candida albicans* was examined immediately, demonstrating that the fermented samples do not show antifungal effects. The reason for these shortcomings could be inadequate concentration levels. The antioxidant content of these fermented fruits is intended to contribute to human health.

**Keywords:** *Cornus Mas*, *Rubus Sanctus*, Fermentation, Antioxidant, Antibacterial

### The key roles of mTOR and p53 during cell fate decision: Senescence or quiescence?

Menderes Yusuf Terzi<sup>1\*</sup> (<https://orcid.org/0000-0001-8478-0451>)

<sup>1</sup>Hatay Mustafa Kemal University, Faculty of Medicine, Department of Medical Biology, Hatay, Türkiye.

\*Corresponding author e-mail: menderesyusufterzi@gmail.com / myterzi@mku.edu.tr

#### Abstract

The researchers can use the terms “senescence” and “quiescence” interchangeably in their studies although they are two distinct cellular states in which altered expression/activation levels of common molecular players play pivotal roles. Among which, mechanistic target of rapamycin (mTOR) and tumor suppressor protein p53 are the key molecules that are accounted for during the decision of a cell’s fate. The presence or absence of mTOR determines whether the cell undergoes normal cell cycle and cell division. If mTOR presents, in this case the activation status of p53 decides further cell pathway; while maximal activation of p53, which inhibits mTOR, leads the cell to quiescence, the partial activation of p53, which keeps mTOR in active state, results in senescence. In the big picture, the blockade of mTOR causes nutritional and growth insufficiency which brings about quiescence however, cellular aging and severe DNA damage cause senescence. In this perspective, senescence is a detrimental process and senescent cells eventually enter into apoptosis whereas quiescent cells can stay at cell cycle arrest as until the growth conditions are optimized. On the other hand, the sustained or prolonged quiescence can lead to degeneration of cells which transforms quiescence into senescence phenotype by abnormal cellular hypertrophy and apoptosis.

**Keywords:** p53, mTOR, Senescence, Quiescence.

### Synthesis and Characterization of Fluorine-Contained Dental Composites

Sedef Kaptan Usul<sup>1\*</sup>, Ayşe Aslan<sup>1,2</sup>

<sup>1</sup>Bioengineering Department, Gebze Technical University, Kocaeli

<sup>2</sup>Institute of Energy Technologies, Gebze Technical University, Kocaeli

#### Abstract

In this study, dental composite series were designed with new-generation antimicrobial, fluorine-containing silica nanoparticles. Silica nanoparticles provided the advantage of long-term use of the composite thanks to their mechanical strength. The fluorine element interacted with silica nanoparticles giving the dental composite anti-microbial properties. The synthesized functional nanoparticles were homogeneously distributed in the resin and dental filling material by UV polymerization. The silica nanoparticles with fluorine-containing content were characterized by FTIR spectroscopy to confirm their binding to BisGMA/TEGDMA resin. Scanning electron microscopy analysis results showed homogeneous distribution of fluorinated nanoparticles in the dental composite. X-ray diffraction studies have shown how the amorphous character of the materials changes with the addition of fluorine-containing silica nanoparticles to the structure. The thermal properties of the materials were determined by TGA. Chemical stability, water absorption, and dissolution experiments of fluorine-containing silica-based dental materials were also carried out. In addition, the antimicrobial properties of dental materials were determined by MIC tests using bacteria and fungi.

**Key Words:** Fluorine, Silica, Dental composites

### Biyoprining tekniđi ve stres toleransı üzerine etkisi

Ayşe Feyza Tufan Dülger<sup>1\*</sup> (<https://orcid.org/0000-0003-4779-6811>)

<sup>1</sup>Ondokuz Mayıs Üniversitesi, Ziraat Fakültesi, Tarımsal Biyoteknoloji Bölümü, Samsun, Türkiye

\*Sorumlu yazar e-mail: feyzadulger@omu.edu.tr

#### Özet

Başarılı bir tarımsal üretimde, tohumdan yüksek verimin elde edilmesi tohumun hızlı ve üniform bir şekilde çimlenmesine ve güçlü fide gelişimi göstermesine bağlıdır. Çeşitli biyotik/abiyotik stres faktörlerine veya doğrudan tohum kalite ve yapısına bağlı olarak tohumun çimlenmesi sırasında sorunlar yaşanabilmektedir. Tohumların ekilmesinden önce tohumlara yapılan çeşitli uygulamalar priming olarak adlandırılmaktadır. Temel olarak priming, tohumda çimlenme için gerekli metabolik aktiviteyi başlatacak, ancak tohumun tam çimlenmeye geçişine imkân tanımayacak seviyedeki kontrollü su alımıdır. Priming uygulamasından sonra tohumlar yıkanmakta ve ardından kurutulmaktadır. Bu şekilde, priming, çimlenme öncesi metabolizmayı harekete geçirmektedir. Bu durum, DNA onarım yollarını ve reaktif oksijen türlerini süpürme sistemlerini aktive eder ve ayrıca genom bütünlüğünün korunmasına yardımcı olur. Çimlenme ile ilgili birçok aktivitenin başlatılmasını da kolaylaştırır. Priming yaklaşımlarından biri olan biyoprining tohumların faydalı mikroorganizmalar ve biyokontrol ajanlarıyla aşılmasını yoluyla biyotik/abiyotik streslere tolerans sağlayan bir yaklaşımdır. Biyoprining sırasında, mikroorganizmalardan gelen uyarı algılanır ve bitkide fizyolojik, transkripsiyonel, metabolik ve epigenetik değişiklikler meydana gelir. Bu durum, stres toleransı ile sonuçlanan daha yüksek savunma tepkilerine neden olur. Biyoprining uygulamalarında yaygın olarak *Trichoderma*, *Enterobacter*, *Pseudomonas* ve *Bacillus* cinslerine ait türler kullanılmaktadır. Biyoprining tekniğinde kullanılan bazı mikroorganizmalar ayrıca bitki büyümesini doğrudan ve dolaylı olarak teşvik edebilir. Biyoprining'in diğer priming uygulamalarına kıyasla üstün olan özelliđi, tohumun hem çimlenme hızı ve üniformitesi üzerine daha yoğun bir etki göstermesi hem de toprak ve tohum kökenli patojenlerin baskılanmasını sağlamasıdır. Tohumlar şekil, boyut ve tohum kabuğunun doğası bakımından farklılık gösterdikleri için biyoprining uygulamasında, kullanılan tohuma göre mikrobiyal konsantrasyon ve sürenin optimize edilmesi önemlidir. Strese toleransta biyoprining yaklaşımı düşük konsantrasyonda aşılamanın yeterli olması, ekonomik olması ve çevre dostu bir yaklaşım olmasıyla ön plana çıkmaktadır. Bu derlemede, biyoprining tekniğinin bitkide yol açtığı fizyolojik ve moleküler değişiklikler ile stres toleransını iyileştirmesindeki rolüne değinilecektir.

**Anahtar Kelimeler:** Tohum, biyoprining, abiyotik stres, biyotik stres

#### Abstract

This study presents the results of a split-plot experiment conducted at Miandoab Agriculture Research Station, West Azarbaijan, during the 2015-2016 years. The study aimed to assess the effects of antitranspirants on several physiological traits of wheat, including photosynthesis, total chlorophyll content (chlorophyll *a* and chlorophyll *b*), grain protein percentage, grain yield, transpiration rate, and photosynthetic water use efficiency, under water deficit stress conditions. The experiment utilized a randomized complete block design with three replications. The main plots were subjected to different irrigation treatments, involving complete irrigation, irrigation withholding at heading stages, and irrigation withholding at flowering stages. Within each main plot, subplots were allocated for foliar applications of distinct antitranspirants, namely Prometrin, Kaolin, Tmatrom, Chitosan, and a control group. Additionally, two wheat cultivars, Zarin and Mihan, were evaluated to study cultivar-specific responses. The findings revealed significant effects of the antitranspirants on various physiological characteristics of wheat under drought stress. Specifically, the application of prometrin during irrigation withholding at the flowering stage resulted in increased photosynthesis at  $2 \mu\text{mol CO}_2 \text{ m}^{-2} \text{ s}^{-1}$  compared to the control. Chitosan treatment at irrigation withholding during the heading stage exhibited the highest total chlorophyll content ( $4.69 \mu\text{g/g FW}$ ), while chitosan treatment also demonstrated the highest chlorophyll content ( $2.42 \mu\text{g/g FW}$ ). In the Zarin cultivar, chitosan application during irrigation withholding at the heading stage showed the highest chlorophyll *b* content. Furthermore, chitosan treatment during irrigation withholding at the flowering stage significantly increased the protein content ( $12.27 \text{ mg/g DW}$ ) and enhanced the yield by  $868 \text{ kg/ha}$  in the Mihan cultivar compared to the control. Notably, the lowest transpiration rate was observed during the irrigation withholding stage ( $3.83 \text{ mM H}_2\text{O m}^{-2} \text{ s}^{-1}$ ). Overall, the results highlighted the importance of considering the timing of stress and the type of cultivar in assessing the effects of antitranspirants. Chitosan, in particular, showed promising potential for improving the photosynthetic properties of wheat (Mihan cultivar) and enhancing seed yield under drought stress conditions.

### Combined treatment of sprouting and high intensity ultrasound to produce functionalized hemp protein

Gülşah Karabulut<sup>1\*</sup>

<sup>\*1</sup> Department of Food Engineering, Sakarya University, 54187, Sakarya / Turkiye

\*Corresponding author e-mail: gkarabulut@sakarya.edu.tr

#### Abstract

In recent years, hemp protein has garnered significant attention for its exceptional nutritional content and high digestibility. However, its industrial applications have been limited due to poor solubility attributes, similar to other plant-based protein sources. To address this issue, a biotechnological approach using sprouting (1, 3, 5 days) was employed to enhance the physicochemical, functional, and bioactive properties of hemp protein. Additionally, high-intensity ultrasound was applied in combination with these treatments for further modifications. The results of the study showed promising outcomes. Protein recovery in the defatted flour increased by an impressive 42% in germinated isolates compared to the untreated isolate. Notably, the particle sizes of the isolates were reduced by a remarkable 83%, leading to a significant increase of 133% in solubility for the sprouted and ultrasonicated isolates. The improved functionality of the modified isolates was also evident in their enhanced water, oil absorption capacities, and emulsion activities, which saw increases of 103%, 194%, and 300%, respectively, when compared to the untreated isolate. Overall, the combination of sprouting and ultrasonication proved to be promising, eco-friendly, and safe biomodification techniques for effectively improving the functionality of hemp protein. These modifications resulted in clean-labeled proteins that can be utilized as bioactive agents in the food industry, offering a valuable alternative for various applications.

**Keywords:** Biotechnology, functional, sprouting, proteolysis, hemp protein.

#### Abstract

Lung cancer is the most common type of cancer all over the world. Chemotherapy is one of the most effective therapeutic modalities to treat a variety of tumors, including lung cancer. Due to drug resistance and serious side effects of chemotherapy, great difficulties are encountered in getting a response from the treatment. Therefore, it is very important to find new therapeutic agents of natural origin that will increase the therapeutic efficacy of targeted chemotherapeutics such as cetuximab. Therefore, to reduce the side effects of cancer drugs, attention has been paid to plant-derived molecules that are non-toxic to humans and have therapeutic effects and biological activities. Epigallocatechin-3-gallate (EGCG) is a compound, one of the most prominent catechins in green tea leaves, that attracts a lot of attention in medical research.

In our study, 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) and Lactate dehydrogenase (LDH) activity tests were performed to demonstrate the cytotoxic effect of cetuximab alone and also with EGCG in cells. It was observed that cell viability of A-549 cells exposed to different concentrations of cetuximab and EGCG for 48 hours decreased depending on the concentration increase. It was determined that the most effective combination concentrations were IC<sub>20</sub> cetuximab and IC<sub>10</sub> EGCG by calculating the cell viability and combination index (CI) value in cells where cetuximab (<IC<sub>50</sub>) and EGCG (<IC<sub>50</sub>) were administered together.

Lactate dehydrogenase (LDH) is the enzyme that converts lactic acid to pyruvic acid in the presence of nicotinamide adenine dinucleotide (NAD<sup>+</sup>). Lactic acid occurs with disruption of cell integrity. EGCG and cetuximab were applied to the cells and it was found that the LDH activity increased compared to the control.

#### Abstract

Cancer is a large group of diseases that can grow abnormally and spread beyond its normal limits to other parts of the body. Various methods are used in the treatment of cancer. Surgery is very effective in removing tumors. However, these are limited to low-stage tumors and cannot be adequately applied to high-stage tumors. However, even with chemotherapy, there is no guarantee of recovery. Photodynamic therapy (PDT) is a successful and clinically approved treatment method used for the treatment of many diseases from past to present. Although there are FDA-approved drugs used in PDT, it is not at the desired level and there has been an increasing interest in new PDT agents recently. The number of efficient organic photosensitizers has been limited. Therefore, there is a strong demand for the development of new photosensitizers. The research in this area is mainly focused on organic dyes that absorb light in the far red or near infrared region of the electromagnetic spectrum, where the light tissue penetration is relatively high.

Within the scope of this study, the synthesis and characterization of fluorescence-based compound that will enable cancer treatment were carried out. On the one hand, a chemiluminescent unit that will be sensitive to reactive oxygen species (ROT) in the design; On the other hand, compounds that simultaneously contain fluorescent dyes suitable for bioimaging and PDT with their superior properties were synthesized. The structures of the synthesized fluorescent dyes were elucidated by spectroscopic methods and their potential as photosensitizing agents was determined.

#### Özet

Kanser; kalp damar hastalıklarından sonra tüm dünyada sayısı giderek artan, bazen sinsice bazense belirgin semptomlar halinde kendini gösteren çağımızın en amansız ölümcül hastalıklarından biridir. Son yıllarda; kanser tedavilerinde hedefe yönelik ilaçların olumlu etkilerinin tespit edilmesi, bu alanda yapılan araştırmalara hız kazandırmıştır.

Ribozom inaktive edici proteinler (RIP'ler); toksine dayalı kanser tedavilerinde kullanılmakta olan önemli bir sitotoksik ajan grubudur. Ribozom inaktive edici proteinlerin antikorlar ile oluşturulan immunokonjugatları, endositozla hücre içine alınmakta ve kanser hücresinin ölümüne neden olmaktadır. Bu grup içerisinde özellikle tip I RIP'lerin; daha düşük toksisite göstermeleri, direkt olarak hedef hücreye bağlanmaları, daha fazla stabil olmaları, hazırlanmalarının daha güvenli oluşu, çok fazla sayıda aktif konjugat oluşturabilme yetenekleri toksine dayalı kanser terapilerinde, onlara yüksek kullanılabilirlik potansiyeli sunmaktadır.

Bu çalışma kapsamında; kepek otu olarak bilenen *Paronychia sp.* (Illecebraceae) bitkisi tohumlarından, kanser tedavilerinde kullanılabilir bir ribozom inaktive edici proteinin saflaştırılması gerçekleştirildi. Ribozom aktive edici proteinin saflaştırılması işlemlerinde; amonyum sülfat çöktürmesi, katyon değişim ve jel filtrasyon kromatografisi adımları uygulandı. Ribozom inaktive edici protein % 1,6 verimle 66 kat saflaştırıldı. Saflaştırma adımlarının etkinliği N-glukosidaz aktivitesi ile değerlendirildi. Saflaştırılan proteinin karakterizasyonunda; SDS-PAGE ile molekül kütlesi 5.2 kDa olarak belirlendi. Yapı analizi MALDI-TOF-MS ile gerçekleştirilerek uzunluğu 7 ila 13 arasında değişen 6 farklı peptid dizisi tanımlandı. Ribonükleaz aktivitesi 9,04 U/mg olarak tespit edildi.

**Keywords:** Kanser, ribozom inaktive edici protein, saflaştırma, *Paronychia*

#### Abstract

Due to its natural bioactive components, propolis has been used in the treatment of many diseases since ancient times. Since propolis has a complex structure, it is necessary to extract bioactive substances from it. The extraction technique and solvent used in the extraction process are very important. In this report, antioxidant and antimicrobial activity rates of propolis samples collected from Gümüşhane were tested using two different solvents (ethanol and glycol). Total Phenolic (TP) – Flavonoid (TF) contents of the samples were calculated with using Folin-Ciocalteu method and colorimetric aluminum chloride assay respectively. Antioxidant activity was measured by the FRAP method. The antimicrobial activity levels of the samples were tested against 6 different microorganisms using the agar well diffusion method. TP and TF values of ethanolic extraction (72.04 mg GAE/mL-39.41 mg QE/mL) were significantly higher than glycolic extraction (52.15 mg GAE/mL-27.23 mg QE/mL). Stronger antioxidant activity was obtained from ethanolic extract (484.15 mM Trolox/mL). Although the zone diameters obtained from the agar well method varied between 7 and 17 mm, it was observed that ethanolic extraction was more effective against selected microorganisms. The most susceptible strain was *Staphylococcus epidermidis* for both extraction. As a result, it was determined that both antioxidant and antimicrobial effects of ethanol, which is the most widely used in propolis extraction, were higher than glycol, but the biological effect of multiple alcohol derivative glycol was undeniably important. In conclusion it is thought that testing different extraction methods and solvents of propolis, which is promising for drug discoveries that can be used in the treatment of some infectious diseases, will contribute to the science of pharmacology.

#### Abstract

Nowadays, rapid industrialization and urbanization have caused a serious increase in heavy metal pollution, which is one of the important ecological problems. Due to their sessile nature, plants are among the most affected organisms by heavy metal pollution. Heavy metal stress negatively affects the growth and development of plants, leads to losses in crop yield and quality, and threatens the life of other living things through the food chain. Some heavy metals are essential to plants at low levels, while others are toxic even at low levels. Lead, one of the most toxic heavy metals, is not necessary for the growth of plants and has toxic effects on plants even at low concentrations. On the other hand, plants have developed effective defense mechanisms to survive in areas contaminated with heavy metals.

In this study, the ecophysiological and molecular responses of the pumpkin plant exposed to two different lead concentrations (25 and 50 mM Pb) were investigated. With some exceptions, it was determined that the ecological parameters of stem and root increased at 25 mM Pb concentration compared to control, while these ecological parameters decreased at 50 mM Pb concentration. It was observed that chlorophyll *a*, *b* and total chlorophyll amounts increased in both applied lead concentrations compared to the control, but MDA content increased only at 50 mM Pb concentration. It was noted that SOD and CAT activities and gene expressions of these enzymes increased at both lead concentrations compared to the control, while APX activity and gene expression increased only at 50 mM Pb concentration. The results show that pumpkin is highly tolerant to lead.

**Keywords:** Heavy metal stress, lead, pumpkin, antioxidant enzyme, gene expression

#### Abstract

*N*-acetylation reactions are widely used in synthetic chemistry, biology, pharmaceutical industries, and drug research. *N*-Acetylated products of organic reactions with acetylation reagents contain an amide bond, which is crucial in medicinal chemistry. Acetylation is generally accomplished with acetic anhydride or acetyl chloride. Beyond these relatively disadvantageous reagents, selective acetylation reactions including thioacids, in situ formed ketene intermediate, ethyl acetate, or *N*-acetyltransferase have been reported. These works provided intermolecularly acetylation reaction mechanisms via two individual reagents or substances.

Michael addition reaction is one of the most useful methods to form carbon-carbon bonds. Active methylene and nitroolefin compounds are commonly used in this method due to their conversion abilities to other functional groups. This functionality enables the formation of biologically active heterocyclic compounds. A typical study for the further reactions of addition products is the intramolecular or intermolecular cyclization reactions. In these reactions, generally, pyrrole, lactam, pyrolizine, pyrazole, and isoxazole derivatives were obtained. Change in starting materials or catalysts can result unexpectedly by means of product formation.

In this study, Michael addition of acetylacetone as an active methylene compound to nitroolefins was investigated. Then, with the addition products in hand, their chemistry in the presence of catalysts was studied and as an interesting outcome, *N*-acetylated products were obtained. Structures of the isolated compounds were clarified using <sup>1</sup>H NMR, <sup>13</sup>C NMR, and HR-MS techniques.

**Keywords:** Nitroolefins, *N*-acetylation, Reduction

#### Abstract

CuFeS<sub>2</sub> known as chalcopyrite is one of the most abundant minerals in nature. CuFeS<sub>2</sub> consists of tetragonal structure in which Fe and Cu ions coordinate with S ions in the crystal lattice [1]. Due to its benefits, CuFeS<sub>2</sub> is widely used as a precursor for Cu smelting, an anode material, an adsorbent for heavy metal removal, and so on [2, 3]. In this study, CuFeS<sub>2</sub> modified with sodium dodecyl sulfate was utilized as an adsorbent for methylene blue adsorption from aqueous solutions. First, adsorption parameters including pH, contact time, adsorbent content and temperature were optimized. No important effect of pH and adsorbent content on the methylene blue adsorption was observed. While the methylene blue removal was about 60% at room temperature, a decrease in the methylene blue removal was determined with increasing temperature. In the optimum conditions, methylene blue adsorption isotherms and kinetics were examined. It was clear that the adsorption data were well fitted to Freundlich isotherm model and pseudo-second-order kinetic model. In the light of the results, the chalcopyrite can be evaluated as a potential adsorbent for dye adsorption processes.

#### Abstract

The emergence and significance of functional foods have drawn attention to their production's ecological consequences. Integrating sustainability in the production process of these foods, known for their positive effects on human health, is critical. A mixed-method approach was employed, utilizing quantitative analysis of industry data and qualitative evaluation through an extensive literature review. The study encompassed various stages, including raw material sourcing, production, processing, packaging, transportation, and consumer behavior. Findings indicate that functional food production may require higher energy and water resources, but advantages were observed in waste management and transportation stages. The study reveals a multifaceted relationship between functional food production and environmental sustainability. Innovative technologies and environmentally friendly methods present potential solutions to mitigate adverse effects. Collaboration within the industry and with regulators, researchers, and consumers is imperative for a holistic approach to environmental stewardship. This research underscores the importance of considering the environmental impacts in the burgeoning field of functional foods, highlighting their increasing significance in human nutrition and health. It calls for targeted strategies, guided by the complexity and variability observed, emphasizing the need for future research, effective policy formulation, and industry-wide sustainable practices. The proliferation of functional health foods is necessary, and continued research is required to facilitate their widespread adoption. The findings provide a basis for further exploration and a pathway towards an environmentally responsible approach in the production of functional foods.

**Keywords:** Environmental impact, Functional foods, Sustainable production.

#### Abstract

2,6-Dimethylnaphthalene (2,6-DMN) serves as a crucial intermediate in the synthesis of Polyethylene naphthalate (PEN) and offers promising applications due to its favourable thermal, mechanical, and gas barrier properties. Unfortunately, the expensive multi-step industrial synthesis of 2,6-DMN limits PEN production and its potential applications. Meanwhile, p-xylene, constituting over 80% of the global xylene demand, holds significant importance as a material for terephthalic acid production.

The primary objective of the study was to address the challenges in 2,6-DMN synthesis while concurrently producing valuable p-xylene. To achieve this, unmodified, and Zr-impregnated ZSM-5 doped Beta zeolite catalysts were prepared and utilized in the transalkylation of 1-Methylnaphthalene with toluene. The prepared zeolite catalysts were characterized through BET, SEM, FTIR, Py-FTIR, XRD, and XRF techniques. The catalytic studies were conducted at atmospheric pressure in a fixed-bed continuous flow reactor at varying WHSV (Weight Hourly Space Velocity) between 1 – 3 hr<sup>-1</sup>, and temperatures ranging from 400 – 500°C, employing three different metal loadings.

The findings revealed that metal impregnation improved zeolite's physical properties and acidity. In the catalytic tests, zeolite activity, in terms of conversion, yield, and selectivity, generally increased with increasing temperatures but decreased with increasing WHSV. Notably, Zr impregnation led to substantial improvements in both 2,6-DMN and p-xylene yield and selectivity. The Zr-loaded catalysts demonstrated enhanced performance, yielding 3.8% 2,6-DMN and 11.7% p-xylene compared to 1.83% and 10.7%, respectively on unmodified zeolite catalysts. Furthermore, the Zr impregnation increased the 2,6-DMN/2,7-DMN ratio in unmodified zeolites from 1.6 to 1.9. The study provides insight that demonstrates that Zr loading enhances catalyst properties by offering alternative pathways to achieve higher yields and selectivity.

**Keywords:** Transalkylation, 1-Methylnaphthalene, Zeolite catalyst, Toluene, 2,6-DMN

#### Özet

Fabaceae familyasında bulunan *Lathyrus* L. ekonomik açıdan önemli bir bitki cinsidir. Dünyada 200'den fazla taksonu yayılış gösteren cins, Türkiye'de tür, alt tür ve varyete seviyesinde 79 taksonla temsil edilmektedir. Cinsin bazı türleri dünyanın değişik yerlerinde hayvan yemi veya insan gıdası olarak değerlendirilmektedir. Bazı *Lathyrus* türlerinin güçlü antioksidan etkileri olan fenolik bileşiklerin kaynağı olabileceği belirtilmiştir. Bitkilerin her yerinde bulunabilen sekonder metabolitler olan fenolik bileşikler çiçeklere renk vermenin yanında bitkileri UV ışınlar, böcekler, otçullar ve patojenlere karşı da korur. Araştırmalar insan diyetinde en çok bulunan antioksidanlar olduğu düşünülen fenolik bileşiklerin birçok hastalığı önlemede etkili olduğunu göstermiştir. Son zamanlarda biyoaktif bileşikler ve biyoaktivite konularında çalışılan bitki cinslerinden birisi de *Lathyrus*'tur. Bu çalışmanın materyalleri de *L. annuus* L., *L. hierosolymitanus* Boiss., ve *L. hirsutus* L. türleridir. Örnekler çiçeklenme döneminde doğal habitatlarından toplanmış, tekniğine uygun olarak kurutulmuş, öğütülerek toz haline getirilmiş ve değişik çözücüler (aseton, etanol, su) kullanılarak ekstraktları hazırlanmıştır. Daha sonra ekstraktların toplam fenolik ve flavonoid içerikleri (TPC, TFC) belirlenmiş, serbest radikal (DPPH: 2,2-diphenyl-1-picrylhydrazyl, ABTS: 2,2'-azino-bis (3-ethylbenzothiazoline-6-sulfonic acid)) süpürme ve indirgeyici güç (RP: reducing power) testleri uygulanarak antioksidan özellikleri ortaya konulmuştur. En yüksek TPC değeri aseton ekstraktları için *L. hierosolymitanus*'ta, etanol ve su ekstraktları için *L. hirsutus*'ta, en yüksek TFC değeri ise aseton ekstraktları için *L. hirsutus*'ta, etanol ve su ekstraktları için ise *L. hierosolymitanus*'ta tespit edilmiştir. TPC ve TFC değerleri bakımından en düşük içerikler aseton ve etanol ekstraktları için *L. annuus*'ta, su ekstraktları için sırasıyla *L. hierosolymitanus* ve *L. hirsutus*'ta belirlenmiştir. En iyi antioksidan aktivite gösteren tür; DPPH radikali süpürme testlerinde aseton, etanol ve su ekstraktları için sırasıyla *L. hierosolymitanus*, *L. hirsutus* ve *L. annuus*; ABTS radikali süpürme testlerinde ise aseton ve su ekstraktları için *L. hierosolymitanus*, etanol ekstraktları için ise *L. annuus* olmuştur. İndirgeyici güç testlerinde aseton ekstraktlarında *L. hirsutus*, etanol ve su ekstraktlarında ise *L. hierosolymitanus* en yüksek antioksidan aktiviteye sahiptir.

**Anahtar Kelimeler:** ABTS, Antioksidan aktivite, DPPH, *Lathyrus*, Toplam fenolik içerik

#### Abstract

Thiadiazoles are one of the most preferred heterocyclic structures in new drug discovery studies. They exhibit many pharmacological and biological effects such as antioxidant, anti-inflammatory, anticancer, antidiabetic, antimicrobial. The pharmacophore structure responsible for the biological effect is -N=C-S- and plays an important role in the interaction with biological membranes. There are many molecules with thiadiazole structure such as acetazolamide, methazolamide, sulfamethizole, megazol and cefazolin, which are drugs on the market or in phase studies. In this study, the synthesis of compounds with 1,3,4-thiadiazole structure was carried out in three steps. In the first step, hydrazide synthesis was carried out from the starting material containing ester structure on pyridine ring. Then this hydrazide structure was reacted with various aromatic or aliphatic isothiocyanates to obtain thiosemicarbazides. In the last step, 1,3,4-thiadiazole structures were obtained in high yields by cyclization of thiosemicarbazides in acidic medium. It was aimed to elucidate the structures of the synthesized compounds by various spectral methods such as IR, <sup>1</sup>H-NMR, <sup>13</sup>C-NMR and elemental analysis.

After the structural characterization of the compounds was completed, it was aimed to examine the *in silico* ADME properties. The physicochemical and pharmacokinetic properties of the synthesized compounds were investigated by SwissAdme software. It was found that the compounds were in full compliance with the rules such as Lipinski, Veber, Egan, Muegge and Ghose, which are expressed as drug-like properties. In addition, it was predicted that the passage of the compounds through the gastrointestinal system was high and the blood brain barrier passage was weak. The low blood brain barrier passage is a positive feature in terms of the lack of central side effects of the compounds. The solubility of the compounds was found to be moderately. Therefore, the compounds were found to have high drug candidate properties.

**Keywords:** Thiosemicarbazide, 1,3,4-thiadiazole, synthesis, ADME.

#### Abstract

Pesticides have shown great benefits in increasing agricultural and industrial production. Rapid population growth and industrialization have increased the demand for the use of pesticides as a necessity in terms of obtaining food products and other agricultural resources to meet the world population [1]. With the development of intensive agricultural practices, widely use of pesticides emerged environmental pollution that has gained great interest as a new task of current research for chemists.

Glyphosate (Gly) as an herbicide, is used to reduce the effects of weeds and pests. Nonetheless, Gly exposure can cause permanent damage to human health [2]. Therefore, it is important to monitor the environment and reduce public health risks. Many time-consuming, expensive instrumental analysis methods requiring experienced staff have been proposed [3]. Based on previously reported studies, the preparation of pesticide sensors by molecular imprinting technology which offers advantages such as ease of fabrication and use, high sensitivity and selectivity, rapid response, and low cost, has been studied with increasing demand in recent years [4]. Among them, molecularly imprinted polymer based Gly sensors are very few. Therefore, it is aimed to prepare a new molecularly imprinted polypyrrole Gly sensor with some modifications compared to similar studies.

Gly imprinted polypyrrole films were electrochemically synthesized on the Pt plate electrode at optimum pH 5.0 PBS buffer media in the presence of functional monomer, template molecule and LiClO<sub>4</sub> as supporting electrolyte by cyclic voltammetry in a potential range of -0.1- +1.4 V with a scan rate of 50 mV/s. The selectivity of the electrode was tested in the presence of chlorpyrifos, aldicarb, phosmet, aminomethylphosphonic acid and glufosinate. LOD ( $1.98 \times 10^{-6}$  fM) and the linear working range ( $4.98 \times 10^{-4}$ -0.26 fM) were calculated by DPV. The proposed MIP sensor was successfully employed in tap water and orange juice samples.

**Keywords:** Electrochemical sensors, Molecular imprinting, Polypyrrole, Pesticide.

### GENZPRO Development Kit Used in GENZPRO© Mini Chip Auto Device Working with Capillary ELISA Technique, Providing Development of Rapid Protein Tests

Umut Ağyüz\* (ORCID: <https://orcid.org/0000-0002-1242-0454>), Caner Demir<sup>1</sup> (ORCID: <https://orcid.org/0000-0001-9460-2333>), Aybüke Üretmen<sup>1</sup> (ORCID: <https://orcid.org/0009-0009-2681-6001>)

<sup>1</sup>Genz Biotechnology, İstanbul, Turkey.

\*umut@genzbio.com

#### Abstract

GENZPRO© Minicchip Auto is an automatic device that works with the capillary ELISA technique developed by our company. Capillary ELISA works by transporting the sample through a capillary and reacting with the analyte. In this method, proteins are immobilized inside a capillary tube. The capillary ELISA technique has been optimized to achieve faster results compared to traditional ELISA methods. It also requires less sample and reagent usage and can be integrated with automated instruments, making the analysis process easier.

GENZPRO© Minicchip Auto automatic device is a portable device with 7-inch touch screen for user control and fully automatic testing. It reads real-time colorimetric signal change at wavelengths between 450nm and 650nm. It works with a 120-volt power supply.

The GENZPRO Development Kit is a test chip with chemically treated active bonding surfaces, the surfaces of which have been specially modified by chemical and physical methods. The desired proteins can be attached to these chips and the test can be performed on the GENZPRO© Minicchip Auto automated instrument. The test is completed in approximately 20 minutes.

For the preparation of test chips, the "GENZPRO Development Kit" is used, which includes the chips and the necessary solutions. First, the necessary tools and auxiliary laboratory equipment are prepared. Then, the solutions required for coating are prepared. Coating and blocking processes are applied to the test chips, respectively.

With the Genzpro Development Kit, It is aimed to develop rapid quantitative protein tests with low cost, low limit of detection value. Like this, Within the scope of their studies, researchers will be able to develop original tests of the protein they want to detect in the analyte and accelerate their academic research with affordable budgets with an innovative platform with high innovation and technology value.

#### Abstract

In terms of catalytic activity, MnO and ZnO Nps exhibit the desired physicochemical characteristics. Hereby, in this study, manganese oxide and zinc oxide nanocatalyzes were green synthesised with kale (*Brassica oleracea*) and einkorn wheat (*Triticum monococcum*), and catalyzes' advanced oxidation process (AOPs) performances such as sonolysis, photolysis, and hybrid photocatalysis (UV+catalyst), sonocatalysis (US+catalyst), and sonophotocatalysis (UV+US+catalyst/H<sub>2</sub>O<sub>2</sub>) were reported for the removal of Rhodamine B (RhB) dye from aqueous media. The operation conditions of the study were: 4.80 for pH value at 22.5 °C, 10 ppm for the initial dye concentration, and 0.5 mL of the hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) concentration, respectively. The results were obtained that with MnO synthesized from *T. monococcum*, 99% of dyestuff removal was achieved in 15 minutes in the hybrid sonophotocatalysis process, and 98% of RhB in 30 minutes in the hybrid sonophotocatalysis process with ZnO. While, MnO synthesized with *B. oleracea* was performed 96% of RhB removal in the 15<sup>th</sup> min in the sonophotocatalysis process, 99% of the RhB dye was removed in the 15<sup>th</sup> min in the hybrid sonophotocatalysis process with ZnO. In summary, the green synthesized MnO and ZnO nanoparticles from *B. oleracea* and *T. monococcum* have huge potential candidate as photocatalysts and they are considered to be a promising alternative in AOPs considering its low cost and high efficiency for the degradation of selective contaminants in water/wastewater systems.

#### Abstract

The aim of this study is to determine the most suitable number of spermatozoa to be used in the post-thawed flow-cytometrical analyzes of frozen bull semen. In the study, a total of 20 frozen semen from 5 different bulls, 4 from each bull, were used. After thawing the straws in a water bath at 37 °C for 30 seconds, they were analyzed in a flow-cytometer device (Beckman Coulter, Fullerton, CA, USA) in terms of Acrosomal Integrity, High Mitochondrial Membrane Potential and Viability parameters. Analyzes were performed by counting 1000, 5000, 10000, 15000, 20000 spermatozoa for each straw. In the study, analysis of variance was used to determine the difference between groups in the measured post-thawed spermatological characteristics. All statistical analyzes were performed by IBM SPSS 23 statistical package program and evaluated considering the criterion of  $p < 0.05$ . As a result of the study, it was observed that the different spermatozoon counted in the flow-cytometrical analyzes of the Acrosomal Integrity ( $p=0.149$ ), High Mitochondrial Membrane Potential ( $p=0.548$ ) and Vitality ( $p=0.347$ ) parameters resulted in statistically similar values and had no effect on the results obtained. According to these results, it was concluded that sperm counts between 1000-20000 were appropriate to use in post-thawed flow-cytometrical analysis of frozen bull semen.

#### **Abstract**

Epigenetics is heritable or non-heritable changes in gene expression without any alterations in DNA. Micro RNAs (miRNAs) are small ncRNAs with 22-24 nt in length, regulating gene expression especially, at the post-transcriptional level. Secondary metabolites such as flavonoids, terpenoids and alkaloids in plants have been commonly used in cosmetics, medicine and other industrial areas. This study aimed to determine the regulatory roles of miRNAs in nine important enzymes involved in the metabolism of flavonoid, phenolic acid, alkaloids, terpenoids, coumarin and stilbene metabolites via *in silico* analyses. For this purpose, reference miRNAs in mountain strawberry (*Fragaria vesca* L.), papaya (*Carica papaya* L.), asparagus (*Asparagus officinalis* L.) and soybean (*Glycine max* L.) were retrieved from miRBase. The number of identified miRNAs was given as strawberry, soybean, papaya, and asparagus, respectively. We determined 10, 40, 5 and 14 miRNAs which target cinnamate-4-hydroxylase while 5, 59, 4 and 9 miRNAs were obtained for chalcone isomerase. Moreover, chalcone synthase enzyme was targeted by 16, 49, 6 and 9 miRNAs whereas 8, 40, 5 and 12 miRNAs were detected for caffeoyl CoA O-methyltransferase. Caffeic acid O-methyltransferase was estimated to have 7, 40, 8, and 16 miRNAs, whereas flavonol synthase was found to have 7, 26, 6, and 12 miRNAs. It was determined that 7, 40, 8 and 16 miRNAs were targeted by caffeic acid O-methyltransferase, while flavonol synthase was targeted by 7, 26, 6 and 12 miRNAs. Another three enzymes showed similar results. 17 miRNAs in strawberry, 41 in soybean, 11 in papaya and 16 in asparagus targeted phenylalanine ammonia lyase enzyme, 6 in strawberry, 50 in soybean, 9 in papaya and 11 in asparagus targeted aromatic-L-amino-acid decarboxylase enzyme, and even 8 in strawberry, 32 in soybean, 6 in papaya and 10 in asparagus targeted tropinone reductase I. Obtaining results of this study are expected to provide possible new insight for further studies related to the optimisation of plant secondary metabolite and also production of novel metabolites with therapeutic benefits.

**Keywords:** Epigenetics, non-coding RNAs, gene expression regulation, medicinal plants

#### Abstract

The injured or damaged articular cartilage is very difficult to regenerate, and the resulting lesion may spread locally. Cell therapy applications based on autologous mesenchymal stem cells (MSCs) with high proliferation and differentiation potential, is recognized as a striking option for treating cartilage injuries. In addition, it is known that progenitor cells in the cartilage tissue has multipotent properties, similar to MSCs. While chondrogenic progenitor cells express some mesenchymal markers, they also express some chondrogenic markers unlike MSCs. In this study, it was aimed to obtain progenitor/stem cells derived from bovine cartilage tissue by explant culture method, and to characterize the isolated cells. The use of slaughterhouse material isn't only eliminating ethical problems but also provides an advantage in terms of the amount of tissue to be collected from the cattle. After washing the hind legs of the cattle, the metatarsophalangeal joint area was disinfected, the joint was opened, and the parts of the articular cartilage was taken from the surface with the help of a scalpel blade. Cartilage tissue pieces were thoroughly washed in PBS with antibiotics, and placed into well plates as 6-7 small pieces in each well, containing culture medium. Cartilage tissue pieces were incubated at 37 °C in an environment with 5% CO<sub>2</sub>. After incubation, the cells were left to proliferate. Progenitor/Stem cells derivation took approximately three weeks. The obtained cells had heterogeneous morphology. In the first passage, the cells showed fibroblast-like morphology. Strong chondrogenic differentiation was noted as a result of differentiation studies. The osteogenic differentiation was evident, but adipogenic differentiation was weak. In future studies, it is planned to determine the gene and protein expression profiles of the isolated progenitor/stem cells. This study was conducted following approval from the experimental Animals Ethical Committee of Afyon Kocatepe University, Türkiye (AKÜHADYEK-50-23; 20.06.2023).

## Özet

Bakterilerin, kendilerini korumak ve üremelerini kolaylaştırmak için oluşturdukları polisakkarit yapılı biyofilm tabakası dezenfeksiyonu zorlaştıran önemli bir faktördür. Bununla birlikte, özellikle patojen bakterilerin oluşturduğu biyofilm tabakaları, hastane enfeksiyonlarının yaygınlaşmasına neden olmakta ve gıda endüstrisinde ürünlerin işlenmesinde problem oluşturmaktadır. Biyofilm tabakaları nedeniyle üretim bantları, borular, zemin ve çeşitli yüzeylerde bakteri birikmekte ve bunlar, patojenlerin çevreye yayılması açısından risk oluşturmaktadır.

Özellikle flagella fonksiyonu olan ve sıklıkla karşılaşılan *Pseudomonas aeruginosa*, *Escherichia coli*, *Salmonella enterica* bakterileri, biyofilm oluşturma potansiyeli yüksek olan bakterilerdir. Bununla birlikte dünya çapında yaygın ve gıda kaynaklı bir patojen olan *Campylobacter jejuni* de biyofilm oluşturma potansiyeli olan bir bakteri olup gıda ve ilaç endüstrilerinde kalıcı bir kirletici haline gelebilir. *C. jejuni*, saf kültüre göre *E. coli* veya *P. aeruginosa* ile birlikte olduğunda daha fazla biyofilm oluşturabilir.

Bakterilerde biyofilm oluşumunu kontrol eden mekanizmada sorumlu molekülün dimerik formda halkalı guanozin monofosfat (c-di-GMP) olduğu anlaşılmıştır. Bakterilere özgü bir nükleotid olan c-di-GMP, biyofilm oluşumunun yanısıra bakteriler arası etkileşim, virulans, flagella fonksiyonları ve motilite gibi bakterinin hayati fonksiyonlarını da kontrol etmektedir. Dolayısıyla c-di-GMP aktivitesinin engellenmesi, bakterilerin hayati fonksiyonlarını sonlandırabilecek, biyofilm oluşumunu engelleyebilecek bir etki yaratır. Molekül yapısı incelendiğinde c-di-GMP, yapısında bulunan dimerik formdaki guanozin grupları nedeniyle belirli şartlarda cis formda dört katlı ve sekiz katlı yapılar oluşturabilmektedir. Düşük konsantrasyonda K<sup>+</sup> tuzu varlığında bu yapıların oluştuğu gözlenmiştir. Bununla birlikte yüksek konjugasyona sahip çoklu aromatik bileşikler de c-di-GMP'nin katlı yapılar oluşturmalarını sağlamaktadır. Katlı yapılar oluşturan c-di-GMP çökerek aktivitesini kaybeder.

Yapılan çalışmada, yüksek konjugasyona sahip çoklu aromatik bileşikler sentezlenerek bunların biyofilm engelleme kabiliyetleri incelenmiştir. Aromatik gruplar içeren aldehit ve amin bileşiklerinin basit bir imin oluşum reaksiyonu ile yüksek konjugasyona sahip çoklu aromatik bileşikler elde edilmiş ve özellikle sağlık ve gıda alanında biyogüvenlik açısından tehdit oluşturan bakterilerden *E. coli* ve *C. jejuni* üzerinde denenmiştir. Deneyleerde kullanılan çoklu aromatik bileşiklerin c-di-GMP ile etkileştiği UV spektroskopisi ile izlenerek anlaşılmıştır.

**Anahtar Kelimeler:** Biyofilm, c-di-GMP, *C. jejuni*, *E. coli*

#### Abstract

Fe<sub>3</sub>O<sub>4</sub> nanoparticles have emerged as promising candidates for drug delivery applications due to their inherent benefits, including small particle sizes, thermal stability, biocompatibility, and large surface areas. This study focuses on the synthesis of Fe<sub>3</sub>O<sub>4</sub> nanoparticles as a drug delivery system using the co-precipitation method and their subsequent modification with chitosan as a binder. Through the co-precipitation method, Fe<sub>3</sub>O<sub>4</sub> nanoparticles were successfully synthesized and subsequently functionalized with chitosan, creating a stable and efficient drug carrier system. Asafoetida, a natural medicinal substance known for its therapeutic properties, was chosen as the drug active ingredient and successfully loaded onto the nanoparticles. Characterization studies were conducted to validate the successful synthesis, functionalization, and drug loading process. The drug release behavior from the Fe<sub>3</sub>O<sub>4</sub>-chitosan-*F. assafoetida* nanoparticles as a potential controlled drug release system was systematically investigated. The findings demonstrated the successful synthesis and modification of Fe<sub>3</sub>O<sub>4</sub> nanoparticles with chitosan as a drug delivery system, effectively encapsulating the therapeutic Asafoetida extract. This study lays the foundation for utilizing these novel nanoparticles in targeted drug delivery applications, offering a promising avenue for enhancing therapeutic efficacy and minimizing side effects through controlled drug release mechanisms.

**Key words:** Fe<sub>3</sub>O<sub>4</sub> MNPs, Chitosan, *Ferula assafoetida*, Drug delivery systems, Drug release.

#### Özet

Postmortem örneklerde ölüm nedeni tayininde alkolün varlığı ve ölüm nedeni üzerindeki etkisini tespit etmek oldukça zordur. Alkol antemortem alkol alımı, postmortem alkol sentezi ya da mikroorganizmaların varlığına bağlı olarak vücutta oluşabilir. Ölüm koşulları, ortam sıcaklığı, örnek alma yöntemleri, örneklerin taşınması, ölüm ile alkol analizi arasından geçen süre gibi parametreler yüksek miktarda alkol oluşmasına neden olabilir. Oluşan alkolün endojen olup olmadığının tespiti için farklı teknikler kullanılmaktadır. Bu yöntemlerden en güvenilir olanı Etanol Faz II metabolitleri olan etil glukronid ( EtG) ve etil sülfatın (EtS) dedeksiyonu ve miktarlı analizidir. Bu konjuge metabolitler ölümden önce etanol alımını kanıtlamaktadır. EtG ve EtS, Etanol alımını takiben oluşur ve belirli bir süre sonra maksimum konsantrasyona ulaşır. ( EtG) ve etil sülfatın (EtS) yokluğu kanda tespit edilen etanolün endojen olduğunun kanıtıdır ayrıca bu metabolitlerin kanda tespiti ölüm öncesi alkol alındığının kanıtıdır. Bu çalışmada kan etanol konsantrasyonu 10 mg/dL üzerindeki örnekler çalışmaya kabul edilmiştir. Kan örnekleri protein çökürme yöntemi ile hazırlanarak LC-MS/MS yöntemi ile EtG ve EtS analizi yapılmış ve vakalardaki alkolün endojen olup olmadığı tespit edilmiştir. Kanda EtG ve EtS tespit edilmiş örneklerle kandaki etanol konsantrasyonu ile EtG ve EtS konsantrasyonları arasında bir ilişki olup olmadığı araştırılmıştır.

**Anahtar Kelimeler:** Etil Glukronid, Etil Sülfat, ETG, ETS, LC-MS/MS, postmortem

#### Abstract

Parkinson's disease (PD) is an increasingly prevalent neurodegenerative disorder that impacts a rising global population (1). The pharmacological treatments for PD include a range of medications, including levodopa, dopamine agonists such as ropinirole, MAO-B inhibitors including selegiline, COMT inhibitors such as entacapone, and medicines with cholinergic activity, exhibited by benztropine (2).

In the context of therapeutic applications, inhibitors targeting MAO-B have predominantly been employed for the management of Parkinson's and Alzheimer's diseases (3). Also, it is essential to advance the development of medication candidates that exhibit a reduced prevalence of adverse effects. Hence, the objective of this study was to conduct an initial assessment of the efficacy and specificity of phenylurea-bearing hydrazones as monoamine oxidase inhibitors.

Phenylurea-bearing hydrazones were synthesized, and their chemical structures were confirmed via <sup>1</sup>H NMR, <sup>13</sup>C NMR, and HRMS methods. The synthesized compounds were investigated for their hMAO-A and hMAO-B inhibitory activity by an *in vitro* fluorometric method. MTT test was employed to identify the cytotoxic properties of the lead compound against SH-SY5Y cell line which has been used in various areas of neuroscience (4).

Hydrazones represent a category of compounds that bear similar to hydrazine and exhibit advantageous biological characteristics, notably their significant capacity to inhibit monoamine oxidase. Among the compounds tested in this study, 1-(2-(2-(4-chlorobenzylidene) hydrazine-1-carbonyl) phenyl)-3-phenylurea showed selective and potent MAO-B inhibition. The compound's inhibitor concentration 50 (IC<sub>50</sub>) value was 0.042±0.001 μM against MAO-B similar to reference selegiline. MTT assay was carried out for the compound to clarify whether the compound is toxic or non-toxic towards SH-SY5Y cell line. MTT results showed that the IC<sub>50</sub> value of the compound was 166 μM. Consequently, the compound tested was found to be non-cytotoxic at its effective concentration against MAO-B. Neurotoxicity-induced SH-SY5Y model (5) is planned to see whether the compound has also neuroprotective effect for further studies.

**Keywords:** Parkinson's disease, phenylurea-bearing hydrazones, cytotoxicity test.

**Acknowledgments:** We thank to Assoc. Prof. Dr. B. Nurpelin Saglik for enzyme assay study.

#### Abstract

The Fiber Loop Ringdown Spectroscopy (FLRDS) technique is an ultra-high sensitive measurement technique that merges the features of fiber optic sensing and the Cavity Ringdown Spectroscopy (CRDS) technique. The FRLDS sensor system consists of a light source, a photodiode, single mode fiber (SMF) and electronic equipment can be employed either individually or as a network platform for sensing several quantities such as strain, pressure, refractive index, temperature, biological cells, chemical species etc. In the FLRDS system, optical loss of a light pulse in the fiber loop is measured by the light decay time constant. To detect a quantity in FLRDS system, time is measured, hence the FLRDS is called as a time-domain sensing technique. FLRDS sensor system has high sensitivity, fast response, real-time monitoring, portability, and low cost. In this study, a strain sensor and a pressure sensor were connected in parallel and setup a sensor network to monitor strain and pressure change simultaneously. Two different fiber loops were utilized with a same continuous laser light source at 1550 nm central wavelength. The strain sensor of 20 cm length was stretched up to 5 cm, resulting 0.12  $\epsilon$  strain sensitivity and the pressure was applied up to  $15.68 \times 10^5$  Pa. Changes in parameters were recorded separately and simultaneously monitored. Results proved that the FLRDS sensors can be utilized for the early detection in structural health monitoring applications as well as biomedical, physical, chemical applications.

**Keywords:** FLRDS technique, sensor network, fiber optic sensor, fiber loop, ringdown, single mode fiber.

Correspondence email: selma.usturk@emu.edu.tr

#### Abstract

The importance of synergistic combinations, as well as the usage of medicines alone, is growing in today's cancer treatment. In this study, the pharmacological effect of the synergistic combination of Ciprofloxacin, Quercetin and Curcumin on colon carcinoma cells (HCT-116), as well as its antiproliferative activity, were studied.

Various concentrations of Ciprofloxacin (Cpx) (10, 20, 40, 80, and 100 M) and various combinations of ciprofloxacin (Cpx), curcumin (Cur), and quercetin (Que) were treated with HCT-116 cells in a dose- and time-dependent manner (24, 48 hours). Using the CompuSyn software, after 48 hours of treatment, the IC<sub>50</sub> values for Cpx were discovered to be 56.49 μM. The IC<sub>50</sub> values of quercetin and curcumin were determined before and reported as 454 μM and 12.0 μM respectively [1].

Cell viability analysis was repeated using varying concentrations of the combinations of ciprofloxacin (Cpx), curcumin (Cur), and quercetin (Que), and the data were entered into the Compusyn software to identify the doses at which the three chemicals were synergistic. The CI values calculated for various combinations of Cpx, Cur, and Que. Results suggest that every combination that was examined has high or extremely strong synergistic effects.

When ciprofloxacin (Cpx), curcumin (Cur), and quercetin (Que) were used together, the ciprofloxacin doses used alone were lowered by approximately 10 times while achieving the same 50% killing on cancer cells. The efficacy of this combination in cancer treatment should be investigated through mechanisms as well as evaluated *in vivo*.

**Keywords:** Ciprofloxacin, strong synergistic, Cell Proliferation, HCT-116 cells

### Koyunlarda reproduktif organlarda Doppler ultrasonografinin kullanım alanları

Çağla Nur Küçükbecir<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-9687-1702>)

<sup>\*1</sup>İstanbul Üniversitesi-Cerrahpaşa Lisansüstü Eğitim Enstitüsü, İstanbul, Türkiye

\*Sorumlu yazar e-mail: [caglakucukbekir@hotmail.com](mailto:caglakucukbekir@hotmail.com)

#### Özet

Ultrasonografi, iç organ ve dokuların gerçek zamanlı, non-invaziv, zararsız görüntülenmesine olanak sağladığından, tanı ve araştırmalarda sıkça kullanılan bir tekniktir. Ultrasonografinin bir tekniği olan Doppler, kan akışının belirlenmesini sağlar. Doppler ultrasonografi; gebelik muayenesi, fetal-plasental bağın izlenmesi, uterustaki fizyolojik veya patolojik değişiklikler, ovaryum muayenesi, üreme potansiyelinin değerlendirilmesi gibi olguların incelenmesine olanak sağlar. Kedi, köpek, inek, at gibi türlerle birlikte koyun ve keçilerde de tanı amaçlı tercih edilmektedir. Koyunlarda Doppler ultrasonografi, fetal gelişimin araştırmalarında kullanılmaya başlanmıştır. Power Doppler, küçük çaplı damarlardaki kan akışını ölçmede hassastır. Bu nedenle ovaryumlardaki kan akışını değerlendirmede oldukça yararlıdır. Renkli Doppler ile yalnızca graaf foliküldeki kan akışı saptandığından, buradaki değişiklikleri belirlemek, ovulatör olan ve olmayan foliküllerin vaskülaritelerini ayırt etmede yararlıdır. Ayrıca, üreme dönemlerinde genital organların kan akışındaki değişikliklerin belirlenmesinde uterus ve ovaryumların vasküler perfüzyonunun belirlenmesinde kullanılmaktadır. Gebe hayvanlarda fetal dokudaki artan veya azalan vaskülarite ve fetomateryal kan akışının değerlendirilmesinde Doppler ultrasonografiden yararlanılır. Koyun fetüslerinde sık incelenen damarlar, umbilical arter, aorta ve umbilikal vendir. En sık değerlendirilen maternal damarlar ise uterin arter ve uteroplazental arterdir. Umbilical arter, sıklıkla fetomaternal kan dolaşımının değerlendirilmesinde incelenir. Fetoplazental kılcal yatak hakkında bilgi vererek, direncin artması halinde fetal riskin erken belirlenmesinde faydalıdır. Kan akımının incelenmesi, fetüs büyümesinin kısıtlandığı durumlarda plasental yetmezliği saptamada önemlidir. Embriyo transferlerinde, donörlerde kullanılan luteal fonksiyonun değerlendirmesinde de Doppler ultrasonografiden yararlanılmaktadır. Luteal vaskülarizasyon ile korpus luteumdan progesteronunun üretilmesi arasında bir bağlantı olduğu, fonksiyonel luteolizin yapısal luteolizden önce olduğu düşünülecek olursa, fonksiyonel korpus luteum ile gerilemiş korpus luteum arasında bir ayrım yapılması sağlanır. Bundan dolayı, koyunlarda intraovulator aralığın belirli aşamalarında ve erken gebelikte korpus luteumun sağlığı hakkında kullanılabilir. Koyunlarda yukarıda belirtilen reproduktif organların patofizyolojik hallerinin irdelenmesinde Doppler' in güncel kullanımı anlatılmıştır.

**Anahtar Kelimeler:** Koyun, Doppler, reproduksiyon

#### Abstract

Nematic liquid crystals have been extensively used in optoelectronic devices, especially in displays. Furthermore, many dopant materials are preferred to improve and develop the properties of nematic liquid crystals and new composites are formed. This study reports the impact of 4'-[(S)-2-Methylbutyl]biphenyl-4-carbonitrile (CB15) chiral dopant concentration on frequency dependent dielectric properties of 4-pentyl-4'-cyanobiphenyl (5CB) nematic liquid crystal. Dielectric parameters (dielectric constants, dielectric anisotropy, relaxation frequency and relaxation time) were determined with dielectric spectroscopy method. Enhancement in the dielectric constants was observed with increasing CB15 concentration in 5CB. Moreover, significant changes were seen in relaxation frequency and relaxation time with CB15 contribution. From this perspective, outcomes of the current study are remarkable and will provide insights for composites to be prepared with 5CB and CB15.

**Keywords:** 5CB nematic liquid crystal, CB15 chiral dopant, dielectric properties.

#### Abstract

Lactate, in particular, has emerged as a salient biomarker with applications in health surveillance and the evaluation of athletic performance. This research is centered on the creation of an electrochemical biosensor system tailored for the analysis of lactate, facilitated by the incorporation of nanorod-modified electrodes. Nitrogen-doped carbon nanorods were synthesized through a hydrothermal approach and subsequently applied to the electrode surface in various configurations (drop casting and electrodeposition) and concentrations (1 mg/mL, 1.5 mg/mL, and 2 mg/mL). The biosensor's design entails the incorporation of lactate oxidase (LOx) enzymes onto the surface of nanorod-modified electrodes, which present a heightened surface area. These nanorods enhance enzyme immobilization and foster efficient electron transfer, thus optimizing the identification of the analyte.

The biosensor's efficacy was evaluated in terms of its sensitivity, selectivity, and stability. The nanorod-modified electrode demonstrated remarkable sensitivity and selectivity in detecting lactate, attributed to its extensive surface area and augmented enzyme loading. Consequently, precise quantification of low lactate concentrations was rendered feasible. Moreover, the biosensor's practical utility was gauged by introducing lactate into serum samples. The outcomes gleaned from these samples corroborated the biosensor's dependability and its capacity for real-time lactate monitoring. The biosensor's stability and consistency were also subjected to comprehensive examination to ensure sustained operational integrity and practical viability. This research highlights the significant progress made in the field of electrochemical biosensors, specifically with regards to the detection of analytes.

#### Özet

Solanaceae familyasından domates (*Solanum lycopersicum* L.) ülkemizde başta Akdeniz, Ege, Marmara, Karadeniz ve Güneydoğu Anadolu Bölgeleri'nde açıkta ve örtü altında geniş alanlarda yetiştiriciliği yapılan önemli kültür bitkilerimizden biridir. Domateste Fusarium solgunluğu; *Fusarium oxysporum* f. sp. *lycopersici* (Sacc.) W. C. Snyder & H. N. Hans (FOL) ile kök ve kök boğazı çürüklüğü hastalığı; *F. oxysporum* f. sp. *radicis-lycopersici* Jarvis & Shoemaker (FORL) ekonomik kayıplara neden olan önemli hastalıklardır. Bu çalışmada, yerel rizosferik *Trichoderma* izolatlarının domateste Fusarium kök ve kök boğazı çürüklüğü hastalığına karşı (FORL) etkinlikleri in vitro'da ikili kültür çalışması ile değerlendirilmiştir. *Trichoderma* izolatlarının hiçbiri 37°C'de gelişme göstermediğinden insanda patojenik olmadıkları değerlendirilmiştir. Kültür koleksiyonundan temin edilen ve antibiyosis etkinliği bilinen iki adet *T. harzianum* izolatı da (T16 ve T23) denemelere dahil edilmiştir. İkili kültür testinde toplam 36 adet izolattan sadece bir izolat Kny/T1-2 (Konya) patojene karşı hiperparazitik etki gösterirken diğerleri antibiyosis etkisi göstermiştir. Antibiyosis etkisi gösteren iki izolat T23 ve Dyb/T10-6 (Diyarbakır) sırasıyla %72,56 ve %58,75 inhibisyon oranı ile patojenin miseliyal gelişimine karşı diğer izolatlardan daha başarılı bulunmuştur. *Trichoderma* izolatları FORL miseliyal gelişimini %35,34'den %72,56'ya kadar değişen inhibisyon oranlarında sınırlandırmıştır. Analizler sonucunda 14 adet *Trichoderma* izolatının ikili kültür testinde kontrole göre başarılı oldukları saptanmıştır. Bu izolatların tohum çimlendirme denemelerinde de kolonizasyon yetenekleri açısından benzer başarıyı gösterdikleri belirlenmiştir.

**Anahtar Kelimeler:** Domates, FORL, *Trichoderma*, ikili kültür

Dipnot: Bu çalışma Erciyes Üniversitesi Bilimsel Araştırma Projeleri BAP-YL-12545 nolu proje kapsamında desteklenen yüksek lisans tez çalışmasının bir kısmını içermektedir.

#### Abstract

Pyridine-containing compounds constitute a class of significantly N-heterocycles. The compounds frequently occur in bioactive natural products, and are widely utilized as versatile building blocks for the preparation of pharmaceuticals, organic materials and agrochemicals. Therefore, the development of synthetic materials bearing pyridine groups has attracted considerable interest in organic, inorganic and medicinal chemistry [1]. As a most known class of macrocyclic aromatic compounds, phthalocyanines (Pc) are compounds that have demonstrated several interesting properties such as high chemical and thermal stability, rich redox chemistry, delocalized 18 p electron system suitable for electrontransfer processes. Besides, Pcs are compatible with chemical modifications with changing of central metal and/or changing of number and position of substituted groups to improve their required features [2]. Because of these properties, phthalocyanines are preferred as functional materials in different technologies, such as electrochemical sensors solar cells, gas sensors, nonlinear optics, semiconductors, liquid crystals, photovoltaics, catalysts, electrochromics, and photosensitizers in photodynamic therapy (PDT) [3]. However, low solubility of phthalocyanines in water and organic solvents and strong aggregation are the biggest disadvantages of these molecules. In this study, manganese(III) phthalocyanines containing water-soluble non-peripheral octa-pyridine groups were synthesized and the aggregation properties were investigated.

This work was supported by KTU-BAP (Project No: 10412).

#### Abstract

Tetra Pak®, known as Composite Packaging, was patented by Ruben Rausing for liquid foods and came to life as Erik Wallenberg's idea. [1]. This original packaging was originally made of wax paper. Today, multi-layer Tetra Pak® packaging consists of laminated rigid paper, LDPE and aluminum foil. In general, technologies applied to PCBCs are divided into those that reprocess them as a blend and those that involve a previous step to remove cellulosic fibers. In the first case, PCBCs are subjected to thermal treatments (incineration, pyrolysis, gasification) together with other products for energy recovery. In the second case, the removal of paper is carried out by hydropulping. This process; in the presence of water, cellulosic fibers are separated from the plastic and aluminum layers by centrifugal forces. [2]. Waste of paper recovery, outer LDPE layer and Al-PE laminate, usually contains up to 4-5% paper fibers. Due to its high heat treatments it is mostly used for energy recovery in heat treatments. Al<sub>2</sub>O<sub>3</sub> obtained as a result of these processes is generally used in the cement industry because it is beneficial for cement production. [3]. Alcoa Aluminio also uses gasification applications, such as the Klabin and TSL Ambiental plant, which use plasma gasification to convert plastic on the other hand to paraffin and recover aluminum in its pure form. [4]. In general, there are methods of recovery of PolyAl® from Tetra Pak® wastes in the literature, but the difficulties of using this material with polyolefins are expressed.

In this study, the use and synthesis of a compatibilizing agent was carried out to turn PolyAl® granules obtained from Tetra Pak® wastes into a masterbatch with polymers such as polyethylene and polypropylene. For this purpose, acidic modification of sepiolite with maleic anhydride was carried out. Analytical and spectroscopic characterization of the obtained powder material was carried out. Then, PE and PP extrusion was carried out with the additive obtained at the rate of 5%. PPRC pipe was produced from the obtained granules. Strength and rheological tests for PPRC pipe show that the strength of the PE-compatibility-PolyAl® (A2) masterbatch used in the PPRC pipe interlayer has improved by 64% compared to the PE-PolyAl® (A1) masterbatch. In the optical microscope images, it is seen that the microcracks have disappeared.

**Keywords:** Polyolefins, Tetra Pak®, Masterbatch, Recycling

\*E-mail: sdasirin@hotmail.com

#### Abstract

Cancer is a fatal disease with a growing mortality rate each year, and it is one of the most serious threats to human health worldwide. Drug resistance, recurrence, and metastasis are all risks of conventional therapy. As a result, there is an urgent need to discover new medications that are both effective and have few adverse effects in order to prevent and treat various forms of cancer. Natural products are at the forefront of anti-cancer chemotherapeutic approach because they have shown considerable promise in preventing and treating cancer. Cyanogenic glycosides are a significant and common class of plant natural products. The objective of this research is to examine at the ADME features and molecular docking of cyanogenic glycosides (amygladin, dhurrin, linamarin, lotaustralin, prunasin, and taxiphyllin) with apoptotic proteins (BAX, BCL2, CASP3, CASP8, CASP9, CYCS, and P53). The ADME study was carried out using the SwissADME program, which was used to compute physicochemical descriptors as well as forecast ADME parameters, pharmacokinetic features, druglike nature, and medicinal chemistry friendliness of one or more small compounds to aid in drug development. The molecular docking analysis were performed by using an CB-Dock2 program to find the binding mode of the ligands to target proteins. The SwissADME demonstrated that results for cyanogenic glycosides (especially amygladin, dhurrin, prunasin, and taxiphyllin) are mostly in the acceptable range. The molecular docking demonstrated a high affinity interaction between the cyanogenic glycosides and the apoptotic proteins. The results showed the significant potential of cyanogenic glycosides to be used as anticancer agents.

**Keywords:** ADME study, Alzheimer disease's, anticancer agent, cyanogenic glycosides, molecular docking.

#### Abstract

A facile and environmentally friendly strategy for the synthesis of graphene/ZnO nano-photocatalysts for the removal of methylene blue under natural sunlight irradiation is described. The graphene/ZnO nanocomposites were successfully synthesized by a green synthesis method. Zinc acetate in an aqueous solution was reduced with corn starch and the graphene was synthesized by a modified Hummer's method from graphite waste derived from pencil rods. The morphology, structure and photocatalytic activity of the nanocomposites were characterized by scanning electron microscopy, transmission electron microscopy, X-ray diffraction spectroscopy and UV-Vis absorption spectroscopy. The ZnO nanoparticles were incorporated between the monolayers of graphene nanosheets by sonication. Based on the electronic conductivity and band gap property, the photocatalytic activity of the graphene/ZnO nanocomposites showed >95% degradation of methylene blue under natural sunlight. Photocatalytic degradation of methylene blue showed no significant decrease after the 5th cycle under natural sunlight. Although ZnO NP-only showed significant removal efficiency under sunlight irradiation, graphene/ZnO nanocomposites facilitate decontamination faster. The obtained results show better degradation rate, waste recovery, environmentally friendly simple synthesis, cost-effective strategy, and promise the development of large-scale adaptation.

#### Abstract

Molds, which are very common in nature and threaten animal health and human health; It is accepted as one of the contaminants that cause hazards in processed, unprocessed or semiprocessed food products along with agricultural products. Mitotoxins are considered as metabolites of molds that cause health problems. Mycotoxicosis is the whole of the health problems experienced as a result of the consumption of these toxins as food by animals and humans. Mycotoxins have many effects such as estrogenic, teratogenic, carcinogenic, mutagenic, dermatotoxic, hepatotoxic, nephrotoxic effects. In this project, food products that are frequently used in daily life among the public were purchased in two forms, packaged and open. All food products were kept for a certain period of time to mold after washing with tap water and boron. The amount of mold formed on the moldy food products was measured in accordance with the Eliza kit and test kit protocols. There was no difference in the amount of T-2 toxin in food products washed with boron solution and tap water. However, it was determined that aflatoxin increased more in products washed with tap water.

#### Abstract

The aim of this project was to prevent the waste of vegetables and fruits in the cafeterias of schools and in daily life from going to waste and to utilize them for human health and life. Examples of common vegetables and plants used in daily life (parsley (*Petroselinum crispum*), leek (*Allium ampeloprasum*), green apple, red apple (*Malus domestica*), orange (*Citrus sinensis*), grapefruit (*Citrus paradisi*), lemon (*Citrus limonum*), kiwi (*Actinidia deliciosa*) were selected. It was observed that not only in school cafeterias, but also in places such as street markets and markets where these vegetables and plants are sold, wastes of vegetables and fruits remain and go to the garbage. As a result of these observations, these wastes of vegetables and fruits were collected. Then, samples were taken from each of them by weighing them to the same extent and mixed. This cell extract was first obtained from the mixture of these vegetable and fruit wastes. This cell extract was then tested for antibacterial, antifungal and antioxidant properties. As a result of these tests, it was found to be antibacterial, antifungal and antioxidant. In addition, it was determined that the same extract was not toxic as a result of the cytotoxicity test. This extract was used in the production of cream. Thus, a useful product for human health and life was obtained from the useful parts of vegetable and fruit wastes used in daily life.

#### Abstract

The aim of this research was to explore the correlation between the mechanisms at the molecular level responsible for liver damage caused by long-term tobacco usage, the caspase cascade, and the Akt/NF-κB signaling pathway. Additionally, the study investigated the protective effects of dexpanthenol (DEX) in this context. Male rats were administered intraperitoneal injections of nicotine at a concentration of 0.5 mg/kg/day and/or DEX at a concentration of 500 mg/kg/day for 8 weeks. After administration, liver function tests were performed on serum samples, and tissue samples were examined for Akt, NF-κB, Bax, Bcl-xL, Caspase-3, and Caspase-9 protein levels, as well as histopathological changes. Additionally, analyses of oxidative stress markers and proinflammatory cytokines were performed. The administration of nicotine resulted in elevated levels of IL-6, IL-1β, MDA, TOS, and OSI, while TAS levels exhibited a reduction. In addition, nicotine administration led to a decrease in the p-Akt/Akt ratio, an increase in NF-κB, Bax, Caspase-3, and Caspase-9 protein levels, and a decline in the antiapoptotic protein Bcl-xL. Notably, DEX intervention effectively mitigated these indicators, restoring them to levels akin to those seen in the control group. The liver damage initiated by nicotine prompted oxidative stress, inflammation, and apoptosis via the modulation of Bax/Bcl-xL, Caspase-3, Caspase-9, and Akt/NF-κB pathways. In contrast, DEX intervenes by mitigating nicotine-induced liver injury through the regulation of apoptosis involving NF-κB, Caspase-3, Caspase-9, inhibition of Bax, and activation of Bcl-xL.

**Keywords:** Nicotine, dexpanthenol, liver, apoptosis, inflammation, oxidative stress

#### Abstract

Colorectal cancer (CRC) was the third most common cancer worldwide in 2020 and the second leading cause of cancer deaths. Although the common treatment strategy for CRC is chemotherapy; toxicity, acquired resistance and low tumor-specific selectivity are still the main impediments to current clinical success. In recent years, it has been stated that changes in the cellular expression levels of specific proteins with roles in checkpoint pathways through carcinogenesis such as cell cycle regulators contribute to malignant phenotypes, making them as possible therapeutic targets for cancer therapy. Among these proteins, one group of cell cycle regulators is Aurora Kinases (AURKs) which contains three members: Aurora Kinase A (AURKA), Aurora Kinase B (AURKB), and Aurora Kinase C (AURKC). While AURKA and AURKB are expressed in most somatic cells, AURKC is limited to meiotic cells. AURKs are belonging to the family of serine/threonine kinases that serve as mitotic regulators with an important role in various stages of the cell cycle such as centrosome separation and maturation, kinetochore-microtubule interaction, regulation of cytoskeletons, spindle-assembly checkpoint, completion of cytokinesis and chromosome compaction. The overexpression of AURKs is evident in numerous different human cancers or solid tumors, including colorectal cancer, which is associated with its clinicopathological parameters and overall survival time. Therefore, Aurora Kinase inhibition is a potent anticancer strategy and there are many selective and pan Aurora Kinase Inhibitors (AKIs) on different phases of clinical development. In preclinical studies, AKIs have exhibited promising results by showing antiproliferative activity and their ongoing Phase-I and Phase-II clinical trials as anticancer molecules have also yielded in encouraging results for future studies.

### Exploring the Impact of Pan-AURKs and Selective AURKB Inhibitors on Non-Small Cell Lung Cancer

Elif Rumeysa Özsoy<sup>1\*</sup> (ORCID:<https://orcid.org/0009-0008-6040-9875>),  
Sibel Sari<sup>2</sup> (ORCID: <https://orcid.org/0000-0002-2505-5804>)

<sup>\*1,2</sup> Abdullah Gul University, Faculty of Life and Natural Sciences, Molecular Biology and Genetics,  
Kayseri, Turkey.

\*Corresponding author e-mail: [elifrumeysa.ozsoy@agu.edu.tr](mailto:elifrumeysa.ozsoy@agu.edu.tr)

#### Abstract

Aurora Kinase B (AURKB) is a mitotic serine/threonine protein kinase belonging to the highly conserved Aurora Kinase family of mitotic kinases, along with Aurora Kinase A and Aurora Kinase C. AURKB is a kinase module of the Chromosomal Passenger Complex, which plays critical roles in the cell cycle, including chromosome compaction and segregation, the spindle-assembly checkpoint and cytokinesis. While AURKB is ubiquitously expressed in healthy cells, it is overexpressed in various human cancers, including lung cancer. Lung cancer is the leading cause of global cancer mortality and incidence, with approximately 2.2 million diagnoses and 1.8 million deaths. Non-small cell lung cancer (NSCLC) is the most common type of lung cancer, accounting for 80-85% of all cases. In NSCLC, AURKB overexpression has been found to be associated with a negative prognosis, poor therapeutic response, and decreased overall survival rate, suggesting that AURKB may be a potential prognostic biomarker. In the past decades, pan-AURKs and selective AURKB inhibitors have been tested in preclinical studies, and some of them have progressed to different stages of clinical trials. Based on preclinical studies conducted on NSCLC cell lines, selective AURKB inhibitors lead cancer cells to apoptosis by causing the formation of cytokinesis defects, polyploidy and impaired chromosome alignments. Pan-AURKB inhibitors that target all AURKs for inactivation exhibit antitumor activity, and some of them tested in patients with NSCLC have shown satisfactory tolerance and a manageable safety profile. Since AURKB has different roles directly or indirectly in NSCLC progression, both pan-AURK and selective AURKB inhibitors have shown anticancer properties based on preclinical studies. Some of their Phase-I and Phase-II clinical trials have yielded desired results, encouraging future studies in this direction.

#### Abstract

Controlled drug delivery systems are platforms that enable the drug to reach its effect in a certain speed-time, while minimizing the side effects of the drug in the body and providing the drug in a personalized and correct dose. Its main task is to transfer the active ingredient of the drug directly to the therapeutic area and to transfer the concentration of the right dose to that pathological area at the right time. Considering the disadvantages of the traditional drug release (i.e. repeated dosing, cost, causing toxicity, poor bioavailability, poor adsorption from target side) from capsules, injections, creams, it is possible to understand the reason for the increased interest in controlled drug release.<sup>1,2</sup>

Pemetrexed disodium 2,5 hydrate (PEM) compound is a drug active ingredient used in the treatment of pleural mesothelioma and non-small cell lung cancer. This active substance is sent to the organism by traditional methods. However, by traditional ways, this active substance has access to many areas outside of the pathological area. As a result, many side effects are seen in patients who receive the treatment. Realization of PEM release with electrical field sensitive hydrogels is a promising way to solve such problems.<sup>3-4</sup>

In this study, a novel drug delivery system consists of polypyrrole (PPy)/Polyethylene glycol diacrylate (PEGDA)/2-Hydroxyethyl acrylate (HEA)/ Ethylene glycol dimethacrylate (EGDMA) hydrogel was prepared for electrically triggered release of PEM and characterized by electrochemical and spectroscopical techniques. The electrically controlled in vitro drug release profile of the prepared electroactive PPy/PEGDA/HEA/EGDMA hydrogel<sup>1</sup> was also investigated.

Scheme 1 : Schematic representation of the 3-electrode system to be used in PEM loading and release

#### Abstract

Graphite is a three-dimensional form of carbon, which is composed of stacked graphene layers, which are bound together by van der Waals forces that can be overcome by applying mechanical forces within appropriate organic solvents. However, the most widely available, non-toxic, environmentally friendly and low cost solvent, water, is considered to be a poor solvent, since graphite is hydrophobic. To be able to exfoliate graphite in water, graphite can be oxidized using strong oxidizers to convert it into the hydrophilic form, so-called graphite oxide. However, this is a time consuming and risky process with a relatively high cost, which make this method non-practical. The objectives of this study were to directly exfoliate graphite in water using polyvinyl alcohol (PVA) and polyvinyl pyrrolidone (PVP) to obtain few or multilayer graphene, and then to fabricate silver nanoparticle/multilayer graphene-based nanocomposites by synthesis of silver nanoparticles within the dispersion of the exfoliated material. The reason for using PVA and PVP as dispersing agents is that their ability to act as stabilizers by coating silver nanoparticles, providing shape and size controlled silver nanoparticle synthesis, as well as their help for the direct exfoliation of graphite in water. At this scope, PVA and PVP aqueous dispersions were prepared at specific concentrations and mixed. The required amount of natural graphite (at different initial concentrations) was added into the PVA-PVP aqueous solution and bath sonicated to exfoliate natural graphite. After resting the prepared dispersions for a certain time, supernatant was collected. Silver nanoparticles were synthesized within the prepared dispersion via chemical reduction method. The exfoliated material and the synthesized nanocomposites were characterized by UV-vis spectrometer, Raman spectrometer, X-ray diffractometer, scanning electron microscope and transmission electron microscope. It was revealed that natural graphite was exfoliated into multilayer graphene sheets, and silver nanoparticles/multilayer graphene/PVA/PVP nanocomposites were successfully produced.

#### Abstract

In recent years, the growth of industries has led to a surge in environmental pollution, particularly concerning the rapid increase in various forms of pollution. One prominent issue is the contamination of aquatic environments due to industrial effluents containing synthetic dyes. Even at very low concentrations, these dyes become noticeable pollutants, contributing to visible color pollution. Furthermore, their presence in water sources poses risks to ecosystems due to potential toxicity. Despite attempts using conventional physico-chemical methods, these persistent pollutants remain largely untreated in aquatic systems due to their non-biodegradable nature. To address this, an effective alternative method is biosorption, which has shown promise in tackling water pollution caused by diverse pollutants including synthetic dyes and metals. Notably, fungal biomass has proven to be an efficient biosorbent, often utilized in immobilized forms due to certain limitations within industrial processes.

In this study, a novel biocomposite sorbent obtained that amalgamates both active and passive immobilization techniques. This inventive approach was effectively utilized for the biosorption of Acid Red 1 (AR1) contamination. Initially, the cells of *Thamnidium elegans* (*T. elegans*) were subject to passive immobilization onto an industrial waste product derived from olive pomace. Subsequently, this *T. elegans*/olive pomace biomass combination underwent active immobilization via chitosan entrapment.

The research investigated the influence of various parameters on the batch decolorization process, encompassing initial pH values ranging from 3.0 to 9.0, sorption times ranging from 5 to 30 minutes, and sorbent dosage within the range of 0.001 to 0.012 g. The peak biosorption efficiency reached an impressive 78.09% at a pH of 3.0, utilizing 0.01 g. Equilibrium in biosorption was achieved within 10 minutes. The study's findings shed new light on the advancement of biosorption techniques using natural materials, which could contribute significantly to pollution control strategies.

**Keywords:** Acid red 1, biocomposite, biodecolorization, biosorption, immobilization,

#### Abstract

Hair, which is one of the distinguishing features of mammals, serves many essential biological functions, including thermoregulation, physical protection, sensory activity, and the distribution of sweat gland products, such as pheromones. Hair shafts are produced by thousands of hair follicles in mammalian skin, and these follicles continuously regenerate throughout life. The hair follicle represents a unique, highly regenerative system that physiologically undergoes cycles of growth (anagen), apoptosis-mediated regression (catagen), and rest (telogen) numerous times in life.

The EGFR/RAS/RAF/MEK/ERK pathway has a well-described role in skin and hair follicle development. Its function in the skin and its appendages, including hair follicles, is necessary for proper development and tissue homeostasis, and its deregulation rapidly results in defects in cellular proliferation and differentiation. The SHOC2 phosphatase complex, which comprises SHOC2, MRAS, and PP1, is a key regulatory node required for efficient RAS-RAF-MEK-ERK pathway activation. Here, we have used a conditional SHOC2 knockout mouse model to examine the effect of SHOC2 ablation on hair growth in adult mice. Our earlier findings demonstrate that when SHOC2 is systemically deactivated in adult mice, it leads to skin dermatitis and various histopathological changes, including an increased number of anagen-phase hair follicles within the hypodermis. Therefore, to investigate whether aberrant anagen-phase hair follicles affect hair growth, we depilated age-matched SHOC2 KO and WT male mice and monitored them for 28 days.

The results indicate that there were no significant differences in hair regeneration between SHOC2 KO and WT mice. This suggests that the increased number of hair follicles in the anagen phase in SHOC2 KO mice does not necessarily correlate with increased hair growth.

#### Özet

Günümüzde birçok küçük ve orta büyüklükteki tarım işletmeleri geleneksel yöntemlerle çiftçilik yapmaktadır. Bu durum hem ülke ekonomisine hem de işletmeye büyük ekonomik kayıplara neden olmaktadır. İşletmelerde artan giderler, çiftçilerin yeterli bilgi ve teknik donanımına sahip olmamaları sonucunda birçok insan çiftçiliği bırakmak durumunda kalmaktadır. Çiftçilerin söz konusu üretimi sürdürülebilir hale getirebilmeleri için ise; devlet kurumları tarafından sürekli çeşitli desteklemelerle (gübre desteği, mazot, litre başına verilen süt desteği gibi...vs.) desteklenmek zorunda bırakılmaktadır. Ancak söz konusu yapılan nakdi desteklemeler işletme sahiplerinin bilgi ve tecrübesine katkı sağlamamaktadır. Yapılan nakdi desteklemelerin yerine, verimi artırmaya yönelik teknik bilgi desteğinin uzman eşliğinde sağlanması daha verimli sonuçlar doğuracaktır. Teknik bilgi desteği çiftçilerin üretimdeki verimini artırdığı gibi, çiftçilerin bu süreç zarfında uygulanan yeni teknik bilgileri de öğrenmelerini sağlayacaktır. Kısacası bu süreç zarfında çiftçilerimiz uygulamalı olarak eğitilmiş olacaktır. Teknik bilgi desteğinin sağlayacağı katkıyı ortaya koymak için, yaptığımız iki farklı çalışmada hem süt veriminde hem de canlı ağırlık artışında anlamlı verim artışları elde edilebileceği ortaya konulmuştur. Bu çalışmada, süt veriminin artırılmasında Adıyaman Gerger ilçesinde bulunan Bakırcıoğlu süt işletme çiftliğinde haziran, temmuz, ağustos ve eylül aylarında holstein ırkı 25 adet süt sığırı üzerinde Yalın Altı Sigma metodolojisinin prosesi uygulanmıştır. Bu çalışmanın sonucunda süt veriminde yaklaşık %67 oranında verim artışı sağlandı. Haziran ayında altı sigma metodolojisi ile işletmenin mevcut durumu izlenip verim kayıplarına sebebiyet veren etkenler tanımlanarak, 2.laktasyonda bulunan süt sığırlarının süt ortalaması 15.3 litre/gün'den, Eylül ayı sonunda 22.53 litre/gün'e çıkarılmıştır. Diğer bir çalışma ise Erzincan Refahiye'de bulunan Zeybekler hayvancılık besi işletmesinde canlı ağırlık artışı konusunda yapılmıştır. Bu çalışmada da işletmenin verimini artırma sürecinde istatistiksel destekli Yalın Altı Sigma prosesi uygulanmıştır. Zeybekler besi işletmesinde rastgele seçilen 50 tane Holstein sığırın kulak numaraları kayıt altına alınmış ve besinin 3. ayında bir ay süre ile sığırlar (İso 9001 sertifikalı) ticari yem ile beslenerek canlı ağırlık artışları kaydedilmiştir. Besinin 4. ayında ise sığırlar Yalın Altı Sigma prosesleri sonunda hazırlanan ve Altı Sigma rasyonu olarak tanımladığımız yeni rasyonla beslenmiş ve günlük canlı ağırlık artışları 0,79 kg/gün'dan 1,250 kg/gün'a çıkarılmıştır. Sonuç olarak besi işletmesinde günlük canlı ağırlık artışında ortalama % 62 oranında artış sağlanmıştır (p<0.01). Çiftçilerimize nakdi yardım yerine teknik tarım desteğinin sağlanması daha etkili olmuş ve bu uygulamanın hem ülke ekonomisine hem de çiftçinin gelirinin artışında daha fazla katkı sağlayacağı ortaya çıkmıştır.

**Anahtar Kelimeler:** Yalın Altı sigma metodolojisi, süt verimi, canlı ağırlık artışı, verim kaybı, rasyon

<sup>\*1</sup> İzmir Kâtip Çelebi Üniversitesi, Su Ürünleri Fakültesi, Temel Bilimler Bölümü, İzmir, Türkiye

\*Sorumlu yazar e-mail: [acaglaroruc@gmail.com](mailto:acaglaroruc@gmail.com)

#### Özet

Sucul ekosistemler günümüzde kirlilik, aşırı avcılık, yapılaşma, istilacı türler ve iklim değişikliği gibi baskıların giderek artan olumsuz etkilerine maruz kalmaktadır. Balıklar ise sucul ekosistemlerin sağlığı ve işleyişindeki kilit rolleri ile elzem canlılardır. Balık biyoçeşitliliğinin tespiti ve periyodik takipleri sucul ekosistemlerin mevcut sağlık durumunun belirlenmesi, ilerleyen süreçteki değişimleri hakkında yorum yapılmasına olanak sağlamaktadır.

Balık topluluklarını etkili bir şekilde izlemek ve yönetmek için gerekli verilerin toplanmasında kullanılan yöntemler geçmişten günümüze değişime uğramış bilim insanları artık trol ağları, dinamitler gibi tahrip edici yöntemlerden ziyade sualtı görsel sayım tekniği, dalıcı kumandalı video tekniği, uzaktan kumandalı araçlar ve yemli uzaktan sualtı video kayıt sistemleri gibi canlıyı ortamından ayırmayan, gözleme dayalı yöntemler kullanmaya başlamıştır.

Yemli uzaktan sualtı video kayıt sistemleri (BRUVs) gelişen teknoloji ile birlikte son yirmi yıldır balık topluluklarının incelenmesinde kullanılmaya başlanmış, görsel sayım tekniğinde yaşanan belli derinlik, zaman ve dalışa elverişlilik gibi kısıtlamaları olmaması, farklı koşullar ve habitatlarda zamansal-mekânsal değişimlerin tespiti için uygun ölçümler sağlaması, düşük maliyetli ve istatistiksel olarak güçlü bir yöntem oluşuyla öne çıkmıştır.

Dünya genelinde büyük çoğunluğu Avustralya ve Yeni Zelanda'da gerçekleştirilmiş olan üç yüze yakın BRUVs çalışması mevcut olmasına karşın Akdeniz basenindeki araştırmalar toplamın ancak %3' lük kısmını oluşturmaktadır. Ülkemiz özelinde ise BRUVs tekniği ile gerçekleştirilmiş bir araştırma bulunmamakla birlikte sucul ekosistemlerimizin, sualtı zenginliklerimizin korunması ve izlenmesine yönelik çalışmalarda bu sistemlerden verimli şekilde faydalanılmalıdır.

**Anahtar Kelimeler:** BRUVs, balık, sucul ekosistem

#### Abstract

Alkaline pectinases are one of the most important enzymes and are widely used in many industrial areas such as wastewater treatment, textile and paper industry, tea and coffee fermentation. Fungi (*Aspergillus*, *Penicillium*), yeast (*Saccharomyces*, *Kluyveromyces*) and bacteria (*Bacillus*) are used in microbial pectinase production. Bacterial production is more advantageous due to ease of process and shorter fermentation time. In this study, 25 *Bacillus* strains that were previously isolated from Lake Van and deposited in the culture collection of Sakarya University Food Engineering Department Food Biotechnology Laboratory were screened for pectinase production. The enzyme production was optimized by choosing the best producer isolate (*Bacillus* sp. VGA7). The bacterium was activated by incubating at 33 °C in a shaking incubator (120 rpm) for 24 hours on nutrient agar and then in nutrient broth. A medium consisting of pectin (10g/L), yeast extract (10g/L), NaCl (1.5g/L), K<sub>2</sub>HPO<sub>4</sub> (1g/L), MgSO<sub>4</sub>·7H<sub>2</sub>O (0.1g/L) was used for enzyme production. The effects of carbon sources (gum, lactose, fructose, sucrose, glucose, starch), nitrogen sources (ammonium sulfate, casein, peptone, soy flour, lentil meal, skimmed milk powder), pectin concentration (0.2-2), pH (7-12), and temperature (25-40 °C) on production of enzyme were determined. Enzyme activity was determined by DNS method. As a result of the study, the maximum enzyme production (3.33 U/mL) was achieved in the presence of pectin and yeast extract, at pH 10 and 33 °C.

#### Özet

Önemli ticari değere sahip olan kiraz (*Prunus avium* L.), uzun süre depolamaya elverişli olmayan bir meyve türü olup, aynı zamanda muhafazası sırasında da bir çok kalite kayıpları görülmektedir. Kiraz meyvesinde kalite özelliklerinin korunması amacıyla öncelikli olarak ürünün soğutulması ve soğuk zincirin ürün hasadından başlayarak tüketiciye ulaşıncaya kadar her aşamada korunması gerekmektedir. Yapılan bu çalışmada üretici bahçesinde yetiştirilmiş olan regina kiraz çeşidi meyvelerine hasat sonrası melatonin uygulamasının ve Modifiye Atmosferde paketlenen (MAP), kiraz meyvelerinin soğukta muhafazası üzerine etkilerini belirlemek amaçlanmaktadır. Çalışma kapsamında regina çeşidi kiraz meyvelerine hasat sonrası değişik dozlarda melatonin uygulamaları 0 (Kontrol), 50,100  $\mu\text{mol L}^{-1}$  ile, Modifiye Atmosfer uygulamaları yapılmış ve 21 gün süre ile depolanmıştır. Depolama süresince hafta da bir kalite parametrelerini (ağırlık kaybı, meyve kabuk ve et rengi, meyve eti sertliği, suda çözünebilir kuru madde miktarı, pH, titre edilebilir asitlik ve tadım testi) ve bazı biyokimyasal özellikleri (C vitamini) belirlemek amacıyla yapılan ölçüm ve analizlerle, uygulamaların kiraz meyvelerinin muhafazasına olan etkileri incelenmiştir. Melatonin, Kontrol MAP, 50 $\mu\text{mol}$  +MAP, 100 $\mu\text{mol}$ +MAP üzere 6 gruba ayrılmış ve MT uygulamaları, 5 dk. süre ile daldırma yöntemi ile uygulanmıştır. . Kontrol grubu meyveler ise aynı süre saf su içerisinde bekletilmiştir. Ön soğutma sonrası MAP uygulamaları da yapıldıktan sonra tüm gruplardaki meyveler, 0°C sıcaklıkta ve %90-95 oransal nem koşullarında meyvelerin dayanma süresine göre 21 gün (3 hafta) süresince depolanmıştır. Çalışma sonucunda başlangıç ve son hafta kalite ve bazı biyokimyasal özellikleri belirlemek amacıyla yapılan analizlerde uygulamalar arasında farklılıklar tespit edilmiştir. 100  $\mu\text{mol}$ +MAP uygulamasının kontrol ve diğer uygulamalara göre kalite ve bazı biyokimyasal özellikleri bakımından daha iyi sonuçlar verdiği belirlenmiştir.

**Anahtar Kelimeler:** Melatonin, Kalite, Muhafaza, Modifiye Atmosfer Paketleme

#### Abstract

The application of genomic studies in livestock species aims to comprehend the genetic underpinnings of specific traits, fortify disease resistance, and elevate product quality and production efficiency. The outcomes are integrated into animal breeding initiatives, which adopt a methodology aimed at enhancing economic attributes within livestock through heightened selection efficacy. Given the understanding that yield-related characteristics result from the additive influence of multiple genes, the identification of Quantitative Trait Loci (QTL) is employed to delineate chromosomal regions governing these traits. The shared objective of QTL identification techniques, along with genomic assessment methodologies, is to juxtapose markers and phenotypic values related to the specific trait. The intricacy inherent in the desired attributes has spurred the development of genomic selection methodology, which is rooted in predictive approaches rather than empirical testing. The utilization of selection strategies, coupled with genotyping for production-related traits and marker identification, has accelerated the pace of genetic advancement. Given that numerous genes contribute to the manifestation of most economic traits, the mere identification of a limited subset of these genes through DNA markers will merely account for a fraction of the overall genetic variance. Furthermore, individual genes are inclined to exert modest effects, necessitating a substantial volume of data to estimate their impact accurately. This challenge becomes more pronounced when utilizing a haplotype of markers to track QTL, as the need to estimate numerous haplotype effects arises. While the markers employed for Marker-Assisted Selection (MAS) may be associated with QTL, they might also exist in linkage equilibrium rather than linkage disequilibrium (LD) with the QTL. In instances of LD, it is plausible that either the QTL or the marker itself could indeed function as the QTL. In this work, our aim was to compare these methodologies, evaluating their efficacy in the context of pivotal selection practices integral to livestock breeding.

### Electrochemical sensor based on Ag-doped ZnO nanocomposite modified pencil graphite electrode for uric acid determination

Mukerrem Findik (ORCID: <https://orcid.org/0000-0002-9441-0814>)

Neighbourhood of Meliksah, Ulusoz Street, Number: 8/17, 42090, Konya, Turkey.

\*Corresponding author e-mail: mmukerrem@gmail.com

#### Abstract

Uric acid is one of the most important diagnostic metabolites resulting from the breakdown of purines in the liver and used in disease diagnosis. Changes in the level of uric acid in human serum and urine are symptoms of various diseases such as leukemia, pneumonia, hyperuricemia, and gout. Determination of uric acid opens the possibility of early intervention in cases of hyperuricemia and prevents deterioration of kidney function. Therefore, a simple detection method for uric acid is very important for clinical and biological fields. In recent years, several methods have been used to detection uric acid. Electrochemical sensors for uric acid detection are preferred due to their many advantages such as low cost, simplicity, high sensitivity, easy handling, and miniaturization. Metal oxides have an important place in the development of biosensors. Especially ZnO has attracted great interest in biosensors due to its desirable properties such as large specific surface area, non-toxicity, good biocompatibility, easy formation of stable nanostructures and high electron communication. The rapid and highly selective detection of ZnO-based electrochemical biosensors for the detection of various diseases has been documented. To improve their sensing performance, Ag can be loaded on the metal oxide surface as promoter, thereby enhancing catalytic activity and sensing performance. In the present study, a nanosensor based on Ag-doped ZnO nanocomposite modified pencil graphite electrode (PGE) was developed for the electrochemical determination of uric acid.

**Keywords:** Uric acid, Ag-doped ZnO, pencil graphite electrode, electrochemical nanosensor

### ctDNA' nın Kanser Tanısında Kullanımında Yeni Yaklaşımlar ve Teknolojiler

Günsel Bingöl (ORCID: 0000-0001-9834-0019)

Ankara Yıldırım Beyazıt Üniversitesi, Mühendislik ve Doğa Bilimleri Fakültesi, Biyomedikal Mühendisliği Bölümü, Ankara, Türkiye.

E-mail: gbingol@aybu.edu.tr

#### Özet

Sirküler Tümör DNA'sı (ctDNA), kanser tanısında giderek daha fazla kullanılan yenilikçi bir yaklaşımdır. Bu yöntem, kanserli hücrelerin vücutta bıraktığı DNA fragmanlarının analiz ederek hastalığın varlığının ve özelliğinin belirlenmesini sağlamaktadır. Kanser, erken evrelerde teşhis ve etkili bir tedavi yönetimi gerektiren ciddi bir sağlık sorunudur. Kanser tanısında geleneksel olarak kullanılan doku biyopsisi ve görüntüleme gibi yöntemlerin invazivlik, zaman, hassasiyet açısından sınırlılıkları bulunmaktadır. Bunun aksine, ctDNA, minimal invaziv bir yaklaşım ile daha hızlı ve hassas bir şekilde kanserli hücrelerin genetik materyalini tespit etme potansiyeline sahiptir. ctDNA analizi, doku örneği almak yerine, kan örneğiyle yapılmaktadır. Yüksek duyarlılıkla çalışan yeni nesil DNA sekanslama teknolojileri (NGS), dijital PCR, tek molekül sekanslama gibi yöntemler sayesinde ctDNA'nın çok düşük konsantrasyonlarda bile tespit edilmesi mümkün olmaktadır. Bu teknolojiler sayesinde kanser türüne ve evresine özgü genetik değişiklikler daha etkili bir şekilde belirlenebilmektedir. Özellikle çoklu kanser taraması, minimal rezidüel hastalığın izlenmesi ve tedaviye yanıtın değerlendirilmesi gibi konularda ctDNA analizi etkili bir araç olarak kullanılabilir. Bunun yanında, yapay zeka ve derin öğrenme gibi yöntemler de ctDNA analizini hızlandırmak ve sonuçları daha doğru bir şekilde yorumlamak için kullanılabilir. Sonuç olarak, ctDNA, kanser tanısı için umut vaat eden bir yaklaşımdır. Erken evre kanserlerin tespiti, tedaviye cevap izleme ve hastalığın yayılmasını takip etme gibi alanlarda önemli katkılar sağlayabilir. Diğer taraftan, bu yaklaşımın klinik uygulamada daha fazla benimsenmesi için standartlaştırılması ve güvenilirliğinin sağlanması gerekmektedir. ctDNA analizinin geniş ölçekte kullanılabilmesi için maliyetin düşürülmesi ve altyapının geliştirilmesi de diğer üzerinde düşünülmesi gereken konular arasındadır.

**Keywords:** ctDNA, kanser, tümör

#### Abstract

Ethylene (C<sub>2</sub>H<sub>4</sub>) is naturally produced in plants via biochemical reactions and widely known as the phytohormone responsible for the ripening of fruits, vegetables and some flowers [1]. 1-Methylcyclopropene (1-MCP) is a cycloalkene compound, exists as a gas at room temperature and commercially developed and used as a synthetic plant regulator. Since 1-MCP inhibits the ethylene receptor, it is used to delay the ripening and softening process of the plants by reducing the respiration rate for extending the postharvest shelf life of the plants.

To control the ripening and extent the shelf life of the plants, the adsorption and activity of ethylene and 1-MCP molecules on Al-doped graphene structure (AIG) were characterized by the DFT calculations, through structural geometry optimization, HOMO and LUMO, adsorption energy and ESP calculations [2-5]. Global reactivity analyzes confirmed that ethylene and 1-MCP molecules showed electrophilic properties, while AIG showed nucleophilic properties on the Al atom. The chemical adsorption of these gas molecules by AIG was effectively confirmed by different analyses such as ESP and DOS. According to these results, AIG structure is capable to be a new gas sensor for the adsorption of both ethylene and 1-MCP molecules.

**Key words:** Ethylene, 1-MCP, Al-doped graphene, DFT calculations

The numerical calculations reported in this paper were fully performed at TUBITAK ULAKBIM, High Performance and Grid Computing Center (TRUBA resources).

## Özet

Metal organik çerçeveler (MOF) metalle organik ligand arasında kovalent bağ oluşturan, yüksek yüzey alanı, gözeneklilik ve aktif bölge içermesinden dolayı ilaç taşıyıcı sistemlerde kullanılmaktadır. Biyopolimerler ise düşük maliyetli ve biyouyumludur. Sodyum aljinat gibi biyopolimerler hidrojel özellik gösterdiğinden ilaç taşıyıcı sistemlerde kullanılmaktadır. Bu nedenle MOF'lar sodyum aljinat mikroküreler üzerinde sentezlenerek ilaç taşıyıcı sistemlerin *in vitro* salım özelliklerinin iyileştirilmesi hedeflenmektedir. Sefaleksinin (SF), solunum ve idrar yolu, cilt enfeksiyonlarında kullanılan birinci nesil sefalosporin antibiyotigidir. SF'nin dezavantajı ise yarı ömrünün kısa olmasıdır. Günde 3-4 doz reçete edilmektedir. Bu çalışmada, model ilaç olan SF, ilaç taşıyıcı sistem olan Cr-MOF-Aljinat'lara yüklenerek ilacın *in vitro* salım özellikleri araştırılmıştır. MOF tabanlı hidrojelleri sentezlemek için yerinde sentez ve doğrudan sentez yöntemleri kullanılmıştır. Metal olarak krom klorür ( $CrCl_3$ ) MOF ligandı olarak 2-metilimidazol (2-MI) kullanılmıştır. Yerinde sentez yönteminde  $CrCl_3$  sulu çözeltisine, aljinatın sulu çözeltisi damla damla eklenerek hidrojeller oluşturulmuştur. 2-MI çözeltisine hidrojeller aktarılarak teflon otoklavda reaksiyon gerçekleştirilmiştir. Doğrudan sentez yönteminde Cr-aljinat hidrojelleri 2-MI çözeltisine eklenmiştir. Cr-aljinat hidrojeller Cr-Alg, doğrudan sentez ve yerinde sentez yöntemi ile elde edilen MOF yapıları ise sırasıyla 2-MI-DS ve 2-MI-YS olarak adlandırılmıştır. Sentezlenen Cr-MOF-Aljinatların karakterizasyonları SEM, FT-IR, TGA ve XRD analizleri kullanılarak yapılmıştır. İlaç yükleme kapasitesi 2-MI-DS, 2-MI-YS ve Cr-Alg için sırasıyla %3,431, 3,97 ve 3,867 olarak bulunmuştur. *In vitro* ilaç salım çalışmaları pH 7.4'te fosfat tamponunda (PBS) ile 24 saat gerçekleştirilmiştir. Kontrol olarak saf sefaleksinin kullanılmıştır. Ortama salınan ilacın konsantrasyonu UV-Vis spektrofotometre kullanılarak 262 nm'de absorbans ölçülerek belirlenmiştir. Sonuç olarak, kontrol grubunda SF'nin yüzeye salımı ilk dört saatte hızlı gerçekleşmiş sonra yavaşlamıştır. Elde edilen verimler, kontrol grubunda 5.saatte %83,20, Cr-Alg'de 8.saate %18,14, 2-MI-DS'de 7.saate %55,83 ve 2-MI-YS'de 24.saate %13,81 olarak gerçekleşmiştir. 2-MI-YS salım uzun süreli gerçekleşmesi, MOF yapısının Cr-Alg hidrojel porlarının içine yerleşmesi olabilir. Özetle Cr-MOF'ların aljinat üzerinden sentezlenebildiği, SF için Cr-MOF-Aljinatların taşıyıcı sistem olarak kullanılabileceği ve yüksek dozda ilaç kullanımını azaltabileceği öngörülmüştür.

**Kelimeler:** MOF-aljinat, hidrojel, sefaleksinin, ilaç salım.

## Özet

Nanoteknoloji günümüzde birçok araştırma alanında kullanılmaktadır. Nanoparçacıklar da nanoteknolojinin önemli bir nanomalzemesi olarak bilinir. Son zamanlarda nanopartikül sentezine ilgi gittikçe artmıştır. Ayrıca metal nanoparçacıklar arasında titanyum oksit nanoparçacıklarının (TiO<sub>2</sub> NP'ler) ve silisyum oksit nanoparçacıklarının (SiO<sub>2</sub> NP) özel bir yeri vardır. Ultra ince TiO<sub>2</sub> NP'lerin, SiO<sub>2</sub> NP'lerin ve ZnO NP'leri ile birlikte en çok üretilen üç nanomalzemenin biridir. TiO<sub>2</sub> değerli bir yarı iletken geçiş metali malzemesidir ve kolay kontrol, düşük maliyet, toksik olmama gibi özel özellikler gösterir; kimyasal erozyona karşı iyi direnç, daha sonra güneş pillerinde, kimyasal sensörlerde ve çevresel dönüşüm uygulamalarında kullanılmaktadır. SiO<sub>2</sub> insan, hayvan ve çevre sağlığı için zararlı değildir. SiO<sub>2</sub> NP'ler elektrot yüzeyler üzerinde ince film oluşturmada sentezlenen metallere biridir. Metalik nanoparçacıkların hazırlanması için yerleşmiş birçok kimyasal ve fiziksel yöntemin yanı sıra Yeşil sentez yöntemi sürdürülebilir, hijyenik, basit, güvenli ve çevre dostu olayların geliştirilmesinde önemli bir yöntemdir. Biyosentez (yeşil sentez), kimyasal olarak toksik etkinin üstesinden gelmek için bir alternatif olarak ortaya çıkmıştır. Bu çalışmada Titanyum oksit nanopartiküllerin (TiO<sub>2</sub> NP'ler) ve silisyum oksit (SiO<sub>2</sub> NP'ler) sentezi için Aspir (*Carthamus Tinctorius* L.) sulu özünü kullanılarak yeşil sentez yöntemiyle sentezlenmiştir. Biyosentezlenen nanopartiküller XRD, SEM ve EDX ile karakterize edildi. TiO<sub>2</sub> NP'lerin XRD analizinde sentezlenen nanoparçacıkların ortalama kristal boyutu 47 nm olarak hesaplandı. SEM analizinde TiO<sub>2</sub> NP'lerin küresel olduğunu ve 24 -35 nm arasında partiküller gözlemlendi. EDX analizinde TiO<sub>2</sub> NP'ler 4-5 KeV'de yoğun bir absorpsiyon spektrumu sergilemiştir. SiO<sub>2</sub> NP'lerin XRD analizinde SiO<sub>2</sub> NP'lerin partikül büyüklüğü yaklaşık olarak 41 nm olarak hesaplandı. SEM analizinde SiO<sub>2</sub> NP'lerin partiküllerin ortalama boyutu 22-36 nm aralığında bulundu. EDX sonucu, "Si" elementinin varlığını %21.2 olarak rapor edildi. Kullanılmış olan yeşil sentez yöntemi diğer sentez yöntemlerine göre daha ekonomik, hızlı, basit, çevre dostu, ve tehlikesiz olduğu kanıtlanmıştır.

Bu çalışma TÜBİTAK 1002- Hızlı Destek Programı kapsamında (122M850 proje kodu) desteklenmiştir.

**Anahtar Kelimeler:** Nanopartikül, Yeşil sentez yöntemi, SiO<sub>2</sub>NP, TiO<sub>2</sub>NP

Aksaray, Türkiye

\*Sorumlu yazar e-mail: aykuttopcu@aksaray.edu.tr

#### Özet

Afinite kromatografisi uzun yıllardan beri biyomoleküllerin saflaştırılmasında kullanılan etkili bir yöntemdir ve yöntemde saflaştırılmak istenen hedef moleküle karşı hem uygun ligandın hem de destek malzemesinin seçimi oldukça önemlidir.

Yapılması düşünülen bu çalışmada; afinite kromatografisinde kullanılmak üzere  $Fe^{+3}$  ile çapraz bağlanmış olan alginat mikrokürelerin elde edilmesi amaçlanmaktadır. Ardından hazırlanmış olan mikroküreler, 2-hidroksietil metakrilat monomerin  $-14^{\circ}C$ 'de polimerleştirilmesi sırasında ortama ilave edilerek kompozit bir afinite destek malzemesi oluşturulması hedeflenmektedir.

Sentez aşamasını takiben elde edilen kompozit destek malzemesi, Fourier Dönüşümlü Kızılötesi Spektroskopisi (FTIR), taramalı elektron mikroskobu (SEM), enerji dağılım X-ışını spektrofotometresi (EDX) ve şişme testi ile karakterize edilerek hazırlanmış olan destek malzemesinin hem kimyasal yapısı hem de fiziksel özellikleri değerlendirilerek, ileri ki dönemde yeni bir destek malzemesi olarak afinite kromatografisi uygulamaları için uygunluğu araştırılacaktır.

**Anahtar Kelimeler:** Afinite kromatografisi, 2-hidroksietil metakrilat, alginat, kriyojel.

#### Özet

Enzim immobilizasyonu, katalitik aktifliğini koruyarak, tekrar ve sürekli kullanımını sağlamak amacıyla organik veya inorganik taşıyıcılara fiziksel veya kimyasal yöntemlerle tutulmasıdır. İmmobilizasyon işlemi, enzimin dayanıklılığını arttırdığı gibi, enzimin istenildiğinde tepkime ortamından kolayca uzaklaştırılabilmesini de sağlar [1]. Bu çalışmada, kimyasal sentez yöntemlerinden en yaygın olarak bilinen Hummers metodu [2] ile grafen oksit sentezlenerek, manyetik hale getirildi. Daha sonra manyetik grafen oksit'e ( $Fe_3O_4@GO$ ) 2-metil 8-hidroksikinolin bağlanarak yeni bir fonksiyonel manyetik grafen oksit sentezlenmiştir ( $mGO@Fe_3O_4/2$ -metil 8-hidroksikinolin). Karakterizasyon için Fourier Dönüşümlü Kızılötesi Spektroskopisi (FT-IR), taramalı elektron mikroskobu (SEM), Enerji Dağılımı X-Işını spektrometresi (EDX), Raman ve UV-Vis kullanılmıştır. Yaban turpu peroksidaz (Horseradish Peroksidaz, HRP),  $mGO@Fe_3O_4/2$ -metil 8-hidroksikinolin nanokompozit üzerine immobilize edilmiştir. Yöntemin optimum ortam şartlarını elde etmek için pH,  $mGO@Fe_3O_4/2$ -metil 8-hidroksikinolin miktarı, enzim miktarı, sıcaklık gibi parametreler taranmış, enzim için şartlar optimize edilmiştir. Daha sonra optimize edilen koşullarda atık sularda bulunabilecek Kongo Kırmızısı, Malahit Yeşili, Evans Blue, Reaktif Black boyaalarının giderilmesinde kullanımı araştırılmıştır.

**Anahtar Kelimeler:** Yaban turpu peroksidazı (HRP), enzim, immobilizasyon, fonksiyonlaştırılmış manyetik grafen oksit, atık sularda boya giderimi.

Bu çalışma, Erciyes Üniversitesi Bilimsel Araştırma Projeleri Birimi tarafından FYL-2019-9137 kodlu proje ile desteklenmiştir.

#### Abstract

Functional products containing probiotics and prebiotics are frequently preferred by consumers to improve body metabolism and achieve a healthier lifestyle. In recent years, a new concept called "synbiotic" has emerged to further increase the positive effects of prebiotics and probiotics that are consumed separately.

When preparing synbiotic combinations, studies involving the growth rate and fermentation profile of different probiotic strains in the presence of different oligosaccharides should be conducted to bring together the species with the best synergistic effect. For this purpose, the synbiotic effects of different prebiotic varieties on probiotic strains were investigated in the present study. The synbiotic effects of *L. rhamnosus* GG, a probiotic strain, with different prebiotic varieties (resistant starch, maltooligosaccharide, pectin, alternan, fructooligosaccharide, isomaltooligosaccharide, FOS LP85, and FOS LP95) added to the medium as a carbon source were investigated. *L. rhamnosus* GG strain was inoculated into modified media with different prebiotics, pH and viability values were measured for 48 h. At the end of the incubation period, the lowest pH and the highest viability values were found to  $3.83 \pm 0.02$ - $8.92 \pm 0.05$  log CFU/mL and  $3.96 \pm 0.05$ - $8.86 \pm 0.01$  log CFU, respectively, in media added FOS LP85 and FOS LP95. After fermentation, viability values were measured once a week for a month at +4°C. At the end of 28 days, the media with the highest viability of the probiotic bacteria were FOS LP95 ( $8.16 \pm 0.02$  log CFU/mL) and isomaltooligosaccharide ( $8.02 \pm 0.03$  log CFU/mL) added media, respectively.

These findings showed that the viability and stability of probiotic bacteria varied depending on the rate of prebiotic sugar usage. Furthermore, this study will enable the development of products that keep viable probiotic cells at the appropriate level for a longer time with appropriate prebiotic-probiotic combinations.

#### Abstract

The global demand for single-use plastics is gradually rising. The amount of global plastic waste is expected to grow from 260 million tons/year in 2016 to 460 million tons/year by 2030. Only 16% of polymer waste were subjected to recycling process while 40% were sent to landfill and 25% of them were incinerated in 2016. Poly(ethylene terephthalate) (PET) composes the majority among those single-use plastics, especially in packaging applications of beverage bottles. Hence, accumulation of its waste in both soil and marine environments is enormous and it is imperative to provide efficient recycling routes immediately to reduce this accretion. The aim of this project is to design a versatile chemical approach to recycle PET waste and provide its reuse in many applications instead of virgin PET.

During melt recycling process of PET, due to high temperatures and applied shear forces, PET's molecular weight significantly decreases. To prevent this, reactive chain extenders such as pyromellitic dianhydride (PMDA), isocyanates or epoxide functionalized oligomers are added to regain the molecular weight by reconnecting the broken chain ends of PET. In this study, novel Meldrum's acid bearing oligomers with tailorable compositions were synthesized to be used in PET recycling. It is known that ketenes are highly reactive intermediates that could be thermally formed from Meldrum's acid derivatives in situ and rapidly react with nucleophiles such as alcohols, carboxylic acids and amines. Our results have revealed that those ketene-based chain extenders resulted in crystallinity increase in recycled PET that could result better processability during manufacturing processes like extrusion, injection molding, and blow molding.

**Keywords:** PET, recycling, chemical recycling, ketenes, Meldrum's acid

#### Abstract

Cancer remains a global health challenge, with increasing incidence and mortality rates worldwide. The disease's complexity arises from diverse cell populations within tumors, where specific subsets, known as cancer stem cells (CSCs), drive tumor growth, resistance to treatment, invasion, and metastasis. Conventional therapies like surgery, radiotherapy, and chemotherapy often struggle to target CSCs effectively. Consequently, researchers are actively exploring new drug models to combat various cancer types, driven by CSCs' inherent resistance to standard treatments. Developing innovative strategies to tackle these resilient cancer stem cells is crucial to improve treatment outcomes and patient survival. The primary aim of this study was to establish a Gemcitabine-resistant cancer stem cell line derived from the non-small lung cancer cell line (A549) and to culture it using a Three-Dimensional Culture (3D) approach, enabling the investigation of diverse therapeutic approaches. Initially, in this study a gemcitabine-resistant lung cancer cell line was established through the gradual exposure of A549 cells to gemcitabine. Subsequently, a population of cancer stem cells (CSCs) characterized by a cluster of differentiation (CD)326+CD133+CD44+ phenotypes was isolated through immunoselection using filtration column method, employing gemcitabine-resistant A549 cells purified via colony forming technology. The resistance mechanisms of the obtained gemcitabine-resistant CSCs were elucidated by investigating P-glycoprotein (P-gp, MDR, ABCB1), which has a prominent impact on resistance, utilizing flow cytometry device. Moreover, the positivity of cancer stem cell markers in the gemcitabine-resistant (CD)326+CD133+CD44+ CSCs was assessed using flow cytometry and immunofluorescence staining methods, confirming their CSC characteristics. In addition to investigate their tumorigenic capabilities, the obtained gemcitabine-resistant (CD)326+CD133+CD44+ CSCs were subjected to three-dimensional (3D) in vitro culture. This study establishes gemcitabine-resistant lung cancer cell lines and lung cancer stem cells (CSCs) for the first time. These models offer valuable insights into gemcitabine-resistant CSCs and hold great potential for further research.

This study was supported by grant (TUBİTAK-1002/221S319) from THE SCIENTIFIC AND TECHNOLOGICAL RESEARCH COUNCIL OF TURKIYE (TUBİTAK)

## Özet

Bitkisel kaynaklı doğal bileşikler ile yapılan çalışmalar, doğal bileşiklerin çeşitli hastalıklarla ilgili koruyucu etkiye sahip olduğunu desteklemektedir. Karvakrol ve naringin'in immun sistem modülatörü olması yanısıra antimikrobiyal, anti-inflamatuar, anti-kanserojen, anti-oksidan ve antifungal etkilere sahip olduğu birçok çalışma ile gösterilmiştir. Karvakrol (2-metil-5-(1-metiletil)-fenol) başlıca kekik ve çok sayıda aromatik bitki tarafından üretilen monoterpenik bir fenoldür. Kekik bitkisinin ana bileşeni olan karvakrol, kekiğin tıbbi bitki olarak kullanılmasında önemli bir etkidir. Naringin ise ağırlıklı olarak portakal ve greylort gibi turuncgillerde bulunan biyolojik aktivite bakımından zengin flavonoid grubu üyesidir. Bu çalışmada karvakrol ve naringin'in endotel hücrelerin canlılığı ve proliferasyonu üzerindeki etkilerinin araştırılması amaçlanmıştır. Çalışmada ECV304 endotel hücre hattı, 15mM HEPES ve %10 FBS içeren, M199 büyüme medium kullanılarak 37 °C'de ve %5 CO<sub>2</sub> içeren nemli bir ortamda kültüre edildi. Farklı karvakrol (10, 20, 50, 100 ve 150µg/ml) ve naringin (10, 25, 50, 100, 150 µM) konsantrasyonları ECV304 hücrelerine 48, 72 ve 96 saatlik sürelerde inkübe edildi. İnkübasyon sonrasında karvakrol ve naringin'in hücre canlılığı ve sitotoksikite etkileri MTT (3-(4,5-dimetiltiazol-2il)-2,5-difenil tetrazolyum bromür) testi ile analiz edildi. MTT analizi sonrasında ECV304 hücrelerinde 10 µg/ml doz ve 72 saat uygulanan karvakrolün hücre sayısını arttırdığı, naringin'in ise 50 µM dozda ve 72 saat inkübasyon süresinde koruyucu olduğu saptandı. Sonuç olarak, bitkisel kaynaklı karvakrol ve naringin'in ECV304 endotel hücrelerinde hücre canlılığını koruyucu yönde etkisi olabileceği düşünülmüştür. Sonuçlarımız, endotel hasarı oluşturabilen hastalıklarda doğal yollardan alınabilen karvakrol ve naringin'in endotel hücre fonksiyonuna destekleyici etkilerinin incelenebileceği in vitro ve in vivo deneysel modeller için bir ön veri niteliğindedir.

**Anahtar Kelimeler:** Karvakrol, Naringin, ECV304, MTT

#### Abstract

Measurement uncertainty (MU), as a value indicating the distribution of measurement results, is a worthwhile tool for the assessment of analytical performance and interpretation of results in medical laboratories. The recommendation for calculating MU is outlined in the ISO/TS 20914:2019 guideline. In this study, it's aimed to calculate the MU values for the parameters of total cholesterol, high-density lipoprotein (HDL) cholesterol, low-density lipoprotein (LDL) cholesterol, and triglyceride according to the calculation model in the ISO/TS 20914:2019 guideline, and to compare these with the maximum allowable measurement uncertainty (MAU) values. The MU values of total cholesterol, HDL cholesterol, LDL cholesterol, and triglyceride parameters were calculated using the long-term imprecision ( $u_{RW}$ ) acquired from 6-month internal quality control data and the calibrator uncertainty ( $u_{cal}$ ). Bias (%) calculated from 12-month external quality assessment data was compared with the desirable bias (%) values obtained from Westgard's biodatabase. In accordance with the recommendation of the ISO/TS 20914 guideline, for all parameters, the obtained biases (%) were disregarded in MU calculations as they were within the desirable bias (%) limits. The combined standard uncertainty, and expanded uncertainty were calculated for these blood lipid parameters analyzed using the Roche Cobas 8000 c 702 autoanalyzer (Roche Diagnostics, Mannheim, Germany), and compared with the European Federation of Clinical Chemistry and Laboratory Medicine (EFLM) 2022 MAU values. The MU values of total cholesterol, HDL cholesterol, LDL cholesterol, and triglyceride analytes were evaluated as within MAU limits. The MU value is an important indicator of quality in the assessment of analytical performance.

#### Abstract

Food waste has increasingly become a major problem around the world. Food waste does not just mean food going to waste. It also means that natural resources are rapidly depleting. This is an important issue that seriously affects natural resources, economy, agriculture, environment and natural balance. For this reason, food waste should be prevented and/or valorized. In addition, the use of food by-products as a source of bioactive compounds is a good opportunity to minimize the environmental problem that arises as a result of increased organic waste. However, when evaluating food waste, the environment and nature should not be forgotten. Large amounts of organic solvents are used for the extraction of bioactive compounds from food by-products. Traditional organic solvents, which are widely used today for the extraction process, are very dangerous and harm the environment because they are volatile and cause toxic effects by leaving residues in the extracts. Deep eutectic solvents attract attention within the framework of green and sustainable chemistry. Deep eutectic solvents have recently been used as an alternative to organic solvents for the extraction of bioactive compounds. When two or more compounds are mixed, the mixture that has a lower melting point compared to compounds forming the mixture is called a deep eutectic solvent. Deep eutectic solvents are prepared by mixing a hydrogen bond acceptor and a hydrogen bond donor at a suitable temperature. Recent studies show that some bioactive compounds such as quercetin, anthocyanins, antioxidants and catechins can be extracted with high yield using deep eutectic solvents.

**Keywords:** Bioactive compounds, deep eutectic solvents, food waste

### Kurak kořullarda yapılan baęcılıkta yaęmur suyu hasadının etkinlięi

İbrahim Samet GÖKÇEN ( <https://orcid.org/0000-0002-1857-7911> )

Kilis 7 Aralık Üniversitesi, Ziraat Fakültesi, Bahçe Bitkileri Bölümü, Kilis, Türkiye

ibrahimsgokcen@kilis.edu.tr

#### Özet

Su, canlı yaşamı için en önemli doğal kaynaktır. Bunun yanında yeryüzündeki tatlı su miktarı, dünyanın toplam su varlığının %1'inden bile azdır. Bu kapsamda Türkiye düşünölenin aksine, su zengini bir öлке olmayıp, yılda kişi başına düşen su miktarı 1566 m<sup>3</sup> ile “su sıkıntısı çeken” bir ölkedir. Ölkemiz iklim yapısı olarak yarı kurak bir iklime sahip olup, son 50 yıllık yaęış miktarına bakıldığında ortalama 618.9 mm yaęış aldığı görölmektedir. Kuraklığın artışı sonucu yaęış miktarının azalmasıyla tarımsal üretimde çeşitli sorunlar ortaya çıkmaktadır. Ölkemizin en önemli tarım ürünlerinden biri olan üzüm, yetiştiricilięi yapılan bazı bölgelerde su yetersizliğinden dolayı gelişim ve ürün verimi açısından yetersiz kalmaktadır. Ayrıca iyi beslenemeyen omcalarda, hastalık ve zararlılara karşı direnç daha düşük kalmaktadır. Tarımsal üretimde başarılı olabilmek için yaęmur sularını idareli kullanmak ve arazinin uygun şekilde yönetilmesi gerekmektedir. Kurak ve yarı kurak alanlara düşen, az ve verimsiz yaęmur sularının yerinde biriktirilmesi veya yüzey akışa geçirilerek depolanması işlemleri yaęmur su hasadı olarak tanımlanır. Amaç, bağlarda arazinin yukarı bölümlerinin yüzeyini geçirimsiz hale getirerek, yaęmur suyunu yüzey akışı ile havzanın alt bölümünde bulunan omcaların etkili kök bölgesine yönlendirmektir. Metrekareye 40 mm yaęışın düştüğü bir günde, 4m<sup>2</sup>'lik yaęmur su hasadı uygulanmış bir omcaya, 160 mm (16 kg) su sağlanabilmektedir. Sonuç olarak yaęmur suyu hasadı uygulaması sürdürülebilir ve çevre dostu bir uygulamadır. Bağcılıkta verimi arttırıp, ilaç kullanımını azaltmaya yönelik üreticiye ekonomik anlamda yarar sağlayacaktır. Yaęmur suyu hasadı ölkemizde çok yeni bilinen ve üreticilerimize tanıtılması gereken, ekonomik ve faydalı bir uygulamadır.

**Anahtar kelimeler:** Bağcılık, kuraklık, su hasadı, yaęmur.

\*Sorumlu yazar e-mail: rifattezel@mu.edu.tr

#### Özet

Toprak havuzlarda deniz balıkları üretimi; çoğunluğu küçük aile işletmelerinden oluşan su ürünleri işletmelerinde, tabana yayılmış bir ekonomik faaliyet olarak yürütülmektedir. Büyük hacimli toprak havuzlarda üretim yapıldığından ve günlük su değişim miktarı, diğer su ürünleri işletmelerine göre düşük olduğundan, bir üretim periyodu süresince havuz tabanında organik madde birikimi meydana gelmektedir. Bu çalışmada, toprak havuz işletmelerinde bir üretim periyodu süresince, havuz tabanındaki element madde miktarının değişimi araştırılmıştır. Milas Savran'da bulunan bir toprak havuz işletmesinde 3 adet toprak havuz, bu çalışma kapsamında kullanılmıştır. Kullanılan havuzlar kontrol (K), taban tahliyeli (T) ve de taban tahliyeli ve havalandırılmalı (TH) olarak kodlanmıştır. Kontrol havuzunda geleneksel tahliye sistemi, diğer havuzlarda ise havuz tabanındaki organik madde birikimini azaltmak amacıyla geliştirilen havuz taban tahliye sistemi kullanılmıştır. Havuzların tabanlarında element miktarı değişimlerini izlemek için 6 ayda bir sediment örnekleri alınarak analiz edilmiştir. Örneklerde toplam organik karbon, azot, fosfor, potasyum, kalsiyum, magnezyum, kükürt, sodyum, demir, mangan, çinko, bakır, bor, molibden miktarları belirlenmiştir. K, T ve TH havuzlarında sedimentte toplam organik karbon miktarı çalışma başlangıcında sırasıyla 50,16±2,9; 51,3±5,2; 49,2±1,1 g/kg olarak ve çalışma sonunda ise 59,6±0,7; 45,8±3,4; 51,4±5,1 g/kg olarak belirlenmiştir. Toplam azot miktarı çalışma başlangıcında K, T ve TH havuzları için sırasıyla 1457±133, 1620±776, 1430±459 mg/kg olarak ve çalışma sonunda ise 2847±827, 2797±1116, 2257±165 mg/kg olarak belirlenmiştir. Fosfor miktarı ise çalışma başlangıcında sırasıyla 602±124, 546±49, 558±446 mg/kg olarak ve çalışma sonunda ise 1332±96, 1107±83, 1156±230 mg/kg olarak bulunmuştur. Yapılan çalışma sonucunda, bir üretim dönemi sonrasında, K havuzunun taban çamurunda toplam organik karbon miktarının arttığı T havuzunda azaldığı ve TH havuzunda sabit kaldığı görülmüştür. Tüm havuzlarda sedimentte azot ve fosfor miktarlarının arttığı görülmüş ancak başlangıç ve bitiş değerleri arasında istatistiksel fark bulunamamıştır.

**Anahtar Kelimeler:** Su ürünleri yetiştiriciliği, Balık üretimi, Su kalitesi, Tarla balıkçılığı

**Teşekkür:** Bu çalışma, Muğla Sıtkı Koçman Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından 18/050 proje numarası ile Doktora Tez Projesi olarak desteklenmiştir. Desteklerinden ötürü Bilimsel Araştırma Projeleri Koordinasyon Birimi'ne teşekkürlerimizi sunarız.

#### Abstract

Salicylaldehyde, is a common chemical raw material, has frequently been used to synthesis aromatic schiff base ligands. Its hydroxyl and aldehyde group are in the adjacent position, so it is easy to take place substitution reaction at two positions. Novel Schiff base ligands can be prepared by the reaction of salicylaldehyde with different amines at 1:1, 1:2 and 2:1 ratio. The chelating ligands containing O and N donor atoms show widely biological activity and have special interest on bonding to metal ions [1] and substituted salicylaldehydes are potent antioxidant, anticancer, antimicrobial, antibacterial and antifungal agents and may have the potential of chemotherapy [2]. In particular, the effective application of cisplatin as an antitumor treatment in the clinic has led to the widespread interest in inorganic metal drugs [3]. Today designing new molecules that can interact with nucleic acids and trigger apoptosis, the discovery of new DNA-targeted anticancer drugs for chemotherapy is one of the most promising strategies. In this study, a Schiff base ligand was synthesized and then eight complexes prepared from this ligand. Elemental analysis and some spectroscopic techniques such as FT-IR, <sup>1</sup>H-NMR, <sup>13</sup>C-NMR, XRD, SEM and UV-Vis were used at structural characterization [4, 5]. To elucidate the mechanism of action of the synthesized compounds, some descriptive molecular properties were calculated using the Schrödinger Suite computer-aided molecular modeling program, the active region where the coupling would take place with the Receptor Grid Generation module was determined, and the interactions of the possible drug molecule candidates synthesized with the Structure-Based Drug Design (SBDD) method with the target receptor region were calculated.

#### Abstract

Schiff bases or azomethines are among the most important groups of biomolecules. These compounds have both remarkable biological activities and a variety of practical applications. There is increasing interest in the discovery of new Schiff base ligands because of their proven usefulness as attractive precursors, sometimes with a different mechanism of action than clinically approved anticancer agents, in the design of new cytotoxic and cytostatic agents [1]. Metal complexes prepared by the coordination of Schiff bases with metal ions play an important role in pharmaceutical sciences due to their multiple and important activities. Schiff bases are versatile pharmacophores capable of forming chelating complexes with several metals in different oxidation states. Although the biological and pharmacological effects of these ligand and metal complexes are known, their use is increasing, especially in cancer treatment [2]. With the determination of the chemotherapeutic effect of cisplatin, there have been developments in other metal complexes with anticancer activity. Cisplatin-related compounds such as oxaliplatin/carboplatin are known to be used worldwide for the treatment of cancer. However, various side effects such as toxicity and drug resistance are observed that limit the clinical use of these drugs. These limitations need to be overcome by discovering new Schiff base ligands for cancer therapy. In this research, a Schiff base ligand and its metal complexes were successfully synthesized [3]. Elemental analysis and some spectroscopic techniques such as FT-IR, <sup>1</sup>H-NMR, <sup>13</sup>C-NMR, XRD, SEM and UV-Vis were used at structural characterization [4]. It was determined that the metal/ligand ratio was 1:2 in all complexes and that Schiff base ligand was bonded to the metal atom with the nitrogen atom in the imine and the phenolic oxygen atom.

**Keywords:** Azomethine, Ligand, Metal Complex, Schiff Base, Structural Characterization

### PARP-1 Levels in Breast Cancer Patients

Merve Alpay\* (ORCID: 0000-0002-8782-9561)

Duzce University, Faculty of Medicine, Department of Medical Biochemistry, Düzce, TR

\*E-mail: mervealpay@duzce.edu.tr

#### Abstract

PARP-1 (Poly ADP-ribose polymerase 1) is an enzyme with crucial functions in cells, including DNA repair and preservation of genetic integrity. Drugs known as PARP inhibitors are used in the treatment of certain cancer types, especially breast cancer. The relationship between PARP-1 and breast cancer involves the formation of BRCA mutations, which impact the DNA repair mechanism and lead to genetic damage. In this context, PARP-1 detects DNA damage and works to repair it. Both the PARP-1 enzyme and PARP inhibitors are utilized as effective treatment strategies in breast cancer patients, particularly those carrying BRCA mutations, by targeting the disruption of DNA repair mechanisms. The research was conducted on a group of 28 patients diagnosed with breast cancer within the age range of 18-65 years, who sought treatment at the Oncology Clinic of Düzce University Hospital, along with 19 healthy individuals. Within the patient group, samples were isolated from individuals who had not commenced active treatment protocols and whose malignant proliferation had not been suppressed, and their ADP-r levels were examined. Routine parameters related to breast cancer diagnosis and prognosis were analyzed using an autoanalyzer, while ADP-r levels were measured using a spectrophotometric method. According to the findings, the ADP-r level in the untreated breast cancer group increased by 34.76% compared to healthy individuals, and a 20.66% increase was observed in the Stage 2 breast cancer patients who had undergone the same treatment protocol. PARP enzymes play a significant role in ADP ribosylation processes. Evidence suggests that dysregulation of ADP ribosylation exists in some cancer types. These abnormalities can render cancer cells vulnerable to DNA damage. Additionally, ADP ribosylation has been observed to increase excessively or abnormally. In the study, a significant increase in ADP-r was observed in breast cancer patients diagnosed with Stage 2, compared to healthy individuals. In the group of patients receiving chemotherapy treatment, this increase was attributed to the direct impact of PARP-1 inhibition on lowering ADP ribosylation and affecting DNA repair mechanisms. For targeted treatment strategies in breast cancer patients, considering the relationship between the ADP ribosylation mechanism, PARP-1 levels, and the patient's individual condition, a personalized approach must be planned.

**Keywords:** PARP-1, Breast cancer, ADP ribosylation

#### Abstract

Gallic acid has been reported to possess several biological activities such as antioxidant, antimicrobial, anticancer and anti-inflammatory. Nanoparticles synthesized using organic molecule have many advantages such as easy availability and low cost. Nanoparticles are widely used in pharmaceuticals, drug delivery, drug release and diagnostic applications. Nanoflowers are a kind of nanoparticle with a high surface area due to their flower-like structure. This high surface area makes the molecule more open to biological interactions. Metallic nanoflowers synthesized using plant extracts have attracted great interest in the scientific community due to their enhanced biological activities and unique physicochemical properties. In this study, nanoparticle synthesis was carried out for the first time by using extracts of gallic acid as organic part and metal ions ( $\text{Cu}^{2+}$ ,  $\text{Co}^{2+}$  and  $\text{Zn}^{2+}$ ) as inorganic part. Characterization of nanoflowers was performed by SEM, EDX, XRD, FTIR and elemental mapping. Then, the anticancer activities of the synthesized nanoflowers were evaluated. A549 and MCF7 cell lines were used for anticancer activity. In the end, the anticancer effect of the nanoflowers were higher than that of the gallic acid alone. It is planned to investigate the nanoflower showing anticancer activity with further in vitro and in vivo methods.

**Keywords:** Gallic acid, Anti cancer, nanoflower

#### Abstract

Fluoxetine is an antidepressant which is selective serotonin reuptake inhibitor. High doses may have serious side effects. It has been reported to cause an increase in oxidative stress which is one of the most important causes of DNA damage. There have been studies on the therapeutic effect of ozone (O<sub>3</sub>), including antioxidant activity in recent years. Therefore, it was aimed to determine the effect of acute high-dose fluoxetine treatment and ozone therapy on DNA damage. 32 wistar rats were divided into 4 groups and exposed to 24 mg/kg oral fluoxetine, 1 mg/kg intraperitoneal ozone (95% O<sub>2</sub> + 5% O<sub>3</sub>) or their combination for 7 days, and a negative control group was formed. At the end of the experiment, blood was taken, and alkaline comet assay was applied, 100 cells per rat were photographed under a fluorescent microscope. The photographs were analyzed with the OpenComet, and the results were compared using a one-way anova. The “%TailDNA” parameter was determined as mean ± standard error, and DNA damage was found to be 5.67 ± 0.58, 6.63 ± 0.64, 8.16 ± 0.70, and 6.90 ± 0.76 for control, ozone, fluoxetine, and fluoxetine + ozone groups, respectively. The fluoxetine group caused a statistically significant increase in DNA damage compared to the control group (p<0.05). Interestingly, there was also an increase in DNA damage in the ozone-treated group, but this increase was not statistically significant (p>0.05). Fluoxetine + ozone treatment reduced fluoxetine-induced damage, but it was not statistically significant (p>0.05). The DNA damage of the fluoxetine + ozone group was still higher than the control group, but there was also no statistically significant difference when compared to the control group (p>0.05). Accordingly, acute high-dose fluoxetine treatment increased DNA damage in rat blood tissue, although the damage was reduced by ozone therapy, it was not therapeutic.

**Keywords:** Fluoxetine, Intraperitoneal ozone, Comet Assay

#### Özet

Modern tıbbın evrimi sürecinde bitkilerin insan vücudundaki gösterdikleri etkileri yani -farmakodinamik özellikleri- sayesinde başlıca kullanılmışlardır. İlk ilkel farmakopeler belli standartları olmayan şekilleriyle günümüzde bazı aktarlarda bulunabilmektedir. Bununla birlikte geleneksel tıbbi bitkilerin modern tıpta kullanımı ve içerdikleri biyokimyasal bileşiklerine bağlı olarak yeni potansiyel tedavi potansiyelleri hala araştırılmakta ve bu araştırmalara dayanarak ana tedavi hammaddesi veya ana tedavi yanında -bazen suistimal de edilerek- takviye gıda olarak sunulmaktadır. Modern ilaçların üretiminde yeni moleküllerin keşfi ve suistimallerin engellenmesi açısından bitkilerin tıbbi özelliklerinin araştırılıp kayıt altına alınması önemlidir. Daha önce tıpta kullanılan bitkilerle ilgili bilgilerin kaybolması, dahası florada yok olan türler nedeniyle bu potansiyelin de yitirilmesi bir çeşit değer kaybıdır. Bu elde edilmiş bilgilerden en önemli kaynaklar Biruni ve İbni Sina tarafından kazandırılmıştır. Bu iki bilim insanı aynı dönemde Türkistan ve güneyinde önemli çalışmalar yapmış ve diğer bilimlerin yanında eczacılık ve tıp dünyasına önemli katkılar vermişlerdir. Türkistan'daki bu tıp tarihinde önemli rol oynayan iki bilim insanının bulunduğu yerlerdeki tıbbi bitkilerin özelliklerinin bilinmesi önemlidir.

Çalışmamızda Kırgızistan'da türü tükenme tehlikesine girmesi nedeniyle ülkede "Kırmızı Kitap" (Kırgızca: Кызыл китеп) adında envanter kitabında koruma listesinde yer alan endemik bitkilerinden daha önce çeşitli çalışmalarla ortaya konmuş olan 15 bitkinin tıbbi özellikleri derlenmiştir. Ayrıca bu türlere yakın ülkemizdeki türler ile tıbbi özellikleri karşılaştırılmıştır. Böylece bu karşılaştırmada bitkilerin biyokimyasal kompozisyon karşılaştırması sayesinde ülkemizdeki veya Kırgızistan'daki bu yakın türlerin diğer potansiyel tıbbi özellikleri konusunda bilgi edinilmesi hedeflenmiştir.

**Anahtar kelimeler:** Tıbbi bitkiler, Kırgızistan Kırmızı Kitap, Kırgızistan Endemik Florası, Geleneksel Tıp

### Özet

Bu çalışmada İstanbul'daki yurtlarda kalan 18-25 yaş arası kız öğrencilerin uyku kalitesinin beslenme davranışları üzerine etkisinin incelenmesi amaçlanmıştır. Çalışma İstanbul ili Kadıköy, Maltepe ve Ataşehir ilçelerindeki kız öğrenci yurtlarında Mart 2023-Mayıs 2023 tarihleri arasında yapılmıştır. Çalışma çevrim içi anket yoluyla, yurttan kalan gönüllü 163 kız öğrenciyle yürütülmüştür. Veriler; Pittsburgh Uyku Kalite İndeksi (PUKİ) ve Sağlıklı Beslenmeye İlişkin Tutum Ölçeği (SBİTÖ) aracılığıyla toplanmıştır. İstatistiksel analiz SPSS 21.0 paket programı ile yapılmıştır. Çalışmaya katılan bireylerin yaş ortalaması 21.75±1.43 yıldır. Bireylerin PUKİ skoru ortalaması 7,75±2,74'tür. Çalışmaya katılan bireylerin PUKİ ölçek puanı sınıflamasına göre %23,9'unun (n=39) sağlıklı uyku, %76,1'inin (n=124) kötü uyku sınıfında olduğu bulunmuştur. Katılımcıların toplam SBİTÖ puan ortalaması 71,34±10,87 olarak elde edilmiştir. Sağlıklı Beslenmeye İlişkin Tutum Ölçeği'nin alt boyutlarından "Olumlu Beslenme"nin puan ortalaması 15,83±4,57; "Kötü Beslenme"nin puan ortalaması 18,25±4,39 olarak saptanmıştır. Toplam SBİTÖ puanı ile PUKİ skoru arasında negatif yönlü istatistiksel olarak anlamlı bir ilişki bulunmuştur (p=0,020; r=-0,183).

**Anahtar Kelimeler:** Beslenme durumu, uyku kalitesi, üniversite öğrencisi, sağlıklı beslenme tutumu

### An Indispensable Method from Separation to Determination: Adsorption

Kazım Köse\* (ORCID: <https://orcid.org/0000-0003-1467-2898>)

\*Hitit University, Alaca Avni Çelik Vocational School, Medical Laboratory Techniques, Çorum, Turkey

\*Corresponding author e-mail: [kazimkose@hitit.edu.tr](mailto:kazimkose@hitit.edu.tr)

#### Abstract

Adsorption, which is based on the principle of attachment of molecules to a solid support as a result of the interaction of molecules with ligands, is a phenomenon that exists in the functioning of nature itself, considering that flower dust adhering to the feet of bees helps plants reproduce. Adsorption and its techniques, which are as old as living things, have come a long way scientifically in the last hundred years and many adsorbents/ligands have been developed. Finding a suitable ligand for the target molecule, modifying the polymeric structure and performing separation, removal and determination after interaction without any problems is a very challenging and knowledge-intensive task. However, although it is very advantageous in terms of easy applicability and cost, considering the environmental and health effects of the chemicals used, there is a need for more 'green' adsorbent designs. Although adsorbents using cellulose materials have been developed recently, it is urgent to introduce 'greener' modifying agents into this field, considering the future of the method, since organic chemicals cannot be completely removed. In this presentation, besides adsorbent development methods, examples of adsorption will be given and information will be shared especially on the development of adsorbents based on cellulose-based materials.

**Keywords:** Adsorption, Separation, Removal, Ligand, Modification, Detection.

### Trend Analysis of Some Economic Fishes in the Mediterranean Sea

Ferhat BÜYÜKDEVECİ<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-8531-525X>)

<sup>\*1</sup> Adana Directorate of Provincial Agriculture and Forestry, Adana, Türkiye

\*Corresponding author e-mail: ferhat.bykdeveci@gmail.com

#### Abstract

The Turkish Ministry of Agriculture and Forestry and the Turkish Statistical Institute (TÜİK) regularly gather statistical data regarding commercial fish species captured in the Turkish coast of the Mediterranean. This collected statistical data is periodically shared with international platforms, especially FAO. Although the accuracy of the catch from fisheries in Turkey has been debated by many studies, it has been proven by different studies that the trends of time series catch data are reliable. Fisheries statistics are therefore a valuable source of data for stock assessment and fisheries management. In this study, the changes in the catches of some economically important species on the Mediterranean coast of Turkey were evaluated by trend analysis. These species include red mullet (*M. barbatus*), gilthead seabream (*S. aurata*), true lizardfish (*S. undosquamis*), grey mullet (*M. cephalus*), European seabass (*D. labrax*), bluefish (*P. saltatrix*), common pandora (*P. erythrinus*), white grouper (*E. aeneus*) and common sole (*S. solea*). Twenty-year data sets derived from TÜİK databases covering the years 2000–2020 were used in this context. When the time series catches are examined generally, it is observed that the catches peaked at the end of 2010 and subsequently had a massive decline. *M. barbatus* (24.46%) was captured the most frequently among these nine species, whereas *D. labrax* (2.1%) was the least frequently caught, according to an analysis of the catch amounts provided by TÜİK databases in terms of species. According to the trend analysis results, red mullet ( $p>0.05$ ), true lizardfish ( $p<0.001$ ), common pandora ( $p<0.001$ ) showed positive trend while gilthead seabream ( $p<0.001$ ), grey mullet ( $p<0.001$ ), european seabass ( $p<0.001$ ), bluefish ( $p<0.001$ ), white grouper ( $p>0.05$ ) and common sole showed negative trend.

#### Abstract

The p53 cellular level is negatively regulated by oncoprotein Mouse Double Minute 2 Homolog (MDM2). The transactivation domain (TAD) of p53 interacts with MDM2, which directs the p53 to proteasomal degradation. Mutagenesis studies showed that Phe19, Leu22, and Trp23 of TAD are the key residues involved in the p53-MDM2 interaction. In several studies, the alteration of these residues through mutations has been reported to dysregulate the transactivation function of p53. Since these residues are located near the Ser15 phosphorylation site of TAD, the effect of Phe19Ala and Leu22Gln-Trp23Ser mutations on the Ser15 phosphorylation by DNA-PK was investigated in this study. The Phe19Ala and Leu22Gln-Trp23Ser mutations were generated by site-directed mutagenesis, and Ser15 phosphorylation was monitored by western blot using phospho-p53 (Ser15) antibody. Our results showed that Ser15 phosphorylation was approximately 57% slower in the Phe19Ala and about 28% slower in the Leu22Gln-Trp23Ser mutant variant compared to the wild type. Obtained results indicate that Phe19, Leu22, and Trp23 play a crucial role in efficient Ser15 phosphorylation by DNA-PK, in addition to their role in MDM2 interaction.

**Keywords:** p53, DNA-PK, Site-Directed Mutagenesis, Ser Phosphorylation.

\*Sorumlu yazar e-mail: [gulistan.okutan@siirt.edu.tr](mailto:gulistan.okutan@siirt.edu.tr)

#### Özet

Çoklu emülsiyonun tekli emülsiyona göre bazı avantajları bulunmaktadır ve bu nedenle çoklu emülsiyon çalışmaları son zamanlarda popüler bir konu haline gelmiştir. Balık yağının içermiş olduğu çoklu doymamış yağ asitlerinin oksidasyona karşı hassas olması balık yağının çoklu emülsiyona işlenmesine yönelik çalışmaları teşvik etmektedir. Bu çalışmada, saf ringa balığı yağı kullanılarak S/Y/S çoklu emülsiyonu üretilmiş ve elde edilen emülsiyonun bazı özellikleri araştırılmıştır. Tek adımlı emülsiyon yöntemi kullanılarak üretilen çoklu emülsiyonun damlacık boyutu  $135.7 \pm 2.6$  nm ve zeta potansiyeli  $-48.56 \pm 1.06$  mV olarak tespit edilmiştir. Balık yağı çoklu emülsiyonunun balık yağına göre daha yüksek iletkenlik değerine sahip olduğu, balık yağının iletkenlik değeri  $0.33 \pm 0.02$   $\mu$ S/cm iken balık yağı çoklu emülsiyonunun iletkenlik değeri  $9.82 \pm 0.11$  mS/cm olarak bulunmuştur. Balık yağı emülsiyonunun asidik olduğu (pH= $2.89 \pm 0.01$ ), balık yağının asitlik değerinin  $3.06 \pm 0.29$ , çoklu emülsiyonun asitlik değerinin ise  $1.60 \pm 0.12$  mg KOH/g yağ olduğu tespit edilmiştir. Emülsiyon stabilitesini belirlemek amacıyla kremalaşma indeksi analizi yapılmış ve kremalaşma indeksi  $13.58 \pm 0.54$  olarak bulunmuştur. Emülsiyonun renk değerleri söz konusu olduğunda; L\* değeri  $96.09 \pm 0.82$ , a\* değeri  $-7.77 \pm 0.23$ , b\* değeri  $8.44 \pm 0.73$  olarak bulunmuştur. Renk değerleri kullanılarak hesaplanan beyazlık indeksi çoklu emülsiyonda  $87.87 \pm 0.87$  iken balık yağında  $46.19 \pm 0.18$  olarak bulunmuştur. Elde edilen sonuçlar, balık yağının çoklu emülsiyona başarılı bir şekilde işlenebileceğini ancak elde edilen emülsiyonun balık yağından oldukça farklı özellikler gösterebileceğini ortaya koymuştur. Çalışmanın sonraki aşamalarında balık yağının çoklu emülsiyona işlenerek raf ömrü ve depolama stabilitesi üzerine çalışmaların yapılması planlanmaktadır.

**Anahtar Kelimeler:** Balık yağı, çoklu emülsiyon, damlacık boyutu, S/Y/S emülsiyonu.

#### Abstract

Biogenic amines in seafood are generally nitrogenous compounds formed by decarboxylation of amino acids as a result of microbial activity. Biogenic amines can be found in canned and marinated seafood as well as unprocessed, raw seafood. Studies show that the most abundant BAs in seafood are histamine, putrescine, cadaverine, tryptamine, and tyramine. Furthermore, it has been reported that the microorganisms responsible for biogenic amine formation are mostly *Hafnia alvei*, *Morganella morganii*, and *Klebsiella pneumoniae*. The amount of biogenic amines in seafood may pose a risk to food safety. However, biogenic amine indices developed using the total amounts of BAs provide a perspective on the quality and safety of seafood products and also allow quantitative evaluation of the palatability of seafood products. In this study, studies on BAs in different seafood products and quality assessment of seafood products according to biogenic amine index were examined. Moreover, it was reached the conclusion that the determination of the presence and quantities of BAs in seafood is an important factor in terms of public health and that biogenic amine indices are also an important parameter about the quality and safety of seafood products.

**Keywords:** Biogenic amines, quality indexes, seafood, shelf life.

#### Abstract

Silver complexes of Schiff bases are biologically active agents and have a wide range of biological applications [1]. Glioblastoma multiforme cells (GBM) is the most common and aggressive primary malignant tumor of the central nervous system. Currently, standard clinical treatment strategies such as surgical resection, radiotherapy and chemotherapy have mostly limited therapeutic efficacy in association with poor prognosis [2]. Herein, we aimed to evaluate the potential anticancer abilities of the newly synthesized Ag(I)- DpNap as a complex (Dp: 1,3-Diaminopropane; Nap: 2-Hydroxy-1-naphthaldehyde) and DpNap as a schiff base on GBM cells (U87-MG) *in vitro*. The cytotoxic effects of the compounds were evaluated by MTT assay for 72h. The compounds showed a significant dose-dependent cytotoxicity at increasing concentrations (0-100µg/mL) on the cells. Ag(I)- DpNap had higher cytotoxic properties than DpNap. In detail, Ag(I)- DpNap affects cells 2.5-fold more than DpNap at 100µg/mL concentration with approximately 81% cell death. According to the results, the silver complex and its ligand can be debate due to their anticancer potential against drug-resistant glioblastoma cells.

**Keywords:** Schiff base, Mtt assay, Glioblastoma multiforme.

#### Abstract

The tumor microenvironment and signaling pathways play an important role in carcinogenesis. Our study aims to examine the changes in transforming growth factor (TGF- $\beta$ ) and chemokine-dependent ligand 12 (CXCL12) signaling pathways and cell viability after co-culture of cancer cells with MSCs, which is one of the important tumor microenvironment elements. The human bone marrow-derived MSCs-cancer cells (T98G; Glioblastoma and MDA-MB-231; Breast cancer) were co-cultured using transwell systems. Cell viability was assessed with the MTT method. Changes in the TGF- $\beta$  (pTGF $\beta$ R1 and pSMAD3) and CXCL12 (pCXCR4, pERK1/2) pathways were measured using ELISA, immunohistochemistry, and immunofluorescence techniques. Results showed that MSCs co-cultured with cancer cells suppressed the viability of cancer cells for both cancer types. Cell viability was also decreased in MSCs after co-culture. TGF- $\beta$  pathway was examined, and expression of pTGF $\beta$ R1 in cancer cells and MSCs showed similarity with control groups. The pSMAD3 molecule was decreased in cancer cells and MSCs after co-culture compared to control groups. CXCL12 pathway, pCXCR4 expression was mild to moderate increased in both groups in cancer cells-MSCs co-culture. While the increase in pCXCR4 in cancer cells increased the activity of pERK1/2, the increase in MSCs did not affect the expression of pERK1/2. In the TGF- $\beta$  signaling pathway, the pTGF $\beta$ R1 receptor activity increases, while the decrease in pSMAD3 indicates that MSCs suppress the signal. Increased CXCL12 signaling pathway activity in MSCs and cancer cells after co-culture does not prevent cancer cell viability from being suppressed by MSCs. On the contrary, it is thought that CXCL signaling pathway activity contributes to the retention of MSCs in the cancerous region and suppression of cancer cell viability through bioactive molecules secreted from MSCs.

**Keywords:** Mesenchymal stem cell, cancer cells, tumor microenvironment, TGF- $\beta$ , CXCL12.

#### Abstract

One of the most widely used options for sedation in patients is midazolam, as it presents a short acting benzodiazepine that can be administrated by different routes. The aim of this study was to reveal the previously unknown genotoxic effects of midazolam on healthy human lymphocytes. To explore this, the researchers conducted a comet assay, a straightforward, rapid, and sensitive method, for genotoxic damage arising from single-strand breaks in DNA. The investigation revealed that midazolam, when administered at concentrations ranging from 0.1 to 0.4 mg/mL, triggers harmful effects in healthy human lymphocytes. Notably, the genotoxic impact of midazolam demonstrated a correlation with the dosage, with the 0.4 mg/mL dose exhibiting genotoxicity closely resembling that of the positive control group.

Furthermore, the study found that midazolam, across concentration levels of 0.1, 0.2, 0.3, and 0.4 mg/mL, led to DNA damage characterized by strand breaks. This was evident through substantial increases in the comet evaluation parameters; DNA tail length and DNA tail intensity when compared to negative and positive control values, indicating a significant impact.

In summary, the research suggests that midazolam could exert cytotoxic, cytostatic, and genotoxic effects on healthy human lymphocytes *in vitro*, with the intensity of these effects contingent on the concentration of exposure. As the investigation progresses, it is expected that these results will receive reinforcement from subsequent studies.

**Keywords:** Midazolam, DNA damage, Comet assay, Genotoxicity, Human lymphocytes.

#### Abstract

Artemisinin is a natural compound traditionally used to treat malaria and has been the focus of attention in recent years due to its potential effects on cancer treatment. However, the anti-tumor mechanism of artemisinin is very complex; a review of the action mechanism is still in its infancy, and more detailed and in-depth research is needed. In this research, molecular docking studies were performed to reveal the possible effects of artemisinin in cancer treatment. ER- $\alpha$ , HSP90, HSP70, HSP27, Bcl-2, mTOR, PR, EGFR, and HIF1- $\alpha$  protein targets known to be involved in cancer, and artemisinin were visualized using Chimera 1.16. Preparation for docking was performed using the Chimera 1.16 DocPrep tool. Active sites in target proteins were determined by CASTp analysis. The docking procedure was performed using AutoDock Vina. Then, Biovia Discovery Studio was used to visualize the complex interaction between the ligand and residues located in the active site of the targeted protein. The docking results demonstrated the significant binding affinities of artemisinin revealed interactions, especially with mTOR (-9.2 kcal/mol), HSP27 (-8.8 kcal/mol), and ER- $\alpha$  (-7.7 kcal/mol). The extensive information from this study provides a basis for a better understanding of artemisinin's potential in cancer therapy and the development of innovative, targeted therapeutic approaches.

**Keywords:** Artemisinin, molecular docking, cancer therapy, mTOR, HSP27, ER- $\alpha$

#### Abstract

Breast cancer continues to pose a significant health problem worldwide. As conventional treatments show limitations, interest in new potential therapeutic agents has increased. Baicalein, a flavonoid compound found in various plant sources, is noted for its natural anticancer properties. In this *in silico* study, it was aimed to investigate the potential therapeutic mechanisms of baicalein as a promising agent in the treatment of breast cancer. The binding affinities of baicalein with crucial proteins such as ER- $\alpha$ , HSP90, HSP70, HSP27, Bcl-2, mTOR, PR, EGFR, and HIF1- $\alpha$ , which play an essential role in breast cancer, were evaluated. Both proteins and baicalein were visualized using Chimera 1.16 and prepared for docking via the Chimera 1.16 DocPrep tool. Active sites of target proteins were determined using CASTp analysis. AutoDock Vina was used to identify potential interaction sites between ligand and target proteins. Biovia Discovery Studio was used to visualize the interactions between baicalein and target proteins. Baicalein exhibited a significant affinity for multiple target proteins, particularly with strong binding with HSP70 (-9.7 kcal/mol), HSP27 (-9.4 kcal/mol), and mTOR (-8.4 kcal/mol). The results demonstrated the potential of baicalein to interact favorably with proteins involved in critical pathways within breast cancer cells. This research provides a strong rationale for future laboratory-based and clinical trials and will potentially enable the development of new targeted therapies.

#### Abstract

Essential oils are volatile components show bioactivity and produced from aromatic plants [1]. They are widely used in agriculture, cosmetics, pharmacology, and biomedical industry. Poor solubility, volatility, and sensitivity to environmental conditions of the essential oil limited to usage as wound healing material [2]. In this study, lavandula essential oil-loaded emulsion hydrogels are rapidly and effectively produced by free radical photopolymerization of egg white/acrylamide in the continuous phase of oil-in-water Pickering emulsion templates. Lavandula essential oil /  $\beta$ -cyclodextrin (LAV/ $\beta$ -CD) complexes were prepared and added into egg white/acrylamide blends. Egg white/acrylamide blends were used as oil phase whereas LAV/ $\beta$ -CD complexes were used as water phase.  $\beta$ -CD, a type of carbohydrate, acts as an efficient emulsifier in the preparation of LAV-in-water Pickering emulsions. The results show that the LAV can be efficiently the loaded polymer matrix. The chemical groups in the hydrogels were verified using Attenuated Total Reflectance-Fourier Transform Infrared Spectroscopy (ATR-FT-IR), and cross-sectional images of hydrogels and emulsions were examined using optical microscopy. Moreover, the swelling capacity of hydrogels was measured. Antibacterial activity of them against Gram (-) (*E.coli*) and Gram (+) (*S. aureus*). According to FT-IR analysis, LAV was successfully loaded in hydrogels. As the amount of essential oil increases, the antibacterial activity increases against *Escherichia coli*, *Staphylococcus aureus* bacteria, while the swelling capacity of hydrogels decreases. In line with the findings, the obtained hydrogels have the potential to be used as wound dressings.

**Keywords:** Egg white, hydrogel synthesis, lavandula oil, polyacrylamide, UV curing.

#### Özet

Bu çalışmada, arka çapraz bağ (AÇB) kesen (PCL- substituting) total diz artroplastisi uygulanan olgular retrospektif olarak incelenerek orta dönem sonuçlarının ortaya konulması amaçlanmıştır. Kliniğimizde Temmuz 2006 - Haziran 2012 tarihleri arasında AÇB kesen TDP tatbik edilen ve yeterli takibi olan 61 hastanın 80 dizi bu çalışmaya dahil edilmiştir. Hastalarımızın 52'si kadın, 9'u erkekti. Yaş ortalaması 65,4 (42-85), ortalama takip süresi 32,6 ay (12-72) olarak saptandı. Hastalar Amerikan Diz Cemiyeti kriterlerine göre; diz skoru ve diz fonksiyonel skoru bakımından değerlendirildi. Radyolojik değerlendirme ise, TDP Radyolojik Değerlendirme kriterlerine göre yapılmıştır. Diz skoru ameliyat öncesi 38-71 (ortalama 43,7) iken, ameliyat sonrası 78-100 (ortalama 95) olarak saptanmıştır. Diz skoru bakımından dizlerin 69'unda (%86,25) mükemmel, 11'inde (%13,75) iyi, Fonksiyonel skoru ameliyat öncesi 10-60 (ortalama 35,08) iken, ameliyat sonrası 60-100 (ortalama 82,2) olarak saptanmıştır. Diz fonksiyonel skoru baz alınarak yapılan değerlendirmede dizlerin 45'inde (%56,25) mükemmel, 29'unda (%36,25) iyi, 6'sında (%7,5) orta sonuç elde edilmiştir. Hastalarda ameliyat öncesi ortalama 9,7° varus (8°valgus-20°varus) tespit edilmiş olup, ameliyat sonrası ortalama 4,75° valgus (2°varus-10°valgus) dizilimi sağlanmıştır. 1 hastada geç derin enfeksiyon nedeniyle revizyon protezi tatbik edilmiştir. Bir hastada travma nedeniyle insert kırılması sonucu insert değişimi yapılmıştır. AÇB kesen total diz artroplastisi uygulamalarımız sonucunda %86,25 mükemmel diz skoru, %56,25 mükemmel fonksiyonel skor elde edilmiştir. Bu değerler pek çok çalışmadaki sonuçlara yakın bulunmuştur. Uygun hasta seçimi, yeterli ameliyat öncesi hazırlık ve dikkatli cerrahi teknik kullanıldığında, AÇB kesen TDP yüz güldürücü bir ortopedik cerrahi girişimdir.

**Anahtar kelimeler:** AÇB, TDP, gonartroz, hareket açıklığı, fonksiyonel sonuçlar.

#### Abstract

The distribution of *Cucurbitaceae* family members is known for tropical and warmer regions. Interspecific variation of the most common members is still represented by limited information. In this study, chloroplast (cp) genome based phylogenetic analysis were carried out in 10 predominating species (*Cucumis melo subsp. melo*, *Lagenaria siceraria*, *Luffa acutangula*, *Luffa aegyptiaca*, *Momordica charantia*, *Cucumis sativus*, *Cucurbita argyrosperma*, *Cucurbita moschata*, *Cucurbita pepo*, and *Cucurbita maxima*) of the family *Cucurbitaceae*. Nucleotide sequences and characteristic data of cp genomes were obtained from GenBank. Correlation matrix and principal component analysis (PCA) for numeric and characteristic data were obtained via GraphPad Prism software. Sequence similarity and UPGMA trees were constructed by using MAFFT software. Bayesian topology analysis were carried out using MrBayes software via TRUBA terminal. R Studio was used to obtain PCA graphics for cp genomes. Correlation matrix showed that there was positive correlation between mRNA number and GC% for each species. In PCA analysis, *C. melo* showed distinction from remaining species by geographic origin, soil characteristics, and the taste. UPGMA tree showed that intraspecific distribution was clear with 3 distinct sub-divisions. The minimum and maximum genetic variation values were recorded as 3.33% and 0.88%, respectively. Bayesian topology analysis and PCA analysis showed that at least three dimensions were present for cp genomes, and PC1 and PC2 were as 51.2% and 28.9%, respectively. In phylogenetic analyses, it was observed that cp genomes can strongly discriminate between genus as in common polymorphism studies; thus, marker genes can be identified in future studies for species distinction in the *Cucurbitaceae* family.

**Keywords:** cpDNA, *Cucurbitaceae*, PCA, sequence similarity

#### Abstract

The enzymes produced by biotechnological procedures present variation in terms of the need for them in laboratory. Enzymes like DNA-directed DNA polymerase could be accepted as highly needed and frequently used enzyme in molecular biology laboratories. It is easy to find out DNA-directed DNA polymerase with the range of different cost and quality. However, there is limited options available for some other enzymes like RNase. In this study, it was aimed to extract RNase A enzyme by ethanol precipitation method by short time cost-effectively. First, expression cassette of the pOpenTaq plasmid was amplified by inverse PCR. Then, *RNase A* gene from pOpen-RNaseA was amplified by conventional PCR. Expression cassette and *RNase A* gene were ligated as a circulated vector, and then transformed into *Escherichia coli* JM107 strain. Confirmed colonies were used in RNase A extraction. Transformants grown in ampicillin (100µg/mL) added medium overnight, then they were induced with IPTG (1 mM) overnight. After extraction step, purification was carried out by 70% ethanol precipitation. In SDS-PAGE assays, 16 kDa protein was checked, and concentration was calculated by BCA protocol. The extracted RNase A (1:10, V:V) was used in SDS-based DNA extraction from 7-day-old mycelium culture of *Fusarium culmorum*. No RNA was detected in gDNA samples of RNase A-treated ones. The findings showed that the ethanol precipitation method could be easily used in any molecular biology laboratories involving common equipments to obtain RNase A enzyme within in short time.

**Keywords:** Enzyme extraction, molecular biology, PCR, RNase A

#### Abstract

Uric acid, known as the end product of purine metabolism, is excreted from the body through the intestines and kidneys. The presence of more than normal levels in body fluids can be considered an indicator of kidney disease. It is also stated that changes in plasma levels may be an indicator of pneumonia and leukemia [1]. For this reason, the interest in sensitive and selective sensors that can detect uric acid continues. Carbon-based nanoparticles allow the design of sensitive sensors that can be used in many areas [2]. Carbon nanotubes, grouped as single (SWCNT) or multi-walled (MWCNT) according to the number of layers, have great advantages in the production of biosensors and chemosensors, thanks to their modifiable surfaces and very large surface areas, and extraordinary conductivity. In addition to these features, their chemical and mechanical resistance also brings this group to the forefront for many applications [3]. Although surface modification of carbon nanotubes is a very interesting subject, non-covalent interactions also provide useful results in functionalization. For such functionalizations, it is usually  $\pi$ - $\pi$  interactions between the aromatic molecules and the nanotube surface. Some aromatic compounds such as anthracene, pyrene, ferrocene, and phthalocyanine derivatives can be used for this purpose and contribute to sensor performance [4]. In this study, the SWCNT structure modified with pyrene-substituted-anthracene was synthesized for the first time and used in the electrochemical uric acid biosensor platform. Cyclic voltammetry (CV) and differential pulse voltammetry (DPV) methods were used for electrochemical measurements and elucidation of the redox mechanism. With the inclusion of a pyrene-substituted-anthracene structure in the system, a sharper peak of uric acid and a higher peak current value were determined.

### Abstract

Karyological properties of *Neogobius fluviatilis* (Pallas, 1814) from the population inhabiting Sakarya Creek, Bilecik, Türkiye were studied by examining conventional metaphase chromosome spreads obtained from the kidney, spleen, and gill tissues. Specimens were captured by electrofishing method and carried as alive to genetic laboratory in well-aerated carrying aquariums. Cell suspension was obtained by hypotonicity, fixation and staining steps and chromosomes were harvested using air-drying technique. Observing and analysing of obtained chromosomes were carried out via Leica DM 3000 research microscope. The investigation of 40 metaphase spread from four (three females and one male) individuals evidenced that the chromosome numbers of this species was determined  $2n = 46$  and the arm number was found as  $NF = 46$ . The prepared karyotype of the invasive monkey goby was consisted of 23 pairs subtelo-acrocentric (st-a) chromosomes that gradually decreased in size, and they can be assessed as uni-armed chromosomes. The chromosome morphology can be noticed as  $2n = 46$  (st-a). No morphologically differentiated sex chromosomes were found in the monkey gobies studied. This study was revealed chromosome number and karyotype of *N. fluviatilis* for the first time from Turkey. The process was approved by the Local Animal Ethics Committee of Türkiye (Protocol Number: 68429034/09).

**Keywords:** Chromosomes, karyology, karyotype, *Neogobius fluviatilis*.

#### Abstract

Carotenoids are pigment molecules that play an important role in coloring plants, algae, and other organisms. These molecules exhibit various biological activities such as anticancer, antiviral and antioxidant activities. They have a huge market size and are mainly used in the food, feed, and cosmetic industries. The current supply chain for carotenoids is mostly relied on the extraction from plants and/or chemical synthesis for certain carotenoids. However, these strategies have various bottlenecks and disadvantages such as being affected by climate change, more difficult and costly extraction processes, and environmental issues. These can be overcome with microbial biosynthesis, which not only addresses the previous problems but also provides advantages of producing in a short time and scale-up for industrial production. In this research, we aimed to biosynthesize the high value-added carotenoids by engineered microorganisms. The genome of a native producer of zeaxanthin diglucoside, identified as endophytic *Pseudomonas* sp. 102515, was edited by CRISPR-Cas9 to knock out zeaxanthin glucosyltransferase (*CrtX*), lycopene  $\beta$ -cyclase (*CrtY*) and beta-carotene hydroxylase (*CrtZ*). This led to  $\Delta$ *CrtX*,  $\Delta$ *CrtY* and  $\Delta$ *CrtZ* mutant strains of *Pseudomonas* sp. 102515. Gene knock-outs were confirmed by colony PCR. HPLC analysis of extracts from mutant strains revealed that all mutants produced the corresponding carotenoids such as zeaxanthin,  $\beta$ -carotene, and lycopene. Thus, this study paved the way for the biosynthesis of valuable carotenoids in the engineered endophytic bacteria.

**Keywords:** Carotenoids, CRISPR-Cas9, Biosynthesis, *Pseudomonas*

### Investigation of Wastewater Remediation Performance of Cost Effective Graphene Supported Photo Catalyst

Hüseyin GUMUS (<https://orcid.org/0000-0002-2029-7978>)

Bilecik Şeyh Edebali University, Osmaneli Vocational School, Bilecik, TURKEY

Cossepongind author e-mail: [huseyin.gumus@bilecik.edu.tr](mailto:huseyin.gumus@bilecik.edu.tr)

#### Abstract

Photocatalysts are effective structures that convert water pollutants to harmless components. In this study, the MO removal efficiency of graphene supported photocatalyst in the presence of ultraviolet light was examined. 5 grams of graphite powder (Gr) was soaked in 0.1 mol/L iron (III) chloride ( $\text{FeCl}_3$ ). The mixture was heated at 250 °C for 1 hour with nitrogen flow (3 ml/min). The precipitate was cooled, washed and dried at 50 °C for 24 h and then grinded to 150  $\mu\text{m}$ , Gr-Fe. 1 gram of Gr-Fe was mixed with 10 mL of 75 ppm MO until adsorption equilibrium. Samples were analyzed by UV-Vis spectrometry at 466 nm. MO adsorption of Gr and Gr-Fe were calculated as 13% and 39%, respectively. Solution was placed horizontally in front of a 30W ultraviolet light source. 1 ml of 0.01 mol/L  $\text{H}_2\text{O}_2$  was added to the solution and UV radiation was applied for 20 min. The same experiments were repeated in the presence of 1 g Gr. The characteristic XRD graphite peak was obtained at 27° and it shifted to 25.5°. Wide 10° peak belonging to the GO peak was observed in Gr-Fe. Gr-Fe structure is partially delaminated with amorphous structure. The interlayer spaces of the graphite are significantly opened and Fe particles are placed. The surface area of Gr was 5.6  $\text{m}^2/\text{g}$ , while it was only 6.4  $\text{m}^2/\text{g}$ . Fe penetrated into the pores, causing the surface to shrink. The MO removal rates of Gr and Gr-Fe after 20 min UV irradiation in the presence of peroxide were 24% and 91%, respectively due to  $\text{HO}\cdot$  radicals are formed. These radicals interacted with MO and breakdown of the dye according to the Fenton process.

#### Abstract

Activated carbon that is formed by burning plants, trees, and synthetic materials is an effective adsorbent. In this study the dye removal performance of polymeric composites (H3-CTW-P), which are prepared according to previous publications, was studied under 50W UV radiation<sup>1</sup>. Textile wastes pretreated with H<sub>3</sub>PO<sub>4</sub> were pyrolyzed at 350° and grounded (H3-CTW). 10%wt H3-CTW was added to a 14%wt polyvinyl fluoride-dimethylformamide (PVDF-DMF) solution and the mixture was phase separated. According to SEM and BET analysis results, the surface area of the %10-H3-CTW-P increased by 182%. The dye removal tests were conducted in a batch system at 298 K. 100 mL of 75 ppm MO aqueous solution and 0.5 g of composite adsorbent (1x1 cm in size) were placed 10 cm away from a 50W ultraviolet lamp. The solution was stirred at 150 rpm for 90 minutes until adsorption equilibrium. Then ultraviolet radiation was applied for 20 minutes. The MO was analyzed by UV-Vis spectrometry at 466 nm. The removal for H3-CTW-P was 36% at 90 min. and this value was calculated as 8.9% for raw PVDF. After 20 minutes of UV interaction it was recorded as 77% while it was approximately 90% for powder H3-CTW. The IR bands at 998 and 1700 cm<sup>-1</sup> of H3-CTW showed that functional groups on the activated carbon was formed. Although the photocatalytic efficiency of H3-CTW powder was higher, it provided ease of use to the composite activated carbon. H3-CTW-P composites can be used in filtration systems.

#### Abstract

Self-assembled monolayer (SAM) coatings are formed by the self-assembly of molecules as a single layer by adsorption on a substrate. Following the surface attachment as the initial step, the molecules often reorganize to form an ordered and uniform monolayer structure. SAM-based technologies have been used in many different areas from biosensing to smart and functional surfaces and energy storage, due to being a cheap and easy-to-apply surface modification technique. SAM formation mechanism and kinetics have always been an interesting research area. In addition to controlling the SAM adsorption kinetics and mechanism, reducing the long deposition times is a significant step to increase their applicability. Metallic surfaces such as gold, silver and platinum, where SAM-based molecules are deposited, typically have uncontrolled potential and thus variable surface charges and energies. Deposition solutions of SAM molecules might also have varying redox compositions and potentials. Therefore, the use of an active, potentiostatic (potential-controlled) method for selective SAM adsorption may offer many advantages. This study presents the feasibility of an active, potential-controlled technique in producing faster and more uniform coatings on gold screen-printed electrode surfaces. To achieve this, thiol-containing molecules with different functional groups and chain lengths have been used and results have been discussed in comparison to coatings prepared using passive (potential-uncontrolled) 24-hour incubation. The optimal potential range and solution concentration for the deposition has also been studied. Complementary characterization techniques have been performed for the detailed analysis; (i) differences in surface electroactivity before and after deposition have been examined by electrochemical techniques (CV, SWV, EIS), (ii) chemical changes for the deposited surfaces have been assessed by X-ray Photoelectron Spectroscopy (XPS) and (iii) the effects of SAM molecules, selected to have different functional groups, on the surface energy and thus on the surface wettability have been checked by water contact angle measurements.

**Keywords:** self-assembled monolayers, electrochemical deposition, electrode modification, screen-printed electrodes, surface characterization

#### Özet

Steroidler, doğal bileşikler arasında önemli bir gruptur ve farklı organizmalarda önemli roller oynarlar. Önceki çalışmalar, steroid konjugatlarının kanser hücrelerini hedefleme ve kanser tedavisinde kullanma potansiyelini göstermektedir. Bu çalışmada, farklı steroidler, biyolojik olarak aktif bileşik ile konjuge edilerek yeni konjugatlar geliştirildi ve bu konjugatların seçici farmakolojik özellikleri incelendi. Antikanser aktiviteleri çeşitli kanser hücre hatları üzerinde *in vitro* olarak değerlendirildi. Seçicilik indeksinin belirlenmesi amacıyla sağlıklı hücre hattına karşı sitotoksiteleri *in vitro* olarak test edildi. Konjugatların Gram-pozitif ve Gram-negatif bakteriler ile mantarlar üzerindeki antimikrobiyal aktiviteleri de araştırıldı. Steroidal konjugatların farmakokinetik özellikleri, *in silico* ADME çalışmaları ile açıklandı ve değerlendirildi. Ayrıca, bu çalışmada ilk olarak, etkin konjugatlar üzerinde protein-ligand etkileşimleri, bağlanma ilgilerini belirlemek amacıyla *in silico* moleküler bağlanma çalışmaları yapıldı. Bu çalışmanın sonuçları, bu konjugatların çeşitli hastalıkların tedavisine çok yönlü bir yaklaşım sunma potansiyeline sahip olduğunu göstermektedir.

**Anahtar Kelimeler:** Antimikrobiyal aktivite, Antiproliferatif aktivite, Biyokonjugat, Moleküler bağlanma, Hidroksi kumarin, Steroid.

ergunseda0@gmail.com

#### Özet

Kemik doku mühendisliği uygulamaları; kemik defektleri, doku kayıpları ve kırıkların tedavisinde büyük rol oynamaktadır. Günümüzde, çeşitli nedenlerle ortaya çıkan kemik hasarlarının tedavi yöntemleri konusundaki araştırmaların sayısı hızla artmaktadır. Her yıl yaklaşık 2 milyon adet kemik grefti kullanılmaktadır. Bazı durumlarda kemikler belirli bir boyuta kadar kendiliğinden iyileşebilse de, hastaların yaklaşık %10'u, dokuda oluşan tam kaynamama, yavaş iyileşme ve yüksek tedavi maliyetleri gibi ciddi kemik hasarı sorunlarıyla karşılaşmaktadır. Özellikle kemik defekti ve kırıklarında kullanılan bir tedavi olarak kemik greftleri için olası sorunların hepsine yanıt verebilecek tedavi yöntemi mevcut olmadığından, altın standart olarak otogreftler son yıllarda sıklıkla kullanılmaktadır. Otogreftler, immünolojik açıdan allogreftlere göre daha başarılı olmasına rağmen yüksek morbidite, limitli donör sahası gibi sebeplerden dolayı dezavantajları bulunmaktadır. Bu tez çalışması kapsamında, kemik doku iskeleleri geleneksel (sponge) ve modern (3D baskı) yöntemler kullanılarak üretilmiş ve sonuçlar karşılaştırılmıştır. Sponge yöntemi; uygulama kolaylığı, düşük maliyetli üretim gibi avantajlar sunmaktadır. Bu teknik temel olarak; seramik çamurunun hazırlanması, süngerlere emdirilmesi ve kurutma işlemlerini içermektedir. Üç boyutlu baskı yöntemi ise sınırlı donör alanı ve morbidite gibi sorunları aşarak daha hızlı ve daha doğal bir yapı elde etmeye olanak tanımıştır. Ayrıca, üç boyutlu baskı teknolojisi; istenilen gözenek deseni, katman kalınlığı ve kütleme süresine göre ayarlanabilen kontrol edilebilir ürünlerin eldesi açısından geleneksel metoda göre daha avantajlıdır. Doku iskeleleri, reçine ve biyoseramik tozlarının birleştirilip üç boyutlu basım yöntemi ile oluşturulmuştur. Son aşamada ise üretilen doku iskeletlerinin dokularla arasındaki uyumunun artırılmasını sağlamak ve implantasyon sonrasında vücuttaki olası enfeksiyonları antibakteriyel özelliği ile engellemek için kemik doku iskeletleri biyomalzeme ile kaplanmıştır. Doku iskeletlerinin kimyasal (FTIR, XRD), morfolojik (SEM, porozite) ve mekanik (basma testi) özellikleri analiz edilmiştir. Yapılan test sonuçlarına göre mekanik özellikleri sponge yöntemiyle yapılan greftlerde 2-3 MPa, 3D ile üretilen greftlerde 3-5 MPa olarak belirlenmiştir. Uygulama kolaylığı ve kontrol edilebilir yapısı nedeniyle 3D basılmış kemik doku iskelelerinin, kemik defektlerinde kullanımında umut verici olduğu öngörülmektedir.

**Anahtar Kelimeler:** Kemik doku mühendisliği, doku iskelesi, kemik defekti, sponge yöntemi, 3B baskı

#### Abstract

Solid waste problem constitutes an important part of environmental pollution in our country. Various factors such as various physical, chemical, biochemical interactions, high moisture content in the waste, rainwater infiltration and contact of water with solid wastes are effective in the formation of leachate. Physico-chemical methods are frequently preferred methods for the practical removal of contaminants from leachate. Among these methods, the adsorption process is an economical and convenient method in terms of applicability in removing pollutants from leachate. In this study, the removal of COD from the leachate formed in the sanitary landfill by the adsorption process was investigated. The effects of adsorbent dose, pH, temperature and mixing speed on the operating conditions were investigated. In addition, suitable operating conditions were determined with the data obtained by using adsorption kinetics and isotherms. According to the results obtained, the alternativeness of the adsorption process as a purification method was evaluated. The highest turbidity removal efficiency obtained with the CBPAC adsorption process was 51.8% at pH 5, 5 g/L adsorbent dose, 20°C temperature and 300 rpm stirring speed. It was determined that CBPAC adsorption from leachate and turbidity removal fit the pseudo-first-order model due to the high correlation coefficient ( $R^2$  0.995). Langmuir isotherm ( $R^2$  0.990) was determined as the most suitable isotherm for turbidity removal from leachate with CBPAC. The  $\Delta H^\circ$  (11,319 kJ/mol) value of the thermodynamic parameters of turbidity removal from leachate with CBPAC was positive, indicating that the adsorption process was endothermic. The positive  $\Delta S^\circ$  (0.0370 kJ/mol.K) value showed that the irregularity of the particles increased after the adhesion on the surface of the CBPAC particles. The positive  $\Delta G^\circ$  (0.478 kJ/mol) value indicated that CBPAC adsorption could not occur spontaneously. In the light of the data obtained, it was determined that the CBPAC adsorption process is a suitable process for turbidity removal from leachate.

**Keywords:** Leachate, adsorption, turbidity removal.

#### Abstract

The research on the synthesis, characterization, experimental, and in silico analyses of ligands containing sulfon groups and their transition metal complexes is an important subject in fields such as drug discovery and development, biochemistry, and bioinorganic chemistry. The presence of pyrimidine, pyrrolidino, pyridyl, and tetrazole groups in conjunction with the sulfone moiety is known to enhance activities like herbicidal and antifungal effects. The tetrazole ring is known to exhibit favourable interactions with biological targets, making it a valuable scaffold for creating compounds with enhanced binding affinity and bioactivity. Herbicides, used to control unwanted plants, face the challenge of resistance, with acetohydroxyacid synthase (AHAS) enzyme inhibitors being a prominent concern due to their widespread use and importance in various organisms, i.e., AHAS, a critical enzyme in amino acid biosynthesis, serves as a target for herbicides through oxidative inactivation, making it a focal point for addressing resistance. One-pot reactions have become widely used in chemical synthesis due to their advantages including simplified procedures, efficient resource utilization, and versatility. These reactions find applications in drug design, combinatorial chemistry, and natural product synthesis, providing environmentally friendly and streamlined approaches to compound synthesis. In these studies, the synthesis of new ligands containing sulfon groups, their characterization, and the determination of their effects on enzyme inhibition are performed with experimental results through in silico analyses and molecular docking calculations. In this study, we have synthesized new sulfonyl hydrazone containing tetrazole group (4-ethyl-tetrazole-ethane sulfonyl hydrazone, 4etzesh) by one-pot reaction process. The structure of the compound was characterized using spectroscopic methods (FT-IR, NMR). In addition, enzyme inhibition studies were examined through molecular docking calculations (Schrödinger Suite 2020-3) with Glide XP OPLS2005 force field docking to elucidate non-covalent interactions. ADME (absorption, distribution, metabolism, and excretion) calculation also performed QikProp in Schrödinger Suite.

**Keywords:** Herbicidal resistance, AHAS enzyme, Sulfon group, One-Pot reaction, Molecular docking, ADME.

#### Abstract

The immune system, which is of mesenchymal origin, is not in direct contact with the antigens in the body. However, microorganisms can invade organs developed from the ectoderm or endoderm layer embryologically. Immunological cells indirectly encountering intruders are primary cells responsible for the extermination of invaders. In humans and animals, the mucosal layer of the digestive system exposed to antigenic stimulation has a vastitude surface area. The gut-associated lymphoid tissue (GALT), responsible for the extermination of food-borne pathogens, comprises the tonsils, Peyer's patches, appendix, colonic and cecal patches, and isolated lymphoid follicles in avian species. A specific area called the pyloric tonsil abounding with lymphoid follicles has recently been reported as a novel component of GALT in chickens. CD45<sup>+</sup> Follicular dendritic cells (FDCs) are a unique population of cells essential for efficient germinal center (GC) formation and maintenance in lymphoid follicles because they have a unique feature to retain intact antigens for extended periods. In this study, we aimed to detect residential dendritic cells in the pyloric lymphoid follicles using the immunofluorescence method. For this purpose, ten adult American bronze turkeys [male: five adults (10-12 kg); female: five adults (8-9 kg)] were taken from farms engaged in turkey breeding and slaughtering in Ankara province. The tissues were fixated with a 10% neutral buffered formalin (NBF) solution, and then tissue samples underwent the tissue preparation protocol. Anti-vimentin antibody (1:50) was dropped on serial sections (5 µm) to demonstrate FDCs, professional antigen-presenting cells that inform the fight against invasive pathogens. Positive reactions within lymphoid follicles revealed that FDCs harboring in the germinal center expressed the intermediate filament vimentin. In addition, it was realized the presence of cellular spiny protrusions. These findings implicate that the pyloric region in turkeys may have lymphoid follicles rather than lymphocyte infiltrations.

### Importance of cellular mitophagy (mitochondrial autophagy) and the role of mitochondrial dysfunction in the occurrence of several diseases

Nuh YILDIRIM<sup>1\*</sup> (ORCID:<https://orcid.org/0000-0002-5315-923X>)

#### Abstract

Autophagy is a catabolic process of degradation of cytoplasmic components and imperfect organelles by membrane vesicles. Mitophagy, a selective form of autophagy, involves the isolation of defective or superfluous mitochondria in autophagosomes. Being a mechanism that controls cellular degeneration, mitophagy plays a crucial role in cell fate. Several mitochondrial parameters, such as membranal potential, structure, and ROS, can ignite the activation of mitophagic machinery. These parameters regulate not only mitophagy but also the mitochondrial Ca<sup>2+</sup> uptake. Calcium handling is fundamental in regulating ATP production by mitochondria and mitochondrial quality control processes. Under these stressful circumstances, damaged mitochondria in mammalian cells have some difficulties (membrane potential loss, isolation, fusion, or fission). Mitochondrial fragmentation due to imbalanced fission and fusion of mitochondria is a prerequisite for mitophagy. On molecular levels, PINK1, a mitochondrial serine/threonine-protein kinase, activates ubiquitin through phosphorylation, and ubiquitin binds to a variety of substrates which are found on the outer mitochondrial membrane (OMM) in a process called substrate ubiquitination. Parkin, an E3-ubiquitin ligase responsible for specific recognition and ubiquitination of target proteins, is recruited from the cytosol. PINK1 phosphorylates Parkin to activate Parkin-enhancing E3 ligase activity. Subsequently, many autophagy receptors migrate from the cytoplasm towards damaged mitochondria and interact with ubiquitinated proteins in OMM. The phagophore engulfs the organelle to form an autophagosome, and then a bi-layered membranous vesicle fuses with the lysosome to degrade the organelle. Mitophagy has recently received increasing attention related to the pathogenesis of clinical diseases, such as cancer, cardiovascular diseases, metabolic diseases, neurodegenerative diseases, renal interstitial fibrosis (RIF), retinal diseases (glaucoma, diabetic retinopathy, retinitis pigmentosa, and age-related macular degeneration). Mitophagy research, a novel and cutting-edge field, is attracting growing interest from the scientific community. As our perspective on mitophagy deepens, we will harvest promising potential therapies against diseases related to dysfunctional mitophagy.

**Keywords:** Cancer, Cardiovascular diseases, Mitophagy, Neurodegenerative diseases, Parkin, PINK1.

#### Abstract

1,3,4-Thiadiazole is a heterocyclic compound that holds significant prominence in various scientific and industrial domains due to its distinctive structural and functional characteristics. Comprising a five-membered ring with two carbon atoms, two nitrogen atoms, and one sulfur atom, this versatile moiety has captured the attention of researchers across fields such as chemistry, pharmacology, and materials science. Building on this information, we synthesized thiosemicarbazones from thiosemicarbazide and aldehydes. The resulting thiosemicarbazone intermediates were converted into 1,3,4-thiadiazoles by a reaction with acetic anhydride used as the solvent. We assessed the synthesized compounds for purity through HPLC and elemental analysis. Their structures were elucidated via IR, <sup>1</sup>H-NMR and LC-MS analyses. Furthermore, we conducted *in silico* ADME studies for our compounds. These studies involved utilizing SwissADME and Osiris software to calculate various properties such as physicochemical attributes, pharmacokinetics, lipophilicity and water solubility. The outcomes of the ADME analysis indicate that the compounds adhere to Lipinski's rule of 5, suggesting favorable oral bioavailability. Additionally, the compounds generally exhibited the potential to interact with kinase enzymes, which could position them as promising macromolecular targets. The potential biological activities of the obtained new compounds are still under investigation.

**Keywords:** 1,3,4-Thiadiazole, synthesis, characterization, ADME screening

#### Abstract

Increased plasma glucose levels are associated with decreased insulin secretion and increased insulin resistance during the development of diabetes. Changes in the expression levels of the gap-junctional connection channels between the beta cells has been the focus of research related to diabetes in recent years. Long-term high plasma glucose levels lead to reduction in the expression of genes encoding the Gap-Junctions between beta cells and thus alteration in the cell network dynamics. Decreased intercellular connection strength due to the increase in the amount of glucose in the diabetes model significantly affects the electrical activity of the cells. Based on their electrical excitability, beta cells in an islet can be categorized as silent, active and overactive. Increased number of silent cells in the population decreases the activity of the cell population and decreases insulin secretion. The unhealthy cells that increase in number with the development of diabetes reduce the insulin-secreting potential of the entire cell population. Cells that are electrically less excitable have a higher  $K_{ATP}$  channel activity on their plasma membrane. The maximum conductivity between two adjacent cells in a pancreatic islet is expressed as the gap-junctional conductance ( $g_c$ ). In a cell population with a high level of unhealthy cells, when  $g_c$  is high, all beta cells remain silent. At moderate  $g_c$  levels, active healthy cells disengage from the unhealthy cells, act independently and oscillate in a synchronized manner, which results in increase in  $Ca^{+2}$  levels. However, when  $g_c$  is reduced to zero, each active cell oscillates independently, while the unhealthy cells remain silent and thus the synchronization is completely lost due to low levels of  $Ca^{+2}$ . In our study, we investigated the dose- and time-dependent effects of glucose concentration on the expressions of Kir6.1, a gene encoding  $K_{ATP}$  channel, and Connexin36, which is a part of intercellular Gap-Junction channels, in an *in vitro* mouse diabetes model. In addition, we showed that reducing the expression of Connexin36 rescued the  $Ca^{+2}$  oscillation, which is accepted as the precursor of insulin release from pancreatic beta cells in our *in vitro* diabetes model.

#### Abstract

Herbicides are substances used to control undesired plants, also known as weeds. Herbicide resistance is a significant problem in agriculture as unwanted plants evolve to withstand herbicides like sulfonylureas, which target the acetohydroxyacid synthase (AHAS) enzyme. These inhibitors are widely used due to their significance across various organisms. The AHAS enzyme is pivotal in amino acid biosynthesis, making it a crucial target for herbicides through oxidative inactivation. As a result, AHAS inhibition disrupts amino acid synthesis in plants, leading to the demise of targeted weeds while posing relatively lower risks to animals and the environment. Sulfonylurea resistance is a significant problem in agriculture where weeds have developed the ability to withstand the effects of sulfonylurea herbicides due to genetic mutations that affect the target enzyme's binding site, reducing the herbicide's efficacy, and necessitating the use of alternative weed management strategies. For that reason, it is needed to synthesize new types of sulfonylureas with additional sub-chemical groups becomes imperative. Among the potential candidates are pyrimidinones, a class of chemicals that have shown promise in inhibiting plant growth processes, particularly photosynthesis, thereby enabling effective weed control. In this study, Combining the attributes of sulfonylurea and pyrimidinone, we envisioned a hybrid compound (Cl-Et) that exhibits potent herbicidal activity. The structure of Cl-Et compound (2-chloro-N-((1-ethyl-2-oxo-4-phenyl-1,2-dihydro pyrimidine-5-yl))benzenesulfonylurea) was characterized using FT-IR, NMR, and MS spectroscopic methods. In addition, enzyme inhibition studies were examined through molecular docking calculations (Schrödinger Suite 2020-3) with Glide XP OPLS2005 force field docking and Induced Fit Docking (IFD) to elucidate non-covalent interactions. ADME (absorption, distribution, metabolism, and excretion) calculation also performed QikProp in Schrödinger Suite. Our work includes conformational studies that help identify the most stable and relevant ligand conformations for effective binding to the target protein.

**Keywords:** Herbicidal resistance, AHAS enzyme, Sulfonylureas, Pyrimidinone, Molecular docking, IFD.

#### Abstract

As exotic animals including pet birds become more common around the world, exotic animal medicine is also becoming increasingly popular as a broad field of study and research for veterinarians. From this point of view, within the scope of this study, data on pet birds brought to Ankara University Faculty of Veterinary Medicine Small Animal Hospital Internal Medicine Clinic between September 2019 and September 2022 were evaluated, retrospectively. It is determined that, a total of 216 budgerigars (78.2%), 54 parrots (19.5%) and 6 canaries (2.17%) were presented between the relevant dates. When control visits were excluded from these, it was determined that 103 budgerigars, 28 parrots and 3 canaries were examined. The mean age ( $\pm$ std) was  $4.62\pm 3.17$ ,  $4.46\pm 3.26$ , and  $7.66\pm 4.12$  of the budgerigars, parrots, and canaries, respectively. The most common diagnosis was categorized as gastrointestinal (54.36%), respiratory (15.53%), and dermatologic diseases (11.65%) in budgerigars while it is gastrointestinal (28.57%), dermatologic (25%) and respiratory diseases (25%) in parrots and gastrointestinal diseases in canaries. Most avian illnesses can affect most of the bird breeds. However, as it is not always possible to list and eliminate all the diseases in the clinical practice, knowing breed-specific diseases, predispositions and some common health conditions contributes significantly to diagnosis and treatment processes. For this reason, it would be beneficial for veterinarians to consider the above disease rates, especially on a regional basis, when examining pet birds.

**Keywords:** avian, exotic animal medicine, pet birds

#### Özet

İyonik sıvılar (İS), erime noktası 100°C'nin altında olan sıvı organik tuzlardır. Organik katyonlar ve organik veya inorganik anyonların sıvı bir formda bir arada bulunduğu yapılardır. Tamamen iyonlardan oluşan ve oda sıcaklığında sıvı halde olan organik tuzlardır [1]. İyonik sıvılar geniş elektrokimyasal pencere, mükemmel iyonik iletkenlik, yüksek viskozite, ihmal edilebilir buhar basıncı, güçlü termal ve kimyasal stabilite gibi sahip oldukları eşsiz fizikokimyasal özelliklerden dolayı elektrokimyasal sensör uygulamalarında modifikasyon ajanı olarak sıklıkla kullanılmaktadır. İyonik sıvı elektrot yüzeyi ile etkileşime girerek reolojik ve iletkenlik gibi elektrotun bazı kritik özelliklerini değiştirmektedir. İS ile modifikasyonun elektrot iletkenliğini ve elektron transferini artırarak sensör cevabını iyileştirdiği bilinmektedir [2]. İS ve metalik nanopartiküllerin bir arada yer aldığı kompozit ve hibrit modifikasyonlar ise bu iki bileşenin sinerjik etkisiyle sensöre daha üstün elektrokimyasal özellikler sağlamaktadır [3-5].

Sunulan çalışmanın ilk kısmında, hidrofobik ve aprotik bir iyonik sıvı olan 1-butil-3-metilimidazolyum hekzaflorofosfat (BMIMPF<sub>6</sub>) ile modifiye edilmiş kalem grafit elektrotların (KGE) morfolojik ve elektrokimyasal karakteristikleri incelenmiştir (Şekil 1). Adsorpsiyon, fiziksel tutuklanma, elektrokaplama ve tabaka-tabaka düzenlenme gibi çeşitli modifikasyon yöntemlerinin ve parametrelerinin İS ile modifiye edilmiş KGE'nin elektrokimyasal cevabı üzerine etkileri dönüşümlü voltametri tekniği ile değerlendirilmiştir. Çalışmanın ikinci kısmında ise, KGE'nin bakır oksit nanopartiküller ve BMIMPF<sub>6</sub> ile hibrit modifikasyonunun sinerjik etkisi fizikokimyasal ve elektrokimyasal olarak incelenmiştir. Bu kapsamda, bakır oksit nanopartiküller KGE yüzeyinde elektrokimyasal çöktürme yöntemiyle sentezlenmiştir. Çöktürme esnasında (in situ deposition) ve çöktürme sonrasında (post deposition) İS ile modifikasyon sensör performansı üzerine etkisi dönüşümlü voltametri tekniği ile araştırılmıştır. Deneysel çalışmaların sonucunda, KGE'nin yalnızca İS ile modifikasyonu ve bakır oksit nanopartiküllerle İS'nin hibrit modifikasyonu karşılıklı sistematik olarak değerlendirilmiştir. Elde edilen sonuçlar doğrultusunda, ileriki çalışmalarda sensör olarak kullanılmak üzere KGE için en uygun modifikasyon yöntemi ve modifikasyon parametreleri belirlenmiştir.

**Anahtar Kelimeler:** iyonik sıvı, elektrokimyasal sensör, kalem grafit elektrot, bakır oksit nanopartikül, elektrot modifikasyonu.

Şekil 1: A) Modifiye edilmemiş ve B) İS ile modifiye edilmiş kalem grafit elektrotların SEM görüntüsü.

#### Abstract

Schiff base derivatives have attracted attention for a long time because they are widely used in a variety of fields, including industrial organic chemistry, biochemistry, and medicinal chemistry. Schiff base molecules may be formed by the reflux reaction of aldehydes or ketones with primary amines in organic solvents like ethanol or methanol. Schiff bases (-C=N-) obtained from carbonyl compounds of amines form complexes with metals. These complex compounds are used in many different fields today, and their usage areas are increasing day by day. Some of these areas are: dyestuffs, color pigments, stabilizers in polymers, anti-inflammatory, anti-cancer, anti-HIV, anti-tuberculosis, antipyretic agent molecules, and Schiff bases and their indispensable metal complexes in the field of pharmacology. In this study, Schiff base ligand was synthesized from 2-hydroxy-5-nitrobenzaldehyde and 4-bromoaniline compounds. Complex compounds were synthesized from some transition metal salts with the obtained Schiff base ligand. The structures of the synthesized complex compounds were elucidated by spectroscopic methods such as UV-Vis and FT-IR, and by measurements such as elemental analysis, magnetic susceptibility, and electrolytic conductivity.

**Figure.** Structure of synthesized complexes

### Tıbbi cihazların ve ürünlerinin değerlendirilmesinde mikrobiyolojik testlerin önemi

Pınar Mursaloglu Kaynar<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-8451-1777>)

<sup>1</sup>Ankara Medipol Üniversitesi, Sağlık Hizmetleri Meslek Yüksekokulu,  
Tıbbi Hizmetler ve Teknikler Programı, Ankara, Türkiye

\*Sorumlu yazar e-mail: [pinar.mursaloglu@ankamedipol.edu.tr](mailto:pinar.mursaloglu@ankamedipol.edu.tr)

#### Özet

Hastalıkların tanı ve tedavisinde kullanılan tıbbi cihazlar ve ürünleri sürekli artmaktadır. Tıbbi cihazların/ürünlerinin geliştirilmesi sürecinden başlayarak güvenlikleri ve etkinlikleri değerlendirilmelidir. Tıbbi cihazların/ürünlerinin üretimi, nakliyesi, depolaması veya kullanımı gibi çeşitli aşamalarında mikroorganizmalar bulunabilmektedir. Bu mikroorganizmalar da enfeksiyonlara, advers reaksiyonlara veya cihaz arızalanmaları gibi hasta güvenliğini ve sağlık sonuçlarını tehlikeye atabilecek olumsuzluklara neden olabilmektedir. Bu nedenle tıbbi cihazlarına/ürünlerine yönelik mikrobiyolojik testlerin yapılması önemlidir. Mikrobiyolojik testler, tıbbi cihazlarında/ürünlerinde mikrobiyal kontaminasyona karşı biyolojik tehlikeleri belirlemek ve potansiyel risklerini değerlendirmek için ihtiyaç duyulmaktadır. Ayrıca, olası kontaminasyon kaynaklarını saptayarak kontaminasyon risklerini azaltmak için en uygun üretim süreçleri, sterilizasyon yöntemleri, uygun kullanımları ve bakım prosedürleri belirlenmektedir. Üretim sonrası da tıbbi cihazın/ürünün kalitesinin sürdürülmesini ve mevzuatta uygunluğunun kontrol edilmesini mikrobiyolojik testlerle sağlanmaktadır. Mikrobiyolojik testleri biyoyük, sterilite, bakteriyel endotoksin, çevresel izleme, mikrobiyal tanımlama ve mikrobiyal limitleri belirleme testleri şeklinde sınıflandırılmaktadır. Biyoyük testi ile bir tıbbi cihazdaki/üründeki canlı mikroorganizmaların sayısı ölçülmektedir. Test sonuçları, biyolojik yükü kabul edilebilir bir seviyeye indirmek için gereken uygun sterilizasyon yöntemini ve dozunu belirlemeye yardımcı olmaktadır. Sterilite testi, tıbbi cihazın/ürünün canlı mikroorganizmalardan arındırılmış olduğundan emin olmak için yapılmaktadır. Özellikle cerrahi aletler veya implant edilebilir cihazlar gibi steril ortamlarda kullanılması amaçlanan tıbbi cihazlar için önemlidir. Bakteriyel endotoksin (LAL) testi, Gram negatif bakterilerin hücre duvarlarının bir parçası olan endotoksinin varlığını ve düzeylerini belirlemek amacıyla uygulanmaktadır. Çevresel izleme testiyle tıbbi cihazların/ürünlerin üretim ve depolama süreçlerinde olası mikrobiyal kontaminasyonu önlemek için alanlarındaki hava, su ve yüzeylerin mikroorganizmalardan arındırılmış olduklarından emin olmak için yapılmaktadır. Mikrobiyal tanımlama testi, tıbbi cihazla/ürünle ilişkili mikroorganizmaların türlerini anlamak için önemlidir. Test sonuçları ile uygun sterilizasyon yöntemini belirlemek ve temizleme prosedürlerinin etkinliğini değerlendirmek için de kullanılmaktadır. Mikrobiyal limit testiyle bir tıbbi cihazın/ürünün kalite standartlarını karşıladığından emin olmak için belirli mikroorganizmaların/patojenlerin varlığı araştırılmaktadır. Sonuç olarak, tıbbi cihazların/ürünlerinin geliştirilmesi ve değerlendirilmesinde uygun mikrobiyolojik testler seçilmelidir. Mikrobiyolojik test sonuçlarının uygunluklarının hasta güvenliğinin sağlanmasında ve sağlık hizmetlerinin iyileştirilmesinde önemli olduğu görülmektedir.

**Anahtar Kelimeler:** Mikrobiyolojik test, Tıbbi cihaz, Medikal Ürün, Güvenlik.

#### Abstract

Gastric cancer is a malignant tumor that is seen in the fifth place worldwide and in the third place in cancer-related deaths. Oxidative stress is a state of imbalance between oxidants and antioxidants in the cell. Increased reactive oxygen derivatives (ROS) in the cell contribute to the development of cancer by causing cellular damage. It is extremely important to suppress oxidative stress in the cell by antioxidants in order to maintain cellular homeostasis. Caffeic acid phenethyl ester (CAPE), the main component of propolis, is a flavonoid compound with antioxidant and anti-cancer effects. Autophagy; it is a self-destruct mechanism activated as a result of stress factors such as nutrient deficiency, hypoxia and oxidative stress. Beclin-1 gene is involved in processes such as autophagy and apoptosis, and it is known that gene expression increases under stress conditions. In this study, it was aimed to investigate the changes in autophagy-related Beclin-1 gene expressions in AGS and MKN-45 gastric cancer cells under oxidative stress conditions. AGS and MKN-45 gastric cancer cell lines were cultured in media containing 89% Dulbecco's Modified Eagle Medium (DMEM), 10% Fetal Bovine Serum (FBS) and 1% Penicillin-Streptomycin at 37 °C and 5% CO<sub>2</sub>. After the cells were cultured, hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) and H<sub>2</sub>O<sub>2</sub>+CAPE were applied to AGS and MKN-45 cells. After cell culture, total RNA isolation and cDNA synthesis were performed from control group, H<sub>2</sub>O<sub>2</sub> and H<sub>2</sub>O<sub>2</sub>+CAPE treated cells. Changes in Beclin-1 gene expression levels in oxidative stress conditions and antioxidant-treated gastric cancer cells were investigated by quantitative real-time-polymerase chain reaction (qRT-PCR). The results were statistically analyzed by the 2<sup>-ΔΔCT</sup> method. Our findings showed that Beclin-1 gene expressions increased in H<sub>2</sub>O<sub>2</sub>-treated AGS and MKN-45 cells compared to the control group, while Beclin-1 expression decreased in H<sub>2</sub>O<sub>2</sub>+CAPE-treated AGS and MKN-45 cells compared to the control group.

**Keywords:** Gastric cancer, Oxidative stress, CAPE, Beclin-1

#### Abstract

The azo acid dye Trypan blue used in the textile industry is carcinogenic, and its wastes pose a threat to the environment, human and animal health. In this study, the adsorption of Trypan blue (TRB) dye at 5-10-25-50ppm concentrations with Cu-Vanadate adsorbent at 25-35 and 45 °C was investigated. In the study performed with UV-Vis spectrometry at 590 nm, the time for adsorption to reach equilibrium was found to be 60 minutes and  $V(L)/m(g) = 1$ . As adsorption isotherms; Freundlich, Langmuir, Tempkin, Frumkin or Fowler-Guggenheim (FFG) Dubinin and Radushkevich (D-R), Flory-Huggins (F-H) isotherms were used. In addition, thermodynamic and kinetic studies were carried out. After 60 minutes of Langmuir adsorption isotherm, it is seen that the maximum adsorbing capacity ( $q_{max}$ ) of the adsorbent at equilibrium changes as 103.1mg/g-37mg/g-33mg/g at 25 °C-35 °C -45 °C temperature values, respectively, and the highest adsorption capacity is at room temperature (25 °C). The characterization of the adsorbent was performed before and after adsorption by FTIR/ATR, SEM and TGA.

**Keywords:** Cu-Vanadate, Trypan blue, Adsorption

#### Abstract

The overuse of antibiotics and their subsequent release into the environment pose a potential threat to the ecosystem. Advanced oxidation processes like photocatalysis, activated persulfate, sonocatalysis, and so on are among the most effective methods for removing highly stable antibiotics resistant to biodegradation. Photocatalysis is preferred for its simple operation, cost-effectiveness, absence of secondary pollution, and high efficiency in pollutant degradation. This process relies on using semiconductor materials to degrade pollutants through redox reactions under visible or ultraviolet light. Numerous semiconductor materials, such as layered double hydroxides (LDHs), TiO<sub>2</sub>, and ZnO can be utilized as photocatalysts. However, the low stability and durability of some photocatalysts restrict their long-term applicability. To solve this problem, catalysts can be immobilized onto supporting substrates such as glass, polymers, and carbon nanotubes, which increases their stability. In the present study, La-ZnFe LDH was immobilized on polydimethylsiloxane (PDMS) sponge to increase the catalyst's stability and reusability. The photocatalytic activity of the La-ZnFe LDH-embedded PDMS sponges was evaluated for the degradation of rifampicin as an antibiotic. By optimizing the operating factors, 92.8% of rifampicin occurs within 60 min with 15 mg/L rifampicin, 118 pieces of LaZnFe LDH@PDMS sponge, 0.2 mmol/L of peroxymonosulfate, and 100 W of light intensity and at natural pH of 8. After seven cycles, the degradation efficiency of rifampicin only decreased by 1.5%, indicating that the immobilized catalyst exhibits remarkable reusability and stability. The results confirmed that immobilizing LDH onto a supporting substrate such as PDMS sponge is a promising strategy for improving the catalyst's reusability.

**Keywords:** Antibiotic degradation, Immobilize catalyst, Polydimethylsiloxane, Photocatalysis, Peroxymonosulfate activation.

### Investigation of the effects of acute caffeine intake on oxidative stress in the brain and depression-like behaviors in ovariectomized mice

<sup>1</sup>Dilek Ozbeyli\* (ORCID: <https://orcid.org/0000-0002-4141-6913>)

\*<sup>1</sup>Marmara University, Vocational School of Health Services, Department of Medical Services and Techniques, Istanbul, Türkiye.

\*Corresponding author e-mail: [dilekobbeyli@marmara.edu.tr](mailto:dilekobbeyli@marmara.edu.tr)

#### Abstract

It is noteworthy that the risk of depression increases in women during the transition to menopause. In ovariectomized rodents, some studies have been reported that oxidative stress increases in areas of the brain related to anxiety and depression-like behaviors due to hormone imbalance. However, there is controversial data on the effects of moderate doses of caffeine on depression, anxiety-like behaviors, and brain oxidative status in the literature. Our hypothesis is that acute caffeine administration alleviates the possible oxidative state in the brain and reduces depression-like behaviors in ovariectomized Balb-C mice. After ethical approval (06.2023.mar), the groups were designed as Sham + Vehicle (Sham+V), Sham + Caffeine (Sham+C), Ovariectomy + Vehicle (OVX+V), and Ovariectomy + Caffeine (OVX+C) (n = 6 per group). Four weeks after ovariectomy, on the day of the experiment, single dose 20 mg/kg caffeine (moderate dose) to the caffeine groups and an equivalent volume of serum physiologic to the vehicle groups were given. Following 4 hours, depression-like behaviors were evaluated by a tail suspension test, and after euthanasia, the brains were removed. Brain oxidative status was assessed by measuring malondialdehyde and glutathione levels. Statistical analysis of the parameters was performed with a one-way analysis of variance (ANOVA) supported by Tukey's multiple comparison tests; variances were considered significant if  $p < 0.05$  and mean  $\pm$  S.D. The findings showed no significant changes in MDA or GSH levels between groups. The immobility time of the Sham + C and OVX+C groups significantly decreased compared to the Sham+V and OVX+V groups, respectively ( $p < 0.05$ ;  $p < 0.001$ ). In conclusion, a 4-week estrogen hormone deficiency did not cause significant oxidative damage to the brain, and acute caffeine administered did not affect oxidative parameters. On the other hand, acute caffeine treatment significantly reduced the increased immobilization time, which is considered a marker of depression-like behavior due to ovariectomy.

**Keywords:** Caffeine, depression-like behavior, tail suspension, ovariectomy, oxidative stress, mice.

## ORAL PRESENTATION

### Habitat Preferences of Anatolian Water Frog Lineages (Genus: *Pelophylax*)

Çiğdem Akın Pekşen<sup>1,2\*</sup> (ORCID: <https://orcid.org/0000-0001-5736-3062>),

#### Abstract

Obtaining ecological knowledge about the terrestrial demands of frogs such as habitat preference is critical to compose effective conservation strategies for changing environmental conditions due to global climate change (Toledo and Jared 1993; Wikström, 2018). There are limited studies on water frog's habitat preferences. For example, in Central Europe *P. lessonae* avoids running waters and can tolerate ponds with hypoxic water; *P. ridibundus* prefers habitats under strong river influence with well-oxygenated water; their hybrid species *P. esculentus* could perform well in both types of environments with variable extent (Lada et al., 2000). Anatolian water frog complex (Genus: *Pelophylax*) consists of narrow (*Caralitanus*, *Cerigensis*, *Cilician*) and widely distributed lineages (*Cf. bedriagae*, *Euphrates*). Although these frog lineages occupy a wide variety of habitat types like lake, river, stream, brook, pond, artificial pond or pool, marsh, brook, and water puddle within their distribution range, it is not known whether there is a significant difference in habitat preferences among frog lineages. Therefore, in this study, we aimed to understand whether there is a difference in habitat preferences of frog lineages distributed throughout Anatolia. In this context, the Kruskal Wallis and post-hoc Dunn tests were respectively applied in accordance with the unpaired nonparametric conditions, and thus habitat preferences across different altitude gradients were investigated and tested both for all water frog lineages and pairs of water frog lineages. Accordingly, the results showed that there is a statistically significant difference between habitat preferences of Anatolian water frog lineages. This means that the distributions of these lineages do not overlap with each other, and they have different habitat preferences. In addition, *Cf. bedriagae*, *Caralitanus*, and *Euphrates* lineages exhibit a generalist behaviour by occupying a wide variety of habitats in a wide altitude range, while *Cerigensis* lineage occupies brook, water puddle habitat types and so exhibit a more selective behaviour. Thus, these findings are very important to developing effective conservation strategies especially for narrowly distributed *Cerigensis* lineage with a more selective behaviour.

**Keywords:** Habitat preference, water frog, *Pelophylax*, lineage, Anatolia.

### Comparison of Phenolic Content and Antioxidant Activity of Two Different White Honey Samples

Tuğba Nigar BOZKUŞ<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0001-9613-6911>)

<sup>1</sup>Artvin Coruh University, Artvin Vocational School, Department of Chemistry and Chemical Processing Technologies, Artvin, Türkiye

\*Corresponding author e-mail: [tugbancakiroglu@artvin.edu.tr](mailto:tugbancakiroglu@artvin.edu.tr)

#### Abstract

White honey is a type of honey produced by Caucasian bees in very limited areas around the world. White honey, which has a crystal structure in the mountainous regions of the Caucasus with the effect of altitude and flora, is produced in Turkey, especially in the high parts of Artvin and Ardahan regions. This study aimed to determine the polyphenol and flavonoid content amounts and antioxidant capacity of the aqueous extracts of two different white honey samples produced in Yusufeli district of Artvin province and to compare the phenolic content and antioxidant activity of the white honey samples from the same region. Total polyphenol content and total flavonoid content of 600 mg/mL aqueous extracts of white honey samples was determined by modified Folin-Ciocalteu method, and Aluminum chloride colorimetric method, respectively. Antioxidant activities of the extracts were determined by ferric (Fe<sup>3+</sup>) reducing antioxidant power. As a result of the analyses; total polyphenol content of the aqueous white honey extract of Bakırtepe and Kılıçkaya villages of Yusufeli district in Artvin province was respectively, 16.37 ± 0.78 mg Gallic acid/100 g honey and 15.27 ± 0.91 mg Gallic acid/100 g honey, total flavonoid content was respectively, 1.54 ± 0.25 mg Quercetin/100 g honey and 4.28 ± 0.65 mg Quercetin/100 g honey, and ferric (Fe<sup>3+</sup>) reducing antioxidant power was respectively 95.43 ± 1.35 mg Trolox/100 g honey and 97.55 ± 0.73 mg Trolox/100 g honey. While it was determined that the aqueous extracts of two different white honey samples were close to each other in terms of polyphenol content and antioxidant activity, the amount of flavonoid content was found to be much higher in the Kılıçkaya sample. In this respect, it was concluded that different white honey samples from the same region showed similar phenolic content and antioxidant activity, but the difference in altitude and vegetation showed variation in flavonoid content.

**Keywords:** White honey, Polyphenol, Flavonoid, Antioxidant activity, Artvin

## ORAL PRESENTATION

### Serotonin ve Melatonin Uygulanmış Meme Kanseri Hücrelerinde MT-1 ve MT-2 Gen Ekspresyon Seviyelerinin İncelenmesi

## Özet

Meme kanserinin tüm dünyada ki görülme sıklığı (özellikle kadın popülasyonunda) akciğer kanserinden sonra 2. sırada gelmektedir. Meme kanseri, tipik olarak hormon-bağımlı kanser türüne örnektir ve literatürde hastaların büyük çoğunluğunun hormon bağımlı meme kanseri olduğu bildirilmiştir. Melatonin, sirkadiyen ritmin düzenlenmesinde büyük öneme sahip olan bir hormondur. Hormon-bağımlı bir kanser olan meme kanserinde, melatoninin onkostatik etki gösterdiği bilinmektedir. G proteinine bağlı melatonin reseptörü olan melatonerjik tip 1 reseptörü (MT-1) (yüksek afiniteli) bir melatonin reseptörüdür. Melatoninin bir diğer reseptörü olan Melatonerjik tip 2 reseptörü (MT-2) (düşük afiniteli) ile olan ilişkisi incelendiğinde MT-2 reseptörünün immün fonksiyonda önemli rol oynadığı bilinmektedir. Yumurtalık kanseri ve kanser kök hücreleri üzerinde yapılan bir çalışmada, melatoninin MT-1 ve MT-2 ifadelerini yukarı regüle ettiği gösterilmiştir. Triptofan aminoasidi hem melatonin hem de serotonin hormonunda bulunmaktadır ve meme bezi gelişiminde büyük öneme sahiptir. Serotonin, insanda mutluluk hissi verdiği bilinen ve çeşitli hücre tiplerinde mitojen olarak aktivite gösteren bir nörotransmitterdir. Literatürde, serotonin hormonunun MT-1, MT-2 gen ifadeleri üzerindeki etkisi bilinmemektedir ve bu projede melatonin ve serotoninin MT-1 ve MT-2 genlerinin üzerindeki etkisinin araştırılması amaçlanmıştır. Bu çalışmada MCF-7 meme kanseri hücreleri %89 Dulbecco's Modified Eagle Medium (DMEM), %10 Fetal Bovine Serum (FBS) ve %1 Penisilin-Streptomisin besiyeri ortamında, 37 °C ve %5 CO<sub>2</sub> koşullarında kültüre edilmiş ve sonrasında MCF-7 hücrelerine 24 saat süre ile 50 nM serotonin ve melatonin uygulaması yapılmıştır. Uygulama sonrasında takiben total RNA izolasyonu, cDNA sentezi ve gerçek zamanlı-polimeraz zincir reaksiyonu (qRT-PCR) yapılmış ve veriler istatistiksel olarak analiz edilmiştir. Bulgularımız, melatonin uygulanan meme kanseri hücrelerinde MT-1 ve MT-2 gen ekspresyonunun kontrol grubuna göre arttığını gösterirken, serotonin uygulanmış hücrelerde MT-1 ve MT-2 gen ekspresyon seviyelerinin kontrol grubuna göre azaldığını göstermiştir.

**Anahtar Kelimeler:** Meme kanseri, Serotonin, Melatonin, MT-1, MT-2

#### Abstract

Fructose is widely used as a sweetening substitute for glucose or sucrose in food processing of modern human diet. Besides fruit by-products, fructose is used on poultry farms and, its' acute effect on the chicks' metabolism is still unclear. We therefore aimed to investigate the effects of high fructose corn syrup (HFCS) consumption on hematological parameters in broilers. Total 36 chicken broilers were divided into three groups with equal number of animals, and fed *ad libitum* with isonitrogenic-isocaloric feeds and water for 42 days. Animals in the first group served as control and were given no other treatment, while the diets of broilers in the second and third groups contained 50 mg/kg (low) or 100 mg/kg (high) HFCS, respectively. At the last day of experiment, animals were killed by cervical dislocation and blood samples (5 mL) were collected into test tubes with anticoagulant (K<sub>3</sub>-EDTA) for hematological analysis. Our findings showed that the RBC of broilers treated low or high HFCS were not statistically different from those of control animals and HGB value was not affected by both concentrations of HFCS treatments (P<0.05). HFCS treatment significantly (P<0.01) increased PCV and MCV in the high-dose group but not in the low-dose group compared with the control. On the other hand, MCH increased (P<0.01) by low-HFCS and MCHC decreased (P<0.05) by high-HFCS compared to untreated control group. WBC and monocyte values were not affected from any HFCS treatment (P>0.05). However, the treatment of low HFCS increased basophil (P<0.05), heterophil and heterophil/lymphocyte ratio, and decreased lymphocyte (P<0.001) while the treatment of high HFCS decreased eosinophil (P<0.05) and heterophil, and increased lymphocyte (P<0.001). In conclusion, this study revealed that dietary fructose intake may change some hematological parameters which can be fore symptoms of further systemic or metabolic diseases.

**Keywords:** high fructose, broilers, blood parameters, heterophil to lymphocyte ratio

## Özet

Mide kanseri, dünya çapında sık görülen malign bir tümördür ve kansere bağlı ölümler arasında üçüncü sırada yer alan küresel bir sağlık sorunudur. Oksidatif stres, pro-oksidanlar ve antioksidanlar arasındaki dengeyi bozarak durumu olarak tanımlanır. Hücre içerisinde süperoksit, hidroksil ve hidrojen peroksit gibi serbest radikallere bağlı olarak reaktif oksijen türleri (ROS) seviyeleri artar. Hidrojen peroksit ( $H_2O_2$ ) tümör hücre büyümesi, proliferasyon, anjiyogenez, metastaz ve apoptoz gibi süreçlerde yer aldığı ve ROS seviyelerini artırdığı bilinmektedir. Artan ROS seviyeleri oksidatif stres ile sonuçlanır ve kanser gelişimine katkıda bulunur. Vasküler endotelial büyüme faktörü (VEGF), anjiyogenezin ana aracısı olmakla birlikte tümör metastazı ve büyümesinde de oldukça önemlidir. Endojen ROS kaynaklarının çeşitli hücrelerde VEGF' i indüklediği, hücre proliferasyonunu ve göçünü desteklediği bilinmektedir. Literatürdeki mevcut kanıtlar, mide kanserinde tümörün ilerlemesi ile birlikte VEGF gen ifadelerinin arttığını yapılan çalışmalar ile ortaya koymuştur. Bu çalışma kapsamında, AGS ve MKN-45 mide kanseri hücreleri AGS ve MKN-45 hücreleri %89 Dulbecco's Modified Eagle Medium (DMEM), %10 Fetal Bovine Serum (FBS) ve %1 Penisilin-Streptomisin besiyeri ortamında, 37 °C ve %5 CO<sub>2</sub> koşullarında kültüre edilmiştir. 100 mm petri kaplarına 10<sup>6</sup> hücre olacak şekilde ekilen AGS ve MKN-45 mide kanseri hücrelerine kontrol grubu hücreleri hariç tutularak 24 saat süre ile 100 µM ve 200 µM H<sub>2</sub>O<sub>2</sub> uygulaması yapılmış ve uygun koşullarda inkübe edilmiştir. Kontrol grubu ve oksidatif stres koşulları oluşturulan mide kanseri hücrelerinden total RNA izolasyonu ve cDNA sentezi yapılmıştır. Sentezlenen cDNA örnekleri kullanılarak kantitatif gerçek zamanlı-polimeraz zincir reaksiyonu (qRT-PCR) gerçekleştirilmiş ve H<sub>2</sub>O<sub>2</sub> aracılı oksidatif stres koşulları oluşturulmuş AGS ve MKN-45 mide kanseri hücre hatlarında anjiyogenez ile ilişkili VEGF gen ekspresyonu seviyeleri incelenmiştir. qRT-PCR'den elde edilen sonuçlar 2<sup>-ΔΔCt</sup> yöntemi ile analiz edilmiştir. Bulgularımız, H<sub>2</sub>O<sub>2</sub> aracılı oksidatif stres koşullarında VEGF gen ekspresyonunun hem AGS hem de MKN-45 hücrelerinde kontrol grubuna göre arttığını göstermiştir.

#### Abstract

Heart disease and high blood pressure are among the most dangerous, significant, and widespread diseases in the present time, which need rapid treatment to control them. Nanotechnology has contributed to a major development in the pharmaceutical industry, improving its positive effect on controlling and improving the performance of traditional medicines in treating diseases. Nanomedicines can target cells that conventional drugs cannot reach at a high rate. Anti-hypertensive nanocrystals and colloidal particles at various concentrations with a suitable stabilizer as an anti-agglomeration agent were produced using the Antisolvent re-crystallization technique. The raw Anti-hypertensive active ingredients nanocrystals and obtained colloidal particles and re-crystallized powders were characterized by using scanning electron microscopy (SEM), X-ray diffraction (XRD), Fourier transform infrared spectroscopy (FTIR), and thermogravimetry analysis (TGA).

**Keywords:** Anti-solvent re-crystallization, anti-hypertensive, nanodrug, characterization

#### Abstract

The metal industry is a sector that has to fight corrosion. Corrosion, known as the oxidation of metal atoms, leads to the deterioration of the metal surface and the reduction of its metallic qualities. It is therefore appropriate to use inhibitors to protect the metal surface from corrosion. Among the effective inhibitors used to prevent metal corrosion, which occurs rapidly in acidic media, are cationic surfactants containing pyridinium ions. Based on this idea, two di-cationic surfactants containing one amide group, one ester group, two pyridinium ions and two positively charged nitrogen atoms thanks to pyridinium ions were synthesized to prevent metal corrosion in 1.0 M HCl solution. Its structure was confirmed by FT-IR spectroscopy. The ability of the compound to inhibit corrosion in acidic corrosive media was evaluated by weight loss technique. For this purpose, different concentrations of inhibitor solutions containing 1.0 M HCl were used and the effect of inhibitor concentration on corrosion was investigated by immersing metal samples in these solutions for 24 hours at room temperature. After the synthesis of di-cationic surfactants, it was revealed that they increased the corrosion resistance of low carbon steel in acidic environment as a result of tests by weight loss method. In these tests, corrosion inhibition efficiencies in the range of 74.61 - 87.95% were determined at different inhibitor concentrations and it was observed that the inhibition efficiency generally increased as the inhibitor concentration increased. Preventing the oxidation of iron atoms in mild steel depends on the adsorption of the inhibitor on the metal surface. As a result of this adsorption, the metal surface gains hydrophobic (water disliking) properties. As the best way to determine this hydrophobic property, the contact angle between the surface and the water dripped onto the metal surface was measured. In addition, surface images were taken with an optical microscope camera with 1600-fold magnification in order to compare the oxide layer images that were visible in the inhibitor-free environment, but not on the surfaces of the metal coupons immersed in the inhibitor (50 ppm) environment, and surface examinations were made by making the surface appearance differences more apparent.

#### Özet

Biyomalzemelerin kemik doku hasarlarının tedavisinde kullanımı son yıllarda hızlı bir şekilde artmıştır. Özellikle bu tedavilerde, uygun yapıya sahip biyolojik olarak parçalanabilen malzemelerin seçilmesi en kritik adımdır. Ayrıca biyofonksiyonel şablon oluşturmak ve doğal yapıyı taklit etmek için polimerler ile inorganik dolgu maddelerinin kombinasyonundan oluşan nanokompozitler, tek başına kullanılan polimer matrislerinden daha başarılı sonuç vermektedir. İnorganik dolgular, yüksek mukavemetleri ve geniş spesifik yüzey alanları nedeniyle matristen aktarılan strese dayanabildikleri için biyomalzemelerin mekanik özelliklerini güçlendirmek amacıyla yaygın olarak kullanılmaktadır. Bu çalışmada, dolgu maddesi olarak kullanılan montmorillonit (MMT), iki farklı silan ajanı ((3-aminopropil)trioksosilan (APTES) ve (3-glisidoksipropil)trimetoksosilan (GPTMS)) ile modifiye edilmiş, organik faz ile ara yüzey etkileşiminin artırılması ve polimer matrisi içerisinde homojen bir şekilde dağılması sağlanmıştır. Polimer matris olarak ise biyobozunur ve biyoyumlu özelliklere sahip sentetik polimerlerden polikaprolakton (PCL) ve biyoyumlu ve hidrofilik özelliğe sahip polivinilpirolidon (PVP) birlikte kullanılmış ve çözelti döküm yöntemiyle biyomalzemeler üretilmiştir. Kemik doku mühendisliğine yönelik doku iskelesi olarak kullanılacak biyomalzemelerin morfolojik ve fizikokimyasal özellikleri, atomik kuvvet mikroskobu (AFM), Fourier transform kızılötesi spektroskopisi (FTIR), temas açısı analizi ve su absorplama kapasitesi analizi ile karakterize edilmiştir. AFM sonuçları, PCL/PVP polimer matrisine modifiye edilmemiş ve edilmiş MMT eklenmesiyle pürüzlülüğün düştüğünü göstermiştir. Pürüzlülük oranı en yüksek GPTMS ile modifiye edilmiş MMT katkılı biyomalzemelerde 0,530 µm olarak bulunmuştur. Temas açısı değerleri ve su absorplama kapasiteleri karşılaştırıldığında modifiye edilmiş MMT katkılı biyomalzemelerin daha hidrofilik olduğu ve su absorplama kapasitesinin MMT katılmamış polimer matristen ve modifiye edilmemiş biyomalzemeden daha yüksek olduğu görülmüştür. Sonuç olarak, APTES ile modifiye edilmiş MMT katkılı PCL/PVP biyomalzemeleri, kemik doku hasarlarının tedavisinde doku iskelesi olarak kullanılabilir.

#### Abstract

Thiocarbohydrazone can react with aldehydes or ketones to form mono or bisthiocarbohydrazones. Thiocarbohydrazones have the ability to form chelates with various metal ions through their donor groups. Thiocarbohydrazones and their metal complexes have some biological activities such as antitumor, antioxidant, antimicrobial, antiviral, antitubercular and enzyme inhibition [1,2]. Pyridoxal is an aldehyde in the form of vitamin B6 with a heterocyclic pyridine ring. Vitamin B6 deficiency is associated with depression, dermatitis, microcytic anemia, confusion, celiac disease and weakened immune function in humans [3]. Isatin, a flexible heterocyclic chemical, also known as 1H-indole-2,3-dione, can be used to synthesize a wide range of heterocyclic compounds. Isatin derivatives have also shown excellent interest as they express anticancer, antibacterial, antiviral, antiinflammatory, antioxidant, antimalarial, antifungal, antitubercular, anticonvulsant, analgesic and antidiabetic activity [4]. In this study, a new bioactive bisthiocarbohydrazone ligand (L) was obtained from biological molecules such as isatin and pyridoxal. Along with their remarkable efficiency in transition metal-catalyzed processes, phosphine-based compounds also possess important bioactivities such as antitumor, antiviral, antifungal, antibacterial and antioxidant [5,6]. A new mixed ligand nickel(II) complex with the general formula [Ni(L)(PPh<sub>3</sub>)] (PPh<sub>3</sub>: triphenylphosphine) was synthesized from the reaction of L with NiCl<sub>2</sub>.6H<sub>2</sub>O in the presence of triphenylphosphine (Figure 1). The structures of the ligand and complex were characterized by elemental analysis, IR, <sup>1</sup>H NMR and UV-VIS spectroscopic techniques. In addition, all compounds were found to show good antioxidant capacity according to the antioxidant activity assay results.

**Figure 1.** Structure of Ni(II) complex.

**Keywords:** Bisthiocarbohydrazone, Nickel(II) complex, Isatin, Pyridoxal, Antioxidant activity.

## ORAL PRESENTATION

### Dondurma üretiminde üvez pulpu kullanılmasının dondurmanın ilk damla süresine etkisi

Hamza GÖKTAŞ<sup>1\*</sup> (<https://orcid.org/0000-0001-9802-9378>)

<sup>1</sup> İstinye Üniversitesi, Meslek Yüksekokulu, Gıda Teknolojisi Programı, İstanbul, Türkiye

\*Sorumlu yazar e-mail: hamzagoktas@yandex.com

#### Özet

Dondurma, süt, şeker, emülgatör ve stabilizatör gibi bileşenlerden oluşan besinsel özellikleri ve serinletici etkisi nedeniyle dünya genelinde hemen her yaş grubu insan tarafından severek tüketilen bir süt ürünüdür. Fonksiyonel gıdalar insanların sağlık durumlarını olumlu yönde etkileyebilecek bileşenler içeren gıdalardır ve son yıllarda fonksiyonel gıdalara olan talep hızla artmaktadır. Bunun yanında dondurma antioksidan bileşikler, probiyotikler ve prebiyotikler gibi fonksiyonel bileşenler açısından oldukça fakirdir ve tüketici talebinin yüksek olması nedeniyle özellikle fenolik bileşikler açısından zengin meyvelerle fonksiyonelleştirilebilir. Üvez meyvesi klorojenik asitler, flavonoller, hidroksisinamik, p-kumarik asit, ferulik asit ve kafeik asit gibi fonksiyonel bileşikler açısından zengindir ve geleneksel olarak reçel, şurup ve likör gibi şekerleme ürünlerinin üretiminde kullanılmaktadır. Ancak üvez meyvesinin sahip olduğu buruk tat nedeniyle bu meyvenin fonksiyonel gıda ürünlerinin üretiminde kullanımına yönelik çalışma mevcut değildir. Bu çalışmada üvez pulpu farklı oranlarda (%2,5 (ÜD1), %5 (ÜD2), %10 (ÜD3) ve %20 (ÜD4)) dondurmaya ilave edilerek fonksiyonel dondurma üretimi hedeflenmiştir ve üvez pulpunun dondurmanın erime süresine (first dripping time-ilk damla süresi) etkisi belirlenmiştir (Şekil 1.). Üvez pulpu içermeyen kontrol dondurma grubunun ilk damla süresi  $83,00 \pm 14,14$  s olarak belirlenmiştir. ÜD1, ÜD2, ÜD3 ve ÜD4 örneklerinin ilk damla süreleri ise sırasıyla  $119,00 \pm 38,18$ ,  $294,00 \pm 57,98$ ,  $319,00 \pm 18,38$  ve  $439,00 \pm 21,21$  s olarak tespit edilmiştir. Dondurma üretiminde üvez pulpunun kullanılması dondurma örneklerinin ilk damla süresini arttırmıştır ve artan üvez pulpu konsantrasyonu daha uzun ilk damla süresiyle dolayısıyla daha geç erimeyle sonuçlanmıştır. Bunun nedeni şeker içeriği ve meyve konsantrasyonunun artması absorbe edilen su miktarını arttırmıştır ve böylece viskozite arttığı için daha uzun ilk damla süresiyle sonuçlanmıştır.

(Kontrol: Üvez pulpu içermeyen dondurma, ÜD1: %2,5 üvez pulpu içeren dondurma, ÜD2: %5 üvez pulpu içeren dondurma, ÜD3: %10 üvez pulpu içeren dondurma, ÜD4: %20 üvez pulpu içeren dondurma) (Farklı harfler istatistiksel farklılığı göstermektedir ( $P \leq 0,05$ )).

Şekil 1. Dondurma örneklerinin ilk damla süreleri

**Anahtar Kelimeler:** Dondurma, Üvez pulpu, İlk damla süresi

#### Abstract

Oxidative stress is closely associated with the development of diabetic wounds. Increased oxidative stress and decreased antioxidant activity cause diabetic wounds to fail to heal. Abnormal production of Nitric oxide (NO<sub>x</sub>) is closely associated with impaired wound healing and the development of chronic wounds. During wound healing, not only lipids but also proteins are affected by increased oxidative stress. This study aimed to determine the effect of the combination of Rosmarinic Acid (RA) and Carvacrol (CAR), which are known to have natural antioxidant properties, on wound tissue Nitric oxide (NO<sub>x</sub>) and Protein carbonyls (Pc) levels during diabetic wound healing. 72 male Wistar-albino rats with streptozotocin-induced (STZ) diabetes were divided into five groups: control, untreated group, vehicle-treated group, topical treated group with a combination of RA (10 mg/kg) and CAR (10 mg/kg) and intraperitoneal (i.p.) treated group with a combination of RA (10 mg/kg) and CAR (10 mg/kg). NO<sub>x</sub> and Pc levels in the wound tissues obtained after the experiment were determined by spectrophotometric methods. When the untreated groups were compared with the treatment groups, a significant decrease was determined in NO<sub>x</sub> levels ( $p < 0.05$ ). When the untreated groups (3 and 7 days) were compared with the treated groups (3 and 7 days), a statistically significant decrease in Pc levels was determined in the treated groups ( $p < 0.05$ ). Combination of RA and CAR successfully contributed to wound healing by reducing the NO<sub>x</sub> and Pc levels in the healing process of diabetic wounds. It has been determined that the strong synergistic effect of these two antioxidants can be a powerful therapeutic agent in reducing or eliminating oxidative stress in diabetic wound healing.

#### Abstract

One of the factors causing water pollution is color formation in water. Especially in textile wastewater, color is formed due to dyestuffs and when discharged to the receiving environment without proper disposal, it negatively affects the water quality and accordingly the living life in the environment. The use of natural substances in the removal of pollutants in water is quite common. Adsorption mechanism is generally used for removal. Biosorption is the uptake of metal ions from aqueous media by biomass. In this study, pure and dimethylglyoxime modified *Pyracantha coccinea* L. plants growing in Nevşehir province were used as adsorbents. The decolorization potential of the modified and unmodified biomass of synthetic dyestuff-containing solution was investigated and different biomass amounts (0.1 g, 0.2 g, 0.4 g, 0.6 g, 0.8 g, 1.0 g) and at different temperature values (5 °C, 15 °C, 30 °C and 45 °C). It was found that better removal was achieved at lower temperatures and under conditions where the solution was basic. However, the effect of the amount of adsorbent used varied according to the analysis temperature.

**Keywords:** Adsorption, biosorption, color removal, *Pyracantha coccinea* L., water pollution.

### Özet

Tiyosemikarbazit ( $\text{NH}_2\text{-NH-CSNH}_2$ ), tiyokarbamik asidin en basit hidrazin türevi olarak bilinmektedir. Çok sayıda biyoaktif heterosiklik bileşiklerin sentezinde çok yönlü bir anahtar ürün olması ve içerdikleri substitüentlere bağlı olarak farklı farmakolojik aktivitelerinden dolayı araştırmacılar arasında geniş bir ilgi odağı olmuştur. Daha önce gerçekleştirilen birçok çalışmada tiyosemikarbazitlerin sentezine yer verilmiş ve kayda değer sonuçlar elde edilmiştir. Bu amaçla başlangıç maddesi olarak kullanılan *L*-fenilalanin etil esterinden hareketle; öncelikle 4-metoksibenzen sülfonil klorür ile reaksiyon sonucunda başlangıç maddesi olan benzensülfonamit elde edildi. Sonra bu bileşiğin ester kısmı uygun çözücü içerisinde % 98'lik hidrazin monohidrat kullanılarak hidrazit türevine dönüştürüldü. Asit hidrazit türevi, asetonitrilli ortamda ticari olarak bulunan süstitüe izotiyosiyanatlar ile tiyosemikarbazit türevleri sentezlendi. Sentezlenen bileşiklerin saflıkları İTK ve HPLC ile kontrol edildikten sonra yapıları elementel analiz (C, H, N, S), IR,  $^1\text{H-NMR}$  ve  $^{13}\text{C-NMR}$  spektroskopik yöntemler kullanılarak aydınlatılmıştır.

#### Abstract

Fullerene C<sub>60</sub> is used in applications in a variety of fields, including nanotechnology, materials science and medicine. Due to its propensity to encapsulate pharmaceuticals and other compounds, it is also preferred in nanomaterial research and as a potential drug delivery mechanism. In this study, the protective roles of fullerene C<sub>60</sub> against chromium-induced oxidative damage in *Saccharomyces cerevisiae* (*S. cerevisiae*) were evaluated. The experimental groups are as follows: (i) Control Group; (ii) Chromium (30 mM); (iii) Fullerene C<sub>60</sub> (30 mM); (iv) Fullerene C<sub>60</sub> (30 mM) + Chromium (30 mM). *S. cerevisiae* cultures were grown at 30 °C for 1, 3, 5 and 24 hours.

Malondialdehyde analyzes, catalase activities, glutathione levels, total protein and cell growth were determined by spectrophotometer. According to the results, it was determined that total protein synthesis, cell growth, catalase activities and glutathione levels increased, malondialdehyde levels decreased in the Fullerene C<sub>60</sub> + Chromium applied groups compared to the chromium applied groups. These results showed that fullerene C<sub>60</sub>, which exhibits many biological activities, reduces oxidative damage by providing protection in *S. cerevisiae* culture.

**Keywords:** Chromium, Fullerene C<sub>60</sub>, Nanoparticle.

#### Abstract

In recent years, faunistic research have been carried out on aquatic insect families. However, it is necessary to detect and monitor the animal diversity of these aquatic areas, which are gradually shrinking as a result of global warming, the expansion of agricultural areas and the effects of pesticides used in these agricultural regions. In this framework, aquatic Coleoptera and aquatic Hemiptera species collected in the Mediterranean coastal regions from the freshwater areas of Antalya and Mersin provinces in October, May and July between 2022 and 2023 were evaluated. 2784 insects were collected in the study area: These are; 99 individuals belong to the order Hemiptera (Corixiidae, Hydrometridae, Pleidae, Gerridae and Notonectidae) and 2685 individuals belong to the order Coleoptera (Dryopidae, Dytiscidae, Helophoridae, Heteroceridae, Hydranidae, Hydrophilidae, Hydrochidae, Haliplidae, Noteridae and Spercheidae). Those collected have yet only been determined at the family level. Hydrophiliade (Coleoptera) and Corixiidae (Hemiptera) families were caught in large numbers individually as ordo, but Spercheidae (Coleoptera) and Pleidae (Hemiptera) families were caught in almost non-existent numbers compared to previous localities. Additionally, insect distributions are shown on maps; greenhouse farming activities, which are known to involve the use of pesticides, and rivers, streams, streams, etc. It has been noticed that the number of insect samples collected near the coast and in the lower regions of greenhouse gardens is very low as a result of the use of water resources such as water resources for agricultural purposes. With this study, aquatic insects were monitored on a map for the first time in the research area. In conclusion, Turkey's aquatic insects in order to fully detect its existence, ecological and faunistic studies are increasing to cover all provinces. Moreover, it must continue.

**Keywords:** Aquatic insects, Mediterranean region, Pesticides, Turkey.

#### Abstract

In this investigation, we employed a microwave-assisted green synthesis methodology utilizing extracts derived from *Cistus salviifolius* L. and *Ferula communis* L. to synthesize silver nanoparticles (AgNPs). Subsequently, we conducted a comprehensive characterization of the biosynthesized AgNPs, denoted as *Cs*-AgNPs (obtained from *C. salviifolius*) and *Fc*-AgNPs (obtained from *F. communis*), employing various analytical techniques, including UV-Vis spectroscopy, Fourier-transform infrared (FT-IR) spectroscopy, X-ray diffraction (XRD) analysis, scanning electron microscopy (SEM), and transmission electron microscopy (TEM). The AgNPs exhibited a spherical morphology, with an average particle size measuring below 11 nm. Two different cell lines, breast adenocarcinoma (MCF-7) and colon carcinoma (HT-29), were used to evaluate their anticancer potential. *Cs*-AgNPs demonstrated elevated cytotoxic efficacy against the MCF-7 and HT-29 cell lines in contrast to *Fc*-AgNPs. Particularly noteworthy, *Cs*-AgNPs displayed the most pronounced cellular inhibition on the HT-29 cell line, with an observed IC<sub>50</sub> value of 57.10 µg/mL. Our findings conclusively demonstrate that biosynthesized *Cs*-AgNPs and *Fc*-AgNPs have significant anticancer activities.

#### Abstract

*T. molitor* L. is one of the most researched insects with its potential as a model organism, as well as being cultivated and used as animal feed and edible. Due to its rapid reproduction compared to other insect groups, industrial production is carried out in many parts of the world. A considerable amount of chitin residue is obtained during the molting process between larval stages. The aim of the study is highlighted the importance of the *Tenebrio molitor* chitin usage on the environmental biotechnology. In the scope of this study, four textile dyes (RR3:1, RO13, RS8, RB13) were treated by insect chitins. The experimental setup was designed in 50 ml working volume with pH 2 dye solution. 50 mg (1 g/L) biomass were used, and incubation was completed at 25 °C by 150 rpm for 30 min. The experiments were practiced in duplicate. Biosorption % and biosorption capacity was calculated. According to biosorption yield, *T. molitor* chitin was found to be effective for removal of RB8 and was used for the following optimization experiments. As a result of the optimization study carried out using *Tenebrio molitor* chitin, the chitin concentration was found to be as 1g/L, the dye concentration was found to be 50 ppm and the incubation time was 30 minutes. To sum up, *T. molitor* chitin can be used to treatment of textile dye wastewater including especially Reactive Black 8.

**Keywords:** biosorption, chitin, dye, *Tenebrio molitor*, wastewater

#### Abstract

Abiotic water stress is a hindrance to plant growth and productivity, with a significant impact on both yield and quality traits. In the face of ongoing global climate changes, the imperative to reduce the detrimental effects of water deficit on plant systems has increased exponentially. This research focuses on increasing the resilience of *Ocimum basilicum* L., a species particularly sensitive to the challenges of water stress. For this purpose, we studied the effects of zinc fertilizer supplementation applied at varying rates (2.5, 5 and 10 mg/kg) on *O. basilicum* grown in silty sandy soil and exposed to water stress conditions. Changes in sweet basil were investigated by assessments including mineral uptake dynamics as well as essential oil composition. The findings underline the negative consequences of water stress on the profile of the studied mineral uptake secondary metabolites. In the spectrum of essential oil constituents, estragole emerged as the dominant compound and recorded the highest concentration (69.37%) in the treatment group receiving 10 mg/kg zinc fertilizer. In contrast, the lowest estragole concentration (66.14%) appeared in the group under water stress without fertilizer supplementation. The application of zinc fertilizer, particularly at concentrations of 5 and 10 mg/kg, demonstrated significant ameliorative effects on the detrimental impacts induced by water stress. Furthermore, zinc exhibited multifaceted mechanisms of action, influencing the uptake dynamics of other essential nutrients from the soil.

**Keywords:** *Ocimum basilicum*, Water stress, Zinc fertilization, Essential oil.

## Özet

Beslenme bireyin büyüme ve gelişmesi, yaşam boyu sağlığın korunması ve yaşam kalitesinin artırılması için ihtiyaç duyulan besin öğelerinin alınıp vücutta kullanılmasıdır. Bireyin yaşamını sürdürebilmesi için yeterli ve dengeli beslenme önemlidir. Vücudun ihtiyacı olan besin öğelerinin ve yeterli enerjinin alınması sağlık açısından gereklidir. Şeker ve şeker içeren yiyecekler enerji yoğunluğu yüksek besinlerdir. Tüketim sıklık ve miktarlarının yüksek olması ideal vücut ağırlığının sağlanması ve korunmasında olumsuz etkiler ortaya çıkarır. Obezitenin varlığı yaşam kalitesini olumsuz etkileyebilmektedir. Bu çalışmanın amacı normal ağırlıktaki kadınlarda şeker tüketim sıklığı ile yaşam kalitesi arasındaki ilişkiyi değerlendirmektir. Bu çalışma Haziran – Temmuz 2022 tarihleri arasında, 18-65 yaş arası, 489 normal vücut ağırlığına sahip kadınlar üzerinde yürütülmüştür. Katılımcılara yüz yüze anket uygulaması yapılmıştır. Anket 3 bölümden oluşmaktadır. Birinci bölümde demografik bilgiler, ikinci bölümde beslenme alışkanlıkları ile ilgili bilgiler ve üçüncü bölümde ise SF-12 Yaşam Kalitesi Ölçeği yer almaktadır. Katılımcıların antropometrik ölçümleri araştırmacılar tarafından yapılmıştır. Çalışmaya katılan toplam 489 kadının yaş ortalaması  $32.75 \pm 9.76$ 'dır. Kadınların %66.2'si (n=324) evli ve yine %66.2'si (n=324) çocuk sahibidir. Kadınların %40.3'ü (n=197) üniversite mezunudur ve %49.1'i (n=240) ev hanımıdır. Sigara içenlerin oranı ise %23.1 (n=113) olarak bulunmuştur. Şeker tüketim sıklıklarına bakıldığında hiç tüketmeyenler, her gün, haftada 1-3 kez, haftada 4-6 kez ve ayda 1-3 kez tüketenlerin oranı sırasıyla %9.0, %49.9, %27.8, %4.5 ve %8.8'dir. Yaşam kalitesi mental ve fiziksel özet puanları en yüksek hiç şeker tüketmeyenlerde görülmüştür (sırasıyla  $41.9 \pm 12.2$  ve  $43.9 \pm 0.26$ ). Şeker tüketim sıklığı ile yaşam kalitesi arasında anlamlı bir ilişki tespit edilmemiştir ( $p < 0.05$ ). Normal vücut ağırlı kadınlarda şeker tüketim sıklığı ile yaşam kalitesi arasında anlamlı bir ilişki tespit edilmemiştir. Yaşam kalitesinin artırılması için ideal vücut ağırlığının korunması önemlidir. Bu noktada şeker tüketim sıklığı ve miktarına gösterilen dikkat önemlidir.

**Anahtar Kelimeler:** Sağlık beslenme, şeker tüketimi, yaşam kalitesi

### Özet

Beslenme, açlık-tokluktan etkilendiği gibi psikolojik etmenlerden, sosyal çevreden, kültürel alışkanlıklardan veya hastalık durumlarından da etkilenebilmektedir. Dünya Sağlık Örgütü'nün pandemi olarak kabul ettiği Covid-19, beslenme davranışlarını etkileyebilen önemli bir viral hastalıktır. Covid-19 sebebiyle evden çalışma durumu, hastalığın ortaya çıkardığı kaygı, değişen uyku düzeni gibi sebepler beslenme davranışlarını etkileyebilmektedir. Yeterli ve dengeli beslenme bağışıklığı etkileyebilen ve sistemik inflamasyonu sınırlayabilen önemli bir faktördür. Dolayısıyla yeterli ve dengeli beslenmeyi sağlayabilecek beslenme davranışlarının benimsenmesi önemlidir. Bu çalışmanın amacı Covid-19 geçirme durumu ile beslenme davranışı arasındaki ilişkinin değerlendirilmesidir. Bu çalışma Ankara'nın Mamak İlçesi'nde Haziran – Temmuz 2022 tarihleri arasında, 18-67 yaşları arasında olan 1205 kadın üzerinde yürütülmüştür. Katılımcıların, yüz yüze anket uygulaması ile, demografik özellikleri, beslenme alışkanlıkları ve Covid-19 geçirme durumları sorgulanmıştır. Ayrıca katılımcıların beslenme davranışları ile ilgili bilgi edinebilmek adına üç faktörlü yeme ölçeği uygulanmıştır. Çalışmaya katılan toplam 1205 kadının yaş ortalaması  $38.0 \pm 11.4$  olup, %77.5'i (n=934) evli ve %36.1'i (n=435) lise mezunudur. Katılımcıların %64.3'ü (n=775) ev hanımıdır ve %54.3'ünün (n=654) geliri giderine eşittir. Sigara içme durumlarına bakıldığında %78.1'inin (n=941) sigara içmediği belirlenmiştir. Katılımcıların %49.8'i (n=600) Covid-19 geçirmiştir. Kontrolsüz yeme, bilişsel kısıtlama ve duygusal yeme puanları Covid-19 geçirenlerde sırasıyla  $37.3 \pm 25.5$ ,  $47.1 \pm 31.8$ ,  $36.1 \pm 38.7$  olarak bulunmuştur. Covid-19 geçirenlerde, Covid-19 geçirmeyenlere göre kontrolsüz ve duygusal yeme puanları daha yüksek tespit edilmiştir ve aradaki ilişki istatistiksel açıdan anlamlıdır ( $p < 0.05$ ). Covid-19 geçirme durumu ile kontrolsüz ve duygusal yeme puanları arasında anlamlı bir ilişki tespit edilmiştir. Ciddi bir pandemiye sebep olan Covid-19 pek çok yaşam şekli alışkanlığını etkilediği gibi beslenme davranışlarını da etkilemiştir. Değişen beslenme alışkanlıklarının sağlığı koruyucu ve iyileştirici yönde olmasını sağlamak önem taşımaktadır.

**Anahtar Kelimeler:** Beslenme davranışı, Covid-19, sağlıklı beslenme

#### Abstract

In this study, the conventional carbon fiber fabrics (CFF) were modified by coating them with a waste biomass-derived porous carbon material. The primary objective of this modification was to enhance the poor energy storage performance of the CFFs to create potential structural supercapacitor electrode materials. The process involved first; the preparation of activated carbon from red pepper industrial wastes which were collected from a red pepper paste factory. The waste biomass was activated with  $K_2CO_3$  in 1:1 mass ratio, followed by heat treatment at  $800^\circ C$  under an inert atmosphere. The resultant solid was washed until the neutral pH was reached, and the activated carbon (AC) was obtained. The surface characterization of AC was conducted utilizing  $N_2$  adsorption-desorption, FTIR, and SEM techniques. The AC sample was determined to have a highly microporous structure with a BET  $1120.96\text{ m}^2/\text{g}$  surface area. The electrochemical performance of AC was tested as symmetrical coin-cell type supercapacitor electrodes by cyclic voltammetry (CV), galvanostatic charge/discharge (GCD), and electrochemical impedance spectroscopy (EIS) analysis methods using 6 M KOH electrolyte. To investigate the energy storage performance of the modified CFFs, the CFFs in  $1 \times 1.5\text{ cm}$  were coated with AC by spray coating at different AC mass ratios of 2%, 5%, 10%, and 15%. Finally, the supercapacitor cells were assembled using the coated CFF electrodes and tested under the same conditions as the previous electrochemical measurements. As a result, the original CFFs, which exhibited poor energy storage performance, have shown a significant increase in energy storage capability by being coated with a highly porous low-cost activated carbon produced from waste biomass. These modified CFFs are promising candidates as reinforcement/electrodes for multifunctional structural energy storage devices.

#### Abstract

Antimicrobial resistance (AMR) is defined by the WHO as a threat to the effective prevention and treatment of an increasing number of infections caused by bacteria, parasites, viruses and fungi<sup>1</sup>. AMR is a competition between natural selection and human intelligence, requiring not only the use of fewer antimicrobials but also the rapid development of new and effective antimicrobials. A number of azaheterocyclic compounds exhibit a wide range of biological activities, including the various antimicrobial agents that are available in literature<sup>2</sup>. Considering this, we designed novel o-chlorophenyl substituted fused triazoles as new antimicrobials. Antimicrobial activity of the compounds was tested against standard strains of Gram-positive (*S. aureus*), Gram-negative (*E. coli*) and fungal (*C. albicans*) bacteria. Inhibition zone diameters and minimum inhibitory concentration (MIC) values were determined by disc diffusion and microdilution methods<sup>3,4</sup>. Changes in biofilm production levels were determined by the spectrophotometric microplate method using crystal violet staining<sup>5</sup>. All experiments were performed in triplicate and statistical analyses (t-test) were performed. According to the results, the MIC values of the compounds were found to be 32-2048 µg/mL against *S. aureus*, *E. coli* and *C. albicans*. Biofilm production levels of *S. aureus*, *E. coli* and *C. albicans* were inhibited in the presence of the compounds in the range of 8.8% - 68.5%. The results obtained showed that the compounds have promising activities. The pharmacokinetic properties of the compounds were evaluated using SwissADME. Targeting virulence factors, including biofilm structures, may play an important role in the control of infections. In addition to antimicrobial activity, microscopic scanning and gene expression experiments are planned to investigate the effects of the compounds against different strains and clinical isolates.

#### Abstract

This study presents a comprehensive analysis of the biodegradation properties of five selected pesticides, namely carbofuran, chlorpyrifos, cyprodinil, propanil, and malathion, using various predictive tools and databases. The aim of the study is to identify potential biodegradation pathways and metabolites for these pesticides, thereby providing valuable insights into their environmental fate and potential impact. The results reveal significant variations in biodegradability and persistence among the selected pesticides, with some exhibiting rapid biodegradation, while others are predicted to exhibit minimal biodegradation. The study provides a reliable methodology for predicting the biodegradation potential of pesticides, which can be useful for environmental risk assessments and management.

#### Özet

Çalışmada YTÜ Gıda Mühendisliği Bölümü koleksiyonunda bulunan laktik asit bakterileri (*Lactobacillus plantarum* LABE29, *Lactobacillus brevis* LABE32) ve maya (*Saccharomyces cerevisiae* TGM55) kullanılarak buğday kepeğine (kökeni bilinen tek bir çeşit, Tekirdağ) mikrobiyal biyoproses ile modifikasyon işlemi uygulanmıştır. Modifiye kepeklerde toplam diyet lifi (TDF) ve toplam fenolik içerik (TPC) – antioksidan aktivite (AA) belirlenmiş; viskozite, hidrasyon özellikleri, fitik asit (PA) gibi teknofiziksel özellikler tespit edilmiştir. Modifiye kepekler kullanılarak baz un ile paçal edilen unlarda (ağırlıkça %15 kepek) farinograf özellikleri incelenmiş, ekmeğin üretim parametrelerine karar verilmiştir. Modifiye kepeklerden ekmeğin üretimi gerçekleştirilmiş; ekmeklere tekstür, spesifik hacim, nem, renk, TDF, TPC, AA ve PA analizleri uygulanmıştır. Modifikasyon iki farklı uygulama şeklinde gerçekleştirilmiştir: *S. cerevisiae* ve *L. plantarum* kombinasyonu M29, *S. cerevisiae* ve *L. brevis* kombinasyonu M32 olarak adlandırılmıştır. M32, M29'a göre TDF'de işlem görmemiş kepeğe göre ağırlıkça %3,4 artış sağlamıştır. M29 ve M32 serbest fenolik içeriği sırasıyla %25,2 ve %26,6 oranında artırmıştır. Bağlı fenolik içerik ise M29 ile %33,4 oranında artarken, M32'de artış %41,3 olmuştur. M29, örneklerin AA değerini işlem görmemiş kepeğe göre %181 oranında artırmış, bu artış M32'de %203 şeklinde ortaya çıkmıştır. Buğday kepeği ekstraktlarının viskozite değeri üzerinde M32 daha etkili bir artış yaratmıştır. Toplam su tutma kapasitesi üzerinde hem M29 hem M32 literatürü destekler şekilde artış sağlamıştır. M29, PA üzerinde %80.7 azalma sağlamış, bu azalma M32'de %72.5 olarak ortaya çıkmıştır. Modifiye kepeklerden elde edilen ekmeklerin spesifik hacim değerleri kontrol örneğine göre düşük tayin edilmiştir. Ekmekler renk özellikleri açısından farklı bulunmamıştır. Her iki modifikasyon uygulamasında da ekmeklerde çözünür diyet lif içeriğinin bir miktar arttığı, suda çözünmeyen diyet lif miktarının ise azaldığı tespit edilmiştir. Buğday kepeği analiz sonuçları ile paralel olarak ekmeklerin modifikasyonla toplam TPC değeri de artmış, M32 kontrol ekmeğine kıyasla TPC değerini %19.3 oranında artırmıştır. Modifikasyon uygulamaları ekmeğin tekstürel özelliklerinde anlamlı bir farklılık yaratmamıştır ancak nihai ürünün PA içeriğinde önemli bir azalmaya katkı sunmuştur.

**Anahtar Kelimeler:** Buğday kepeği, mikrobiyal modifikasyon, besinsel lif, toplam fenolik madde, ekmeğin

#### Abstract

In this study, sawdust adsorbent prepared from fig wood which is grow Adana/Turkey was used for removal of crystal violet (CV) dye from aqueous solutions by batch adsorption process. Effects of initial dye concentration, solution temperature and contact time on adsorption were studied. It was seen that the removal of crystal violet (CV) increased with increasing initial dye concentration (from 10 to 40 mg/L), solution temperatures (298 K, 308 K, 318 K) and contact time (start to 200 min). The initial dye concentration rises from 10 to 40 mg/L, removal percentage on wood sawdust adsorbent increases from 63.30 to 68.80 (%), 73.40 to 78.60 (%) and 82.50 to 83.50 (%) for 298 K, 308 K and 318 K, respectively. Adsorption isotherms were analyzed by Langmuir, Freundlich and Temkin models at different temperatures, and Freundlich model shows more suitable results for removal of crystal violet. Adsorption kinetics were analyzed by pseudo first order (PFO), pseudo second order (PSO) and intraparticle diffusion (IPD) models for different temperatures and initial dye concentrations. Kinetic model results were best fit the PSO model which kinetic constants were higher than PFO and IPD models. Moreover, the thermodynamics of adsorption process were also studied. It was found that the values of standard free energy ( $\Delta G^\circ$ ) were negative and standard enthalpy ( $\Delta H^\circ$ ) and entropy ( $\Delta S^\circ$ ) values were found to be positive for this removal process. Thermodynamic results were shown that removal process is physisorption and these values suggest feasibility and spontaneous nature of adsorption. The results of this study showed that prepared sawdust adsorbent from wood waste could be employed as effective and low-cost materials for the removal of dyes from aqueous solution.

**Keywords:** Adsorption, crystal violet, wood sawdust adsorbent, isotherm, kinetic, thermodynamic

#### Abstract

The consequences of climate change resulting from anthropogenic activities cause different effects in different ecosystems, and the severity of these effects is predicted to increase in the near future. The number of studies for the responses of forest ecosystems to these changes is increasing day by day. However, studies on how saproxylic organisms will experience the consequences of climate change, which is one of the crucial factors for the healthy functioning of these sensitive ecosystems, are still insufficient. In our study, we carried out ecological niche modeling of *Chalcophora detrita* (Klug, 1829), both as a saproxylic species and as an organism of economic importance, under climate change scenarios. Our findings indicate that in two different scenarios (SSP2-4.5, relatively optimistic and SSP5-8.5, most pessimistic) suitable habitats for this species will be decreased gradually in future climate change scenarios. This study provides a theoretical framework of reference for habitat conservation and improvement of management plans on species belonging to the *Chalcophora* genus and the other saproxylic beetles.

#### Abstract

One of the reasons that reduces the effectiveness of radiotherapy is that radiation can increase the survival rate of cancer cells by stimulating autophagy in various types of cancer. Chloroquine (CQ), which has been used in the treatment of malaria for many years, has been shown to inhibit autophagy in recent years. Apocynin (APO) is a substance known as an effective NADPH oxidase inhibitor with antioxidant and antiapoptotic properties. In our study, it was aimed to determine how the use of CQ together with radiotherapy will affect healthy tissues and to reveal whether APO shows protective effects with this combination. Randomly selected animals were divided into eight groups: Control, radiation (RAD), CQ, APO, RAD+CQ, RAD+APO, RAD+CQ+APO and CQ+APO, respectively. The first and second groups were injected saline, the third and fifth groups were injected 50 mg/kg CQ, the fourth and sixth groups were injected 20 mg/kg APO, the seventh and eighth groups were injected with CQ and APO. All injections were administered intraperitoneally (i.p.) five times every 24 hours for 5 days. One hour after the fifth injection, 8 Gray (Gy) whole body irradiation was applied to the radiation groups. Small intestinal tissues were obtained from dissected rats one day after radiation administration. As a result of our study, radiation causes significant histological damage, causes a significant increase in oxidative damage parameters, weakens the antioxidant system, has antiproliferative, inflammatory and apoptotic effects, and also stimulates autophagy are determined. CQ given together with RAD inhibits autophagy, increases oxidative stress, weakens antioxidant capacity, has antiproliferative and anti-inflammatory effects, and does not cause a significant change in apoptosis alone are observed. The fact that APO significantly reverses these changes caused by RAD and CQ shows its protective effect. We anticipate that our results may shed light on clinical applications.

#### Abstract

Competition for resources between sympatric species can result in diminished fitness. Resource partitioning promotes the minimizing of competitive pressures, thereby supporting the coexistence of a diversity of organisms. In this study, we aimed to examine the idea that Danford's Lizard (*Anatololacerta danfordi*) and Golden Grass Mabuya (*Heremites auratus*), which coexist in the northern slopes of Mediterranean Biodiversity Hotspot, Anatolia exhibit discernible ecological niches as a means of reducing interspecific competition. In order to evaluate the hypothesis of resource partitioning, we conducted a comparative analysis of the activity times, perch microhabitat parameters, and thermal dynamics under investigation. Despite the absence of discernible disparities in the timing of morning activity between the two species, distinct variations were seen in their utilization of structural perch microhabitats and thermal preferences. Golden Grass Mabuya exhibited a preference for elevated and narrower perches that offered a greater degree of canopy coverage compared to Danford's Lizard. Additionally, it was observed that male Golden Grass Mabuya tended to occupy higher perches in comparison to their female counterparts. Moreover, the body temperature of *A. danfordi* was found to be higher than that of *H. auratus*, and solar radiation was identified as a key parameter affecting the thermal requirements of both species. The utilization of distinct microhabitats by perch and thermal differentiation species may potentially mitigate interspecific competition, hence facilitating coexistence between these sympatric species.

### Detection and characterization of thermophilic bacilli associated with pasteurized milk in markets and determination of their biofilm production properties

Basar Karaca<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0001-6943-8965>)

<sup>1</sup>Ankara University, Faculty of Science, Biology, Ankara, Turkey.

#### Abstract

Thermophilic bacilli are an important group that pose a problem as contaminants in the dairy industry. In this study, thermophilic bacilli were isolated from pasteurized milk sold in markets. The isolates were first genotyped, then their biofilm production characteristics were defined and the risks they may cause in the dairy industry were assessed. In this context, the biofilm morphotypes of thermophilic isolates identified in Congo red media and their pellicle formations were studied to determine their ability to form biofilms at the liquid-air interface. Subsequently, the biofilm production of the isolates on polystyrene and stainless steel surfaces was determined. In addition, the ability of the isolates to produce biofilm on abiotic surfaces commonly used as surfaces for product processing in the dairy industry was tested. While one of the isolates was identified as *Aeribacillus pallidus*, all other isolates were identified as *Bacillus licheniformis*. Based on their biofilm morphotypes and pellicle formations, it could be seen that all isolates were strong biofilm producers. All isolates were able to produce biofilms on both polystyrene and stainless steel surfaces in a wide temperature range (45-50-55-60°C). The isolates *A. pallidus* A1 and *B. licheniformis* C1, which were selected as the strongest biofilm producers, produced biofilms mainly on polystyrene and Teflon surfaces in the milk-containing environment. According to these results, *B. licheniformis* can be detected as a common contaminant in pasteurized milk sold in markets, and it is predicted that the detected isolates could be a problem in the dairy industry due to their ability to produce biofilm.

**Keywords:** *Aeribacillus pallidus*, *Bacillus licheniformis*, biofilm, dairy industry, thermophilic bacilli

### The effects of meteorological factors and atmospheric pollutants on *Acer* pollen loads in urban area

Aydan Acar Şahin<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-5350-5534>)

<sup>1</sup> Ankara University, Faculty of Science, Department of Biology, Ankara, Türkiye.

\*Corresponding author e-mail: aydanacar24@gmail.com

#### Abstract

Pollen allergies can have a significant impact on public health, leading to increased healthcare costs and reduced quality of life for allergy sufferers. Choosing non-allergenic plants can contribute to a healthier urban population. However, *Acer* trees (maple) are commonly found as an ornamental plant in various urban landscapes, parks, gardens and along roadsides. These trees produce pollen that can trigger allergies in susceptible individuals during the spring months when they typically release their pollen. In this study, I investigated the effects of meteorological factors and air pollutants on airborne *Acer* pollen levels. Airborne pollen sampling was performed using a 7-day Hirst type volumetric spore trap for 2023 in Ankara province. The length of the whole season was found to be only 32 days. Spearman's correlation test was performed to determine the relations between the pollen concentrations and meteorological factors. As a result, the annual pollen integral values (API<sub>n</sub>) were recorded as 802 pollen\*day/m<sup>3</sup> and the highest pollen concentration was observed on March 27. Daily minimum temperature and carbon monoxide (CO) were the most relevant meteorological factor and air pollutant influencing the daily airborne pollen concentrations. Nevertheless, the pollen season is short, significant levels of allergenic *Acer* pollen are released into the air in the spring. It is very important that plants with allergenic pollen, such as maple, are not recommended to be included in urban landscape planning. Ultimately, collaboration among landscape planners, healthcare professionals, and environmental experts can help strike the right balance in urban landscaping decisions.

**Key words:** *Acer*, pollen, temperature, CO, urban

#### Abstract

From the past to date, conventional microbial inactivation methods have been used in the food industry to ensure food safety and security and prolong the shelf life. However, these conventional methods lead to losses in quality parameters, such as losses in nutritional components and the sensory quality of food products. As a novel inactivation method, ultrasound technology (UST) attracts attention with its advantages compared to conventional methods. Minimized flavor loss, increased sphere of influence homogeneity, significant energy savings, and being green technology are reported as important advantages of UST.

UST is an alternative non-thermal technology for inactivating microorganisms in food products. During ultrasound treatment, with the effect of ultrasounds pressure and sudden temperature changes occur, leading to the formation of cavitation. Cavitation helps to thin the microbial cell membrane, and with increased heat's synergistic effect, microbial inactivation occurs. Furthermore, during ultrasound treatment, various parameters such as frequency, amplitude, exposure time, process temperature, type of microorganisms, volume of the treated food, and food composition have an impact on microbial inactivation. Thus, it is important to evaluate the effects of UST on each microorganism under different conditions and UST parameters.

Although UST has remarkable microbial inactivation in both liquid and solid foods, many researchers have revealed an increased antimicrobial effect of ultrasound when combined with other methods such as chemical treatment, mild heat application, pressure, steam, or organic acids applications. This study aims to review the effects of UST on the inactivation of main foodborne pathogens such as *Listeria monocytogenes*, *Escherichia coli*, *Salmonella* spp. either alone or combined inactivation methods.

**Keywords:** Ultrasonication, microbial inactivation, combined treatment, food safety

#### Abstract

Due to factors like contaminated water and surfaces in poultry processing facilities, the risk of microbial contamination increases in processes. Although all necessary precautions are tried to be taken during the processing of poultry products, ensuring complete product quality and microbial safety remains a challenge. Thus, poultry meats may contain pathogenic and spoilage microorganisms in the final product. In order to protect products from microorganisms, several physical, chemical, and biological sanitation methods have been used alone or in combination from the past to date. Among these sanitation methods, as well as suitability for use in the product, efficiency in decontamination, cost-efficiency, and harmlessness for the environment and health are important matters. At this point, ultrasound technology (US) emerges as a technology that can be useful in decontamination. The US is one of the non-thermal technologies accepted as green technology and reported as an effective decontamination method. Also, it is reported that US technology improves some of the processing features of meats. This study focuses on the application possibilities of the US in poultry carcass decontamination and provides a short literature review.

**Keywords:** Poultry meat, microbial decontamination, food safety, non-thermal technologies

#### Abstract

Asymmetric synthesis plays an important role in the field of organic chemistry, targeting the selective production of optical isomers. Organocatalysis has emerged as a powerful tool in the field of asymmetric synthesis, enabling the efficient production of chiral compounds with high selectivity. Cellulose, an abundant and renewable biopolymer, offers several advantages such as biocompatibility, low cost, and environmental sustainability. Cellulose derivatives have been successfully used in a wide variety of asymmetric reactions, including Michael addition, Aldol, and Mannich reactions. These derivatives exhibit the ability to form non-covalent interactions such as hydrogen bonding, van der Waals forces, and  $\pi$ - $\pi$  interactions. The use of thiourea-modified cellulose derivatives as organocatalysts in asymmetric Mannich reactions represents an exciting area in organic chemistry that could replace conventional sustainable and biocompatible organocatalysts. Future research in this area could enable the discovery of new thiourea-derived cellulose structures with improved catalytic properties, expanding efficient and environmentally friendly asymmetric synthesis methodologies. Herein, microcrystalline cellulose was modified with 3,5-bis(trifluoromethyl)phenyl isocyanate, and new organocatalysts were synthesized. The synthesized catalysts were systematically characterized and their properties were tested in asymmetric Mannich reactions (Fig. 1).

Fig.1. Thiourea-modified cellulose catalyst and the standard Mannich reaction.

\* ezgiibaran@gmail.com

#### Özet

İlaç, hastalığın tedavisinde veya önlenmesinde kullanılması amaçlanan bir madde olarak bilinmektedir. İlaç dağıtımını, vücudun bazı bölgelerindeki ilaç konsantrasyonunu diğerlerine kıyasla özellikle artıracak şekilde ilacın hastaya verilmesi yöntemidir. Her doz miktarının formu, ilaç/aktif farmasötik bileşenler ile katkı maddeleri adı verilen ilaç dışı bileşenlerin bir kombinasyonudur. İlaç etken maddeleri hastalıkları tedavi etmek için kullanılan asıl kimyasal bileşenlerdir. Konvansiyonel sistemlere göre kontrollü ilaç sistemleri daha farklı bir sistematiğe dayanmaktadır. Kontrollü ilaç salım sistemleri ilaç etken madde miktarını en aza indirerek canlı sistemde kalış süresini uzatır ve ilaç miktarına bağlı olarak hastada oluşabilecek zararlı yan etkileri azaltmayı hedefler. Bu çalışmada, biyouyumlu bir polimer olan polivinil alkol (PVA) ve antimikrobiyal özellikli Gümüş oksit nanoparçacıklar (Ag<sub>2</sub>O Np) kullanılarak hidrojel yapılı filmler hazırlanmış ve karakterize edilmiştir. Oluşturulan filmlerin ilaç salım kapasitelerini incelemek üzere hidrojelere ibuprofen etken maddesi yüklenmiştir. Gümüş bazlı ürünlerin antimikrobiyal özelliğinden yararlanılmak üzere, yeşil sentez ile Equisetum telmateia bitkisinden gümüş nanoparçacık sentezi yapılmıştır. PVA hidrojelleri donma-çözme tekniği ile hazırlanmıştır. Hazırlanan filmlerin yapısal karakterizasyonu için FTIR spektrofotometre ve morfolojik özelliklerinin anlaşılması için SEM analizleri yapılmıştır. Ayrıca şişme testleri yapılmış olan filmlerin mekanik dayanımlarının belirlenmesi için çekme testi gerçekleştirilmiştir. İlaç yüklenen hidrojel yapılı filmlerin ilaç salım profilleri incelendikten sonra sitotoksikite özellikleri ve antibakteriyel etkileri belirlenmiştir. Yeşil sentez ile elde edilen gümüş oksit nanopartiküllerin parçacık boyutları Zeta Sizer cihazı ile yapılan analiz edilmiştir. İlaç etken maddesi salım deneylerinde Ag<sub>2</sub>O Np katkılı %10'luk (w/v) (E1) ve %5'lik (w/v)'lik (B1) PVA filmleri kullanılmıştır. Salım deneyleri sonucunda; kullanım amacına ve kullanılan süreye göre daha hızlı bir salım isteniyor ise E1, daha yavaş bir salım hedefleniyor ise B1 hidrojel tercih edilebileceği düşünülmektedir. Konvansiyonel yöntemlerden farklı olarak düşük maliyetli ve çevre dostu olarak hazırlanan nanopartikül katkılı PVA hidrojel yapılı sistemleri içeren bu çalışmanın sonucuna göre, belirlenen zaman aralığında ve ilacın istenilen salım miktarına göre hidrojel yapılı film tasarımının gerçekleştirilebileceği ve düşünülmektedir.

<sup>2</sup>Acıbadem Üniversitesi, Mühendislik ve Doğa Bilimleri Fakültesi, Temel Bilimler, İstanbul, Türkiye

\* volkanbaki34@gmail.com

#### Özet

Üç boyutlu biyoyazıcılar, özellikle Rejeneratif Tıp ve Doku Mühendisliği alanında kullanılan ve pek çok sorun için umut vaat edici çözümler üreten ileri teknolojik biyomedikal cihazlardır. Biyoyazıcılar geleneksel doku mühendisliği tekniklerindeki kısıtlamaların üstesinden gelebilmek için, 3B karmaşık dokuların/organların, baskılama veya 3B fabrikasyon teknolojilerinin kullanılarak üretildiği yeni geliştirilen bir yöntemdir. Ayrıca bu yöntem biyomalzemeler içerisinde hücrelerin kontrollü bir şekilde yerleşimine izin verir. Fabrikasyon tekniği, bilgisayar destekli tasarım (CAD) çizimlerinin sanal olarak tasarlanan verilerini okuyarak 3 boyutlu nesnelerin tabaka tabaka inşa edilmesiyle oluşturulan hızlı prototipleme prensibine dayanmaktadır. Bu çalışmada bilgisayar destekli bir çizim programı olan SolidWorks kullanılarak tek başlıklı bir üç boyutlu biyoyazıcı tasarımı ve prototip imalatı yapılmıştır. Biyoyazıcının metal ve plastik parçaların çoğunluğu CNC ve Torna makineleri ile işlenmeye uygun şekilde çizilerek üretilmiştir. Üretilmiş olan yazıcının ekstruder kısmı bir şırınga pompası şeklinde tasarlanmış olup dişliler sayesinde motorun dönme hareketini şırıngaya aktarmaktadır. Elektronik devrenin kontrolü için Duet3d firmasının “Duet 2” elektronik kartı ve ekran olarak ise aynı firmanın “PanelDue” ürünü tercih edilmiştir. Biyoyazıcıda X,Y,Z eksenlerinde hareketi sağlayan birer tane ve şırıngada baskıyı aktif hale getirmek için de 1 adet olmak üzere toplam 4 adet motor bulunmaktadır. Baskı işlemlerinde tabladan dökülen, saçılan sıvıların kızaklara zarar verebileceği ihtimaline karşın X eksen hareketi kayış-kasnak sistemi ile sağlandı. Eksen hareketleri 3 adet optik limit switch ile sınırlandırılmıştır. Şırıngaya eklenen diş macunu ile bazı denemeler yapılarak sistemin verimli çalışıp çalışmadığı kontrol edilmiştir. Yapılan denemeler sonucunda üretilmiş olan bu biyoyazıcının istenilen kalitede baskılar alınabilecek bir 3 boyutlu biyoyazıcı olduğu görülmüştür. Bu çalışmada hala gelişmekte olan 3B biyoyazıcı teknolojisine uygun olarak tasarlanan bu ürün ile; ülkemize, geleceğin öncelikli tıbbi araştırma alanları içerisinde bulunan, Rejeneratif Tıp ve Doku Mühendisliği alanında araştırma imkânı sağlayacak, yerli imkânlarla üretilmiş bir 3B biyoyazıcı kazandırılmıştır.

**Anahtar Kelimeler:** 3B yazıcı teknolojileri, 3 boyutlu biyoyazıcı, biyobaskı, doku mühendisliği, biyomedikal mühendisliği

\*Corresponding author e-mail: shahykalaty@gmail.com

#### Abstract

Aquatic enterprises in our time are no longer limited to fishing and fish and bivalve farming but have also begun to focus on culturing other products. One of these examples is the products obtained from aquatic algae. Marine algae have been used in various industries, from food production to biofuel, medical and pharmaceutical products, fish feed, and water purification. Marine algae contain biomolecules that can produce biomaterial by treatments like fermentation. Enzyme production by algae fermentation is one of the recent trends to benefit from algae. Enzymes used in the animal feed industry are generally obtained from animal or plant sources. Still, the production cost is high, and their stability is lower than bacterial enzymes. At the same time, algae can produce proteins and enzymes either through the process of photosynthesis or through the process of fermentation using different microorganisms on substrates to produce specific enzymes. Algae and its enzymes have critical industrial applications, but we focus on their uses as feed additives in aquafeed. The fermented algae and enzymes could be potential sources of protein and additives in fish feed to enhance digestion and immunity in fish, which achieves economic benefits for aquaculture projects and environmental sustainability. This study will present information about obtaining new products from algae through fermentation and their effects on fish.

**Keywords:** enzymes, ulva, bromealin, yeast, marine algae, fermentation, aquafeed.

#### Özet

Bu çalışmada pirimidin türevlerinden olan 4,6-Dikloro-2-(metiltio) pirimidin-5-karbonil klorür ve 4,6-Dikloro-2-(metiltio) pirimidin-5-karboksiamid maddelerinin, hücre içi detoksifikasyonu sağlayan Glutatyon ile konjuge çalışmasıyla bilinen GST enzimi üzerine olan inhibisyon etkileri incelendi. Elde edilen veriler GST inhibitörü olarak kabul edilen etakrinik asit değerleri ile kıyaslandı. Molekül a, molekül b ve etakrinik asit için IC<sub>50</sub> değerleri sırasıyla 38,5 nM, 46,2 nM, 5,82 nM olarak hesaplandı. İnhibisyon çalışmasının ikinci basamağında ise IC<sub>50</sub> grafiklerinden hareketle Ki değerlerine ulaşıldı. Ki değerleri yine sırasıyla 57,61 nM, 43,75 nM, 4,43nM olarak bulunurken; a ve b moleküllerinin yarışmasız, etakrinik asitin ise yarışmalı inhibisyon tipine sahip olduğu görüldü. Çalışmanın ikinci bölümünde ise ilgili moleküllerin antioksidan kapasitelerini belirlemek amacıyla DPPH (2,2-difenil-1-pikrilhidrazil) yöntemi kullanıldı. a ve b molekülleri DPPH yönteminde standart olarak kabul edilen askorbik asit (vitamin C) ile karşılaştırıldığında standarda oldukça yakın değerler verdiği görüldü. Ayrıca bu tez çalışmamızda GST enzimi ile ilgili pirimidin moleküllerinin bağlanma mekanizmasını gösteren doking çalışması yapılmış olup molekül a için -5,6 kcal/mol, molekül b için -6,2 kcal/mol olarak bulunmuştur.

**Anahtar Kelimeler:** Glutatyon S-transferaz, Pirimidin, Doking

#### Abstract

The Caryophyllaceae family consists of approximately 90 genera, traditionally utilized across various ethnic communities for treating numerous ailments. In particular, Caryophyllaceae family has great significance in Chinese traditional medicine as a remedy for a wide range of health conditions [1]. Members of the Caryophyllaceae family are rich in natural compounds, such as triterpenes, phenolics, and alkaloids. These compounds are known to have medicinal properties [2]. Among the most enormously studied metabolites of the Caryophyllaceae circle of relatives are flavonoids, that are classified as polyphenolic compounds and display an extensive type of organic and pharmacological activities along with antioxidant, anti-oedemic, anti-inflammatory, antimicrobial, and immunomodulatory outcomes [3].

*Gypsophila* is the third largest genus in the Caryophyllaceae of Turkey. *Gypsophila* species are annual, biennial, or perennial herbaceous plants. This genus is mainly distributed in the Mediterranean areas of Turkey, Iran and Turan. There are 56 species in 10 sections of *Gypsophila*, 33 species in Turkey [1, 4]. In literature, there are several studies on *Gypsophila* species [5, 6]. Mainly saponins and phenolic compounds have been isolated from *Gypsophila*. However, there is no phytochemical study on *Gypsophila venusta*. This is the first study that describes the isolation and identification of secondary metabolites from *Gypsophila venusta*.

Saponins and flavonoids are specialized metabolites that remain the most extensively studied constituents of the *Gypsophila* species. Recently, the flavonoids variety in the Caryophyllaceae was reviewed by Jakimiuk et al. [7]. Cheikh-Ali et al. (2019) highlighted structural organization of saponins in the family [8].

*Gypsophila venusta* was collected from Malatya, Turkey. Air-dried and powdered plant material was extracted with *n*-Hexane, DCM and MeOH. The DCM phase was chromatographed over column chromatography. The fractions repeatedly subjected to normal phase silica gel CC and reverse phase silica gel column chromatography.

In this study, one saponin and one phenolic compound were isolated from the DCM extract. Their structures were elucidated by extensive spectroscopic methods including <sup>1</sup>H and <sup>13</sup>C-NMR techniques.

**Keywords:** Caryophyllaceae, *Gypsophila*, Secondary metabolities

#### Özet

Buğday ıslahında genellikle erken kademe materyallerinin miktarının azlığı sebebiyle protein kalitesinin tahmini için SDS (Sodyum Dodesil Sülfat) Sedimentasyon analizi yoğun olarak kullanılmakta ve hızlı sonuç alınmaktadır. Bunun yan sıra buğday tanesinde emgi zararı olup olmadığını test etmek amacıyla Beklemeli SDS Sedimentasyon analizi yapılır. Ekmeklik buğdayda zeleny sedimentasyon analizine karşılık kırma ve makarnalık buğdayda SDS sedimentasyon analizi kullanılmaktadır. Bu çalışmada; %100 Tosunbey ekmeklik buğday unu, %100 siyez buğday unu, Tosunbey ve siyez tam buğday unlarının farklı oranlardaki karışımlarına ait örneklerde 15., 20 ve 25. dakikada yapılan SDS sedimentasyon ve beklemeli sedimentasyon analizleri yapılmıştır. Sonuçlar toplu olarak değerlendirildiğinde; buğday paçalarında un ile tam buğday karışımın miktarı arttıkça SDS sedimentasyon değerleri düşüş göstermektedir. Ayrıca Normal koşullarda 15. dakika da ölçülen SDS sedimentasyon sonuçları ile karşılaştırıldığında 20. ve 25. dakikada yapılan ölçümlerden elde edilen sonuçlarda önemli ölçüde düşüşler meydana gelmektedir. Sonuçlar açık olarak göstermektedir ki; un analizi sonuçları kırma veya tam buğday örneklerine göre daha yüksek sonuçlar vermektedir. Ayrıca standart metot tarafından bildirilen süre olan 15. dakika sonrasında yapılan 20. ve 25. dakika ölçümlerin normal ölçümlere göre daha düşük olduğu belirlenmiştir. Sonuç olarak SDS sedimentasyon ve beklemeli SDS sedimentasyon analizi için belirtilen 15. dakika ölçümleri daha yüksek olarak ölçülmüş ve kalite değerlendirilmesinde kullanılmasının uygun olduğu ve bekleme süresinde meydana gelecek artışların değerler üzerinde olumsuz etkiler meydana getireceği sonucuna varılmıştır.

**Anahtar Kelimeler:** SDS sedimentasyon, beklemeli SDS, siyez, ekmeklik buğday, SDS ölçüm süresi,

#### Abstract

Coffee is the second most-traded commodity in the world, after oil and one of the world's most popular beverages [1]. Coffee waste is used for various purposes such as biofuels [2], polymeric films [3], porous materials [4], activated carbon [5] and adsorbents [6–8]. In this context, activated carbon (CAC) samples obtained from waste coffee were modified with the cationic surfactant cetyltrimethylammonium bromide (CTAB) (CCAC), and the obtained samples were characterized by scanning electron microscopy (SEM) and X-ray diffraction (XRD). The adsorption behaviour of methyl orange (MO) and reactive blue 4 (RB4) onto CAC and CCAC from aqueous solution and the adsorption mechanism were investigated. Scanning electron microscopy (SEM) revealed irregular pores on the CAC surface characterized by deep voids and long, irregular hollow protrusions. This increased porosity is the reason why carbon-containing adsorbents are mostly preferred for adsorption processes. The CCAC surface exhibits an irregular and dense morphology with enhanced and clearly visible macro- and micropores as well as high pore density and heterogeneity. The XRD pattern showed that the crystal structure of CCAC was not affected. Both diffraction patterns show characteristic peaks around  $2\theta = 28^\circ$ , indicating the presence of an amorphous structure [9]. The results showed that equilibrium was reached within 45 minutes and the optimal pH for MO and RB4 was 2 and 5, respectively. It was observed that the percentage of MO removal from the aqueous solution was increased from 83% to 99% and RB4 from 67% to 82% by the effect of CTAB modification. The results were consistent with the pseudo-second-order model and showed that the adsorption mechanism of MO and RB4 on CAC and CCAC mainly involved electrostatic attraction and surface adsorption [10]. In conclusion, CCAC is a promising material for dye wastewater adsorption as well as an environmentally friendly and effective material for water treatment applications.

**Keywords:** Active carbon, adsorption, CTAB, dye, surfactant, waste coffee.

#### Abstract

*Polygonum cognatum* Meissn., belonging to the *Polygonaceae* family, is a perennial plant that grows spontaneously in our country. This plant is rich in phenolic content. Phenolic compounds constitute the most important secondary metabolite group of plants and are known to have antioxidant and antimicrobial activities. In this study, a new HPLC-DAD method has been developed and validated for the simultaneous qualitative and quantitative determination of 10 phenolic compounds (protocatechuic acid, catechin, gentisic acid, caffeic acid, p-coumaric acid, polydatin, coumarin, resveratrol, ellagic acid, quercetin) in the plants which were harvested from different regions at different times. Chromatographic determination was performed with the gradient program on the SUPELCOSIL LC-18 (25cmx4.6mm,5µm) column. Evaluating of the validation parameters, the method proved to have remarkable linearity, sensitivity, and precision. LOD and LOQ values were calculated in the range of 0.051-0.188 µg/mL and 0.169-0.628 µg/mL, respectively. The plant extracts which include phenolic compounds were analyzed as simultaneous utilizing the chromatographic method that developed and validated. The antioxidant, and antimicrobial activities of the plants which are collected from Sivas (Plant A) and Ordu (Plant B) and extracted by soxhlet method were investigated. Antioxidant activities of the plants were determined by DPPH and CUPRAC method. IC<sub>50</sub> (IC<sub>50</sub>=0.781 mg/mL for Plant A, IC<sub>50</sub>=0.657 mg/mL for Plant B) and EC<sub>50</sub> values (EC<sub>50</sub>=368.0 µg/mL for Plant A, EC<sub>50</sub>=364.3 µg/mL for Plant B) were calculated by DPPH and CUPRAC methods, respectively. Antimicrobial activities of *Polygonum cognatum* methanolic extracts were investigated by diffusion and dilution method against both Gram-negative/positive bacteria and fungi. *Candida albicans* was exhibited to be greater sensitive 24.60 ± 0.55 mm inhibition zone and detected MIC values of 4.75 mg/mL and MBC values of ≥ 4.75 mg/mL.

#### Abstract

The diagnosis, symptoms, biology of some important fungal diseases that are problems in rice growing areas in the Thrace region of Turkey, and how to control these diseases are reported in this review. The emergence of fungal diseases in rice, together with changing climate parameters, leads to significant crop losses day by day. The most common disease in rice is rice blast, and the disease agent is the fungus *Magnaporthe grisea* (teleomorph, TT Hebert ME Barr, anamorph *Pyricularia oryzae* Cav.). In terms of prevalence, this disease agent is followed by *Cochliobolus miyabeanus* (teleomorph, synonym: *Helminthosporium oryzae*, anamorph *Bipolaris oryzae*), which causes brown spot disease. The leading seed-borne disease in plants is *Gibberella fujikuroi* (bakanae-disease) (anamorph, *Fusarium fujikuroi*), also known as *Fusarium verticillioides* (anamorph, Syn [*F. moniliforme*]) in recent years.

**Keywords:** Rice (*Oryza sativa*), *Magnaporthe grisea*, *Cochliobolus miyabeanus*, *Gibberella fujikuroi*

### Özet

Bu çalışma, kafa içi lizolesitin enjeksiyonu ile indüklenen miyelin hasarının bağırsak florasına olan etkisini incelemeyi amaçlamıştır. Bu bağlamda, 10-12 haftalık erkek Wistar Albino sıçanlarında antibiyotik kokteyl tedavisiyle bağırsak flora hasarı ve hipokampal lizolesitin enjeksiyonuyla lokal miyelin hasarı modelleri oluşturulmuştur. Bağırsak florasındaki değişiklikler metagenomik sekanslama yöntemi kullanılarak belirlenmiştir. Ayrıca, hipokampal miyelin hasarı ile bağırsak mikrobiyom çeşitliliği arasındaki ilişkiyi incelemek amacıyla Miyelin Temel Proteini (MBP), Oligodendrosit Spesifik Proteini (OSP), Alfa-Sinüklein (aSyn), Interlökin-3 (IL-3), Tümör Nekroz Faktör- $\alpha$  (TNF- $\alpha$ ) ve Klaudin-5 (CLDN5) protein ve gen ifade seviyeleri ELISA ve qPCR yöntemleriyle analiz edilmiştir. Elde edilen sonuçlara göre, kafa içi lizolesitin enjeksiyonu ve oral antibiyotik uygulamasının bakteri florasında benzer değişikliklere yol açtığı ve bakteri besleyici oral prebiyotik ile miyelin üretimini artıran klemastin tedavisinin bakteri florası üzerinde benzer yatıştırıcı etki gösterdiği görülmüştür. Ayrıca, lizolesitin uygulanan grupta hipokampüsteki TNF- $\alpha$  ve IL-3 gen ifadelerinin anlamlı bir şekilde artmıştır ( $p<0.05$ ). Klemastin tedavisi, hipokampal MBP ve CLDN5 seviyelerini anlamlı bir şekilde artırırken, TNF- $\alpha$  seviyesini azaltmıştır. Kolon ve vagus örneklerindeki IL-3 seviyeleri de klemastin tedavisiyle anlamlı bir şekilde azalmıştır ( $p<0.05$ ). Davranış deneyi sonuçlarına göre, lizolesitin uygulanan grupta anksiyete benzeri davranışların arttığı, ancak klemastin tedavisiyle birlikte bu davranışlarda azalma gözlemlenmiştir. Uyumlu bir şekilde, Morris Su Labirenti davranış testi sonuçlarına göre lizolesitin uygulanan grup ile klemastin uygulanan grup arasında S3 çeyrekliğinde geçirilen süre bakımından anlamlı bir farklılık bulunmuştur. Sonuç olarak, hipokampusta yapay olarak oluşturulan miyelin hasarının bağırsak mikrobiyom çeşitliliğini değiştirdiği ve davranış üzerinde etkili olduğu önerilmektedir. Ancak, bu çalışmanın sonuçlarına dayanarak kesin neden-sonuç ilişkisi önermek için transgenik model kullanılan daha detaylı araştırma gerekmektedir ve “sinaptik plastisite” alanındaki görüş ayrılıklarının dikkate alınması önerilmiştir.

**Anahtar Kelimeler:** Bağırsak disbiyozu, Lokal miyelin hasarı, Kolon, Miyelin-mikrobiyom aksı.

#### Abstract

Organo-clays, such as organo-montmorillonite (Org-MMT/O-MMT), are the most widely used silicates in polymer nanotechnology (1). By using modified clays, it is possible to eliminate the weak mechanical structure and low thermal stability of the polymers, thus resulting in more durable nanocomposites (2). Our study aims to assess the anticancer effects of polymer-Org-MMT nanocomposites synthesized at different time intervals and containing varying concentrations of clay material. The anticancer effects of O-MMT, poly(MA-alt-VCL), and poly(MA-alt-VCL)/O-MMT polymer clay materials, were assessed using HeLa (cervical carcinoma) and A549 (lung cancer) cell lines, and HDF (human dermal fibroblast) cells as healthy control. To evaluate the cytotoxic effects of the materials, cells treated with materials in concentrations ranging from 0.0002 mg/ml to 10 mg/ml and an MTT analysis performed after 24 hours treatment. Furthermore, we conducted a colony formation assay with a concentration of 0.2 mg/ml to investigate the impact of the materials on cancer cell colony formation. The results showed that a concentration of 2 mg/ml gave an IC<sub>50</sub> value in cancer cells, especially the substances were more effective in the A549 cell line, whereas this value was 10 mg/ml in healthy cells. Also O-MMT, poly(MA-alt-VCL), and poly(MA-alt-VCL)/O-MMT polymer clay materials suppressed colony formation in cancer cells. The data indicated an inverse correlation between clay content in the copolymer complex and cell viability. The copolymer complex without clay had no negative impact on the cells. According to these results, the nanocomposites containing organo-clays appear to hold promise for use in anticancer drug studies.

#### Abstract

There is only the *Moringa* genus in the Moringaceae family, and the most important species among the 13 species in this genus is *Moringa oleifera*. Although *Moringa oleifera* was first grown in the North Indian Regions in the foothills of the Himalayas<sup>1</sup>, it is now widespread in many parts of the world such as Indonesia, Mexico, South America and the Middle East<sup>2</sup>. It is a species that can grow in semi-arid, tropical and subtropical climates. The root, seed, fruit and leaf parts of the plant are known to contain important vitamins and minerals such as vitamins A and C, calcium, protein and potassium, as well as secondary metabolites such as flavonoids, phenolic acids, glucosinolates, terpenes and alkaloids<sup>3-5</sup>. The biological activity studies on the plant have shown that it has anti-inflammatory, antidiabetic, antimicrobial, antioxidant, anticancer activities and sexual function regulating, wound healing properties<sup>6-9</sup>.

The main aim of this study is isolation, purification and structural characterization of biologically active compounds from *Moringa oleifera* plant. After the seeds of the tree were dried and grounded under suitable conditions, MeOH and EtOH extracts were prepared. Afterwards, isolation procedures were continued with various chromatographic applications such as CC, RP-CC, RP-VLC, MPLC, TLC methods. So far, 2 compounds have been obtained in pure form and their chemical structures have been determined by advanced spectroscopic methods (1D, 2D-NMR and HR-Mass techniques). The isolation studies on the other fractions and structural determinations are still ongoing.

**Keywords:** isolation, purification, secondary metabolites, moringa oleifera

#### Abstract

Transmissible venereal tumors (TVT) are malignant (cancerous) round cell tumors. Different from other cancers, TVTs are transferrable sexually between dogs through direct skin-to-skin contact with the tumor. Although the exact source of TVT cells remains unclear, the presence of inclusion bodies in tumor cell cytoplasm indicates the involvement of a viral agent. However, this hypothesis has not been fully revealed. Considering that papillomaviruses, which can cause cancer in many animal species, may play a role as an etiological agent in TVT cases, in this study, the presence of papillomaviruses in samples taken from dogs with TVT was investigated by PCR using different primer pairs. All samples were analyzed with FAP59/64, MY09/11, PVF/FAP64 primer sets targeting the L1 gene of PVs, and CP4/5 primer sets targeting the E1 gene of CPV. PV DNA was detected in 33 (45.20%) of 73 dogs with TVT. After carrying out PCR, positive samples were used for typing using sequence analysis. The MY09/11 primers amplified a 450 bp band in 27 out of 33 positive dogs (81.81%) as single. The MY09/11-CP4/5, PVF/FAP64, and PVF/FAP64-FAP59/64-CP4/5 primer sets showed positivity in 4, 1, and 1 of the animals, respectively. After molecular studies, only the oral biopsy sample of one dog showed a 98-99% nucleotide sequence similarity with the L1 and E2 genes of canine PV type 1 for three primer sets but not for MY09/11. The other sequenced samples showed 70-73% similarity to *Leptoncyochotes weddellii* papillomavirus 6 and 7. This therefore represents a novel PV, indicating that papillomaviruses belonging to different genera may cause TVT cases. These results suggest PV infection may be involved in TVT pathogenesis in sampled dogs with TVT. Comprehensive studies on this subject can both clarify the etiology of these case and also indicate effective practices for controlling the disease, such as treatment and vaccination.

**Keywords:** Etiology, Dog, Papillomaviruses, Transmissible Venereal Tumors.

\*Sorumlu yazar e-mail: mesutyalcin@duzce.edu.tr

#### Özet

Çok çeşitli kullanım yerinde değerlendirilen özellikle doğal dayanıklılığı düşük ahşap malzemeler, kullanım yerlerinde karşılaştıkları birçok biyolojik faktöre karşı çeşitli koruyucu kimyasallar ile koruma altına alınarak daha uzun bir servis ömrüne sahip olması sağlanabilmektedir. Koruyucu kimyasalların ahşaba uygulanması çeşitli emprenye yöntemleri ile gerçekleştirilmektedir. Ancak ahşap malzemenin türü ve anatomik yapısı, kullanılan kimyasalın özellikleri, uygulama yöntemi gibi faktörler emprenye işleminin başarısını etkileyen unsurlardır. Ahşap malzemenin emprenye işleminin yeterli olup olmadığına ilişkin değerlendirmeler çeşitli standartlarda belirtilen husulara göre yapılabilmekte ve özellikle ahşabın kullanım yeri sınıfına ve kendisinden beklenen servis ömrüne göre minimum retensiyon ve penetrasyon değerleri ile değerlendirilmektedir. Bu değerler tespit edilirken; ağaç türü, dayanıklılık sınıfı ve diri/öz odun kısmı, ahşabın kullanım yeri sınıfı, ağaç malzeme kesit şekli (yuvarlak, kereste) ve minimum servis ömrü beklentisi ve sonuç olarak müşterilerin belirlediği kabul edilebilir kalite seviyesi dikkate alınmalıdır. Retensiyon miktarının tespiti emprenye işleminden önce ve hemen sonra yapılacak ölçümler ile tespit edilmektedir. Penetrasyon tespiti ise emprenye işleminden kısa bir süre sonra montaj öncesi veya montaj sonrası kullanım halinde iken tespit edilmesi mümkündür.

**Anahtar Kelimeler:** Ahşap koruyucu kimyasal, emprenye işlemi, retensiyon testi, penetrasyon testi

#### Özet

Kronik fruktoz tüketimi başta karaciğer olmak üzere birçok dokuda yapısal ve işlevsel bozukluklara neden olmaktadır. Mitokondri ile ilişkili hücrel stres cevaplarının fruktoz diyetinin neden olduğu hepatik değişikliklerde rolü olabileceği düşünülmektedir. Son yıllarda flavonoid yapıdaki bileşiklerin metabolik hastalıkların önlenmesinde ve/veya tedavisinde yararlı etkileri olduğu gösterilmiştir. Bu çalışmada güçlü antioksidan aktiviteye sahip olan Mirsetin'in yüksek fruktoz tüketiminin neden olduğu metabolik ve hepatik değişikliklerde potansiyel etkileri araştırılmıştır. Fruktoz, erkek Wistar sıçanlara içme suyu içerisinde (%20, a/h) 15 hafta boyunca verilmiştir. Mirsetin, (50mg/kg/gün) çalışmanın son 6 haftasında oral gavaj yoluyla uygulanmıştır. Sıçanların vücut ağırlıkları, sıvı ve yem tüketimleri haftalık olarak takip edilmiştir. Deney sonunda anestezisi altındaki hayvanlardan alınan kan örneklerinden plazma elde edilmiş ve glukoz, trigliserid, LDL ve HDL düzeyleri ölçülmüştür. Karaciğer dokusu çıkarılarak tartılmış ve Western Blot yöntemi ile Dynamin ilişkili protein-1 (DRP1), Mitofusin-2 (Mfn2) ve PTEN ile indüklenen kinaz-1 (PINK1) protein ekspresyonları belirlenmiştir. Fruktozla beslenen sıçanların vücut ağırlığı, karaciğer ağırlığı, karaciğer ağırlığının vücut ağırlığına oranı, plazma glukoz ve trigliserid düzeylerinde anlamlı artış görülürken, Mirsetin uygulaması bu parametreleri etkilememiştir. Plazma HDL kolesterol seviyesi fruktoz tüketen hayvanlarda azalırken, Mirsetin tedavisi bu azalmayı tersine çevirmiştir. LDL kolesterol seviyesi ise tüm gruplarda benzerdir. Ayrıca içme suyu içerisinde fruktoz alan sıçanların yem ve sıvı tüketimleri azalmış, Mirsetin uygulaması ortalama sıvı tüketimini artırmıştır. Mitokondriyal fizyon belirteci DRP1'in ekspresyonu fruktozla beslenen sıçanların karaciğer dokusunda artarken, Mirsetin uygulaması bu artışı önlemiştir. Mitokondriyal füzyon belirteci Mfn2'nin protein ekspresyonu tüm gruplarda benzerdir. Fruktoz tüketen sıçanların karaciğer dokusunda mitofaji belirteci PINK1'in ekspresyonu önemli ölçüde artarken, Mirsetin ile tedavi edilen grupta bu artış gözlenmemiştir. Bulgularımız, yüksek fruktoz diyetiyle beslenen sıçanlarda Mirsetin uygulamasının plazma HDL kolesterol seviyesindeki düşüşü önlediğini ve karaciğerde mitokondri ile ilişkili hücrel stres molekülleri DRP1 ve PINK1'in ekspresyonunu düzenlediğini ortaya koymuştur. Sonuç olarak Mirsetin, fruktoz tüketimine bağlı metabolik bozukluklarda terapötik bir potansiyel olarak dikkate alınabilir.

**Anahtar Kelimeler:** Fruktoz, Mirsetin, Karaciğer, Mitokondriyal füzyon, Mitokondriyal fizyon, Mitofaji.

#### Abstract

The objective of this study is to assess the performance of lipase-inorganic hybrid nanoflowers (L@ihNFs) across various parameters, including their activity on different types of commercial liquid/solid oils and waste oils, as well as their compatibility with liquid/solid laundry detergents, surfactants, organic solvents, and variations in pH and temperature. For this, lipase-inorganic hybrid nanoflowers (L@ihNFs) were synthesized using a mixture of lipase enzymes and Cu<sup>2+</sup> ions. L@ihNFs were characterized by their morphology and chemical point of view by using techniques including SEM and IR. Then, the enzyme activity and stability of L@ihNFs were compared with free enzyme spectrophotometrically at different pH and temperatures. The optimum pHs of free enzyme and L@ihNFs were pH 8 and 9, respectively. The optimum temperatures of the free lipase and L@ihNFs were 40 °C and 50 °C, respectively. Even in the presence of detergents/surfactants, where free lipase could not fully protect its activity, L@ihNFs were able to maintain their activity. L@ihNFs were able to retain 50.38% of their activity in 10 reuses. When their activities in commercial solid /liquid oils and waste oils were evaluated, L@ihNFs was determined to be higher compared to the free enzyme. In addition, when the storage stability was evaluated, it was determined that L@ihNFs retained 50% activity compared to the free enzyme at the end of the 20th day.

Our data reveal that enzyme activities and stability of L@ihNFs were significantly higher compared to the free enzyme and it was determined that L@ihNFs have several novel properties that are important for industrial value. In conclusion, can be a good choice L@ihNFs which can be used for the treatment of waste oil degradation, detergent and biocatalysts applications in the future.

#### Abstract

Cancer is a disease in which human deaths are widespread worldwide and is continuing to increase day by day. During the process of cell cancer, many of its metabolic activities change. Increased heparanase enzyme release is just one example of this. Heparanase is an endoglucosidase enzyme that can cut the side chains of heparansulfate molecules found in the extracellular matrix tissue (ECM). As a result of its activity, it ensures the re-formation of the basal membrane and intercellular matrix structure. The breakdown of heparan-sulfate chains causes growth factors such as FGF and VEGF to be produced, these growth factors increase tumor growth and angiogenesis. To reduce tumor growth and metastasis, various drug designs can be made by modifying chitosan and its derivatives. In this study, the activity of heparanase enzyme was studied by DNS (3,5-Dinitrosalicylic acid) and WST-1 (water-soluble tetrazolium salt) methods. The activity was analysed by degradation of fondaparunx molecules, a synthetic substrate, in a pH 5 40 Mm acetate buffer at 37°C for 24 hours. A previously synthesized heparin mimic molecule was used as an enzyme inhibitor. The released enzyme products were read in the spectrophotometer with WST-1 and DNS reagents. The results have been saved. Two reagents detected the enzyme products. However WST-1 is better than DNS method due to its sensitivity to ultra-low products. Novelty inhibitor agent showed the inhibition effect on the heparanase at 0.01 mg/ml concentration of inhibitor. According to the results obtained, it was concluded that it can be applied as an alternative to the WST method, since the reducing end released as a result of enzyme activity reacts with the DNS reagent.

\* cananvardarkor@gmail.com

#### Özet

Zeytin, ülkemiz ekonomisi için oldukça önemli bir tarımsal üründür. Son yıllarda pek çok hastalık etmeninden dolayı zeytinde önemli ürün kayıpları yaşanmaktadır, Zeytinde meyve çürüklüğüne neden olan pek çok hastalık etmeninin varlığı bildirilmiştir. Bu hastalık etmenlerinin en önemlilerinden birisi Glomerellaceae familyasına bağlı *Colletotrichum fiorinae*'dir. Bu çalışmada, ülkemizin Akdeniz Bölgesi zeytin çeşitlerinin farklı olgunluk derecelerinde antraknoz meyve çürüklüğüne karşı çeşit dayanıklılığı belirlenmiştir. Denemelerde, İzmir Kemalpaşa'da Zeytincilik Araştırma Enstitüsüne ait koleksiyon bahçesinde bulunan Büyük Topakulak, Sarı Ulak, Küçük Topakulak, Çelebi (Silifke), Halhalı (Hatay), Sarı Habeşi, Saurani, Sayfi, Karamani, Elmacık, Yağlık Sarı Zeytin, Maraş No:7 zeytin çeşitlerinin meyveleri kullanılmıştır. Çalışmada 12 çeşitten alınan, yeşil (1), sarı-yeşil (3) ve siyah (5) olarak 3 farklı olgunluk derecesinde zeytin meyveleri, iklim odası koşullarında *Colletotrichum fiorinae*'ye karşı hastalık şiddeti belirlenmiştir. Değerlendirmeler, meyve inokulasyonun 3. gününde lezyonlar gözlemlendiği için 7.günden sonra lezyon gelişimi duyarlılık grubunu değiştirebilecek bir artış olmadığından sonlandırılmıştır. Halhalı (Hatay) %0, Sayfi %2,4, Yağlık Sarı Zeytin %3,2, Saurani %5,2 Maraş No:7 %13,6, Sarı Habeşi %16,4 çeşitlerinin 1. olgunluk derecesindeki meyveleri inokulasyondan 3 gün sonra yüksek dayanıklı ve dayanıklı gruptadır. Diğer çeşitler ise orta duyarlı-duyarlı gruptadır. Ancak denemenin 5. ve 7. gün sonunda hastalık şiddetinin sırasıyla Sarı Habeşi'nin %31,8-%83,6'ya ve Maraş No:7'nin %56,0-%90,4 ile yüksek duyarlı gruptadır. 3. olgunluk dönemindeki meyvelerin, inokulasyonun 3. gününde Halhalı (Hatay) %0, Saurani %6,4, Büyük Topakulak %8,4 hastalık şiddeti ile yüksek dayanıklı, Maraş No:7 %16,4, Yağlık Sarı Zeytin %17,6 ve Sayfi %22,8 çeşitleri dayanıklıdır. Denemenin 7. gün sonunda ise Halhalı (Hatay) %0'ın yüksek dayanıklı, Saurani'nin %24,4 ile dayanıklı, diğer çeşitlerin duyarlı ve yüksek duyarlı olduğu belirlenmiştir. Çeşitlerin 5. olgunluk derecelerindeki hastalık şiddetleri 3. olgunluk dereceleri ile benzer değerlerdedir. Bu çalışmada, ülkemizin Akdeniz Bölgesi zeytin çeşitlerinin farklı olgunluk derecelerinde antraknoz meyve çürüklüğüne karşı en dayanıklı çeşit Halhalı (Hatay) iken en duyarlı çeşit Sarı Habeşi'dir. Araştırma sonuçlarından elde edilen verilerin bundan sonraki dayanıklılık çalışmalarına ışık tutacağı düşünülmektedir.

**Anahtar Kelimeler:** Zeytin, antraknoz, hastalık şiddeti, meyve çürüklüğü

<sup>1-2</sup>Zeytincilik Araştırma Estitüsü, Bitki Sağlığı Bölümü, İzmir, Türkiye

\* latife.erten@tarimorman.gov.tr

#### Özet

Antraknoz (*Colletotrichum spp.*), Glomerellaceae familyasına bağlı dünya çapında zeytin (*Olea europaea* L.) bitkisinin en önemli hastalıklarından biridir. Hastalık etmeni, zeytin yetiştiriciliğini olumsuz yönde etkilemesinin yanısıra, zeytinyağı sektöründe de ciddi sorunların ortaya çıkmasına neden olmaktadır. Bu çalışmada, ülkemizin önemli zeytin çeşitlerinden Trabzon Yağlık, Marantelli, Samsun Tuzlamalık, Halhalı (Hatay), Samsun Yağlık, Taş Arası, Hurmakara, Çakır, Tavşan Yüreği, Çekişte, Girit, Yağ Zeytini, Dilmit, Saurani, Butko, Erkence, Memeli, Eşek (Tekirdağ) ve antraknoza duyarlı olduğu bilinen İspanyol çeşitlerinden Manzallina' nın duyarlılık grupları belirlenmiştir. Denemelerde, *İzmir Kemalpaşa'da Zeytincilik Araştırma Enstitüsüne ait koleksiyon bahçesinde bulunan zeytin çeşitlerinin* genç ( $\leq 3$  aylık yaprak) ve yaşlı ( $\leq 1$  yaşında yaprak) yaprakları kullanılmıştır. Yapraklar 22-24 °C'de 12 saat ışık, 12 saat karanlık fotoperiyotta % 90-95 nem oranında iklim odasında inkübasyona bırakılmıştır. Deneme kurulduktan sonraki 5, 10, 15 ve 20. gün değerlendirme sonuçları skala değerlerine göre yapıp hastalık şiddeti Towsend-Heuberger formülü ile hesaplanmıştır. Bu sonuçlara göre çeşitlerin *Colletotrichum fioriniae* 'ye karşı yapraktaki duyarlılık grupları belirlenmiştir. Zeytin çeşitlerinin genç yapraklarına yapılan inokulasyonun 5. ve 10. gün değerlendirmesinde Marantelli %66, Samsun Tuzlamalık %52,0 ,Memeli % 63 duyarlı, Butko %32,0, Erkence %45,0, Eşek (Tekirdağ) orta duyarlı olup, diğer tüm çeşitler patojene karşı dayanıklıdır. Denemenin 15. gününde ise Trabzon Yağlık %10, Samsun Yağlık %2,0, Hurmakara %7,0 ve Yağ Zeytini %6,0 ile yüksek dayanıklıdır. Yaşlı yapraklar inokulasyondan 5 gün sonra *Colletotrichum fioriniae* 'ye karşı Manzallina dışındaki tüm çeşitler yüksek dayanıklı, 10 gün sonra ise dayanıklıdır. Denemenin 20. günü sonunda Trabzon Yağlık-Yağ Zeytini %10 ve Hurmakara'nin %7 ile yüksek dayanıklı, Marantelli %61, Erkence %64 ve Manzallina'nın %95 duyarlı-yüksek duyarlı olduğu belirlenmiştir. Kimyasal mücadeleye alternatif, yöntemlerin başında hastalıklara karşı dayanıklı çeşitlerin kullanımı gelmektedir. Bu çalışma Türkiye'de, zeytinde *Colletotrichum fioriniae* 'ye karşı yapılan ilk yaprakta dayanıklı çeşit çalışmasıdır.

**Anahtar Kelimeler:** Zeytin, antraknoz, dayanıklılık, yaprak

#### Abstract

Herein, a glassy carbon electrode was modified with carbon nanotube-supported Pt catalysts (Pt/CNT), and its performance for HCOOH dehydrogenation reaction was investigated. Pt/CNT catalysts were prepared by chemical reduction and characterized by scanning electron microscopy with X-ray energy dispersive (SEM-EDX), X-ray diffraction (XRD), and inductively coupled plasma mass spectrometry (ICP-MS) methods. Electrochemical measurements were carried out by cyclic voltammetry (CV) and chronoamperometry (CA). Independent parameters affecting specific activity of Pt/CNT for HCOOH dehydrogenation were optimized with response surface methodology (RSM). For the modification conditions of GCE with Pt/CNT, the amount of catalyst sludge transferred to the electrode surface, ultrasonification time, and drying time of the catalyst sludge transferred to the GCE surface were selected as independent parameters, and the optimum values were determined as 9  $\mu$ l, 50 min, and 9.07 min, respectively. The specific activity for HCOOH dehydrogenation under optimum conditions was obtained as 12.8 mA cm<sup>-2</sup>.

**Keywords:** Formic acid, Dehydrogenation, Response surface method, Platinum.

#### Abstract

Along with the increasing population, mis-land use, natural resource destruction and loss have been experienced. In this process, the land use/land cover (LULC) changes in urban areas and the increase in impervious surfaces play an important role. In this study, it has been aimed to reveal how the land surface temperature (LST) changed according to the land uses in the Kağıthane watershed between 2002-2021, which is located in the province of Istanbul. In this context, the satellite images of Landsat 5 for 2002 and Landsat 8 for 2021 were used and analyses were carried out with remote sensing (RS). When the LULC results of the study were examined, the major increase was observed in urban areas with 1014.7 ha and the major decrease was in forest areas with 933.3 ha. In addition, the highest LST values related to LULC were observed in urban and open areas while the lowest values were observed in forest areas and water bodies. Besides, the lowest increase in LST was 0.6 °C in forest areas, whereas the highest increase was detected in urban areas with 2.6 °C. These results can be considered as a clear indication of the cooling effect of the forests in the northern part of the watershed. Therefore, this study has shown the importance of protecting the forest areas in the watershed from fragmentation and how necessary it is to plan forests or green areas in the urban areas in order to increase the cooling effect in the urban climate.

**Keywords:** Land use/land cover (LULC), Land surface temperature (LST), Forest areas, Urban watersheds, Cooling effect

#### Özet

Dünyada yılda oluşan lignoselülozik biyokütlelerin %97'ye yakın kısmı değerlendirilmemektedir. Bu büyük potansiyelden kimyasal ve biyokimyasal yöntemlerle sıvı ve gaz yakıtlar ile çeşitli kimyasalları elde etmek için laboratuvar ve pilot ölçekte yoğun çalışmalar yapılmaktadır. Lignoselülozik biyokütleden üretilebilecek 12 önde gelen kimyasaldan (Building Blocks) oluşan bir liste 2004 yılında yayınlanmıştır. Bu kimyasallar çok yakın bir gelecekte petrokimya rafinerilerinin yerini alması planlanan biyorafinerilerin temelini oluşturacaktır. Bu 12 kimyasaldan biri de LEVÜLİNİK ASİT (LA)'dir. Bu çalışmada, ülkemiz için önemli olan biyokütlelerin atıklarından, aromatik sülfonik asit katalizörleri varlığında otoklav reaktör sistemi kullanılarak LA oluşum koşulları araştırılmıştır. Belirlenen parametreler için optimum koşulların belirlenmesi amacıyla, selüloz-hemiselüloz içeriği yüksek olan aspir sapı ile çalışmalara başlanması uygun görülmüştür. Reaksiyon sıcaklığı (120, 140, 160, 180, 200 ve 220°C), pH (0,5, 1,0 ve 1,5), solvent / biyokütle oranı (ağırlıkça 10, 15 ve 20) ve katalizör tipinin (BSA, PTSA ve LABSA) maksimum LA verimi üzerindeki etkileri incelenmiştir. Minitab-19 Yazılımı ile oluşturulan L18 Taguchi deney tasarımına göre yapılan denemelerde maksimum LA verimi için optimum koşullar, 200°C sıcaklıkta 0.3 M konsantrasyonda paratoluensülfonik asit (PTSA) ve çözücü/biyokütle oranı 20 olarak bulunmuştur. Elde edilen bu sonuçlara göre ayçiçeği sapı, mısır koçanı, fındık kabuğu ve palamut denemeleri optimum noktalarda gerçekleştirilmiştir. Mısır koçanı ile yapılan denemelerde maksimum LA verimi 120. dakikada 94 g/kg olarak bulunmuştur. Bu değer optimum koşullarda aspir sapında bulunan değerden (88 g/kg) daha yüksektir. Ayçiçeği sapı denemesinde 120. dakikada maksimum LA verimi 49.38 g/kg olarak bulunmuştur. Bu değer aspir sapı ile optimum koşullarda bulunan değerden (88 g/kg) oldukça düşük olması dikkat çekmektedir. Fındık kabuğu ve palamut ile yapılan deneylerde maksimum LA verimi sırasıyla 70 g/kg (20. dakikada) ve 61 g/kg (20. dakikada) olarak bulunmuştur. Bu değerler, optimum koşullarda aspir sapında bulunan değerden (88 g/kg) daha düşüktür.

**Anahtar Kelimeler:** Hidrotermal dönüşüm, levulinik asit, lignoselülozik biyokütle, Taguchi yaklaşımı, aromatik sülfonik asitler.

#### Abstract

Reversible addition/fragmentation chain transfer (RAFT) polymerization is a unique method for the synthesis of polymers of desired molecular weights with low polydispersity [1]. Ring opening (ROP) polymerization is widely used in the polymerization of lactones [2]. The “Click” chemistry method introduced by Sharpless et al. is a unique technique for copolymer synthesis and has attracted great attention from many researchers [3]. In this study, well-known poly( $\epsilon$ -caprolactone-*b*-4-vinylbenzyl-*g*-ethyleneglycol) [P( $\epsilon$ -CL-*b*-VB-*g*-EG)] block-graft terpolymer were synthesized by recycling addition/fragmentation chain transfer (RAFT) polymerization, ring-opening polymerization (ROP) and click chemistry method. For this purpose; in the first step, a novel RAFT-ROP agent was synthesized by the reaction 3-chloro-1-propanol and potassium ethyl xanthogenate salt. In the second step, poly( $\epsilon$ -caprolactone-*b*-4-vinyl benzyl chloride) P( $\epsilon$ -CL-*b*-VB) block copolymer was synthesized by RAFT polymerization of 4-vinyl benzyl chloride and ROP of  $\epsilon$ -caprolactone using synthesized a novel RAFT-ROP initiator in the one-step. In the third step, poly( $\epsilon$ -caprolactone-*b*-4-vinyl benzyl chloride)-N<sub>3</sub> was obtained by reaction synthesized poly( $\epsilon$ -caprolactone-*b*-4-vinyl benzyl chloride) block copolymer and NaN<sub>3</sub>. On the other hand, PEG-propargyl (alkyne-terminated-PEG) was obtained by the reaction polyethylene glycol (PEG-3000) with propargyl chloride. In the last step, [P( $\epsilon$ -CL-*b*-VB-*g*-EG)] block-graft terpolymer were obtained by the reaction PEG-propargil and poly( $\epsilon$ -caprolactone-*b*-4-vinyl benzyl chloride)-N<sub>3</sub> via the "click" chemistry method. The synthesized products were characterized by using multi-instruments such as GPC, <sup>1</sup>H-NMR, FT-IR, DSC ve SEM.

**Scheme 1:** The chemical synthesis reaction of RAFT-ROP initiator (A), synthesis mechanism of poly(CL-*b*-VBC) block copolymers (B), chemical synthesis reaction of poly (CL-*b*-VB)-N<sub>3</sub> (C), synthesis of PEG-propargyl (D), synthesis mechanism of poly(CL-*b*-VB-*g*-EG) block-graft terpolymers (E).

#### Abstract

The aim of this study was to produce a low-cost adsorbent using coffee wastes. Activated carbon prepared from coffee silverskin will be used for heavy metal adsorption from wastewater. The present study describes a synthesis of the activated carbon by the combination of chemical activation and microwave treatment in the oven without radiation leakage, which is a safe, simple, and fast method compared to the hydrothermal pyrolysis. The combination of microwave pyrolysis with chemical activation and the use of lignocellulosic waste (coffee silverskin) was investigated as an alternative method to the hydrothermal pyrolysis. The zinc chloride and phosphoric acid were used as an activation agent followed by microwave treatment at 600W for 5 min with 30 sec time intervals. When the zinc chloride was used at 1:4, 1:5 molar ratios, maximum metal adsorption capacity of the activated carbon was 76,95 mg/g, 115,1 mg/g for 2 hours. When phosphoric acid was used in similar molar ratios the maximum adsorption capacity of activated carbon was registered as 115,2 mg/g, 100 mg/g for 2 hours respectively. The removal of heavy metal ions was studied by UV-spectroscopy and had shown 96% and 82,3%. Additionally, the effect of the temperature, time and concentration on the adsorption were investigated. These results illustrate that coffee silverskin can be used as a low-cost adsorbent for the removal of heavy metal ions from wastewater.

**Keywords:** Activated carbon, Microwave treatment, Wastewater, Heavy metals.

#### Abstract

In recent years, there has been a growing trend toward the production of biopolymer-based films due to consumer demand. This shift is driven by consumers' increasing awareness of the harmful effects of non-biobased films on human health and the detrimental impact of non-biodegradable materials on the environment. In the literature, natural films made from biopolymers such as gelatin, alginate, cellulose, and chitosan have emerged as alternatives to petroleum-based plastics. Among these, chitosan-based films stand out prominently. Chitosan, derived from the deacetylation of chitin, is a biodegradable, non-toxic, antimicrobial, antioxidant, and biocompatible polysaccharide. Its unique properties have led to a growing interest in chitosan. Films made from chitosan find applications in various fields, including food, medicine, and agriculture, among others. However, it is worth noting that in the existing literature, all chitosan films are typically prepared by dissolving chitosan in a weak acid and forming it into a gel. Therefore, these films should be classified as synthetic or semi-synthetic chitosan films.

**Keywords:** Chitosan film, Natural films, Semi-synthetic films

### Relationship of Diabetes Mellitus and Cancer

Filiz YILDIRIM<sup>1</sup>, Hasan KARAGEÇİLİ<sup>2</sup>

<sup>1</sup>Department of Internal Medicine, Polatlı Duatepe State Hospital, Ankara, Turkey, drfyildirim@yahoo.com;

<sup>2</sup>Siirt University, Faculty of Healthy Sciences, Siirt, Turkey

#### Abstract

Cancer is the most dangerous disease of our contemporary day, and it ranks high on the list of causes of human mortality. While cancer is the leading cause of death in wealthy societies, it is steadily growing in emerging countries. Diabetes mellitus affects 250 million individuals globally. This figure is expected to reach 380 million during the next 20 years. Cancer rates in diabetes people are greater than in non-diabetic patients, according to studies. Furthermore, diabetes medicines, food, and metabolism control level may all play a part as defining variables in the link with cancer. Diabetes people are more likely to develop malignancies of the liver, pancreas, endometrial, colon and rectum, breast, bladder, prostate, and esophageal lining. Cancer in type 2 diabetes patients is caused by three factors: (1) direct effects such as hyperglycemia, hyperinsulinemia, and insulin resistance, inflammation (IL-6 secreted from adipocytes, TNF- $\alpha$ , PAI-1, adiponectin, and leptin), (2) indirect effects such as advanced age, obesity, sedentary lifestyle, malnutrition, and (3) incorrect therapies. The examination of the relationship between cancer and diabetes revealed that diabetic people had a greater risk of many forms of cancer than healthy ones. Diabetics are about twice as likely as healthy people to develop liver, pancreatic, and uterine malignancies. Given that the control group in this research includes people who have never been diagnosed with diabetes, it is reasonable to assume that the risk is higher. In the case of prostate cancer, the scenario is just the contrary. Diabetic persons were shown to have a decreased chance of acquiring prostate cancer than healthy ones. The hormone testosterone is thought to play a role in the development of prostate cancer. The comparatively low amount of testosterone hormone in diabetic people lowers the chance of acquiring this malignancy. Diabetic medications also have a role in this. Some diabetic medicines have been demonstrated to lessen the chance of acquiring cancer. Metformin, the first-line medication for diabetes, inhibits proliferation and prevents cancer. In recent research, the prevalence of cancer in insulin users has raised concerns regarding the use of insulin in the treatment of diabetes. In conclusion, the incidence of cancer in diabetes individuals is higher than in the general population. Routine cancer tests should be done more carefully in the first 5 years, especially in the event of new diabetes appearing at an elderly age.

**Keywords:** Diabetes mellitus, Cancer, Metformin

#### Abstract

This study presents a novel and environmentally friendly approach for the determination of Iron (III) utilizing *Helichrysum arenarium* infusion. The increasing demand for green analytical methods has led to the exploration of natural sources for reagents. In this context, *Helichrysum arenarium*, known for its rich chemical composition [1-3], has been harnessed for its potential as a colorimetric agent in iron quantification. According to the principles of green chemistry, this method is simple, eco-friendly, and simple to implement. A colorimetric reaction occurs between Iron (III) and the infusion, resulting in a measurable color change that corresponds to the concentration of the analyte. This reaction was optimized under various conditions to achieve the best analytical performance. The developed method demonstrates a linear range for Iron (III) quantification, with a good correlation coefficient. Moreover, the method showcases exceptional sensitivity, as indicated by the low limit of detection and quantification values.

As a result, an efficient and environmentally friendly colorimetric method has been developed for determining iron (III) using *Helichrysum arenarium* infusion as a reagent. The method's efficiency, accuracy, and compatibility with green analytical principles make it a promising alternative for iron quantification in various applications. Incorporating natural reagents like *Helichrysum arenarium* infusion underscores the potential of sustainable practices in analytical chemistry.

**Keywords:** Green analytical chemistry, Iron(III)-polyphenol complex, colorimetry, spectrophotometry.

#### Abstract

*Pistacia khinjuk* Stocks is a species of plant in the Anacardiaceae family, which is contained commercially important species. *Pistacia* genus has been used in traditional medicine to treat many diseases duo to their therapeutic properties. The aim of the study is to reveal the total phenol (TPC) and flavonoid content (TFC) and antioxidant activity of ethanolic extract of *Pistacia khinjuk* Stocks. The plant was collected from Siirt/Turkey and diagnosed by Assoc. Prof. Dr. Süleyman Mesut Pınar. A voucher specimen was stored at Van Yüzüncü Yıl University's herbarium (VANF) (Herbarium number: 164257). The ethanolic extract of the plant was prepared. Total phenolic (TPC) and flavonoid (TFC) contents were measured spectrophotometrically. Antioxidant potentials of the extracts were evaluated by DPPH (1, 1-diphenyl-2-picrylhydrazyl) and ABTS [2,2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)] radical scavenging capacity tests. The extraction yield was 5, 5 % (w/w) for the ethanolic extracts of *Pistacia khinjuk*. TPC was calculated as 329± 9, 68 µg GAE/mg. TFC of the ethanolic extracts were determined as 416,6±9, 99 QE/ mg dry extracts and 105± 8,85 µg CE/ mg dry extracts according to Quercetin (QE) and Catechin (CE) standards, respectively. IC<sub>50</sub> values were determined as 0, 56 and 0, 46 mg/ml for DPPH and ABTS+ assay, respectively. As a result, the extraction yield was low due to the hard nature of the seed. A different extraction method should be used to increase the extraction yield in the plant. Thanks to its high TPC and TFC, the ethanolic extract of *Pistacia khinjuk* Stocks has strong antioxidant properties. This situation must also have resulted from the polarity of the extraction solvent which affects the contents of the plant extracts. Duo to the high antioxidant activity, *Pistacia khinjuk* Stocks may have considered as an experimental material to protect against the oxidative stress-related diseases.

**Keywords:** Antioxidant activity, Flavonoid, Phenolic, *Pistacia khinjuk*

\*Sorumlu yazar e-mail: a.aycaozdemir@hotmail.com

#### Özet

Mikrodizi, genlerin ifade seviyelerini aynı anda ölçmeye yarayan bir teknolojidir. Binlerce genin aynı anda ölçümü yapılabilen bu teknolojiye cihaz ya da çevre kaynaklı eksik gözlemler oluşabilmektedir. Bu eksik gözlemlerin oranı ise değişkenlik göstermektedir. Literatürde genellikle ilk olarak eksik gözlemlere atama işlemi yapılmakta ve sonrasında diğer analizlere devam edilmektedir. Ayrıca mikrodizi verilerine herhangi bir analiz yapılmadan önce normalizasyon uygulanması gerekmektedir. Biz de araştırmamızda mikrodizi verilerinde eksik veri atama ve normalizasyon uygulaması sıralamasında sınıflama performanslarında gözlenen değişkenliği değerlendirmeyi amaçladık. Bu amaçla R programı Madsim paketinde gen sayısı 100, 500 ve 1000, örnek genişlikleri ise 10, 20, 40, 100 ve 200 olacak şekilde sentetik mikrodizi verisi üretilmiştir. Oluşturulan veri setlerinde %1, %5, %10, %20 ve %50 Tamamen Rastgele Kayıp yapısına uygun olarak eksik veriler oluşturulmuştur. Her durum 1000 kez tekrar olacak şekilde simüle edilmiştir. Eksik veri oluşturulan veri setlerine ilk olarak KNN ve CART ile atamalar yapılmış sonrasında ise Kantil normalizasyon uygulanmıştır, ikinci durumda ise önce normalleştirme sonra eksik veri atama adımı gerçekleştirilmiş ve sınıflama performansları Tek Katmanlı İleri Beslemeli Sinir Ağı ile değerlendirilmiştir. Gen sayısı 100 ve 500 iken önce normalizasyon sonra atama yönteminin kullanılması durumunda daha yüksek doğruluklar elde edilirken, gen sayısı 1000 olduğunda önce atama sonra normalizasyonun uygulanması daha yüksek performans göstermiştir. Örnek genişliklerine ve gen sayısına göre doğruluk oranları oldukça değişiklik göstermekte olup, genel olarak CART algoritmasının KNN'e göre daha yüksek performansa sahip olduğu sonucuna ulaşılmıştır. Bu sebepler doğrultusunda, mikrodizi verileri gibi örnek genişliği küçük, değişken sayısı fazla olan veri setlerinde klasik bilinen eksik veri atama ve normalizasyon sıralamasının aksine önce normalizasyon sonrasında eksik veri ataması uygulanarak sonuçların karşılaştırılması, verinin yapısına göre değerlendirme yapılarak analiz performanslarının oldukça önemli ölçülerde değişebileceği düşünülmektedir.

**Anahtar Kelimeler:** Mikrodizi, Eksik veri, Normalizasyon

#### Abstract

Nanotechnology deals with nano-sized particles ranging from 1 to 100 nm. Nanoparticles (NPs) are used in a wide variety of fields such as biology, medicine, agriculture, chemistry, and engineering. There are various synthesis methods and green synthesis is a fairly new and rapidly developing technique among them. When compared to other procedures, green synthesis avoids different problems such as reaction complications of chemical methods, high cost, environmental pollution, toxic effects, and safety. Bioactive agents such as plants, bacteria, fungi, etc. are utilized for green synthesis. Psychrophiles, as a subgroup of extremophiles, thrive in extremely cold habitats within the temperature range of -20°C to -15°C and are also used for NP preparation. We aim to synthesize silver (Ag), zinc (Zn), and calcium (Ca) NPs from *Psychrobacter* sp. *TaeBurcu001* which was identified by our group in Antarctica. The formations of NPs were observed by the color change in the solution. In addition, NPs were also analyzed with SEM and Zetasizer. Sizes of Ag NPs in SEM were in the range of 10-50 nm, ZnO NPs were in the range of 80-150 nm and CaO NPs in the range of 100-250 nm. Zeta potential measurements also showed negative charge in the averages as -15.8 mV, -22.8 mV, and -12.8 mV for Ag NP, ZnO NP, and CaO NP, respectively. We know that NPs can be different shapes, sizes, and stability when obtained from different species. In addition, these different characteristics have been used for different purposes in numerous areas. Our analyses continue to determine the potential use of obtained NPs, especially in agriculture.

#### Özet

Ülkemizin geçit kuşağı bölgesi üzerinde bulunan Bilecik ili, bitki çeşitliliği açısından önemli bir yere sahiptir ve birçok bitki türüne ev sahipliği yapmaktadır. Bölgenin, Sakarya Nehri'nin kıyısında konumlanmış ve birçok medeniyete ev sahipliği yapmış olması biyoçeşitlilik açısından önemlidir. Çalışmada, Bilecik ilinin Söğüt ilçesinin floristik yapısını incelemek için ilçenin biyoçeşitlilik açısından önemli bir kısmını oluşturan Küre ve Çaltı Köyleri ile çevresindeki bölge seçilmiştir. Bölgede, 2023 yılının Nisan ve Ağustos ayları arasında on beş günlük periyotlar halinde ilk yıla ait arazi çalışmaları gerçekleştirilmeye başlanılmış olup; bu süreçte toplanan bitkilerin gövde, yaprak, çiçek ve meyve/tohum durumlarından alınan örnekler ile tür tayinleri yapılmaya başlanılmıştır. Çalışma devam etmekte olup Nisan-Ağustos sürecindeki arazi çalışmaları sonucunda, bölgede 37 familyaya ait 66 cins ve 81 türün varlığı saptanmıştır. Tür sayısının fazla olduğu familyalar ise şu şekilde sıralanmaktadır: Rosaceae (15 tür), Asteraceae (9 tür), Fabaceae (7 tür), Lamiaceae (4 tür), Moraceae (3 tür), Oleaceae (2 tür).

**Anahtar Kelimeler:** Flora, Biyoçeşitlilik, Bilecik, Söğüt

### Biyoaktif bileşiklerin glikasyon ürünleri üzerine etkisi

Esranur Seyyar<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-6773-5541>),  
Merve Tomas<sup>1</sup> (ORCID: <https://orcid.org/0000-0003-1057-7914>)

<sup>1</sup>İstanbul Sabahattin Zaim Üniversitesi, Müh. ve Doğa Bil. Fakültesi., Gıda Mühendisliği Bölümü, İstanbul, Türkiye

\*esranur.seyyar@std.izu.edu.tr

#### Özet

Beslenme alışkanlıklarındaki değişimler ve günümüzdeki diyetlerin büyük ölçüde ısıyla işlenmesi beraberinde yüksek seviyelerde glikasyon ürünlerine maruziyetini de arttırmaktadır. Glikasyon ürünleri, indirgeyici şekerler ile proteinlerin, lipidlerin veya nükleik asitlerin serbest amino grupları arasındaki enzimatik olmayan bir reaksiyon yoluyla oluşur. Bu reaksiyon aynı zamanda Maillard veya esmerleşme reaksiyonu olarak da bilinmektedir. Maillard reaksiyonuna dayanan glikasyon ürünleri üç aşamada gerçekleşmektedir. Birinci aşama glukoz enzimatik olmayan bir yolla protein, lipit veya DNA'nın serbest bir amino asidine bağlanarak Schiff bazı oluşturur. İkinci aşamada ise Schiff bazı, Amadori ürünlerine (daha stabil ve geri dönüşümlü olan, erken glikasyon ürünleri olarak da bilinir) dönüşür. Üçüncü aşamada ise Amadori ürünleri bileşiklerin dehidrasyonu ve oksidasyonu ile haftalar veya aylar süren bir zamanda geri dönüşümü olmayan glikasyon ürünleri oluşur. Mevcut araştırmalar, farklı gıda bileşenlerinin (şeker, protein, yağ, su vb.), saklama yöntemlerinin (depolama sıcaklığı, süresi, nem, gaz vb.) ve işleme yöntemlerinin (buharda pişirme, kaynatma, kızartma, fırınlama, kavurma vb.) gıdalardaki glikasyon ürünlerinin oluşumunu etkilediğini bildirmektedir. Gıda yoluyla alınan glikasyon ürünlerinin bir kısmı insan vücudunda birikerek bir dizi kronik hastalığa neden olmaktadır. İnsan vücudunda ve işlenmiş gıdalarda glikasyon ürünlerinin oluşumunu engelleyebilen biyoaktif bileşikler, birçok bitki de bulunmaktadır. Son yıllarda bazı bitki ekstraktlarının glikasyon ürünleri oluşumu üzerindeki etkileri değerlendirilmektedir. Bu bitki ekstraktlarının çoğunun glikasyon ürünlerinin oluşumu üzerindeki önleyici etkilerinin esas olarak içerdikleri büyük miktardaki fenolik antioksidanlardan kaynaklandığı belirtilmektedir ve bunların glikasyon sürecinde serbest radikal oluşumunu engellemeleri ve ardından proteinlerin modifikasyonunun engellenmesi, anti glikasyon aktivitelerine aracılık eden ana mekanizmalar olarak kabul edilmiştir. Bu çalışmada amaç biyoaktif bileşik içeren gıdaların, glikasyon ürünleri üzerine etkilerini incelemektir.

**Anahtar Kelimeler:** Biyoaktif bileşikler, glikasyon ürünleri, anti glikasyon aktivite

#### Abstract

A phenolic compound caffeic acid phenethyl ester (CAPE) is a main substance of propolis with its anti-inflammatory, antiviral, and anti-tumor properties. Human umbilical vein endothelial cell (HUVEC) is used model for research on human endothelium. This study was designed to evaluate the effect of different concentrations of CAPE on HUVECs. The effects of CAPE on cell viability and apoptosis were determined by MTT and annexin V/7-aminoactinomycin D (7-AAD) assay. The gene expression levels of vascular endothelial growth factor (VEGF)-A and VEGF-B were measured using RT-PCR. Our results demonstrated that CAPE treatment at 7.5  $\mu\text{M}$  and higher concentrations for 24 h significantly suppressed the viability of HUVECs with  $\text{IC}_{50}$  value of 25.3  $\mu\text{M}$ . 48 h treatment of HUVECs with CAPE reduced cell proliferation between 5-40  $\mu\text{M}$  with  $\text{IC}_{50}$  value of 19.8  $\mu\text{M}$ . The percentage of necrotic cells treated with 19.8  $\mu\text{M}$  CAPE for 48 h was remarkably higher than control group ( $p < 0.05$ ). No significant difference was found in the percentage of early and late apoptotic cells after treatment with  $\text{IC}_{50}$  value of CAPE (19.8  $\mu\text{M}$ ) for 48 h. The gene expressions of VEGF-A and VEGF-B were partially decreased after 48 h treatment with CAPE at 19.8  $\mu\text{M}$  concentration ( $p = 0.061$  and  $p = 0.117$ , respectively). Treatment with CAPE revealed a significant cytotoxicity and induced necrosis in HUVECs possibly via a slight downregulation of VEGF-A and VEGF-B gene expression. CAPE could demonstrate dose-dependent effects on endothelial cells.

**Keywords:** caffeic acid phenethyl ester, endothelial cells, vascular endothelial growth factor, cell proliferation

### Exploring the Function of a Candidate Calcium-Binding Protein in Cilio-biogenesis in *C. elegans*

Sebiha Çevik-Kaplan\*

\*Rare Disease Laboratory, Department of Molecular Biology and Genetics, School of Life and Natural Sciences, Abdullah Gul University, Kayseri, Turkey

#### Abstract

Microtubule-structured cilia, ubiquitously present in diverse organisms, including *Chlamydomonas reinhardtii*, nematode *C.elegans* and humans ect., serve pivotal roles in essential cellular processes encompassing both motility and sensory functions. The significance of cilia in these critical cellular events is underscored by the emergence of ciliopathies in humans, which stem from structural and functional aberrations within these cellular organelles. These ciliopathies can be attributed to genetic mutations affecting ciliary genes or genes modulating ciliary function, as well as disruptions in protein transport mechanisms vital for cilia functionality. Symptoms include retinal degeneration, polycystic kidney disease, obesity, and polydactyly. This phenotypic heterogeneity complicates the comprehension of ciliopathy pathogenesis and, consequently, the development of effective therapeutic interventions. Consequently, the investigation of mutations in genes associated with ciliopathies assumes paramount importance, providing valuable insights into these conditions and necessitating the exploration and characterization of novel ciliary genes. The primary objective of this research project is the comprehensive characterization of a candidate gene, which represents the ortholog of the human gene. The candidate gene possesses calcium binding domain suggesting a role in the positive regulation of protein localization to the ciliary membrane and exhibit Calcium ion binding activity. To investigate role of a candidate calcium binding gene in ciliobiogenesis we apply *C.elegans* as a model organism. Our initial data shown that mutation of the candidate calcium binding gene shown significantly shorter body length of animal. Since our candidate gene has calcium binding domain, external and internal calcium intake may essential for body length. Collectively, this endeavor is poised to contribute significantly to the elucidation of the functional role of the newly characterized ciliary gene. The observation of distinct phenotypes promises to illuminate our understanding of cilia and ciliopathy mechanisms, paving the way for future research endeavors in this domain.

**Keywords:** A Candidate Calcium-Binding Protein, cilia, ciliopathy, *C.elegans*

#### Abstract

*Bilacunaria scabra* (Apiaceae) (syn: *Ferula scabra* Fenzl, *Hippomarathrum scabrum* (Fenzl) Boiss., *Cachrys scabra* (Fenzl) Meikle.) is a perennial herb that grows in Southeastern Anatolia, Cyprus, and Syria. In this study, enzyme inhibitory activities of acetyl/butryl cholinesterase (AChE/BChE) associated with Alzheimer's disease and tyrosinase (TYR) associated with skin lightening effect and antioxidant activities (DPPH, ABTS) of ethanol (BSE) and hexane (BSH) extracts prepared from *B. scabra* aerial parts were evaluated with using ELISA microplate reader. In addition, the total phenol and flavonoid contents (TPC/TFC) of the extracts were also examined. According to the results, BSH extract (43.29%) has remarkable AChE and high BChE (94.20%) inhibitory activity. BSH (16.13%) and BSE (23.81%) showed moderate inhibitory activity against TYR. BSE has higher TPC (84.85 gallic acid mg/g extract) content than BSH (69.95 gallic acid mg/g extract). The reason why BSE (66.83%; 87.64%, respectively) had higher antioxidant activity than BSH (34.77%; 48.00%, respectively) in both DPPH and ABTS radical scavenging activity is probably due to the richness of phenolic compounds. *B. scabra* may also be a possible treatment option with the contribution of antioxidant activity in neurodegenerative diseases.

**Keywords:** *Bilacunaria scabra*, Apiaceae, cholinesterase, tyrosinase, antioxidant.

#### Abstract

Cyanide ions are one of the most toxic anions and are unfortunately extensively utilized in a wide range of chemical and industrial activities, including the manufacture of plastics, the resin industry, organic synthesis, metallurgy, and gold mining. Thus, cyanide is present around us in various forms. It can be absorbed through the skin, lungs, and digestive system, which can result in vomiting, convulsions, unconsciousness, and even death. Therefore, it is imperative to design fluorometric sensors that are sensitive, selective, affordable, and simple for the detection of cyanide. Among various approaches for detecting cyanide, fluorescence spectroscopy is crucial in molecular sensing because of its high sensitivity, quick response time, and relatively low cost. In this study, a novel fluorometric chemosensor (**L**) was used to determine cyanide in water samples. The sensing properties of the newly synthesized sensor **L** were investigated by fluorescence spectroscopy. The sensor **L** showed a notable fluorescence after interacting with cyanide ions. The detection limit and association constant were examined by fluorimetric titration data and the Benesi-Hildebrand equation. The detection limit of the sensor for cyanide ions is 0.23  $\mu\text{M}$ , which is lower than the maximum permissible level of cyanide in drinking water set by WHO. The sensor **L** has been successfully applied to determine cyanide ions in natural water samples and has showed selectivity towards cyanide over other common anions in the mixed solution.

**Keywords:** Chemosensor, cyanide, fluorescence spectroscopy, water samples

#### Abstract

Corrosion is defined as the chemical or electrochemical wear of materials by interacting with their environment and the formation of physical and chemical changes in their structures. Many sectors directly and indirectly affected by corrosion, such as aviation, energy, chemistry etc. Today, the aviation sector is the leading sector when considering safety and speed factors. There are two main approaches to applying smart coatings with self-healing properties used for anti-corrosion applications. The first method involves localized repair of the damaged coating by the controlled release of polymerizable agents, while the second method requires electrochemical protection of the exposed metallic substrate using corrosion inhibitors stored in nanocontainers [1,2]. Nanoscale reservoirs provide uniform and long-term release of corrosion inhibitors [3]. Within the scope of this study; a self-healing nanostructure developed with the use of smart nano-containers that provide protection against corrosion, and the synthesis of pH-sensitive poly(maleic anhydride-*alt*-acrylic acid) copolymers to be used in the end stop system has been carried out in the layer-by-layer bonding (LBL) method. Within the scope of the study, aluminium 7075 was used as the main material. The morphology and properties of nanocontainers were characterized by scanning electron microscopy (SEM) and Fourier transform infrared spectroscopy (FTIR). The loaded amount of benzotriazole (BTA) the halloysite lumen was determined by thermogravimetric analysis (TGA). Dynamic Mechanics Analysis (DMA) was used to follow dynamical mechanical properties of nanocontainers. The control of the healing of the defective area subjected to corrosion was illuminated with emission scanning electron microscopy.

**Keywords:** Self-repair, halloysite, LBL method, BTA, poly (MA-*alt*-AA)

\*edibeozmen@gmail.com

#### Abstract

In this research, *Iberis simplex* species complex was studied in the terms of pollen morphology. Pollen samples were obtained from 31 population of *I. attica*, *I. carica*, *I. gypsicola*, *I. halophila*, *I. simplex* and *I. spruneri*. The palynological characteristics were measured under light microscope (LM) on 30 pollen grains for each sample. We evaluated different characteristics including polar axis, equatorial axis, colpus length and width, Amb diameter, apocolpium, exine structure and sculpture. Besides, the detailed exine sculpture of each sample examined by scanning electron microscopy (SEM). Principal component analysis (PCA) and cluster analysis were performed to reveal similarities between studied populations in terms of pollen morphology. As a result, it was determined that the pollen grains of the taxa included in *Iberis simplex* species complex had a wide variation at the intraspecific and interspecific levels. The diversity in pollen grains was compatible with anatomical, morphological and phylogenetic studies. However, pollen data did not elucidate the taxonomic confusion in the *Iberis simplex* species complex.

**Keywords:** Brassicaceae, intraspecific diversity, interspecific diversity, PCA, pollen morphology.

### Echinodermata Filumunun Türkiye'deki Gelişimi (2003-2023), Bibliyometrik Bir Analiz

Sera Övgü KABADAYI YILDIRIM (ORCID: <https://orcid.org/0000-0002-0060-2445>)

<sup>1</sup>Isparta Uygulamalı Bilimler Üniversitesi, Eğirdir Su Ürünleri Fakültesi, Temel Bilimler ABD, Isparta, Türkiye

serakabadayi@isparta.edu.tr

#### Özet

Echinodermata phylumu, deniz ekosistemlerinin önemli bir bileşeni olan ve biyolojik çeşitliliği ve ekosistem işlevini etkileyen; deniz kestaneleri, deniz yıldızları, deniz hıyarları gibi önemli türleri içerir ve bilimsel araştırmalar için büyük bir potansiyele sahiptir. Derisi dikenliler, okyanusların ve denizlerin çoğunda yaygın olarak bulunur ve çeşitli ekosistemlerin anahtar türleridir. Ancak, ticari nedenlerle avlanmaları ve toplanmaları aynı zamanda balıkçılık av araçlarının baskısı bazı türlerin popülasyonlarının tehlikede olmasına yol açmaktadır. Özellikle deniz kestaneleri ve deniz hıyarları, ticari avcılıkla karşı karşıya olan türlerdir. Bu türlerin popülasyon biyolojisi hakkında eksik bilgi, artan avcılık baskısı ve sıkı balıkçılık yönetimi eksikliği, dünya çapında popülasyonlarının azalmasına katkıda bulunmaktadır. Echinodermata filumuna dair yapılan bilimsel araştırmaların sayısı giderek artmaktadır. Fakat bu araştırmaların büyük bir bölümü farklı bilimsel kaynaklarda yayınlanmakta ve bu da bu alandaki veri bütünlüğünü ve erişilebilirliği zorlaştırmaktadır. Bir veri tabanı oluşturularak, bu dağınık verilerin bir araya getirilmesi ve daha iyi bir araştırma altyapısının oluşturulması mümkün olacaktır. Bibliyometrik bir çalışma, Echinodermata phylumuyla ilgili yapılan araştırmaların analizini ve sentezini sağlayarak, bu organizmaların ekolojik, biyolojik ve ekonomik önemini daha iyi anlamamıza yardımcı olacaktır. Bu analizler, gelecekteki araştırmalara yön verme açısından da büyük önem taşır. Bibliyometrik çalışmalar, bu alandaki bilimsel verilerin toplanması, analizi ve sentezi için önemli bir araç olabilir. Ayrıca, kendi veritabanını oluşturarak bu çalışmanın daha da etkili hale getirilmesi mümkündür. Bu çalışma, Echinodermata phylumunu daha iyi anlamamıza ve korumamıza yardımcı olabilir ve literatürdeki boşlukları analiz ederek gelecekteki araştırmalara yol gösterebilir. Çalışmamız ile Türkiye ve Akdeniz'de son 20 yılda Echinodermata filumu ile ilgili yapılan çalışmalar analiz edilmiş ve literatürdeki boşluklar belirlenmiştir.

**Anahtar Kelimeler:** Bibliyometrik analiz, Echinodermata, Benthos, Mediterranean

#### Abstract

In this study, the effect of modification with surfactant on organic dye adsorption capacity of char based adsorbents, hydrochar and its activated carbon, was investigated. Adsorbents were modified by sodium dodecyl sulphate, an anionic surfactant, with the aim of increasing the negative charge on the adsorbent surface and hence its adsorption capacity of methylene blue, a basic and cationic organic dye present in waste streams. Equilibrium adsorption study of the adsorbents was carried out with 100 mL methylene solutions at concentrations between 50 and 350 mg. L<sup>-1</sup> and at adsorbent concentration of 1 g.L<sup>-1</sup>. The residual methylene blue in the filtrated solutions were determined by the UV-visible spectrophotometer (UV-160A, Shimadzu) at the wavelength of 665 nm. The isothermal equilibrium data obtained from tests were interpreted by applying Langmuir and Freundlich isotherm equations. Adsorption of methylene blue on all adsorbents displayed better fit to the Langmuir model in comparison with Freundlich model as implied by the R<sup>2</sup> values. The Langmuir capacity, S<sub>M</sub>, of hydrochar was calculated as 34.2 mg.g<sup>-1</sup>, while that of activated carbon was much higher (294.1 mg.g<sup>-1</sup>) due to its improved porosity and surface area as a result of ZnCl<sub>2</sub> activation. The methylene adsorption capacity calculated for adsorbents modified with sodium dodecyl sulphate were found to be lower than that of unmodified adsorbents which was attributed to the dominance of pore blocking effect of sodium dodecyl sulphate over the positive effect of its anionic functional groups during methylene blue adsorption.

**Keywords:** Modification, Hydrochar, Activated Carbon, Adsorption, Methylene Blue

farslan@karabuk.edu.tr

#### Abstract

The design and synthesis of coordination polymers have received intense interest not only their intriguing structural topologies but also have their potential applications such as chemical sensors, magnetism, adsorption, catalysis and so on. [1-3]. One of the most effective methods for design and synthesis of targeted CPs is mixed ligand strategy [4]. Polycarboxylates because of their diverse coordination modes and bridging abilities, and N-donor ligands with different conformations, and flexibility, play a vital role in these process [5]. This study has aimed to hydrothermal synthesis of  $\{[\text{Cu}(\mu\text{-dmglu})(\mu\text{-bipy})]\cdot\text{H}_2\text{O}\}_n$  (**1**) (H<sub>2</sub>dmglu: 3,3'-dimethyl glutaric acid, bipy: 4,4'-bipyridine) and to analyse its structural characteristics using elemental analysis and single crystal X-ray diffraction techniques. X-ray structural analysis of the complex **1** reveal that **1** crystallize in the monoclinic systems with the  $P2_1/n$  space group. The asymmetric unit of **1** contain one Cu(II) ion, one dmglu ligand and one lattice water molecule. Each Cu(II) ion is coordinated by three carboxylate oxygen atoms from two different dmglu ligands and one nitrogen atom from bipy ligand to give a distorted square pyramidal geometry ( $\tau = 0.236$ ) [6] (Fig. 1.).

**Figure 1.** View of the molecular structure for **1** showing the atom numbering scheme

**Keywords:** 3,3'-Dimethyl glutaric acid, bipy: 4,4'-bipyridine, Cu(II) coordination polymer.

#### Abstract

Effective harvesting of solar radiation needs absorbers that have been wisely designed. Thanks to a well-designed multichromophoric system, it is possible to work in a wide spectral region. In a multichromophoric system, if one of the chromophores is excited by light with an appropriate wavelength, energy transfer can occur when the donor returns to its ground state and the acceptor is simultaneously brought to its excited state [1]. In this work, two different BODIPY dyes were brought together by a cyclotriphosphazene ring (Figure 1). The structural integrity of the molecule was demonstrated by mass and <sup>1</sup>H-NMR studies. Intermolecular interactions in a newly synthesized BODIPY-cyclotriphosphazene-distyryl-BODIPY triad have been established from spectral studies. As predicted from the literature [1,2], occurrence of energy transfer from the donor BODIPY units to the distyryl-BODIPY acceptor within the triad was witnessed. This construction ensured strong absorption in a large part of the visible spectrum, but emission occurred highly from the distyryl BODIPY units by energy transfer processes.

**Figure 1.** Illustration of energy transfer processes in the BODIPY-cyclotriphosphazene-distyryl-BODIPY triad

**Keywords:** BODIPY, cyclophosphazene, energy transfer

### Özet

Coleoptera takımı dünya üzerinde 350.000'in üzerinde tanımı yapılmış tür sayısı bakımından en zengin böcek guruplarından birisidir. Bu böcek takımı içerisinde yer alan Buprestidae familyası da tanımlanmış 16.000 tür ile temsil edilmektedir. Bu familyanın üyelerinin birçoğu ekonomik zarara sebep olmaktadır. *Capnodis tenebricosa* (Olivier, 1790) (Coleoptera: Buprestidae) meyve ağaçlarında önemli zarara sebep olmaktadır. Bu çalışmada zararlı bir tür olan *C. tenebricosa* 'nın dişi üreme sisteminin anatomisi ve histolojisi stereo, ışık ve taramalı elektron mikroskobu teknikleri kullanılarak incelenmiştir. Yapılan çalışmalar sonucunda *C. tenebricosa* 'nın dişi üreme sisteminde çok sayıda lineer dizilmiş ovaryoller ayırt edilmiştir. Ayrıca dişi üreme sistemi 1 spermateka, 1 bursa copulatrix, bir çift lateral kanal, 1 ortak kanal ihtiva etmektedir. Her bir ovaryolde terminal filament, germarium, vitellarium, pedisel kısımları bulunmaktadır. Germariumda trofositlere, vitellariumda farklı gelişim aşamalarında oositlere (previtellogeniz, vitellogeniz ve koryogenez aşamasındaki oositler) rastlanmıştır. Bu oositlerde gelişim ovaryolün distalinden proksimaline doğru artmakta olup oositi çevreleyen epitel hücrelerinin şeklinde ve oosit lümen içeriğinde farklılıklar ayırt edilmiştir. Pedisel ve lateral kanal yüzeyinde boyuna kaslar dikkat çekmektedir. Bursa copulatrix yüzeyinde enine kaslara rastlanmıştır. Bursa copulatrix lümeni salgı materyaliyle doludur. Spermateka bursa copulatrix'ten oldukça küçük olup kas yapısı daha zayıftır. Spermatekanın lümeninin spermle dolu olduğu görülmüştür. Sonuç olarak, bu çalışma, önemli bir zararlı tür olan *C. tenebricosa* 'nın dişi üreme yapısı hakkında temel bilgiler sağlamaktadır. Bu bulgular, Buprestidae dahil Coleoptera'daki üreme sistemi morfolojisinin çeşitliliği üzerine yapılacak çalışmalarda ve bu türün zararı ile mücadele konusunda yapılacak çalışmalarda temel oluşturması açısından önem taşımaktadır.

#### **Abstract**

Plant species are frequently used in the pharmaceutical, agriculture, and food industries because they are rich in antioxidants and bioactive components. Many plant extracts have been studied for their effects on enzyme inhibition, and many herbs have been utilized to treat cognitive impairment and memory loss. In fact, the first clinical application of Acetylcholine esterase (AChE) inhibitors in Alzheimer's Disease (AD) began with the use of physostigmine isolated from plants. As a result, studies aimed at lowering AD symptoms have focused on herbal therapies with little adverse effects. In this study, the *in vitro* inhibition effect of aqueous, ethanol, and methanol extracts of Acai berry on the AChE enzyme isolated from human erythrocytes by ion exchange chromatography was investigated. For this purpose, dried and powdered Acai Berry was mixed with water, ethanol, and methanol in a ratio of 1:5 by a magnetic stirrer at room temperature for 24 hours. The effects of the obtained extracts on enzyme activity were studied *in vitro*. As a result of the experimental studies, it was found that aqueous, ethanol, and methanol extracts of Acai berry inhibited hAChE with IC<sub>50</sub> values of 0.15 µg/ml, 0.49 µg/ml, and 0.62 µg/ml respectively.

**Keywords:** Acetylcholine esterase, Acai berry, inhibition

#### Özet

*Capnodis tenebricosa* (Olivier, 1790) (Coleoptera: Buprestidae) larvaları özellikle sert çekirdekli meyve ağaçlarının köklerinde beslenerek zararlı olmaktadır. Ülkemizde kiraz, kayısı ve zerdali gibi meyve ağaçlarında ve kuzukulağında zararlıdır. Bu zararlı ile mücadele için sindirim yapısının bilinmesi oldukça önem taşımaktadır. Bu çalışmada tarımsal zararlı bir tür olan ve daha önce çalışılmamış olan *C. tenebricosa*'nın sindirim sisteminin bir kısmı olan arka bağırsak yapısı detaylı olarak tanımlanmıştır. Bu çalışmada kullanılan ergin *C. tenebricosa* örnekleri Haziran 2019'da Sivas'tan toplanmıştır. Stereomikroskop altında disekte edilen örnekler ışık mikroskobu ve elektron mikroskobunda incelenmiştir. Elde edilen verilere göre *C. tenebricosa*'nın sindirim sisteminin ön, orta ve arka bağırsak kısımlarından oluştuğu görülmüştür. Arka bağırsak dışkı ve idrardan suyun, tuzların ve diğer yararlı maddelerin emilmesini sağlamaktadır. Sindirimi sisteminin üçüncü kısmı olan arka bağırsak; ileum, kolon ve rektum kısımlarından oluşmaktadır. Arka bağırsağın ilk kısmı olan ileum yıldız şeklinde bir lümenine sahip olup ürik asit kristallerine rastlanmıştır. İleum duvarı intima, tek tabakalı silindirik epitelle çevrelenmiştir. İkinci kısım olan kolon duvarı Malpighi tübüleriyle bağlantılıdır. Kolon duvarı lümeden itibaren intima, tek tabakalı kübik epitel ve kas tabakasıyla çevrelenmiştir. Sindirimin son kısmı olan rektum yüzeyi oldukça kalın enine kas tabakasıyla çevrelenmiştir. Histolojik incelemelerde rektumu çevreleyen intima tabakası, tek tabakalı kübik epitel ve kas tabakası görülmektedir. Bu çalışmada sunulan verilerin gelecekte bu konularla ilgili yapılacak çalışmalara ilaveten taksonomik, sistematik ve tarım zararlısı olan türlerle mücadelede yapılacak çalışmalara temel oluşturarak katkı sağlayacağı düşünülmektedir.

**Anahtar Kelimeler:** İleum, kolon, rektum, ışık mikroskobu, elektron mikroskobu

### Türkiye akar faunası için yeni bir tür kaydı; *Erythraeus (E.) opilionoides* (C. L. Koch, 1837) (Acari: Erythraeidae)

İbrahim Karakurt<sup>1\*</sup> (<https://orcid.org/0000-0003-4056-0822>)

<sup>1</sup>Erzincan Binali Yıldırım Üniversitesi, Sağlık Hizmetleri MYO, Sağlık Bakım Hizmetleri, Erzincan, Türkiye

\*e-mail:ikarakurt24@gmail.com

#### Özet

Oldukça zengin tür çeşitliliğine sahip ve dünya genelinde yayılış gösteren Erythraeidae Robineau-Desvoidy, 1828 ailesi, Erythraeoidea üst ailesini oluşturan iki aileden en büyük olanıdır ve günümüzde 900'ün üzerinde tür sayısı ile temsil edilmektedir. Heteromorfik larva yapıları sayesinde bazı türler yalnızca larva veya yalnızca postlarva (larva sonrası) evrelerinden tanımlanmışken; bir kısmı ise artan deneysel çalışmalarla birlikte her iki evreden de tanımlanabilmiştir. *Erythraeus (Erythraeus)* Latreille, 1806 alt cinsi bu ailenin en fazla tür çeşitliliğine sahip olan *Erythraeus* Latreille, 1806 cinsine dahildir. Ülkemizden bu alt cinse ait şu ana kadar yalnızca 9 türün kaydı yapılmıştır. 2023 yılı Mayıs ayında, Erzincan ili, Kemaliye ilçesinden (39°36'K 39°09'D 1162 m) alınan çam ağacı altı yosunlu döküntü örnekleri, araştırma laboratuvarına getirilmiş ve Berlese sistemine yerleştirilerek, akar örnekleri ayıklanmıştır. Elde edilen örnekler % 70'lik etilalkol ile muhafaza edilmiş ve Hoyer ortamında preparatları hazırlanmıştır. Preparatlar Olympus BX63 mikroskopunda incelenerek, tür teşhisleri yapılmıştır. Yapılan inceleme sonucunda; *Erythraeus (E.) opilionoides* türünün nimf evresi teşhis edilmiş ve Türkiye akar faunası için yeni bir kayıt olarak listelenmiştir. Böylece ülkemizden bu alt cinse ait kaydedilen tür sayısı 10'a ulaşmıştır.

#### Abstract

Microplastics are plastic particles generated by human-induced environmental pollution. These particles pose a growing threat to ecosystems worldwide. These tiny plastic fragments, often less than five millimeters in size, arise from deliberate industrial and cosmetic production or the gradual disintegration of larger plastic items. Research on microplastics has primarily focused on marine environments and aquatic invertebrates, with limited attention given to the interaction between microplastics and terrestrial ecosystems, particularly pollinators like honeybees. This study aims to evaluate different methods of applying microplastic particles to honeybees using controlled cage experiments. Cage experiments are recognized for their capacity to provide comprehensive data, especially regarding nutrition regimens and lifespan. To conduct our research, emerging adult worker honeybees were carefully collected from an apiary. These bees were then placed in a test cabinet, maintaining a temperature of  $34 \pm 1^\circ\text{C}$  and a relative humidity of  $55 \pm 5\%$  RH. Subsequently, groups of 50 bees were put within specialized cages designed for experimentation. Microplastic pieces smaller than 130 microns in diameter were obtained from a local manufacturer and measured using a microscope. Microplastic particles were presented to bees using 4 different methods: in water, in sugar syrup, in pollen cake and in pollen gel. The experiment was continued for 14 days with the types of food that the bees accepted to consume. Feeds were renewed every day and daily consumption amounts were determined by weighing. The results were evaluated statistically. Our findings demonstrate the effectiveness of various microplastic administration methods in controlled cage experiments. These methods allowed us to quantify the consumption rates of microplastics by honeybees and assess their potential effects on the bees. This study highlights the importance of selecting appropriate administration methods to accurately evaluate the impact of microplastics on honeybees and emphasizes the need for further research in this evolving field.

#### Abstract

Sulfanilamide is an organic compound belonging to the sulfonamide class of antibacterial drugs and is a sulfa drug that mimics para-aminobenzoic acid, an important component of bacterial cell wall synthesis. Sulfanilamide has been widely used to prevent microbial infections, particularly it continues to be used topically to treat vulvovaginitis caused by *Candida albicans*. Many effective antibacterial drugs derived from sulfa drugs have been used and discovered in medicine. Examples of some common sulfa drugs are sulfanilamide (SA), sulfaquinoxaline, silver sulfadiazine, sulfasalazine, and sulfamethoxazole. 4-Methoxycinnamaldehyde (4MeOCA) is a natural compound of *Cinnamomum cassia*. Cinnamaldehyde; It contains essential oil components and shows antibacterial activity. Essential oils have been widely used for bactericidal, virucidal, fungicidal, antiparasitic, insecticidal, medical, and cosmetic purposes since the Middle Ages. This study synthesized a new compound SA-4MeOCA from sulfanilamide (4-aminobenzenesulfonamide) and 4-methoxy cinnamaldehyde, which may have potential drug properties. The synthesized compound was analyzed using various spectral tools such as FTIR, <sup>1</sup>H-NMR, and <sup>13</sup>C-NMR and compared with highly correlated simulated results. Since it is a new compound, frontier orbitals, HOMO and LUMO energies, chemical reactivity descriptors, and molecular electrostatic potential (MEP) map were calculated with detailed theoretical calculations. That's why we use the structure of the newly synthesized SA-4MeOCA molecule, which is a sulfa drug derivative, optimized with the DFT/B3LYP method and 6-31+G (d,p) basis set. All calculations were performed using the Gaussian 09 package program.

### The Entomofauna Visiting *Salvia cryptantha* Flowers

Çiğdem Özenirler\* ORCID: <https://orcid.org/0000-0003-0390-2416>

\* Hacettepe University, Faculty of Science, Department of Biology, Ankara, Türkiye.

\*Corresponding author e-mail: cozenir@hacettepe.edu.tr

#### Abstract

*Salvia cryptantha* Montbret & Aucher ex Benth, is an endemic species for Türkiye. Its high nectar and pollen content makes it an attractive foraging plant for insects. *Orobanche anatolica* is a parasitic plant that thrives on *Salvia cryptantha*. The research was conducted at Hacettepe University's Beytepe Campus, located in Ankara, Türkiye. The study aimed to ascertain whether the parasitic relationship between these plants influences the diversity of insects that feed on them. Over a 10-day observation period during the flowering season, insects that visited *Salvia cryptantha* plants, both infected and uninfected with *Orobanche anatolica*, were monitored. Sampling was carried out using insect nets for a total of 6 days. These insects were identified by their species and individual numbers. Additionally, a comparison was made at the order level using percentage values. In the case of *Salvia cryptantha* plants not infected by *Orobanche anatolica*, 297 individuals from 97 species were observed. The order Hymenoptera accounted for 66.33%, Coleoptera for 12.12%, Homoptera for 9.76%, Diptera for 4.72%, Lepidoptera for 2.02%, and Hemiptera for 1.68% of the visitors. On the other hand, *Salvia cryptantha* plants infected with *Orobanche anatolica* attracted 161 individuals from 75 species, with the following percentages: Hymenoptera 57.14%, Homoptera 15.13%, Coleoptera 11.8%, Diptera 7.46%, Orthoptera 5.59%, Lepidoptera 1.86%, and Hemiptera 0.62%. In conclusion, *Salvia cryptantha* plants infected with *Orobanche anatolica* were found to be visited by relatively fewer insects. As a result, *Salvia cryptantha* individuals infected with *Orobanche anatolica* were found to be visited by relatively few insects.

**Keywords:** insects, *Salvia cryptantha*, parasitism, biodiversity

#### Özet

Pestisit dünyasında Bentazone, geniş yapraklı yabani otları hedef alan seçici bir herbisittir. Bu çalışma, Bentazon'un üç boyutlu bir elektro-oksidasyon işlemi kullanılarak sulardan uzaklaştırılmasını konu almıştır. Pozitif ya da negatif yüzey yüküne sahip tanecikler elektrik alan altında yüklü partikül elektrotlara dönüşürler. Anot ve katot arasında yerleştirilen yüklü partiküller elektrot yüzeyini arttırarak üç fazlı üç boyutlu elektro oksidasyon reaktörünü oluşturur. Bu çalışmada organik yapılı kirleticinin degradasyonunda üç boyutlu reaktöre uygulanan potansiyel farkın ve akım yoğunluğunun etkisi araştırılmıştır. Partikül elektrotlar olarak TEPA (Tetraethylenepentamine) yüklü aktif karbon pa kullanılmıştır. Anot ve katot olarak karbon fiber kullanılmıştır. Destek elektrolit olarak NaCl'ün kullanıldığı çalışmalarda 4V ila 7V arasında değişen potansiyel farklar, ve 2,4 mA/cm<sup>2</sup> ila 9,6 mA/cm<sup>2</sup> arasında değişen akım yoğunlukları kullanılarak degradasyon verimi araştırılmıştır. Potansiyel farkın 4V dan 7 V a arttırılması degradasyon verimini olumlu yönde etkilemiştir. Bentazonun degradasyon verimi %76.80'den %81.66'ya yükselmiştir. Akım yoğunluğunun 2.4'den 9.6 mA/cm<sup>2</sup>'ye arttırılmasının degradasyon verimi üzerinde oldukça önemli etkiye sahip olduğu belirlenmiştir. 2.4 mA/cm<sup>2</sup> akım yoğunluğunda %61.85 degradasyon verimi elde edilirken, 9.6 mA/cm<sup>2</sup> akım yoğunluğunda %91.53 bentazon degradasyonuna ulaşılmıştır. Elde edilen sonuçlar kinetik açıdan değerlendirildiğinde degradasyonun sözde birinci mertebeden hız ifadesine uyduğu belirlenmiştir. Yapılan çalışmada TEPA-yüklü aktif karbon partiküllerinin bentazonun degradasyonunu desteklediği belirlenmiştir. 3 fazlı üç boyutlu elektro oksidasyon sisteminin organik yapılı moleküllerin degradasyonunda oldukça etkili olabileceği ortaya konulmuştur.

**Anahtar Kelimeler:** TEPA-modifiye aktif karbon, üç fazlı üç boyutlu elektro oksidasyon reaktörü, bentazon

## Özet

Vücudun dış örtüsü ve örtü sisteminin en büyük organı deridir. Derideki yaralar veya yaralanmalar; yanık, kazara travma veya kronik ülserasyonlardan kaynaklanabilmektedir. Derideki bu yaralar kontaminasyona müsait olup enfeksiyon riski taşımaktadır. Günümüzde yara bakımı, enfeksiyon riskini en aza indirerek hızlı ve etkili bir iyileşme sağlanması açısından büyük bir öneme sahiptir. Bu kapsamda antibakteriyel yara örtüleri bu alandaki önemli gelişmelerden biridir. İdeal bir pansuman, yarada hemostaz ve nemli ortam sağlayarak enfeksiyondan korumalıdır. Ayrıca su ve hava geçirgenliğine izin vermeli ve epitelizasyonu desteklemelidir. Tıp alanında yeni pansuman türlerinin keşfedilmesi ve geliştirilmesi büyük önem taşımaktadır. Bu çalışmanın amacı, polikaprolakton (PCL) ve kitosan (CS) polimerlerine tigesiklin yükleyerek elektrospinleme yöntemiyle kontrollü salım hedefli, antibakteriyel nanolif yapılı çok katmanlı bir membranının sentezlenmesi ve yara örtüsü olarak uygulanabilirliğinin gösterilmesidir. Tigesiklin, geniş antimikrobiyal etkiye sahip bir minosiklin çeşidi olup ABD Gıda ve İlaç Dairesi (FDA) tarafından onaylanan ilk glisilsiklin antibiyotiktir. Bu antibiyotik çok sayıda Gram pozitif ve Gram negatif mikroorganizmaya karşı *in vitro* etkinlik göstermektedir. Yara örtüsü olarak kullanılacak ilk polimer olan PCL, yüksek mekanik stabiliteye sahip olup zayıf hücre tutunma özelliği gösteren, biyolojik olarak parçalanabilen, biyolojik olarak uyumlu ve hidrofobik bir sentetik polimerdir. Diğer polimer olan CS ise, doğada bulunan bir polisakkarit olup kitinden türetilen biyoyumlu ve biyobozunur yapıya sahiptir. İyi hücre yapışması ve çoğalması özellikleri göstermektedir. Bu polimerlerin avantajlarından yararlanarak, yüksek hücre tutunma ve hücre proliferasyonuna sahip aynı zamanda mekanik stabilitesi yüksek çok katmanlı PCL-CS-Tigesiklin kompozit malzemesi elektrospinleme yöntemiyle üretilmiştir. *In vitro* salım çalışmalarında çok katmanlı yara örtüsünden tigesiklin salımı, tek ve iki katmanlı membranlara oranla %65 oranında kontrollü salım ile gerçekleşmiştir. *S. aureus* ve *E. coli* bakterileri üzerinde yapılan antibakteriyel analiz sonuçları ise, iki ve çok katmanlı membranların tigesiklin yüklenmemiş yara örtüsüne göre belirgin oranda antibakteriyel etkiye sahip olduğunu göstermiştir. Sonuç olarak, bu çalışma çok katmanlı biyoyumlu ve biyobozunur polimerik matris yapısıyla yara örtüsü alanındaki araştırmaların ilerlemesine katkı sağlamıştır.

**Anahtar Kelimeler:** Yara örtüsü, antibakteriyel, çok katmanlı, polikaprolakton, kitosan, tigesiklin.

#### Özet

Yüksek miktarda protein ve düşük miktarda yağ içeriğine sahip olmalarının yanı sıra Omega-3 yağ asitleri ve vitamin-mineral bakımından zengin besin içerikleri sebebiyle çift kabuklu yumuşakça türlerine olan ilgi Türkiye’de ve dünyada her geçen gün artış göstermektedir. Çift kabuklu türlerinden birisi olan Akdeniz midyesi (*Mytilus galloprovincialis*) ekonomik değeri ve tüketim popülaritesinden dolayı Türkiye’de son yıllarda avcılık ve yetiştiricilik üretimi artan tek tür olarak istatistiklerde yerini almaktadır. Akdeniz midyesinin gerek iç gerekse dış piyasadaki talebini karşılamak üzere üretim çiftliklerinin kurulmasına ilişkin başvurular son yıllarda artış göstermiştir. Bu bağlamda Akdeniz midyesi üretimi yapan tesislerin durumunu ortaya koymak ve geleceğe yönelik bir planlama yapmak sektörün doğru bir şekilde gelişimi açısından oldukça önemlidir. Bu çalışmada, 2023 yılı Ocak-Nisan dönemini kapsamak üzere, Türkiye’de yetiştiricilik belgesine sahip toplam 47 Akdeniz midyesi üretim tesisi tespit edilmiş ve bu tesisler ile anket çalışması yapılmıştır. Anket çalışmasında tesislerin kapasiteleri, alanları, üretim yöntemleri, personel durumları, pazarlama stratejileri ve karşılaştıkları sorunlara dair konularla ilgili istatistiki veriler alınmıştır. Sonuç olarak, bu çalışma ile midye üretim sektörünün gelişime açık bir sektör olduğunu ancak, malzeme temini ile birlikte kurdaki dalgalanmalar, yetişmiş personel ve bilgi eksikliğinin yanı sıra ulaşım ve lojistikte yaşanan altyapı eksikliklerinin en çok karşılaşılan sorunlar olduğu ortaya konulmuştur.

**Anahtar Kelimeler:** Akdeniz midyesi, *Mytilus galloprovincialis*, long-line, yetiştiricilik

Not: Bu makale ÇOMÜ Lisansüstü Eğitim Enstitüsü Su Ürünleri Yetiştiricilik Anabilim Dalı Öğrencisi Nihat Sami KUYUMCU’ya ait “Türkiye’deki Akdeniz midyesi (*Mytilus galloprovincialis*) yetiştiriciliğinin mevcut durumu, sorunları ve çözüm önerileri” isimli Yüksek Lisans tez çalışmasından türetilmiştir.

#### Abstract

In the field of molecular fluorescence sensors, the design and synthesis of novel, highly selective, and sensitive probes for the detection of metal ions is considered one of the most important methods of detecting low concentrations of metal ions, comprising environmental monitoring and biological systems. Here the synthesized sensor contains a quinaldinium group bound to an imidazole moiety via Knoevenagel reaction, forming a new fluorescence sensor. The ion binding affinity of quinaldinium-imidazole sensor towards specific metal ions leads to increase selectivity and sensitivity in the detection process. Among various metal ions, the sensor displays a remarkable fluorescence response towards  $\text{Cd}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Cu}^{2+}$ , and  $\text{Fe}^{3+}$  ions in acetonitrile, presenting a distinct emission spectrum for each metal ion. Moreover, the sensor's detection limits fall well within the environmentally relevant concentration ranges, making it highly suitable for trace metal ion analysis.

**Keywords:** Quinaldinium derivative, Fluorescence sensor, Metal-ion detection, Knoevenagel reaction.

#### Abstract

Kojic acid (KA) is a secondary metabolite of economic value produced by a limited number of microorganisms, including *Aspergillus oryzae*, *Aspergillus flavus*, *Aspergillus tamari*, and some other species, during the stationary phase of growth. Secondary metabolites are produced by many organisms, including molds. Secondary metabolites; they play very important roles in mold ecology by providing survival functions to the mold that produces it. One of the main roles of KA in molds is its involvement in iron uptake. The ability to bind iron is important for molds because iron is an essential nutrient for the growth and metabolism of molds. KA may also exhibit antimicrobial properties, inhibiting the growth of other microorganisms and potentially providing a competitive advantage to molds that thrive in the same environment. This antimicrobial activity helps mold protect its territory and resources. KA is also an important industrial secondary metabolite for the food and cosmetic industries. While it is used as a color regulator and preservative in the food industry, it is used as a skin lightener and antioxidant in cosmetic products. In this study, the effects of different temperatures (35°C, 40°C, and 45°C) and different salts (NaCl and KCl) at different concentrations (0.1M, 0.5M, 1M) on KA production in *A. flavus* were examined. According to the study results, it was seen that temperature had a significant effect on KA production. The highest KA yield was observed at 35°C, while the lowest yield was recorded at 45°C. Additionally, salt applications were found to negatively affect KA production. This study guides in understanding the factors affecting KA production by *A. flavus* and identifying potential strategies to increase the production of this important secondary metabolite. Additionally, the results obtained will contribute to optimizing the industrial production and use of KA.

**Keywords:** *Aspergillus flavus*, Kojic acid, temperature, salt

#### Abstract

Teknolojinin gelişmesi ve endüstriyel faaliyetlerin artması sonucunda açığa çıkan çeşitli atıkların sulara salınması; su, toprak ve atmosfer gibi farklı ekolojik sistemlere zarar vermektedir. Özellikle boya, tekstil, kâğıt endüstrisi gibi çeşitli sektörlerin işletmelerinde uygulanan kimyasal prosesler sonucu oluşan atık sular yüksek miktarda boyar madde içermektedir. Ürünlerin üretimi sonucunda çevreye salınan atıkların minimum seviyede olması, arıtımı yapılacak su içerisindeki boyar maddelerin yok denecek kadar aza indirgenmesi gibi kriterler göz önünde bulundurulduğunda sulardan boyar madde giderimi oldukça önem taşımaktadır. Günümüzde boyar maddelerin giderimi için farklı yöntemler uygulanabilmektedir. Literatürde bu uygulama için en çok adsorpsiyon yöntemi kullanılmakta ve farklı adsorbent maddeler araştırılmaktadır. Kullanılan adsorbent maddenin kolay ulaşılabilir olması, ucuz ve giderilecek madde ile uyumlu olması önemli kriterlerdir. Bu çalışmada, özellikle endüstriyel faaliyetler sonucunda yaygın bir şekilde ortaya çıkan atık sulardan boyar madde bertarafını sağlamak için yeni bir nanoadsorban malzeme sentezlenmiştir. Nanoadsorban madde, atık olarak değerlendirilen kestane kabuğu ve TiO<sub>2</sub> malzemesinin sol-gel yöntemiyle bir yapı oluşturması sonucu elde edilmiştir. Bu malzeme sentezinin amacı atık malzemeyi, farklı bir atığı gidermek için kullanarak değerlendirmektir. Kestane kabuğu ve TiO<sub>2</sub> den elde edilen adsorbent madde ile metilen mavisi boyar maddesinin giderimi üzerindeki etkisi incelenmiştir. Deneysel çalışmalar, Box-Behnken deneysel tasarımı ile bağımsız değişken olan sıcaklık, pH ve adsorbent miktarı parametreleri için bağımlı değişken %giderim değerleri olacak şekilde planlanmıştır. Farklı sıcaklık, pH ve adsorbent miktarı için deneysel çalışmalar yapılarak Metilen Mavisi için % giderim değerleri belirlenmiştir. Bu değerler kullanılarak, Design Expert programı ile çok değişkenli analiz gerçekleştirilmiştir. Bu deneysel tasarım planı için elde edilen boyar madde giderim verimliliği modellenerek, bu verimliliği en iyi şekilde temsil eden model denklemi belirlenmiş ve en iyi deney koşulları için optimizasyon yapılmıştır.

**Keywords:** Kestane kabuğu, TiO<sub>2</sub>, Sol-jel yöntemi, Boyar madde giderimi, Nanoadsorban Madde, Box-Behnken

#### Abstract

Acrylamide is a white, crystalline, odorless compound that is formed during processes such as frying and roasting used in the preparation of foods. Acrylamide has been identified in cigarette smoke and sewage, in addition to being used as polyacrylamide in industry. Acrylamide intake is inevitable due to its existence in foods that are often consumed in daily life, such as bread, coffee, and french fries. Researchers have been attempting to find ways to mitigate the cytotoxic and genotoxic effects of chemicals, including acrylamide, that are always present in our bodies. Knowledge of the harmful effects of acrylamide has led researchers to undertake studies to minimize these effects. Flavonoids, plant secondary metabolites, have been studied for their antioxidant properties, which protect against cellular damage and preserve vitamin and enzyme deposits in fruits and vegetables. Compared to other flavonoids, luteolin is a potent antioxidant with strong DNA-protective activity. In this study, the cytotoxicity of acrylamide in 3T3 embryonic fibroblast cells was determined by the cell viability and lactate dehydrogenase tests. The DNA damage caused by acrylamide in 3T3 embryonic fibroblast cells and the protective effect of luteolin against this damage were evaluated by cytokinesis-blocked micronucleus analysis. As a result, the concentrations of acrylamide exposed to embryonic fibroblast cells have been found to significantly decrease cell viability while increasing the levels of lactate dehydrogenase enzymes and the incidence of micronuclei. On the other hand, luteolin treated in combination with acrylamide has been shown to prevent genotoxicity as well as its therapeutic effects on embryonic fibroblast cells.

**Keywords:** Acrylamide, Cytotoxicity, Embryonic fibroblast cells, Genotoxicity, Luteolin.

#### Abstract

In this study, some quantum chemical calculations were carried out using density functional theory (DFT) on N'-(3-ethoxy-2-hydroxybenzylidene)acetohydrazide ligand. The molecular structure of this compound was optimized at the B3LYP/6-311G+(d,p) level. The Natural Population Analysis (NPA) charges of the ligand in gas, aqueous and ethanol medium were obtained from Natural Bond Orbital (NBO) analysis, and its coordination mode was estimated. To predict the chemical reactivity of this compound, its molecular electrostatic potential (MEP) surface map was investigated, and some of its global reactivity descriptors (chemical potential  $\mu$ , electronegativity  $\chi$ , hardness  $\eta$  and electrophilicity index  $\omega$ ) were calculated using DFT. The interaction of the hydrazone ligand with some heavy metals such as Sn, Hg, Cd, and Zn was investigated by the Charge Transfer ( $\Delta N$ ) and Energy Lowering ( $\Delta E$ ) parameters.

**Keywords:** Hydrazone, DFT, Metal-Ligand interaction.

#### Abstract

From production to consumption, the rheological and textural properties of gelatin play a crucial role in determining the quality of gelatin based products. In this study, covalent modification of bovine skin gelatin was conducted under alkaline conditions using oxidised phenolic extracts from four different industrial food wastes, namely pomegranate peel (PP), grape pomace and seed waste (GPS), black tea waste (BT), green tea waste (GT), at varying concentrations (1%, 3%, and 5% w/w, based on gelatin). Dynamic oscillatory measurements were performed by using stress and strain-controlled rheometer (Anton Paar, MCR-302, Austria) equipped with a parallel plate (PP25). To obtain bloom, rupture strength, brittleness and adhesiveness values, a TA-HD Plus Texture Analyzer (Stable Micro Systems, Godalming, UK) equipped with a AOAC plunger (P/0.5) was used. The effect of the modification on the color (L, a, b), clarity, total phenolic content, ABTS and DPPH antioxidant activity, free amino content (FAC), microstructure (scanning electron microscopy (SEM)), Fourier transform infrared (FTIR) spectroscopy, differential scanning calorimetry (DSC), circular dichroism (CD) spectroscopy, zeta potential, swelling, water holding capacity, emulsion activity and stability, foam capacity and stability properties of the gelatin was also investigated. Extraction yields of the PP, GPS, BT, and GT were 40.74%, 14.41%, 6.71%, and 4.22% on a dry weight basis, respectively. Bloom value was increased for all concentration of GPS and 5% of BT, while decreased for rest of the extract and concentration combinations. Gelling and melting temperatures increased with increasing extract concentration, with PP having the highest effect, followed by BT, GPS, and GT, respectively. Our results showed that gelatin properties can be modified using covalent interaction with various type of oxidised industrial food waste phenolic extracts at different concentration levels.

**Keywords:** Gelatin, Covalent modification, Industrial food waste, Phenolic extract, Rheology, Texture.

#### Abstract

Finding a sustainable replacement for fossil fuels is one of today's challenges, and hydrogen appears to be a promising option. One sustainable method for molecular hydrogen (H<sub>2</sub>) production is photocatalytic water reduction, catalyzed by molecules that have transition metals as reaction centers. Studies have demonstrated that Cobalt-based catalysts exhibit significant activity in photocatalytic water reduction reactions, providing an economical alternative to costly transition metals such as ruthenium and platinum. In this study, we investigate the EECC water reduction reaction mechanism of a planar Co-based poly-pyridyl water reduction catalyst in explicit solvent environment using Ab-initio Molecular Dynamics (AIMD), Density Functional Theory (DFT), and Free Energy Perturbation Theory. We model two reduction and two protonation steps through AIMD simulations, analyze allowable spin states, and examine solvent responses following electron injections. The electronic structures of selected AIMD snapshots are further characterized using the hybrid density functional within the DFT framework. Finally, we calculate the first and second reduction free energies utilizing Marcus theory of electron transfer.

**Keywords:** H<sub>2</sub> production, Cobalt based poly-pyridyl catalyst, reduction free energy

This study has received funding from the TUBITAK under the 3501 Career Development Program (grant agreement No: 120Z240).

\*Sorumlu yazar e-mail: [bkaraagac@kocaeli.edu.tr](mailto:bkaraagac@kocaeli.edu.tr)

## Özet

Floroelastomerler (FKM), ana zincirinde ve/veya karbon atomlarına bağlı yan zincirlerde flor atomları içeren sentetik kauçuklardır. Koruyucu etkisi ve yapısında bulunan C-F bağının yüksek bağ enerjisi sayesinde, diğer kauçukların karşılayamadığı yüksek sıcaklıkta sürekli performans gösterebilme (225 °C'ye kadar), değişken atmosferik koşullara dayanım, aşındırıcı kimyasallara ve petrol türevli hidrokarbonlara (yağ, yakıt gibi) karşı mükemmel direnç ve düşük gaz geçirgenliği gibi özellikleri ile bilinirler. Bu özellikleri sayesinde savunma sanayi uygulamaları başta olmak üzere, reaktör kaplamaları ve turbo şarj hortumları gibi özel uygulamalarda tercih edilmektedirler. Çok sayıda üstün özelliği birlikte taşıyan FKM kauçuk, yapısındaki güçlü flor bağları nedeniyle klasik vulkanizasyon yöntemleri ile çapraz bağlanamayan, kullanım alanındaki gereksinimlere göre çapraz bağlayıcı sistem tasarımı gerektiren bir hammaddedir. FKM vulkanizasyonunda diamin vulkanizasyonu (iyonik reaksiyon), bisfenol AF vulkanizasyonu (iyonik reaksiyon) ve peroksit vulkanizasyonu (serbest radikal reaksiyonu) olmak üzere üç farklı mekanizma uygulanmaktadır. Diamin vulkanizasyonu kauçuk-metal yapışmasının istendiği ve dinamik uygulamalarda tercih edilirken, bisfenol AF vulkanizasyonu kalıcı deformasyonun azaltılması ve ısıl dayanımın geliştirilmesi amacıyla, peroksit vulkanizasyonu ise hızlı ve görece düşük maliyetli uygulamalarda tercih edilir. Literatürde, FKM için adı geçen vulkanizasyon sistemlerinin çaprazbağ yoğunluklarının ve vulkanizat mekanik özelliklerinin değerlendirildiği çalışmalara rastlanmaktadır. Bununla birlikte, genellikle savunma sanayi gibi yüksek performans gerektiren uygulamalarda sıklıkla karşılaşılan gerilme etkisinde ısınma sırasındaki malzeme davranışlarının incelendiği ve vulkanizasyon sistemine bağlı olarak oluşan çaprazbağ tiplerinin malzeme özellikleri üzerindeki etkilerinin değerlendirildiği bir çalışmaya rastlanmamıştır. Bu çalışmada, farklı vulkanizasyon sistemleriyle hazırlanan FKM esaslı hamurların çaprazbağ yapıları ve çaprazbağ yoğunlukları kauçuk proses analizörü (RPA) kullanılarak Lee-Pawłowski-Coran yaklaşımına göre belirlenmiş, ısınma sırasındaki gerilim durulması davranışları ve karakteristik sıcaklıkları sıcaklık taramalı gerilim-durulması cihazı (TSSR-metre) yardımıyla araştırılmıştır. Diamin, bisfenol-AF ve peroksit vulkanizasyonu sistemleri birbirleriyle ve kendi içlerinde pişirici sistem bileşenlerinin seviyeleri açısından karşılaştırmalı olarak değerlendirilmiştir.

**Anahtar Kelimeler:** Çapraz bağlanma, Floroelastomer (FKM), Sıcaklık taramalı gerilme-durulma (TSSR) analizi

#### Abstract

Some novel triazole-bearing acetamide derivatives **7-20** were synthesized starting from carvacrol. Structures of all synthesized compounds were characterized by spectral techniques. *In vitro* cytotoxic activities of these molecules against five cancer lines (human breast cancer MCF-7, human lung cancer A549, human prostate cancer PC-3, human chronic myelogenous leukemia K562, human neuroblastoma SH-SY5Y cell lines) were evaluated by MTT assay. Compounds were also tested on mouse embryonic fibroblast cells (NIH/3T3) to determine their selectivity. As a result of MTT assays, it was determined that compound **9** had antiproliferative activity on MCF-7 cells with an IC<sub>50</sub> value of 3.41 µM. Since the compound **10** showed over 80% antiproliferative activity on both PC-3 and MCF-7 cells, studies were carried out to determine the IC<sub>50</sub> value on both cell lines. While the IC<sub>50</sub> value of compound **10** for PC-3 cells was determined as 3.24 µM; IC<sub>50</sub> value of this compound was >100 µM in MCF-7 cells. Apoptosis, invasion and migration studies showed that compounds **9** and **10** might be important candidates as anti-cancer agents for the treatment of breast cancer and prostate cancer, respectively. Angiogenesis studies of compounds **9** and **10** did not show toxicity on HaCaT cells at 48 hours in viability analysis. At the same time, these compounds have been shown to significantly inhibit tube formation compared to untreated cells. It was determined that compounds **9** and **10** were not genotoxic according to the OECD 487-*In vitro* Mammalian Cell Micronucleus Test, one of the genotoxicity tests. Finally, it was also determined that these compounds were not mutagenic with TA98 and TA102 strains in the presence and absence of S9.

**Keywords:** 1,2,4-Triazole; carvacrol; cancer; apoptosis; angiogenesis; mutagenicity.

#### Abstract

The removal of heavy metal ions, such as lead (II) from wastewater is of utmost importance due to their propensity for bioaccumulation, toxicity, persistence, and resistance to biodegradation in the environment [1]. The accumulation of lead in the human body can lead to reproductive issues, damage to the central nervous system, developmental delays in physical and mental activities, especially in childhood. Moreover, it poses potential carcinogenic and neurological risks and can even be fatal. Hence, there has been a growing interest in conducting effective studies on the removal of Pb (II) ions [1,2]. In wastewater, Pb (II) primarily originates from metal plating and finishing processes, battery manufacturing, soldering materials, printing and pigments, glass industries, ceramics, ammunition, as well as steel and iron manufacturing facilities [3]. Conventional approaches for eliminating heavy metal ions, including membrane processes, chemical precipitation, and ion exchange, have long been employed to purify water from these contaminants. Nonetheless, the use of these chemical techniques is frequently constrained by technical or economic challenges. As a result, the utilization of biomaterial-based adsorption has emerged as a viable and cost-effective alternative for industrial wastewater treatment, offering both affordability and environmental safety [1,2,4]. In the present study, the effectiveness of an agricultural material- Teff seeds (*Eragrostis tef*)- for the removal of Pb (II) from an aqueous solution was investigated for the first time. The effects of pH, adsorbent dose, contact time, initial Pb (II) concentration and temperature were analysed. The equilibrium isotherm, kinetic and thermodynamic models were studied. The adsorbents were also applied to real wastewater samples. Optimal experimental conditions were found to be pH 5, 0.25 g/L of adsorbent dose with 1440 min of contact time. The adsorption isotherm was described by the Langmuir model. The thermodynamic studies revealed that the adsorption was spontaneous and exothermic.

**Keywords:** Lead, biosorption, Teff seeds, flame atomic absorption spectrometry.

#### Abstract

*Raphanus sativus* is a plant from Brassicaceae family. There are several species such as *Raphanus sativus* var. niger, *Raphanus sativus* longipinnatus and *Raphanus sativus* var. Radicula. Their root and seed have been reported to be used for the prevention and treatment of gallstones, jaundice, bloating, indigestion, and various stomach ailments in traditional medicine. The sulforaphane molecule is one of their natural compounds which is known to be an anticancer molecule. In this study, sulforaphane was extracted from two types of radishes, *Raphanus sativus* var. Niger and *Raphanus sativus* Longipinnatus by a simple solid-phase extraction (SPE) method. The amount of the compound was measured by HPLC analysis. The optimal conditions in HPLC methods were developed by using a silica SPE C18 cartridge and carbon tetrachloride and dichloromethane as washing and eluting solvents, which could eliminate interferences originating from the radish. Firstly, acidic water at pH 6 was used to dissolve, and then we let it warm at 45 degrees for 2 and a half hours. After the sample was warmed, carbon tetrachloride was added to the sample to separate the two phases, and the upper phase was taken to HPLC column C18. After impurities were removed from the extracts, they were directly injected into high-performance liquid chromatography (HPLC) for further chromatographic analysis. Good linearity was obtained from 10 to 166 µg/mL ( $r = 0.9999$ ) for sulforaphane with the relative standard deviations. The SPE method provides a higher yield of sulforaphane from crude extracts compared to conventional liquid-liquid extraction. The mean recoveries of sulforaphane from broccoli were more than 90.8%, and the detection limit was 2.70 µg/mL.

**Keywords:** radish, sulforaphane; solid-phase extraction; HPLC analysis

<sup>3</sup>Department of Pharmacognosy, Faculty of Pharmacy, Gazi University, 06330, Ankara, Turkey

#### Abstract

Chymotrypsin and trypsin are key players in the digestive process, where it acts to break down dietary proteins. However, maintaining the balance of proteolytic processes is crucial for overall health and the proper functioning of biological systems. Chymotrypsin and trypsin inhibitors can be used as therapeutic agents to treat conditions characterized by excessive protease activity, such as inflammatory diseases. Inhibitors of chymotrypsin-like proteases are under investigation for their potential to modulate proteolytic activity in diseases like cancer and neurodegenerative disorders. Urease allows *Helicobacter pylori* to survive in the acidic environment of the stomach by neutralizing the acid through the production of ammonia. Therefore, urease inhibitors have become one of the mechanisms investigated for the treatment of *H. pylori* positive ulcers. In these study, it was aimed to investigate the in vitro trypsin, chymotrypsin and urease inhibitory activities of *Centaurea helenioides* Boiss. & Hausskn. In addition, its antioxidant activity were determined by three different methods (ABTS, DPPH and CUPRAC). For these purpose 80% ethanol extract and liquid-liquid fractions were prepared from flowers and analysed by in vitro methods. According to the activity test results, *n*-hexane fraction showed important chymotrypsin inhibitory activity (IC<sub>50</sub>: 64.36 ± 1.36 µg/mL); while the remaining water fraction exhibited significant urease inhibition (IC<sub>50</sub>: 46.59 ± 1.35 µg/mL). The prepared extracts and fractions generally showed strong antioxidant activity in all studied antioxidant methods. Based on these results, it is planned to carry out further studies to determine the compounds responsible for the activity in *Centaurea helenioides*.

**Key Words:** Chymotrypsin, trypsin, urease, *Centaurea helenioides*, antioxidant

## Özet

Hekzaklorosiklotrifosfazen bileşiği (trimer, HCCP, P<sub>3</sub>N<sub>3</sub>Cl<sub>6</sub>) fosfor ve azot atomlarının birbirine ardışık olarak bağlanması ile oluşan inorganik heterohalkalı bir bileşiktir. Termal kararlılık, biyoyumluluk ve çok yönlü reaktivite gibi önemli özelliklere sahip olan trimerik fosfazen bileşiğinin yapısında bulunan klor atomları, inorganik ve organik gruplar ile yer değiştirebilmektedir [1-4]. Bu nükleofilik süstitüsyon reaksiyonları neticesinde, tercih edilen süstitüentlere bağlı olarak farklı kimyasal, biyolojik özelliklere sahip halkalı fosfazen bileşikler sentezlenebilmektedir. Ayrıca, bu nükleofilik süstitüsyon reaksiyonları, kiral bileşiklerin sentezlenmesine de imkân tanımaktadır [5-8]. Çalışmaların ilk aşamasında, ligant olarak kullanılmak üzere benzildiamin bileşikler sentezlenmiştir. Ardından bu diamin bileşiklerinin, trimerik fosfazen ile regioselektif olarak etkileşmesinden monospirofosfazenler (**1**, **2**) ve oluşan bu bileşiklerin karbazolildiamin (**3**) ile tepkimelerinden cis/trans dispirofosfazenler (**4a/4b**, **5a/5b**) hazırlanmıştır. Bu bileşikler, spiro halkadaki metil ve/veya etil gruplarının uzaysal oryantasyonu uyarınca cis ve trans geometrik izomerler halinde elde edilmiştir. Bu orijinal bileşiklerin; **spektroskopik, stereojenik özellikleri, kristal yapıları, fotofiziksel özellikleri ve biyolojik aktiviteleri** araştırılmıştır. Yapısal karakterizasyon çalışmaları, tek boyutlu NMR teknikleri ve X-ışını kırınım metre yöntemi kullanılarak gerçekleştirilmiştir. Bileşiklerin kiral özellikleri, X-ışını kristallografi yöntemi ve kiral çözücü (chiral solvating agent; CSA) ilaveli <sup>31</sup>P NMR spektroskopisi yöntemi ile detaylı bir şekilde incelenmiştir. Biyolojik aktivite çalışmaları kapsamında, bileşiklerin antibakteriyel ve antifungal aktiviteleri belirlenen veriler yardımı ile karşılaştırmalı olarak değerlendirilmiştir. Ayrıca, bileşiklerin fotofiziksel özellikleri UV-Vis ve Floresans spektroskopisi yöntemleri ile incelenmiştir. Bununla birlikte, bileşiklerin pBR322 plazmid DNA ile etkileşimleri araştırılmıştır.

**Anahtar kelimeler:** Dispirofosfazenler, trimer, spektroskopi, kristallografi, biyolojik aktivite, fotofiziksel özellikler.

**Bu çalışma “122Z180” numaralı Tubitak Projesi ile desteklenmiştir.**

#### Abstract

In the last two decades, microalgae have been evaluated for biodiesel production due to their high lipid content, but microalgal biomass is also a raw material for bioethanol production, because of its cellulosic structure without the need for other applications. *Botryococcus braunii* is a single-celled, slow-growing photosynthetic microalgae of the green algae, that produces large amounts of biomass, lipid, carbohydrate and other bioactive molecules. It is one of the most evaluated microalgae species for biodiesel production due to its high lipid content. Although it is a prominent feedstock for biodiesel production, the biomass remained after lipid extraction should be also utilized in the aspects of zero waste management. In this context, investigating the effect of microalgal bioethanol production parameters on bioethanol yield is of great importance. In this study, de-oiled *B. braunii* microalgae was valorized for bioethanol production by evaluating the process parameters. Highest bioethanol yield was obtained as 20.42% under condition of 1 N H<sub>2</sub>SO<sub>4</sub>, pre-treatment temperature of 100°C, and 45 minutes of pre-treatment time, respectively.

#### Abstract

Xylanases are the enzymes that can hydrolyse xylan, the major hemicellulose, which is found in the structure of the plant cell wall in nature. Nowadays, xylanases have been intensively used in many industrial areas such as food, textile, pulp and paper industries, ethanol production, and waste treatment. Due to its industrial importance, the discovery of more effective xylanases still attracts the attention of the scientific world. In this study, the 329 amino acid gene encoding *Anoxybacillus caldiproteolyticus* xylanase was cloned into the pET-28a(+) expression vector and the gene product was expressed in *E.coli BL21* for the first time. The produced enzyme was purified by column chromatography methods and evaluated in terms of biochemical and kinetic parameters. As a result of the study, the optimum conditions in which the enzyme showed the best activity were determined as pH 6.50 and 60 °C. The enzyme showed over 80% activity in a wide pH range such as pH 5.00-9.00. The enzyme did not lose activity between pH 6.00-9.00 at +4 °C for 75 days.  $K_m$ ,  $V_{max}$ ,  $k_{cat}$  and  $k_{cat}/K_m$  values of AcalXYN329 were calculated as  $3.5929 \pm 0.166 \mu\text{g}/\mu\text{L}$ ,  $58.767 \pm 0.02 \mu\text{mol}/\text{min}/\text{mg}$  protein, 75.64 1/sec, and  $21.05 \text{ l}/\text{mMs}^{-1}$ , respectively. In conclusion, the xylanase of *A. caldiproteolyticus* has excellent potential to be utilized in many industrial processes.

#### Abstract

The RAS-RAF-ERK pathway orchestrates a cascade of intracellular events that regulate cell growth, proliferation, and differentiation and its aberrant activation is a major driver of human cancer. The MRAS-SHOC2-PP1 (SHOC2 phosphatase) heterotrimeric complex plays an essential role in RAF-ERK pathway activation by dephosphorylating a specific phosphoserine site on RAF kinases. To investigate the function of SHOC2 in tissue homeostasis, we have generated Tamoxifen-inducible Cre mice that are homozygous for floxed SHOC2. To this end, we crossed SHOC2<sup>fl/fl</sup> conditional knockout (KO) mice with Rosa26-CreER<sup>T2</sup> mice to generate SHOC2<sup>fl/fl</sup> KO Rosa26-CreER<sup>T2</sup> mice, which carry an inducible ubiquitously expressed CreER<sup>T2</sup> recombinase. The administration of tamoxifen results in highly effective recombination of more than 80% across all investigated tissues, excluding the brain. Serum biochemical assessment helps predict pathological processes in vital internal organs of the body, such as the liver, muscle, heart, pancreas, and kidney. To elucidate alterations in metabolism and organ functions resulting from systemic SHOC2 deletion, blood was collected from wildtype and SHOC2 knockout mice via cardiac puncture at morbidity, and serum biochemical parameters were analysed. The blood test for the biochemistry profile included a series of biomarkers for liver and kidney functions, lipid levels, electrolytes, as well as additional metabolic markers such as glucose, fructose, total protein, and albumin. Most of the serum chemistry parameters were unaffected suggesting SHOC2 inactivation does not cause major and/or clear alterations in liver or kidney function. However, albumin, total cholesterol, high-density lipoprotein, glucose, fructose and alkaline phosphatase levels were significantly decreased in SHOC2 KO mice compared to wild type controls. While the significance of these changes is unclear, they are consistent with the weight loss that was observed in the SHOC2 KO mice at the time of analysis and thus may be the reflection of weight loss like consequence rather than the cause.

#### Abstract

Cancer is one of the most common disease threads lives of billions worldwide. The increasing number of cancer-related deaths, the lack of a definitive cure, and the serious side effects of treatment for patients have accelerated the discovery of natural based cancer preventives or therapeutics. Essential oils extracted from different plants such as sesame and black cumin have been studied for a long time as natural anticancer agents. However, insolubility of oily agents in aqueous solutions limits the accuracy of the in vitro assays such as cell culture, antioxidant, phenolic content assays etc. In this study, we report, for the first time, content analysis and biological activities of DMSO extracts of sesame and black cumin oils in vitro. To determine the phenolic content, antioxidant capacity and flavonoid content of DMSO extracts, Folin-Ciocalteu, CUPRAC and aluminum chloride calorimetric assays were performed, respectively. In biological tests, MTT cell proliferation assays against human bladder cancer (T-24) for anticancer activity and disk diffusion assay against *S. aureus* and *E. coli* for antibacterial activity were conducted. According to content analysis results, DMSO extracts were found to be rich in phenol (4391 mg gallic acid equivalent/ml extract for sesame; 6200 mg gallic acid equivalent/ml extract for black cumin) and flavonoid (546 mg catechin equivalent/ml extract for sesame; 1100 mg catechin equivalent/ml extract for black cumin) contents. In antibacterial tests of DMSO extracts, which were also found to have high antioxidant capacity, showed that zone formation was found in DMSO extract obtained from black cumin. According to in vitro MTT cell proliferation assay, the IC<sub>50</sub> value of the obtained DMSO extracts from sesame and black cumin were found 1.47% and 0.37% against T-24 cells, respectively. A novel method, presenting an alternative extraction technique for herbal products characterized by complex phytochemical components, was introduced for the first time in this study.

**Keywords:** sesame, black cumin, natural agents, anticancer

#### Abstract

*Malus floribunda coccinella* is a plant used for landscaping purposes because it has small red fruits and pinkish flowers. The aim of the study is to determine whether the fruits of the plant have different usage areas by performing GC-MS analyses of their total antioxidant capacity. To determine the total antioxidant capacity of methanol extracts of plant fruits, total phenolic and flavonoid analyses, and DPPH radical scavenging activities were examined. The content of methanol extracts from plant fruits was determined by the GC-MS (gas chromatography/mass spectroscopy) method. A spectrophotometer device was used in total antioxidant capacity analyses. The total phenolic amount ( $46.55 \pm 2.15$  mg GAE/g extract), total flavonoid amount ( $61.37 \pm 2.49$  mg QAE/g extract) of the methanol extract of the fruits were determined. Solutions of fruit methanol extract at 250, 500, and 1000  $\mu\text{g/mL}$  concentrations were prepared, and their inhibition was calculated. Additionally, the  $\text{IC}_{50}$  values of samples with known inhibition percentages were also calculated. The  $\text{IC}_{50}$  value of the methanol extract of the plant fruit was determined as ( $876.91 \mu\text{g/mL}$ ). In addition, fifteen different substances were identified as a result of the GC-MS analysis of the fruit methanol extract. Especially 1,6-Anhydro-beta-D-glucopyranose and beta-D-Glucopyranose, 1,6-anhydro- substances were found in high amounts. As a result, the fruits of this plant, whose phytochemical content was determined, were found to have antioxidant properties. It was concluded that the substances identified as a result of the GC-MS analysis were important and used in different fields. It is thought that this study will contribute to the plant literature.

#### Abstract

Events that disrupt or stop the development and physiological processes in plants are called stress. In this sense, heavy metals (HMs) are one of the important stress factors that threaten the organism by accumulating in ecosystems. HMs affect many cellular activities negatively, such as protein synthesis, respiration, photosynthesis, mineral nutrient intake and membrane structure. Of those, Lead (Pb), is used for a wide variety of purposes and produced over several million tons annually. Photosynthesis, as a physiological processes, is one of the most sensitive processes to Pb toxicity and chlorophyll is the key pigment of this process for all living things demanding energy. Chlorophyll converts light energy into chemical energy. Therefore, chlorophyll content is an important indicator in determining the characteristics of a plant such as development, photosynthetic capacity, stress and yield. The level of stress in the plant can be determined by measuring the amount of chlorophyll. Extraction of leaf tissue and subsequent spectrophotometric measurements is a common method used in chlorophyll measurement and determines the amount of chlorophyll per gram in leaf tissue. As an alternative to this method, portable chlorophyll meters have been developed that save time. Chlorophyll meters give a result expressed as SPAD, indicating only the relative chlorophyll content. So, it is important to create reference curves for the SPAD value and the total amounts of chlorophyll obtained by the extraction method to decipher the level of relationship between the two methods. In this study, the effect of different concentrations of lead chloride (PbCl<sub>2</sub>) exposure on chlorophyll contents in two different wheat varieties (*Triticum aestivum* cv. Bezostaya and cv. Yunus) were investigated. Measurements were made by two different methods, portable chlorophyll meter and extraction method. When the of both methods were compared, it was determined that the results of these two varieties were consistent with each other.

**Keywords:** Heavy metal (Pb), Wheat, Chlorophyll Content

#### Abstract

Graft copolymers continue to be of increasing importance, with numerous studies from synthesis to application reported each year. With the use of controlled radical polymerization (CRP) techniques, it is possible to create perfectly controlled complex macromolecular structures [1,2]. While a graft copolymer obtained from a single polymerization method enables a facile synthesis, the combination of two different polymerization techniques can be an advantageous way to incorporate classes of monomers that would not be compatible, such as lactones and vinyl monomers [3]. In this contribution, poly( $\epsilon$ -caprolactone-g-2-hydroxy ethyl methacrylate) [P( $\epsilon$ -CL-g-HEMA)] graft copolymer hydrogels were synthesized in two polymerization steps by atom transfer radical polymerization (ATRP) and ring-opening polymerization (ROP) methods. For these syntheses, hydroxyl-terminated poly  $\epsilon$ -caprolactone (PCL-OH) was obtained by the ring-opening polymerization method of  $\epsilon$ -caprolactone by using 3-chloro-1,2-propanediol initiator, which is suitable for the ring-opening polymerization method, in the first step. From the reaction of this synthesized PCL-OH and 3-bromine propionyl chloride, a new bromine-terminated poly  $\epsilon$ -caprolactone (PCL-Br) was synthesized to be used as an ATRP initiator. In the second step, poly( $\epsilon$ -caprolactone-g-2-hydroxy ethyl methacrylate) [P( $\epsilon$ -CL-g-HEMA)] graft copolymer hydrogels were synthesized by ATRP polymerization of 2-hydroxy ethyl methacrylate (HEMA) in the presence of the new synthesized ATRP initiator, and hydrogel properties were examined. The routes of these syntheses are shown in Scheme 1. The obtained initiator and graft copolymer hydrogels were characterized by spectroscopic methods such as <sup>1</sup>H-NMR, FT-IR, TGA, DSC, GPC and SEM.

**Scheme 1.** Synthesis mechanism of PCL-OH (A), Chemical synthesis reaction of PCL-Br (B), Synthesis mechanism of PCL-g-PHEMA graft copolymer hydrogels (C).

**Keywords:** Atom transfer radical polymerization (ATRP); graft copolymer; hydrogels; Ring-opening polymerization (ROP); bromine-terminated poly( $\epsilon$ -caprolactone) (PCL-Br).

#### Özet

Bu çalışmada, çeşitli kanser türlerinin tedavisinde etkin olarak kullanılan vinkristin'in neden olduğu bağırsak hasarında quercetin'in koruyucu etkileri araştırılmıştır. Çalışmada, erkek Sprague Dawley sıçanlarına 12 gün boyunca oral olarak 25 ve 50 mg/kg dozlarda quercetin verildi ve 30 dakika sonra intraperitoneal olarak 0,1 mg/kg dozda vinkristin (kümülatif doz 1,2 mg/kg) uygulandı. Oksidatif stres düzeyi biyokimyasal metotlarla tespit edildi. Nuclear Factor kappa B (NF- $\kappa$ B), Interleukin-1 beta (IL-1 $\beta$ ), Bcl-2 ile ilişkili X proteini (Bax), B hücreli lenfoma-2 (Bcl-2) ve caspase-3'ün mRNA transkript seviyeleri RT-PCR ile belirlendi. Bağırsak dokusunda glutatyon (GSH) düzeyleri ile süperoksit dismutaz (SOD), katalaz (KAT), glutatyon peroksidaz (GPx) aktivitelerinin azalması, malondialdehit (MDA) düzeylerinin artması, vinkristin kaynaklı NF- $\kappa$ B, IL-1 $\beta$ , Bax, Bcl-2 ve caspase-3 ekspresyonlarındaki artışın sırasıyla oksidatif strese, inflamasyona ve apoptoza neden olduğu, ancak quercetin'in vinkristin kaynaklı oksidatif stresi, inflamasyonu ve apoptoza giderdiği tespit edildi. Bu sonuçlar sıçanlarda quercetin'in vinkristin kaynaklı bağırsak toksisitesine karşı koruyucu etki gösterebileceğini göstermektedir.

**Anahtar Kelimeler:** Apoptoz, Bağırsak toksisitesi, İnflamasyon, Oksidatif stres, Quercetin, Vincristin

#### Abstract

Coumarin and its derivatives are important chemicals used in various fields such as fluorescent probes, cosmetic industries, and coumarin dyes. Also, coumarin derivatives have shown a wide spectrum of pharmacological activities such as antibacterial, anticoagulant, antifungal, antimycobacterial, and anti-inflammatory. In the present times, great importance is attached to the research of perimidines and their derivatives. This interest is not only due to its various biological activities such as anti-cancer, anti-inflammatory, antioxidant, antibacterial, but also due to various applications such as dyes, photochemical sensor, DNA binding properties. Molecular hybridization has become a powerful method for the synthesis of new and more activated molecules by bringing together active compounds in pharmaceutical or other fields. Considering the literature activities of coumarin and perimidine structures, the use of these heterocycles in hybrid form may lead to the formation of more active structures. With this in mind, in this study, the hydrazide derivative perimidine compound was synthesized, starting from the reaction of 1,8-naphthalidiamine and urea. And also the synthesis of coumarin derivatives was carried out in several steps, starting with the reaction of different 2-hydroxybenzaldehyde compounds and 2,2-dimethyl-1,3-dioxane-4,6-dione compound. In the final step, coumarin-perimidine hybrid compounds were obtained as a result of the reaction of the obtained hydrazide derivative perimidine and coumarin compounds.

**Keywords:** Coumarin, Perimidine, Hybrid Molecule.

#### Abstract

In recent years, there has been a growing interest in the development of hydrogels that utilizes natural and sustainable sources instead of relying solely on synthetic materials. In this study, the aim was to fabricate sustainable hydrogels made up of collagen/keratin/alginate (C/K/A) and characterize their physical, chemical and biological properties. In this regard, keratin was extracted from waste human hair by reduction method, and collagen was obtained from bovine achilles tendon via acid solubilization and enzymatic hydrolysis. Hydrogels, cross-linked with calcium chloride and EDC/NHS, were produced by using different weight ratios of 1:1:1 and 2:2:1 C/K/A. The FTIR spectra obtained from isolated keratin and collagen demonstrated the existence of characteristic absorption peaks. In SDS-PAGE analysis,  $\alpha$ -keratin and  $\beta$ -keratin bands and the  $\gamma$ -collagen,  $\beta$ -collagen and  $\alpha$ 1(III),  $\alpha$ 1(I),  $\alpha$ 2(I) collagen bands were observed to confirm the keratin and collagen structures. Physicochemical properties of hydrogels such as water uptake, *in vitro* hydrolytic degradation, porosity, chemical and microstructural properties were examined. Porosity was higher for the 1:1:1 C/K/A (80%) than 2:2:1 C/K/A (47%), yet the amount of weight loss was observed to be higher for the 2:2:1 C/K/A group at the end of 21 days. The swelling ratio of 2:2:1 C/K/A (1337%) is found to be lower than 1:1:1 C/K/A (2063%). Protein release was twice as high as for the 2:2:1 C/K/A group as expected. Lastly, L929 mouse fibroblast cells interacted with the hydrogels, and it was observed that 1:1:1 C/K/A group supported the highest cell proliferation rate.

**Keywords:** Keratin, collagen, alginate, hydrogel

## Özet

Günümüzde çözücüsünde veya dispersiyon ortamında stabil kalmayan, ısıya hassas enjeksiyonluk ürünlerin stabil bir şekilde saklanması için en sık tercih edilen kurutma metodu liyofilizasyondur. Dondurarak kurutma olarak bilinen liyofilizasyon, sulu çözelti/dispersiyon halinde bulunan katıların kurutma yöntemlerinden biri olup, buzun süblimleşmesiyle suyun uzaklaştırılması esasına dayanmaktadır. Liyofilizasyon işlemi dondurma, birincil kurutma ve ikincil kurutma olarak adlandırılan üç basamaktan oluşur. Bu üç basamağı içeren proses, liyofilize ürünlerin üretiminde en çok zaman alan ve enerji harcanan üretim basamağıdır. Diğer yandan doğru yürütülmemiş bir liyofilizasyon prosesi ürünün kalitesini doğrudan etkileyerek bitmiş ürünün hedeflenen özellikleri sağlayamamasına neden olabilmektedir. Tüm bu nedenlerle çalışmamız kapsamında üretmeyi hedeflediğimiz kapreomisin içeren liyofilize enjeksiyonluk toz için liyofilizasyon prosesi geliştirme süreçleri yürütülmüştür. Bu kapsamda öncelikle liyofilizasyon prosesinde etkili olabilecek kritik proses parametreleri belirlenmiş ve bu parametrelerdeki değişikliklerin ürünün hedeflenen kalite özelliklerine nasıl etki ettiği incelenmiştir. Çalışma sonunda ürünün kuruma süresi için en önemli faktörlerin doğru primer kurutma ve sekonder kurutma sıcaklığı olduğu belirlenmiştir. Doğru olmayan sıcaklıklarda yürütülen süreçlerin liyofilizasyon süresini uzattığı ve tamamen kuruyamayan ürünlerin geri erimeye neden olduğu gösterilmiştir. Belirlenen bu reçete üretim boyutuna aktarılmış ve geliştirilen süreç valide edilmiştir.

**Anahtar Kelimeler:** Liyofilizasyon, Kapreomisin, Ölçek Büyütme

#### Abstract

Osteosarcoma (OS) is a primary and highly aggressive malignant bone tumor frequently seen in children. Chemotherapy is the current therapeutic strategy used to treat OS. However, due to its severe side effects, there is a need to develop a new agent with increased effectiveness and reduced toxicity in treatment. Serotonin (5-HT) is a central nervous system neurotransmitter. In addition to its known functions in neuroendocrine mechanisms, Serotonin has also been shown to be associated with cancer. miRNAs have essential biological functions in various processes and carcinogenesis. miR21 is one of the best-known and most essential oncomiRs. In this study, we aimed to investigate the effect of Serotonin on the proliferation of human osteogenic sarcoma cells (Saos-2) by modulating miR21 expression. The effect of Serotonin on the proliferation of Saos-2 cells was performed by MTT analysis at 24, 48, and 72 hours. The expression level of miR21 was analyzed by qPCR. The apoptotic effect was determined by Annexin V/PI analysis. In the MTT analysis, it was observed that the proliferation of Saos-2 cells decreased in response to Serotonin. miR21 expression was down-regulated in Serotonin-treated Saos-2 cells. Serotonin has a potential therapeutic strategy for OS.

#### Abstract

Wound repair is a biological process that varies with regard to the period of time to attain healing. In recent years, biomaterials-based wound dressings have received much attention due to their potentials and many studies have been performed based on them. After development of hydrogel appearance which facilitated the production of wound dressings from the passive material to active and functionalized ones. The chitosan (CS) based hydrogel wound dressing encapsulated with drugs serves better in wound healing and exudate management. CS is the common biopolymer used in wound and burn dressings, due to their antimicrobial activity, resistance against environmental conditions, adhesive nature, antifungal, and excellent oxygen permeability. Polyvinyl alcohol (PVA), is one of the most frequently synthetic polymer have been employed as wound dressings and drug delivery systems. It is a biological friendly polymer due to its biocompatibility, lack of toxicity and appropriate mechanical properties. In this study, we prepared PVA/CS hydrogel films containing a model drug (amphotericin B) to develop a suitable material with potential application as high performance wound dressing with controlled drug release. For that, the physicochemical, thermal, morphological and biological characterizations of the biocomposite hydrogel films were evaluated, as well as the release assessment of the drug. The interactions between the constituents of the hydrogels were analyzed by FTIR spectroscopy. This biocomposite films in all compositions showed desirable swelling behavior at pH 7,4. To develop the potential application of chitosan based biocomposite film dressings, the antibacterial potentials, as well as the wound healing activities, were investigated *in vitro*. The studies also showed a sustained release of drug from the hydrogel films. Overall, the results signaled the potential application of amphotericin containing PVA/CS based hydrogel films as wound dressings.

## Özet

Elementel impüriteler kullanıma hazır ilaçların içerisinde bulunabilen ve hasta haslığını riske atan impüriteler olarak dikkat çekmektedir. Bu impüriteler ilacın içerisine sentez sırasında bulaşmış olabileceği gibi ilacın hazırlanması sırasında da bitmiş ürün içerisine geçebilmektedir. Üretim sırasında kullanılan ekipman, filtreler, su, yardımcı maddeler, bitmiş ürün ambalajları, kapakları gibi faktörler tüm süreçte risk yaratabilen unsurlardır. Bitmiş ürün dozaj formları içerisinde elementel impüritenin doğrudan kana karışmasına neden olabilecek paranteral kullanım yolu en fazla dikkat edilmesi gereken dozaj formlarından birini oluşturmaktadır.<sup>1,2</sup> Endüktif Eşleşmiş Plazma Kütle Spektrometresi (ICP-MS) geniş spektrumda elementel impüriteyi düşük konsantrasyonlara kadar belirleyebilmesi ile avantaj sağlayan önemli bir analiz tekniğidir. ICP kaynağı elementlerin atomlarını pozitif yüklü iyonlara çevirir ve bu iyonlar da kütle spektrofotometresi tarafından kütle yük oranına göre ayrılır ve dedektöre iletilir. Avantajlarına rağmen cihazın pahalı olması, kullanımında ve metot geliştirilmesinde uzman personel gerektirmesi tekniğin olumsuz yönleri olarak dikkat çekmektedir.<sup>1</sup> Bu çalışma kapsamında ürettiğimiz Kasporfungin Liyofilize Toz ürünü elementel safsızlıkların takibini sağlamak için ICP-MS analiz metodunun geliştirilmesi ve validasyonunun gerçekleştirilmesi amaçlanmıştır. Bu amaçla ICH Q3D’de belirtilen 24 elementin hedeflenen limitlerde analiz edilmesini sağlayan analiz metodu geliştirilerek valide edilmiştir. Sonuç olarak tüm bu elementler için hedeflenen konsantrasyon aralığında doğrusallık gösterilmiş, LOD ve LOQ değerleri hesaplanmış, tekrarlanabilirlik, geri kazanım gibi tüm validasyon parametreleri başarı ile sağlanmıştır.

#### Abstract

Organic and inorganic pollutants are known to occur worldwide as a result of human activities such as agriculture, industry, and spillage as well as natural resources. Since low levels of these pollutants pose a threat to human health and the environment, it is vital to perform qualitative and quantitative determinations with high accuracy and precision. Numerous techniques have been reported in the literature for organic and inorganic pollutants. Among these techniques, colorimetric detection has become very interesting in recent years as an alternative to complex instrumentation with advantages such as rapid response, simple experimental setup, easy operation, low cost, and high sensitivity. Thanks to the colorimetric sensors developed within the scope of the method, many organic / inorganic analytes such as heavy metals and metal salts, pesticides and drug residues can be determined even using a smartphone digital camera with the high accuracy. In this presentation, the limit of detection and limit of quantitation of the developed colorimetric systems for target analytes and the percent recovery results to investigate the feasibility in real samples are evaluated.

**Keywords:** Colorimetric detection, pollutants, sensor

#### Abstract

Hydrocolloids derived from various seed sources are known for their unique functional properties, characterized by polysaccharide polymers. While the utilization of hydrocolloids has been studied, that remains an untapped potential in unexplored sources. Quince seed mucilage (QSM) has received attention due to its antioxidative, anti-inflammatory, and antimicrobial attributes. Its biocompatibility, non-toxicity, and biodegradability have found applications in diverse industries, including food, cosmetics, and surfactants. Remarkably, its potential in biotechnology, concerning its antimicrobial properties, has yet to be investigated. The aim of the present study is to test potential contribution of quince seed on growth rate of green algae specifically on *Chlamydomonas reinhardtii*, as a growth medium additive. The content of quince seed has been extracted by distilled water by mixing magnetic stirrer. Then in a proportion of 1:2 (50ml QSM/100ml TAP), 1:1(75ml QSM/75ml TAP), and 2:1(100ml QSM/50ml TAP) combination of quince seed mucilage and TAP growth medium respectively were used as growth medium for *C. reinhardtii*. Cultures were maintained in 25  $\mu\text{mol s}^{-1}\text{m}^2$  light intensity and aerated with 5%  $\text{CO}_2$ . The results revealed a remarkable outcome, with algae cultivated in the presence of quince mucilage exhibiting more than a twofold increase (OD 672nm value was 1,51) in growth compared to the control group (OD672nm was 0,73) in the combination of 1:1. Moreover, a synchronized statistically significant enhancement in chlorophyll a (16,54 $\mu\text{g}/\text{mL}$ ), chlorophyll b (8,915 $\mu\text{g}/\text{mL}$ ), total chlorophyll (25,46 $\mu\text{g}/\text{mL}$ ) and carotenoid content (4,34 $\mu\text{g}/\text{mL}$ ) coincided with the growth curve in treatment of 1:1 than control groups (7,07 $\mu\text{g}/\text{mL}$ , 3,65 $\mu\text{g}/\text{mL}$ , 10,73 $\mu\text{g}/\text{mL}$  and 1,76 $\mu\text{g}/\text{mL}$  respectively). These findings suggest a promising role for quince mucilage as an inducer and a sustainability agent, serving to mitigate contamination, in the cultivation of algae. This study underscores the potential of quince seed mucilage as a valuable resource in biotechnological applications, opening new avenues for sustainable and efficient algae production.

**Keywords:** Quince extract, *Chlamydomonas reinhardtii*, microalgae, chlorophyll, and carotenoids

\*Corresponding author e-mail: [acara@metu.edu.tr](mailto:acara@metu.edu.tr)

#### Abstract

The selection of drug-resistant clones can inevitably result in treatment failure due to resistance to cancer treatments. With the development of single-cell barcoding, it is now possible to quantify medication resistance by calculating the frequency of chosen clones that contain distinctive cellular barcodes. To characterise barcode frequencies, in this study, it was aimed to generate a single barcode containing chemotherapy-resistant HCT116 cells. Before the development of their chemotherapy-resistant derivatives, the initial HCT116 cell line was integrated with cellular barcodes using a lentiviral barcode library. Amplicon-based NGS method was used to identify the mechanism of resistance, whether pre-existing or de novo drug resistance was present. To create a new cell line from a single barcode, drug-resistant barcoded HCT116 cells have been utilised through a single cell dilution experiment. A single barcode's characterisation and confirmation were carried out using newly developed drug-resistant HCT116 cell lines. The outcomes show the effectiveness of using single-cell dilution and cellular barcoding technology to create single-cell derived colonies in HCT116 cells under the influence of chemotherapeutic selection pressure. The barcoding method displays the frequency of barcode enrichment in drug-resistant HCT116 cell variants. The usefulness of this experimental model system to examine drug resistance at the single-cell level was also demonstrated by unique-barcode containing drug-resistant HCT116 single cell-derived cell lines. With the introduction of recently discovered cellular barcoding technology, it is now possible to monitor treatment resistance at the single cell level, giving the capacity to take advantage of the tumour's susceptibility.

**Keywords:** treatment resistance, cellular barcoding, cancer

#### Abstract

Canine parvoviral enteritis is highly contagious infection in intestines caused high morbidity and mortality in untreated dogs younger than 6 months. The aim of this study was to examine the expression of Matrix Metalloproteinase-9 (MMP-9) and Tissue Inhibitors of Matrix Metalloproteinases-1 (TIMP-1) in Natural Canine Parvoviral Enteritis Infection of 25 dogs diagnosed with parvoviral enteritis by clinical tests and histopathology. On histopathology, shedding and blunting of the villi epithelium, severe mononuclear inflammation in the lamina propria and locally enlarged crypts with lymphocytolysis in peyer's patches were noted in the ileum. Immunohistochemically, mean strong (+++) expression for MMP-9 and mean moderate (++) expression for TIMP-1 were observed in the crypt epithelium and inflammatory cells in the small intestines of infected animals. As a result, overexpression of MMP-9 and weaker expression of TIMP-1 as its inhibitor in canine parvoviral enteritis may determine the development of the disease.

**Keywords:** MMP-9, TIMP-1, Parvoviral Enteritis, Immunohistochemistry

#### Abstract

The SARS-CoV-2 has been declared by the WHO as the most devastating pandemic affecting the world's population and economy. Although many vaccines and drugs are available against SARS-CoV-2 infection, the need for promising treatments and drugs remain. RdRp is an attractive and promising therapeutic target for the treatment of SARS-CoV-2 disease due to it is one of the key enzymes that control viral replication (Bekheit et al., 2023; Brindani et al., 2023; Rehman et al., 2023). It is also known that the biologically active 1,2,4-triazol-3-thione ring has antiviral activity. In this study, novel *N*-[3-(methylsulfanyl)-1-(4-aryl/alkyl-5-sulfanylidene-4,5-dihydro-1*H*-1,2,4-triazol-3-yl)propyl]benzamide derivatives were designed and their potential antiviral effect were evaluated against SARS-CoV-2 RdRp enzyme using molecular modeling studies. Autodock Vina, an open licensed software developed by Scripps Research Institute, was used in molecular modeling studies. SARS-CoV-2 RdRp (pdb code: 6M71) (Gao et al., 2020) structure were obtained from the protein database and prepared for use in docking studies using The AutoDock Tools program. The conformations of the designed compounds were scanned with the semi-experimental PM3 method using the Spartan4 quantum chemistry program (SPARTAN 04, Wavefunction, Inc., Irvine, USA). The most stable conformation for each ligand was selected and made ready for the molecular modeling process. Enzyme-ligand interactions were examined with open license imaging software such as Discovery Studio Visualizer to determine the best binding conformation for each ligand, and the binding mechanisms to the active site of the enzyme were elucidated.

**Keywords:** 1,2,4-triazoles, SARS-CoV-2 RdRp, molecular modeling, antiviral.

#### Abstract

Membrane fabrication using silver nanoparticles (AgNPs) and polymers has gained popularity in recent years due to its superior optical, conductivity, and antibacterial properties. AgNPs are employed in water treatment because of their exceptional antibacterial capabilities even at low concentrations due to interaction with microorganisms. Macroporous hydrogels, called cryogels, are a type of hydrogel with a macroporous structure and durability that are intrinsically interconnected. Cryogels are formed by cryogelation at sub-zero temperatures by freezing the initial polymer solution containing a crosslinker. In this study, Poly(2-hydroxyethyl methacrylate-vinylimidazole) cryogels were synthesized as solid support. Particle size analysis was used to determine the size of AgNPs. Also, swelling test and scanning electron microscopy (SEM) were performed for the characterization of the cryogel. The antibacterial test was carried out with AgNPs embedded cryogels at three different concentrations.

**Keywords:** Antibacterial, silver nanoparticles, cryogel.

#### Abstract

According to GLOBOCAN 2020 statistics, the rates of lung and colon cancer are 11.4% and 18.0%, respectively. Natural products like royal jelly have drawn the attention of many researchers due to their potential anti-cancer properties. One of the important bee genetic resources in the Anatolian region is the Caucasian bee. This bee species, which is widespread in our country and extends to the provinces of Kars, Ardahan, and Artvin in Northeast Anatolia, is known to be an excellent nectar collector with high honey yields. This study aims to investigate the cytotoxic effect of lyophilized royal jelly produced in the Ardahan and Ordu regions on lung (A 549) and colon (HT 29) cancer cell lines, as well as on healthy human (CCd18Co) cell lines, at concentrations ranging from 0 to 200 µg/mL over a 24-hour period. The significant cytotoxic activity of royal jelly produced in the Ardahan region on lung (A 549) and colon (HT-29) cell lines ( $IC_{50}=53.59 \pm 1.16$ ,  $109.54 \pm 2.65$  µg/mL) can be attributed to the presence of the Caucasian bee (*Apis mellifera caucasica*) in the Ardahan region, where it is widely distributed in Turkey. Its non-toxic effect on healthy cells (CCD18Co) ( $IC_{50}>200$  µg/mL) suggests a supportive role in cancer treatment and raises hopes for pre-clinical research against the side effects of chemotherapeutic products. In evaluating the effectiveness of royal jelly on lung and colon cancer, which are widespread worldwide, it is believed that there is a need for further evaluation of additional mechanisms of action to reduce the side effects of chemotherapy. Additionally, the assessment should include histopathological and additional biomarkers for cancer treatment, along with the parameters and genes/proteins tested in vitro.

**Keywords:** Royal jelly, cytotoxic effect, lung and colon cancer

#### Abstract

In this study, plant samples of *Mentha piperita*, *Salvia officinalis*, *Melissa officinalis*, *Achillea filipendulina*, *Echinacea purpurea* from Çorum province, and *Lavandula* species from Eskişehir, Çorum and Kütahya provinces were collected. The aim of the study is to determine and compare the antimicrobial activities of the extracts obtained from these plants on *Escherichia coli*-ATCC-25922, *Pseudomonas auriginosa*-ATCC-27853, *Staphylococcus aureus*- ATCC-29213 and *Enterococcus faecalis*-ATCC-29212. The plant extracts obtained using ethanol in the Soxhlet device and the EUCAST disc diffusion method used. Bacteria were suspended to a density standard of 0.5 McFarland (108CFU/mL). Three replicates at 3 different doses (15, 20 and 25µL) were used. Ethanol and standard Ciprofloxacin antibiotic disc (5mcg) were used as negative and positive control respectively. Then the petries were incubated at 37°C for 24h in an incubator. When all the plant extracts applied in three volumes, no considerable antimicrobial activity was observed on *E.coli* and *P.auriginosa*, and the zone diameters ranging from 4.67-14.33mm and 21.67-23.67mm were detected on *S.aureus* and *E.faecalis* respectively. The antimicrobial activity of the positive control was higher than that the plant extracts. However, it was observed that the *L.angustifolia* from Eskişehir and Kütahya produced the zone diameters close to the positive control on *S.aureus* and *E.faecalis*. The negative control displayed no antimicrobial effect on any bacteria in all volumes applied. According to the results of this study, *E.coli* and *P.auriginosa* were determined to be the most resistant and *S.aureus* and *E.faecalis* were the most sensitive microorganisms against the plant extracts. *L.angustifolia*-Eskişehir, *M.piperita* and *S.officinalis* attracted attention with their high antimicrobial activities. Conclusively, using different solvents and extraction methods more effective secondary metabolites could be obtained from medicinal aromatic plants and used more widely as natural products in alternative medication against pathogenic diseases, in food packaging, and in areas such as the pharmaceutical and cosmetic industries.

#### Abstract

Phytate is the main storage form of phosphorous in inositol ring in the plants. Phytase hydrolyses phytate and releases phosphorus from the structure. Monogastric animals including poultries, pigs, and fishes lack phytate-degrading enzymes in their gastrointestinal systems. Therefore, the animals cannot benefit from the phosphorus found in phytate in feed. Furthermore, phytate in the gastrointestinal systems of these animals cause chelation of metallic cations such as calcium, ferric, zincs, minerals, amino acids and proteins; therefore, it has anti-nutritional effects in feeding the monogastric animals. To eliminate its anti-nutritional effects and utilize phosphorus from phytate, phytase is added to feeds, and it has been used in the feeding of monogastric animals. Phytases from fungal and bacterial sources can be used for this purpose. Phytases obtained from the *Bacillus* species have several advantages such as high thermal stability, requirement of low calcium level for activation, substrate specificity, pH profile, and resistance to proteolysis. Even though phytase from several *Bacillus* species have been cloned and purified, phytase from *Bacillus mojavensis* has not studied, yet. Here, phytase gene from *B. mojavensis* TH309 strain was cloned into pet20b(+) expression vector for extracellular synthesis of phytase in *E. coli* BL21. Using special primers, phytase gene from *B. mojavensis* TH309 was amplified by PCR. The vector and PCR product were digested by *Bam*HI and *Eco*RI restriction enzymes and ligated by T4 DNA ligase. After obtaining recombinant plasmid called pet20b(+)-phytase, transformation and colony PCR were carried out to select clone. After isolation of the plasmid, DNA sequencing was carried out bidirectionally. BLAST analysis indicated that *B. mojavensis* TH309 phytase gene contained several mutations compared to *B. mojavensis* reference sequence. Three of the mutations are missense, R290G, T301K and N366D, which indicates the unique structure of the enzyme. Expression, purification, and characterization studies of the enzyme are in progress.

**Keywords:** Cloning, Sequencing, Phytase, *Bacillus mojavensis*

#### Abstract

Hyaluronic acid injection has increased rapidly in cosmetic applications. Although it seems safe, it causes complications such as nodules or papules, Tyndall effect (bluish discoloration of the skin), hypersensitivity, tissue necrosis, infections, microbial biofilms and granulomas. The use of hyaluronidase to treat is increasing day by day. Hyaluronidase enzyme is an endoglucosidase that breaks its substrate, hyaluronic acid, from its glucosidic bonds and separates it into monosaccharides. In our study, the hyaluronidase enzyme gene from *S. aureus* was amplified, cloned in pET-30a(+) expression vector and transformed into *E. coli* BL-21 (DE3) competent cell. Recombinant hyaluronidase enzyme production was induced with 5g/L lactose for 24 hours. Purification was performed by his-tag nickel affinity using the IMAC colulactos HPLC. It was determined by the agar-well diffusion method that there was a high level of enzyme activity in the fractions at the elution stage. Today, in addition to the complications listed above, hyaluronidase is used in the treatment of lumps, bumps and over corrections as a filling dissolving agent in incorrectly performed filling procedures. It is considered an effective tool in preventing serious complications. The recombinant microbial hyaluronidase (HysA-9) enzyme may have potential for use in cosmetics and medicine.

#### Abstract

Probiotics are microorganisms that live in our bodies and positively affect health when consumed regularly. One of the ways to have a healthy body is to have a healthy microbiota. Because of that, the importance given to the consumption of probiotic foods among the public is increasing. Since probiotics are especially abundant in fermented and traditional foods, consuming these foods is vital to have a healthy microflora. Among the specific properties of probiotics, adhesion is the one of the most significant features. Since the adhesion is the requirement for growth and colonization of probiotic bacteria and support the colonization resistance, adhesion abilities of probiotic bacteria should be evaluated. In this study, adhesion of bacteria isolated from tarhana, einkorn sourdough, Turkish and Bulgarian-type boza and pickled beetroot foods were investigated. According to the results, 7 strains showed over 35%, 4 strains showed over 50% adhesion and especially, two of the strains showed over 85% adhesion to Caco-2 cells. Afterwards, 16S rRNA sequencing was conducted for identification of bacteria at species level and identifying them under the *Lactobacillus* and *Enterococcus* genera.

**Keywords:** Probiotics, Lactic acid bacteria, traditional foods, adhesion

#### Abstract

Determination of pH value is considered to be a critical measurement utilized in a large number of applications. It is mainly used to evaluate the acidity of aqueous solutions in order to classify them as acidic or alkaline. There are several pH measurement methods. The most conventional and widely utilized method is the use of pH strips. While they have a lower level of precision than pH meters, they are known to be an economical and affordable measurement method to be used by non-experts users. The major drawback of this method is the large possibility of having scientific errors due to the limited ability of human eyes in precisely reading the strip's value, especially when highly accurate results are required. However, the availability of advanced technology and mobile phones nowadays provides a great advantage to overcome this challenge. For this purpose, a literature review was conducted about utilization of image processing in determining the accurate pH value from reading pH strips; by taking a picture of it using a mobile phone camera and analysing the color differences. Many researchers reveal that it is possible to determine the pH value by comparing the color of the strip with the reference solutions associated with the pH levels. Each researcher used this method for determining pH value for a specific substance. Our goal is to investigate the most recent applications that determine the pH value of solutions from the pH strips, providing essential information for researchers that aim to develop a mobile application regarding the determination of the pH value.

e-mail: ozgeberrak@gmail.com

#### Abstract

Breast cancer is the second most common cancer when its incidence is evaluated. Increases in breast cancer aggressiveness due to AMPK deregulation have triggered the development of AMPK-targeted therapy models. Metformin is a drug used in the treatment of type 2 diabetes mellitus, which reduces blood glucose levels by inhibiting gluconeogenesis, decreasing hepatic glucose production and improving insulin sensitivity. A 2014 meta-analysis showed that individuals using metformin had a lower incidence of breast cancer. Metformin suppresses anti-proliferative mammalian target of rapamycin and inhibits cell growth due to activation of AMP-activated protein kinase (AMPK). miR-506 has been shown to be anti-oncogenic and suppress tumor growth in vitro and in vivo studies. At the same time, miR-506 has been examined to have a role in regulating epithelial-mesenchymal transition (EMT) in breast cancer cell lines. It has been shown that high expression of miR-506 inhibits the proliferation and metastasis of breast cancer cells. The aim of this study is to examine the effect of metformin on the EMT signaling mechanism in MDA-MB-231 and MCF-7 breast cancer cells with increased miR-506 expression. According to the results obtained, the inhibitory effect of metformin on cell proliferation, colony formation, and migration in breast cancer cells was significantly increased when miR-506 expression was increased. As a result, miR-506 expression acts as a tumor suppressor in breast cancer cells and its enhancing effect of metformin has provided preliminary data for future in vivo studies.

**Keywords:** Breast cancer, AMPK, EMT, miR-506

\*Sorumlu yazar e-mail: ihsankaraboga@gmail.com

#### Abstract

The therapeutic properties of apilarnil, an apitherapy product, in a gastric ulcer model were examined in our study. Male Wistar albino rats (32) were used in the study. Rats were divided into 4 groups; Group I (Control, n=8), Group II (Ethanol, n=8), Group III (Apilarnil +Ethanol, n=8), Group IV (Lansoprazole + Ethanol, n=8). Ulcer was induced by oral administration of 1 ml absolute ethanol to rats in groups II, III and IV following the 24-hour fasting process. Apilarnil (0.8 g/kg) was administered to Group III rats 1 hour before ulcer induction, and Lansoprazole (30 mg/kg) was administered to Group IV rats. Ulcer index was calculated in the gastric mucosa. Histopathological changes in the gastric mucosa were revealed by Hematoxylin-Eosin (H&E) staining. Immunohistochemical inducible nitric oxide (iNOS) expression level was also determined in gastric tissue. Cellular death in the mucosa was shown by the TUNEL method. Superoxide Dismutase (SOD), Malondialdehyde (MDA) and Myeloperoxidase (MPO) levels that are the oxidative status markers in the stomach tissue were studied spectrophotometrically. Moreover, Interleukin 1-beta (IL-1 $\beta$ ) and Interleukin-10 (IL-10) levels in stomach tissues were determined by ELISA method. While apilarnil administration significantly improved the gastric ulcer index, gastric iNOS expression and mucosal apoptosis are significantly reduced ( $p<0.05$ ). Apilarnil application caused a significant increase in SOD level compared to the ulcer model group ( $p<0.05$ ), on the other hand, it caused a significant decrease in MDA and MPO levels ( $p<0.05$ ). In addition, Apilarnil administration provided a significant decrease in the level of IL-1 $\beta$  compared to Group II, and a significant increase in the level of the anti-inflammatory cytokine IL-10. The outcomes obtained in our study reveal the antioxidative and anti-inflammatory effects of Apilarnil and its protective properties on the gastric mucosa in the ethanol-induced gastric ulcer model.

**Key words:** Apilarnil, gastric ulcer, inflammation, oxidative stress

#### Abstract

Parvoviral enteritis is a very common disease in dogs in Turkey. The treatment of the disease is difficult and often results in puppy deaths. There are many studies on the pathogenesis of parvoviral enteritis, but the role of apoptosis is little known. The aim of this study is to investigate the relationship between disease and apoptosis in dogs naturally infected with parvovirus. Intestinal tissues of 18 dogs diagnosed with parvoviral enteritis were used as material. TUNEL method was used to determine apoptosis. Histopathological examination revealed shedding of intestinal villus epithelium, villus mass, dilatation of crypts, and desquamation with necrosis of crypt epithelium. TUNEL staining found few tunnel positive epithelial and connective tissue cells in control tissues. A statistically significant number of TUNEL positive cells were found in infective tissues compared to control tissues. These results suggested to us that there was a positive correlation between Parvoviral enteritis and apoptosis. Apoptosis studies with different markers will contribute to the mechanism of the disease.

**Keywords:** TUNEL, Parvoviral Enteritis, Immunohistochemistry

#### Abstract

DEET, also known by its chemical name N,N-diethyl-meta-toluamide, is the main component in many repellents. It is frequently used to keep off biting insects like ticks and mosquitoes. As natural and regarded as safer, p-menthan-3,8-diol (PMD) is a well-known repellent active product against mosquitoes exhibiting an exceptional repelling action. *Corymbia citriodora*, formerly known as *Eucalyptus citriodora*, is a plant with leaves that yield an essential oil that contains trace amounts of PMD. Aim of this study was to evaluate the effects of the synthetic n,n-diethyl-meta-toluamide (DEET) and PMD (Bioarge) produced by green chemistry method on the development and oxidant antioxidant parameters of zebrafish embryos. Zebrafish embryos were exposed to DEE) and PMD (Bioarge) for up to 72 hours post fertilization (hpf). Developmental parameters, mortality and hatching rates were monitored and documented daily during embryonic development. Oxidant-antioxidant status of the embryos were evaluated through lipid peroxidation, glutathione S-transferase and superoxide dismutase activities determined at 72 hpf. Significant alterations were observed in the oxidant-antioxidant parameters of the DEET and PMD exposed embryos. Delayed hatching, developmental defects and increased mortality rates were observed in the zebrafish embryos exposed to DEET when compared with PMD. When all these results are evaluated, naturally sourced PMD produced by the green chemistry method was more biocompatible and showed less toxic effects on zebrafish embryos than synthetic DEET in terms of mortality and hatching rates. These results have emphasized the importance of green chemistry method in producing insect repellents.

#### Abstract

Apoptosis, also known as programmed cell death, is a critical process for all organisms and serves as an essential component of the cell cycle. It plays a vital role in the elimination of damaged or dysfunctional cells. Certain plants, such as garlic, onion, and broccoli, are rich in organosulfur compounds. Compounds like allicin, diallyl trisulfide, and S-allyl cysteine have the potential to inhibit the growth of cancer cells and promote apoptosis. In this study, molecular docking analysis was used to understand how the mentioned organosulfur compounds (S-allyl cysteine, diallyl trisulfide, allicin, allyl mercaptan, captopril, glucosinolate) interact with genes crucial to the apoptosis process (CASP3, CASP7, CASP8, CASP9, BAX, BCL-2, p53 ve TNF $\alpha$ ). Additionally, the SWISS ADME tool was utilized to assess the physicochemical properties, bioavailability, and potential toxicities of these compounds. The results indicate a positive correlation between organosulfur compounds found in garlic and critical proteins in the apoptosis process. SWISS ADME and molecular docking assessments have shown that glucosinolate and captopril ligands exhibit strong binding to proteins associated with the apoptotic pathway. The interaction between glucosinolate and CASP9 protein (PDB ID: 2ar9) has the highest binding affinity with a value of -7.3 kcal/mol. The low free energy value and identified interactions indicate that glucosinolate and captopril ligands may serve as effective potential activators for protein targets associated with the apoptotic pathway. SMILES data reveal the potential of allicin, allyl mercaptan, diallyl trisulfide, and captopril as drug candidates. These findings pave the way for more extensive studies to deeply explore the potential of organosulfur compounds in modulating apoptotic pathways and their possible treatment in cancer therapy.

#### Özet

Tarım atıklarının katma değeri yüksek, değerli ürünlere dönüştürülmesi hem ekonomik hem de çevresel olarak oldukça önemli bir konudur. Özellikle ceviz gibi bol bulunan ve kullanımı geniş olan ağaçların atıkları bu bağlamda büyük potansiyele sahiptir. Bu atıkların yapısı itibarıyla en uygun değerlendirme yöntemlerinden birisi biyochar üretmektir. Biyochar, piroliz adı verilen bir termokimyasal reaksiyon sonucu açığa çıkan ve biyoyakıt, adsorbent ve toprak iyileştirici gibi önemli alanlarda kullanılabilen değerli bir katı üründür. Bu çalışmanın amacı ceviz ağaçlarından kuruyup düşerek çevresel kirliliğe sebep olan yaprakların biyochar üretiminde kullanılma potansiyellerinin belirlenmesi ve piroliz reaksiyonu mekanizmasının termogravimetrik yöntemle incelenmesidir. Bu kapsamda kuru ceviz yapraklarından farklı sıcaklıklarda (400, 500 ve 600 °C) biyochar üretilmiş ve üretilen biyocharların karakterizasyonları yapılmıştır. Ayrıca piroliz kinetiği parametreleri Coats-Redfern yöntemi kullanılarak hesaplanmış ve en uygun kinetik modeller ve piroliz kinetiği parametreleri belirlenmiştir. Elde edilen sonuçlara göre en yüksek verimde biyochar 400 °C sıcaklıkta üretilmiş olup, sıcaklık arttıkça biyochar verimi düştüğü görülmüştür. Kinetik hesaplamalarına göre ceviz yaprağının pirolizi için en uygun model ikinci-derece (F2) modeldir ve bu modelde hesaplanan piroliz aktivasyon enerjisi ve regresyon katsayısı değerleri sırasıyla 66.90 kJ/mol ve 0.966'dır. Elde edilen biyochar ve kinetik sonuçlarına göre kuru ceviz yaprağı atıklarının biyochar üretimi için oldukça uygun bir kaynak olduğu ve üretilen biyocharların katı biyoyakıt olarak kömüre alternatif ya da kömürle karıştırılarak yakma sistemlerinde kolaylıkla kullanılabilceği anlaşılmıştır.

**Anahtar Kelimeler:** Ceviz yaprağı, Biyochar, Piroliz, Kinetik, Termogravimetrik analiz, Coats-Redfern

#### Özet

Bilindiği gibi dopamin (DA), ürik asit (UA) ve askorbik asit (AA) insan serumundaki önemli bileşiklerdir ve bu bileşiklerin elektrokimyasal olarak deteksiyonu alanında dünya çapında birçok sensör çalışmaları yapılmaktadır. Geliştirilen elektrokimyasal sensörlerde performans, maliyet, dayanıklılık, doğruluk, kesinlik, kullanılabilirlik gibi değerler açısından istenilen değerler elde edilmeye çalışılmaktadır. Bu çalışmada öncelikle genel sensör türlerinden ve deteksiyonu yapılan biyomoleküllerden ve yapılarından teorik olarak bahsedilmiştir. Daha sonra da dopamin (DA), ürik asit (UA) ve askorbik asit (AA) tayini yapabilen bazı güncel elektrokimyasal sensör çalışmaları incelenmiş ve kısaca bu çalışmalar açıklanmıştır. Üretilen elektrokimyasal sensörlerin kimyasal bileşimleri, algılama sınırları (LOD) ve performansları da tablo halinde sunulmuştur. Ayrıca ele alınan sensörlerin kimyasal olarak üretim aşamaları da gösterilmiştir. İncelenen sensörler birbirleriyle malzeme, algılama sınırı, maliyet vb. değerler açısından kıyaslanarak bir değerlendirme yapılmıştır.

**Anahtar Kelimeler:** Elektrokimyasal sensör, dopamin, ürik asit, askorbik asit

#### Abstract

In order to preserve the safety and quality of cosmetic products during their shelf life, preservatives are included in their compositions to give protection against microbiological growth. Preservative selection and quantification are crucial in the design and development of cosmetic formulations. According to the regulations, benzoic acid and benzyl alcohol are among the preservatives that are allowed to be utilized in limited quantities in cosmetic formulations. Aim of this study was to evaluate the effects of the liquid natural preservative (Preallnat 65, Bioarge) on the development and oxidant antioxidant parameters of zebrafish embryos and compare with the synthetic preservative. The natural preservative contained natural benzoic acid, benzyl alcohol, phenylpropanol from *Cinnamomum Cassia*, and natural pentylene glycol from corn and sugar cane whereas, the synthetic preservative consisted of synthetic benzoic acid and synthetic benzyl alcohol. Zebrafish embryos were exposed to the natural and synthetic preservative for up to 72 hours post fertilization (hpf). Developmental parameters, mortality and hatching rates were monitored and documented daily during embryonic development. Oxidant-antioxidant status of the embryos were evaluated through lipid peroxidation, glutathione S-transferase and superoxide dismutase activities determined at 72 hpf. Significant alterations were observed in the oxidant-antioxidant parameters of the natural and synthetic preservative exposed embryos. Zebrafish embryos exposed to the synthetic preservative hatched later, delayed in development, and had a higher mortality rate than those exposed to natural preservative. According to our findings, natural preservative was found to be more biocompatible in zebrafish embryos than synthetic preservative in terms of mortality rates, embryo development, hatching rates and malformations. Our results have shown the importance of green chemistry method in producing preservatives used in cosmetic products.

**Key words:** Preservatives, cosmetic products, green chemistry, zebrafish embryos

#### Abstract

Insects are found almost everywhere, including deserts and mountainous regions. Identification and classification of these creatures, which have a wide variety and distribution, are generally based on morphological parameters, and this is not easy and requires a long time. Furthermore, the experience of the researcher is significant in their diagnosis. Barcoding based on gas and liquid chromatography-mass spectrometry analytical methods and DNA-based techniques have been developed to overcome these classification obstacles. Although these techniques are susceptible, they often require many individuals, sophisticated, specialized equipment and expensive reagents. Therefore, as an alternative to morphology-based methods, there is a need for an efficient, user-independent, fast, inexpensive and non-destructive method without requiring sample preparation. One of the techniques with these advantages is Fourier transform infrared (FTIR) spectroscopy. Based on reflectance measurement, this technique's attenuated total reflectance (ATR) module enables direct spectrum acquisition from samples and is, therefore, widely used in biological spectroscopy studies. Recent studies have shown that FTIR spectroscopy effectively determines the biochemical content (lipids, proteins, cellular processes) of plants and insects. Information about differences in biochemical components can be obtained from FTIR spectra, which can be used to discriminate between species based on their spectral characteristics. Because the cuticle of each species has a unique biochemical composition, FTIR spectrum is a method that reveals this composition as a fingerprint. This study developed a method for identifying female individuals of 3 different species of the genus *Laccophilus* based on FTIR spectra using multivariate analysis techniques. Chemometric findings based on the spectral data obtained show that all three species are distinguished with 100% sensitivity and specificity.

**Keywords:** Insect, Dytiscidae, *Laccophilus*, Classification, FTIR.

## Özet

Gelişmekte olan ülkelerdeki kentleşme ve nüfus artışı, tatlı su talebini ve atık su üretimini artırmaktadır. Kontrolsüz atık su deşarjı, çevresel kirliliğe neden olmakta, tatlı su kaynaklarını, ekosistemleri ve insan sağlığını tehdit etmektedir. Bu nedenle, atık suyun arıtılması küresel bir zorunluluktur. Atık su arıtımının maliyetleri ve aşırı kimyasal kullanımı çeşitli sorunlar yaratmaktadır. Bu bağlamda, bilim insanları, yeşil ve sürdürülebilir teknolojilere odaklanmıştır. Mevcut literatürde, ökaryotik bir organizma olan *Tetrahymena thermophila*'nın atık su arıtımı üzerine yapılmış bir çalışma bulunmamaktadır. Bu çalışma, literatüre yeni bir bakış açısı getirmek amacıyla yürütülmüş ve elde edilen ön veriler ışığında, *Tetrahymena thermophila*'nın atık sulardaki organik madde giderimi için kullanılabilirliğine yönelik potansiyel sunması ve gelecekteki çalışmalar için bir temel oluşturması hedeflenmiştir. Çalışma kapsamında, *Tetrahymena thermophila*'nın sentetik atık sulardaki KOI (Kimyasal Oksijen İhtiyacı) üzerindeki etkisini değerlendirebilmek için öncelikle atık suyun toksisitesinin belirlenebilmesi için MTT testi yapılmış ve LD50 değeri (350 mg/L) belirlenerek kinetik (10 dakikadan 24 saate kadar), pH (4-9 arası) ve sıcaklık (20-40 °C arası) parametreleri analiz edilmiştir. Kinetik çalışmanın sonuçları, 20. dakikadan sonra ortamdaki kirliliğin arttığını göstermiş ve en yüksek giderim verimliliğinin %27,97 ile 10. dakikada olduğunu belirlemiştir. Ayrıca, pH 7'de %25 ve 30 °C'de %23 arıtım performansı gözlemlenmiştir. Bu sonuçlar, *Tetrahymena thermophila*'nın atık su gideriminde potansiyel bir uygulama için umut vermektedir. Bu nedenle, protokolün optimize edilmesi için çeşitli çalışmaların yapılması planlanmaktadır.

#### Abstract

Aerogel materials have emerged as a highly versatile class of materials due to their exceptional properties, including low density, high porosity, and excellent thermal insulation. These unique characteristics make aerogels suitable for a wide range of applications, such as energy storage, catalysis, and environmental remediation. Biowaste, comprising organic residues from agricultural, forestry, and food industries, represents a promising and sustainable feedstock for the synthesis of aerogel materials. Utilizing biowaste not only addresses the issue of waste management but also contributes to the development of eco-friendly materials. The drying process employed during the synthesis significantly influences the final properties and performance of the aerogels. Various drying methods, including atmospheric, freeze, and supercritical drying, can be employed to eliminate the solvent from the gel skeleton. The drying process plays a crucial role in the fabrication of aerogels, as it involves the removal of liquid solvents from the wet gels while preserving their nanoporous structure to prevent shrinkage and cracking during the drying phase. Therefore, it is imperative to explore and compare different drying methods to optimize the synthesis of aerogel materials from biowaste. Atmospheric drying relies on the capillary force generated by the surface tension of the solvent. However, this method can cause the wet gel to collapse due to its low mechanical properties. Freeze-drying, on the other hand, is suitable for gels prepared using water-soluble polyamic acid as a precursor. Supercritical fluid drying, utilizing supercritical carbon dioxide, has emerged as a reliable method for producing high-performance aerogels, both inorganic and organic. Supercritical drying is a single-phase process that avoids the surface tension at the phase boundary, thus preserving the nano-structure of the aerogel. In this study, two drying methods; supercritical carbon dioxide drying and atmospheric drying, were employed to synthesize aerogel materials from biowaste. The results revealed that the aerogels dried using the supercritical carbon dioxide method exhibited a more uniform pore size distribution and satisfactory surface area with an amorphous structure.

**Keywords:** Aerogel, Biowaste, Supercritical drying

#### Abstract

Within the FHD-2023-4261 project, flavored spreadable oleogels were prepared and rheological characterized using cold-pressed Tiger nut oil (*Cyperus esculentus* L.) and beeswax. For this purpose, unflavored (TBO), butter (TBO-BU) and honey (TBO-HM) flavored oleogels were prepared with beeswax and tiger nut oil. First of all, the oscillatory strain (%),  $G'$  and  $G''$  changes of the samples were detected in the linear viscoelastic region (LVR), which is a range where gel structures can be kept under a certain strain without deterioration. The LVR strain values TBO, TBO-BU and TBO-HM were found to be % 0.0641, 0.0254 and 0.0163, respectively. Frequency sweep tests were performed to identify time-dependent behaviour in the LVR. It was detected that all of the oleogels met the  $G' > G''$  condition, did not show free flow but exhibited solid-like behaviour and had a gel structure with the results of the frequency sweep test. The thixotropic behaviour of oleogels was examined by the time sweep test. Different strain values were applied to the oleogels at constant temperature and constant frequency at three different time intervals (in the first region; (strains determined in LVR), in the second region; (LVR strain  $\leq$  Strain), in the third region; (LVR strain  $\geq$  Strain)). The oleogels had thixotropic behaviour. Temperature ramp tests at constant amplitude and constant frequency were performed to examine their flow behaviour at different temperatures. It was observed that the flow behaviour of all oleogels was greatly affected by temperature and  $G'$  and  $G''$  values gradually decreased with the increase in temperature. Rheological characterization of the produced oleogels is extremely important in determining the application areas of the food product.

**Key words:** wax oleogels, tiger nut oil, rheology, stability, flavor

#### Abstract

Cisplatin and its derivatives continue to play a significant role in tumor therapy today, although drug resistance and cell toxicity limit their usage. Platinum(II) complexes containing benzimidazole ligands (Fig 1.) have been reported as cytotoxic against various cancer cell types. The objective of this investigation was to construct platinum(II) complexes [Pt(L)(DMSO)Cl<sub>2</sub>] containing 2-/3-/4-(benzimidazol-2-yl)phenol ligands and evaluate their *in vitro* cytotoxic effects on HeLa human cervix and A549 human lung cancer cell lines. The benzimidazole ligands were synthesized through the reaction between 1,2-phenylenediamine and 2-/3-/4-hydroxybenzaldehyde. The formation of [Pt(L)(DMSO)Cl<sub>2</sub>] complexes was achieved through the reaction between benzimidazole ligands and cis-Pt(DMSO)<sub>2</sub>Cl<sub>2</sub>. The synthesized complexes were characterized, and their *in vitro* cytotoxic activity was examined using the MTT test. As a result, the **Pt2** and **Pt3** complexes have demonstrated significant potential for further investigation owing to their moderate *in vitro* cytotoxic activity, which is comparable to carboplatin.

**Keywords:** Platinum complexes, Cytotoxicity, A549, HeLa

<sup>2</sup>Benli Recycling Technologies, Eskişehir, Türkiye

\*haakdamar@eskisehir.edu.tr

#### Özet

Günümüzde, sanayileşme, nüfus artışı ve globalleşme gibi etkenler, tatlı su kaynaklarının kirlenme ve tükenme sorunlarını ciddi bir şekilde artırmaktadır. Bu etkenler hem ekosistemler hem de insan sağlığı üzerinde olumsuz etkiler oluşturmaktadır. Özellikle sulama amaçlı kullanılan tatlı su kaynaklarının sürdürülebilir bir şekilde korunması, gıda güvenliği açısından son derece kritik bir öneme sahiptir. Ancak, sulama sularına karışan bor (B) gibi kirlenmeler, yalnızca çevresel sorunlara yol açmakla kalmayıp aynı zamanda ürünlerde ve insanlarda toksik etkilere neden olmaktadır. Su kaynaklarından borun (B) etkili bir şekilde uzaklaştırılması ise geleneksel yöntemlerle oldukça karmaşık ve zor bir süreç içermektedir. Silli protozoanlar arasında *Tetrahymena* türleri, çevre araştırmaları ve toksikoloji çalışmalarında kullanılan en popüler model organizmalardandır. Literatürde, *Tetrahymena thermophila* üzerinde biyoremediasyon çalışmaları oldukça sınırlı olup Bor giderimi açısından bir çalışmaya rastlanmamıştır. Önerilen bu proje ile *Tetrahymena thermophila* protistinin Boron biyoremediasyonu potansiyeli araştırılmıştır. Öncelikle organizma üzerinde Bor'un farklı konsantrasyonlardaki toksisitesi analiz edilip, LD50 dozu MTT testi ile belirlenmiş ve 20 ppm olarak bulunmuştur. Çalışma kapsamında, farklı temas sürelerinde (15 dakikadan 24 saate kadar), pH değerleri (4-9) ve sıcaklık aralıkları (20-40°C) kullanılarak gerçekleştirilen kinetik, pH ve sıcaklık belirleme çalışmaları yapılmıştır. Sonuçlar, 2 saatlik temas süresi, pH 8 ve 30 °C'de %24,17 ile %24,67 arasında değişen maksimum B giderim verimliliği elde edildiğini göstermektedir. Bulgular, ökaryot *Tetrahymena thermophila* organizmasının biyoteknolojik araştırmalarda kullanılabilirliğinin ötesinde ekoteknolojik uygulamalara da umut verdiğini ve bu organizmanın sulama sularındaki B'un toksisitesini azaltma amacıyla kullanım potansiyelini yansıtmaktadır. Bu sonuçlar ışığında çalışmanın ileri düzeyde geliştirilmesi ve optimize edilmesi ile B biyoremediasyonu için alternatif bir yöntem geliştirilebilecektir.

**Anahtar Kelimeler:** Çevre Biyoteknolojisi, Biyoremediasyon, Boron giderimi, *Tetrahymena thermophila*.

#### Özet

Genetik olarak düzenlenen ve organizmayı çevresel faktörlerin de etkisiyle meydana gelen yapısal/işlevsel değişimlerle ölüme sürükleyen olaylar bütünü olarak tanımlanan yaşlanma, hücrenin karmaşık ve merak uyandıran fenomenlerinden biridir. Yüksek ökaryotlardaki yaşlanma ilişkili yolların mayalar gibi basit ökaryotlarda da iyi korunduğunun bilinmesi bu organizmayı yaşlanma süreci hakkında yeni bilgilerin elde edilmesi çalışmalarında popüler bir model organizma haline getirmiştir. Bu çalışmada, insan Bcl-2, Bcl-xL ve Mcl-1 proteinlerinin hücre yaşlanması üzerindeki olası koruyucu etkileri ilgili proteinleri ektopik olarak ifade eden *Saccharomyces cerevisiae* BY4741 suşu kullanılarak incelenmiştir. Çalışmada öncelikle yaşlı geç stasyonere faza ulaştırılan hücrelerin FE-SEM görüntüleri alınarak morfolojik değerlendirmeleri yapılmış ve genç eksponansiyel faz hücrelerine göre çarpıcı değişimler gösterdikleri kaydedilmiştir. Boş vektörü taşıyan ve kontrol grubunu oluşturan geç stasyonere faz hücrelerine kıyasla plazmid DNA taşıyan yaşlı hücrelerdeki canlılık koloni oluşturan birim (CFU) yöntemi ile tespit edilmiş ve özellikle Bcl-2 proteinini ifade eden transforme suşun daha fazla proliferasyon olduğu görülmüştür. Söz konusu proteinlerin geç stasyonere faza giren yaşlı hücrelerdeki canlılık-ölüm yüzdeleri üzerindeki etkilerini aynı zamanda flow sitometrik Annexin V-PI testi ile de irdelenmiştir. CFU yöntemi ile uyumlu olarak kontrol grubuna kıyasla özellikle Bcl-2 proteinini ifade eden transforme suşun hücre canlılığında anlamlı bir artış belirlenmiştir. Ayrıca, ilgili proteinlerin ifadenmesine bağlı olarak hücrenin biyokimyasal kompozisyonunda meydana gelen değişimler Fourier Dönüşümlü Kızılötesi Spektroskopisi (FTIR) tanımlanmıştır. Elde edilen verilere göre kontrol grubuna kıyasla plazmid DNA'larını taşıyan hücrelerde özellikle lipid ve mannan konsantrasyonlarının değiştiği görülmüştür. Elde edilen sonuçlar, yaşlanma ilişkili oksidatif stres karşısında başta Bcl-2 proteini olmak üzere bu proteinlerin önemli koruyucu roller oynadığına işaret etmektedir.

**Anahtar Kelimeler:** *Saccharomyces cerevisiae*, Yaşlanma, Oksidatif Stres, Bcl-2, Bcl-xL, Mcl-1

### Antimikrobiyal maddeler için lipozomal formülasyon

Münevver Müge Çağal\* (ORCID ID: 0000-0002-1786-1216)

Bursa Teknik Üniversitesi, Mühendislik ve Doğa Bilimleri Fakültesi, Biyomühendislik Bölümü, Bursa,  
Türkiye

\*munevver.cagal@btu.edu.tr

#### Özet

Lipozomlar sulu bir merkezi çevreleyen bir ya da daha fazla fosfolipit çift tabasından oluşan veziküller yapılarıdır. Lipozomlar yapısal özellikleri, kompozisyonları, çeşitleri ve hazırlama yöntemleri ile birçok avantaja sahip olmaktadır. Günümüzde gıda, kozmetik, tıp, eczacılık, tekstil gibi birçok farklı alanda kullanılabilir. Lipozomlar bu alanlarda ilaç taşıyıcı sistemler olarak işlev görmektedir. Lipozomların ilaç taşıyıcı sistemler olarak işlev görmesi; test edilecek maddenin lipozom içine enkapsüle olmasını ve hedef lokasyonda salınmasını sağlamaktadır. Lipozomların bir enkapsülasyon aracı olarak kullanılması antimikrobiyal açıdan da önemlidir. Günümüzde sıklıkla antimikrobiyal açıdan test edilmek istenen ajanlar; peptitler, antibiyotikler, biyoaktif bileşikler, ekstraktlar, esansiyel yağlar ve metal iyonları lipozomlarda enkapsüle edilmektedir. Lipozomal enkapsülasyon, biyoaktif bileşiklerin hidrofobik özellikte olmasına göre lipozomların membranındaki fosfolipit kısımlarına ya da sulu merkezine tutunmasıdır. Lipozomal formülasyon bir ilaç taşıyıcı sistem olarak kullanılıyorsa enkapsülasyon canlı organizmadaki hedefe ulaşılan kadar devam etmektedir. Enkapsülasyon farklı parametrelere bağlı olsa da (ilaç/lipit oranı, ilacın alıkonması, ilaç ve lipozomun stabilitesi vb.) temelde 2 farklı teknik ile biyoaktif bileşikler lipozomlar içerisine enkapsüle olabilmektedir. Bu teknikler; ilaç enkapsülasyonunun vezikül oluşumu sürecinde gerçekleştiği pasif enkapsülasyon ve oluşumu tamamlanmış veziküllere biyoaktif bileşiklerin yüklendiği aktif enkapsülasyondur. Genel olarak lipozomların en önemli avantajları ise enkapsüle edilen maddenin toksisitesini azaltması ile daha az miktarda etken maddeden daha çok biyoyararlanım elde edilmesidir.

**Anahtar Kelimeler:** Lipozom, Antimikrobiyal Maddeler, Formülasyon

<sup>2</sup>Gazi Üniversitesi, Fen Fakültesi, Biyoloji Bölümü, Ankara, Türkiye.

\*Sorumlu yazar e-mail: [acelya.seyrek@gazi.edu.tr](mailto:acelya.seyrek@gazi.edu.tr)

#### Özet

Üleksit (UX), bor bileşiklerinden biridir. Epoksi ve polipropilen kompozitlerde, otomotiv fren balatalarında ve sürtünme malzemelerinde, vitrifiye karo üretiminde, radyasyon koruyucu betonlarda, katalitik kağıt üretiminde ve dekoratif cam kaplama gibi çok çeşitli endüstriyel alanlarda kullanılmaktadır. Diğer yandan UX, çeşitli organizmalarda, antioksidan savunma sistemini teşvik etmesi, manyetik nanopartiküllerin neden olduğu oksidatif stresi azaltarak, ağır metallere karşı koruma sağlaması kısaca koruyucu yönde etkili olması nedeniyle önemle incelenmeye başlanan bir bileşiktir. Bu nedenle, bu çalışmada, UX'in *in vitro* genotoksik ve antigenotoksik potansiyeli, insan periferel lenfositlerinde komet testi ile araştırılmıştır. İki sağlıklı genç donörden elde edilen izole lenfositler, UX'in tek başına dört farklı konsantrasyonu (2,5; 5, 10 ve 20 µg/mL) ve aynı dozlar ile eş zamanlı şekilde H<sub>2</sub>O<sub>2</sub> (100 µM) ile muamele edilmiştir. Her muamele için bir negatif (saf su) ve bir pozitif (100 µM H<sub>2</sub>O<sub>2</sub>) kontrol kullanılmıştır. Komet kuyruk uzunluğu (µm), kuyruk yoğunluğu (%DNA) ve kuyruk momentleri değerlendirilmiştir. Floresan mikroskobuna bağlı "Comet Assay IV" programı kullanılarak (Perceptive Instruments Ltd., İngiltere), her konsantrasyon için toplam 200 (her donör için 100) nükleoid değerlendirilmiştir. Elde edilen sonuçlara göre, negatif kontrole kıyasla, UX'in tek başına uygulamasında, kuyruk uzunluğunda 2,5 ve 5 µg/mL'lik konsantrasyonlarda istatistiksel olarak anlamlı azalmalar meydana gelirken, 10 ve 20 µg/mL'lik konsantrasyonlarda ise anlamlı artış olmuştur. UX+H<sub>2</sub>O<sub>2</sub> eş zamanlı uygulamasında, incelenen tüm parametrelerde (kuyruk uzunluğu, kuyruk yoğunluğu ve kuyruk momentleri), pozitif kontrole kıyasla anlamlı düşüşler gözlenmiştir. Tüm veriler birlikte değerlendirildiğinde, UX'in DNA'da genelde anlamlı bir DNA hasarına neden olmadığı, daha ziyade, H<sub>2</sub>O<sub>2</sub>'nin sebep olduğu DNA hasarına karşı antigenotoksik bir potansiyele sahip olduğu görülmektedir. Ancak UX'in olası genotoksik ve antigenotoksik potansiyeli için daha farklı testler kullanılarak hem *in vitro* hem de *in vivo* detaylı araştırmalar yapılması gerekmektedir.

**Teşekkür:** Bu çalışma, Gazi Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından (Proje kodu: FYL-2023-8246) desteklenmiştir.

**Anahtar Kelimeler:** Üleksit, Hidrojen peroksit, Genotoksisite, Antigenotoksisite, Komet testi

#### Özet

Boratların en yaygın şekli olan borik asit (BA), günümüzde sağlık, kozmetik, cam, pestisit, yangın geciktirici, gıda ve biyositler gibi pek çok alanda yaygın bir şekilde kullanılmaktadır. BA, bitki, insan ve hayvanlarda hücre büyümesini, çoğalmasını ve gelişimini etkilemektedir. BA, kanserojen, mutajen ve genotoksinlerin neden olduğu DNA hasarına karşı antigenotoksik özellik göstermektedir. Bu çalışmada, BA'nın hem tek başına olası genotoksik ve hem de hidrojen peroksit ( $H_2O_2$ -100  $\mu M$ ) ve bakır oksit nanopartikülüne (CuO NP-100  $\mu g/mL$ ) karşı olası antigenotoksik potansiyeli, *in vitro* insan lenfositlerinde komet testi kullanılarak araştırılmıştır. İzole lenfositler, BA'nın beş farklı konsantrasyonu (0,5; 0,25; 0,125; 0,0625 ve 0,0313  $\mu g/mL$ ) ile hem tek başına ve hem de hidrojen peroksit (BA+ $H_2O_2$ ) ve CuO NP (BA+CuO NP) ile eş zamanlı olarak 1 saat muamele edilmiştir. Ayrıca, bir negatif kontrol (distile su) ve 2 farklı pozitif kontrol (100  $\mu M H_2O_2$  ve 100  $\mu g/mL$  CuO NP) grubu kullanılmıştır. Her konsantrasyon için 200 nükleoid incelenmiş ve DNA hasarı, komet kuyruk uzunluğu ( $\mu m$ ), kuyruk yoğunluğu (%DNA) ve kuyruk momentini açısından değerlendirilmiştir. Yapılan analizlere göre, BA'nın tek başına muamelesi, negatif kontrole kıyasla, DNA hasarını hiç bir parametrede artırmamıştır. Tam tersine, BA+ $H_2O_2$  eş zamanlı muamelesi, kuyruk uzunluğu ve kuyruk yoğunluğunda, pozitif kontrole ( $H_2O_2$ ) kıyasla anlamlı bir azalma oluşturmuştur. BA+CuO NP eş zamanlı uygulaması, pozitif kontrole (CuO NP) kıyasla, kuyruk uzunluğunu anlamlı olmayan şekilde azaltmıştır (0,5  $\mu g/mL$  hariç). Kuyruk yoğunluğu ve momentinde ise anlamlı olmayan değişiklikler görülmüştür (0,5  $\mu g/mL$  hariç). Bu sonuçlar, BA'nın tek başına DNA hasarı oluşturmadığını, tam tersine,  $H_2O_2$  ve CuO NP'nin oluşturduğu DNA hasarlarını iyileştirici/antigenotoksik potansiyele sahip olduğunu göstermektedir. Ancak daha güvenilir sonuçlara ulaşabilmek için, diğer *in vitro* ve *in vivo* genotoksisite testleri ile daha detaylı araştırmalar yapılması gerekmektedir.

**Anahtar Kelimeler:** Borik asit, hidrojen peroksit, bakır oksit nanopartikülü, genotoksisite, antigenotoksisite, komet testi.

#### Abstract

The RAS proteins, specifically KRAS, HRAS, and NRAS, serve as binary molecular switches, undergoing dynamic transitions between their active (GTP-bound) and inactive (GDP-bound) states. These proteins hold a pivotal role in the regulation of critical cellular signalling pathways governing fundamental processes such as cellular differentiation, proliferation, and viability. Particularly, KRAS stands out as the most frequently mutated oncogene in human malignancies, manifesting in approximately 30% of cases. Historically, targeting KRAS has posed a formidable challenge due to its robust affinity for GDP and GTP molecules within intracellular environments. However, recent scholarly literature has advanced several pharmaceuticals as potent inhibitors of KRAS, thus offering promising prospects in the realm of anticancer therapeutics.

**Figure 1.** (left) Pharmacophore-based virtual screening flowchart (right) screened ligand with the highest docking score along with KRAS protein

In this scope, we have applied various computational techniques, including pharmacophore-based virtual screening through Pharmit, to uncover potent KRAS inhibitors. Specifically, PubChem database, which contains 103,302,052 compounds, was employed using a pharmacophore model based on the 91S/KRAS co-crystallized receptor structure (PDB ID: 5V9U). After implementing pharmacophore and Lipinski's filters, we identified 87 promising compounds for subsequent molecular docking simulations. To this purpose, target molecules were constructed using GaussView 5.0.8, and further refined their geometry through optimization studies using Gaussian 09 with the DFT/B3LYP/6-31G(d,p) method. To assess the compounds' efficacy and their compatibility with drug-like characteristics, we conducted ADMET evaluations utilizing SwissADME, OSIRIS, Molinspiration, Toxtree and an AI-driven platform, Syntelly. Simultaneously, we also performed molecular docking simulations (via SAMSON platform/2022-R2 and OneAngstrom/AutoDock Vina Extension) to unveil the binding potential of these screened candidates as potent KRAS inhibitors.

**Keywords:** KRAS, pharmit, virtual screening, molecular docking, ADMET.

\*Sorumlu yazar e-mail:cigdem.yuksel@cbu.edu.tr

#### Özet

Aktinobakteriler, tedavide kullanılan antibiyotikler başta olmak üzere, bitki büyümesini teşvik edici maddeler, antimikrobiyal, antitümöral ve antiinflamatuvar ajanlar olarak da bilinen önemli kimyasalları ve metabolitleri üretme potansiyeline sahiptirler. Bu metabolitlerin çoğunluğu, endüstriyel olarak tekstil, fırıncılık, tıp, biyoteknoloji ve tarım sektörü gibi farklı alanlarda uygulama olanağı bulunmaktadır. Birçok mikrobiyal patojenin mevcut tedavide kullanılan antibiyotiklere karşı direncinin ortaya çıkması ve fungal enfeksiyonlarının sayısındaki artış, biyolojik olarak aktif bileşiklerin yeni rezervlerinin bulunmasına olan ilginin artmasına neden olmuştur. Bu nedenle, araştırmacılar son zamanlarda daha etkili yeni biyolojik aktif bileşiklerin keşfi için yoğun çalışmalar gerçekleştirmektedir. Bu çalışmada, farklı habitatlardan alınan toprak örneklerinden aktinobakteri izolasyonları gerçekleştirilmiş ve antimikrobiyal aktiviteleri belirlenmiştir. Aktinobakteri izolasyonu için toprak örneklerinin her birinden 10 g alınarak steril petrilere aktarılmış ve üzerine 0.1 g CaCO<sub>3</sub> ilave edilerek 2 gün ön işlemden geçirilmiştir. Sonrasında farklı dilüsyonları hazırlanarak uygun seyreltmelerden 1'er ml steril petri kabına aktarılarak üzerine 45-50 °C'ye kadar soğutulmuş International Streptomyces Project (ISP) 2 ve Potato Dekstroz Agar (PDA) besiyerlerinden eklenmiştir. Homojen karışım sağlandıktan sonra petrilere 30 °C'de 7-21 gün inkübasyona bırakılmıştır. İnkübasyonun 2. gününden itibaren ekimi yapılan besiyerleri çıplak gözle ve ışık mikroskobu altında (10x) tipik aktinobakteri varlığı açısından taranmıştır. Aktinobakteri olduğu tespit edilen izolatlar numaralandırılarak belirlenmiştir. Çalışma sonunda toplamda 80 aktinobakteri izole edilmiştir. İzole edilen aktinobakterilerin antimikrobiyal aktiviteleri nokta ekim yöntemi ile kültür koleksiyonundan temin edilen *Staphylococcus aureus*, *Escherichia coli*, *Bacillus cereus* ve *Candida albicans*'a karşı tespit edilmiştir. Taranan aktinobakterilerden UZ-74, UZ-78, TA-13, TA-14, TA-15, TA-16 ve TA-25 kodlu izolatlar tüm test organizmalarına karşı farklı oranlarda (4-30 mm) inhibisyon zonu oluşturarak antimikrobiyal aktivite göstermiştir. Antimikrobiyal aktivitesi yüksek çıkan izolatların tanımlanması ve biyoaktif metabolitin üretimi, saflaştırılması ve tipinin belirlenmesi çalışmaları halen devam etmektedir. Seçilen antimikrobiyal aktivitesi yüksek izolatlardan elde edilebilecek metabolitlerin yeni ve farklı alanlarda kullanılabilirliği ihtimali bulunmaktadır.

**Anahtar Kelimeler:** Aktinobakteriler, antibiyotik, antimikrobiyal, metabolit tarama, izolasyon

#### Abstract

In this study, quality control studies were carried out on the flowers of *Sambucus nigra* L. (Viburnaceae), known as black elderberry in Anatolia. Among the people, the flowers of the plant are used in the form of tea for diuretic, diaphoretic, and laxative purposes, and all samples in this study were purchased from herbalists. Only one sample was obtained from a farm producing organically in the Konya region. The samples were analyzed in terms of the criteria (microscopic analysis, foreign matter, loss of drying, determination of total ash content, analysis of thin layer chromatography) specified in the "Sambuci flos" monograph in the European Pharmacopoeia 10.0, and the rutin, caffeic acid, chlorogenic acid, and hyperoside contents of the samples were determined using the High Performance Liquid Chromatography technique. Except for the ash amounts of all samples, the results were incompatible with the Pharmacopoeia. By HPLC analysis, it was determined that the phenolic compounds analyzed in all samples were in different amounts. While caffeic acid could not be detected in flowers produced by organic farming, coarse pedicel fragments were also found in high amounts. It was predicted that these differences were related to the collection time, collection, and drying methods of the samples. In terms of public health, these drugs should be standardized in terms of pharmacopoeial criteria.

**Keywords:** Elderberry, *Sambucus nigra*, European Pharmacopoeia, RP-HPLC

\*abdullahtaskin52@harran.edu.tr

#### Abstract

Royal jelly is a product made by honey bees that contains bioactive peptides. These peptides provide unique therapeutic effects, such as anticancer, antioxidant, antimicrobial, anti-aging, and anti-inflammatory properties. In addition to these unique properties, royal jelly has also been reported to have minimal toxicity compared to other bee products. One major challenge in cancer treatment is minimizing harm to healthy cells during chemotherapy. This study aimed to investigate the anticancer effects of royal jelly on the A549 lung cancer cells and BEAS-2B human normal bronchial epithelial cells. Concentrations of royal jelly at 0.001, 0.01, 0.1, 1, 10, and 100 mg/ml were prepared. These concentrations were incubated with A549 and BEAS-2B cells for 24, 48, and 72 hours. The cytotoxic effect of royal jelly concentrations was analyzed by the MTT method. IC50 values were calculated with the GraphPad Prism 8 program. According to MTT assay, it was found that 0.001-100 mg/mL royal jelly concentrations had a cytotoxic effect on A549 and BEAS-2B cells in a concentration-related manner ( $p < 0.001$ ). At the end of 24, 48, and 72 hours of incubation periods, the IC50 values of A549 cells were calculated as 0.862, 2.872, and 0.697, respectively, and the IC50 values of BEAS-2B cells were calculated as 7.420, 3.275 and 6.328, respectively. After three incubation periods, it was found that royal jelly had more cytotoxic effects on cancer cells than on normal cells. Our results show that royal jelly reduces cell proliferation more in the A549 cells than in BEAS-2B cells, depending on dose and time, at 24, 48, and 72 hours of incubation periods. This difference between cancer and normal cells shows that royal jelly may be a potential cancer agent candidate. Supporting these results with further molecular analysis may be an alternative option in the treatment of lung cancer and other cancers.

#### Abstract

Alzheimer's disease (AD) is a multifaceted neurodegenerative disorder characterized by progressive memory decline, cognitive dysfunction, and pronounced behavioral anomalies. Accumulating evidence suggests pivotal roles of acetylcholinesterase (AChE) and Rho-associated coiled-coil kinase 2 (ROCK2) proteins in the pathogenesis of AD. Contemporary therapeutic strategies for AD predominantly focus on enhancing cholinergic neurotransmission, specifically by elevating cerebral acetylcholine concentrations. This modality offers symptomatic relief, ameliorating the clinical manifestations of AD. Concurrently, the ROCK2 protein, implicated in AD pathophysiology, modulates neural processes and synaptic retraction, influencing neural information processing and retention. Recent advancements spotlight hybrid molecules with dual-inhibitory capacities. A salient hybrid derivative, amalgamating FDA-sanctioned tacrine and donepezil, has demonstrated potential in attenuating the activities of these pivotal proteins, heralding a promising avenue for AD therapeutics.

Within this framework, our study embarked on an exhaustive computational exploration, entailing structural modifications of the piperidine and amine moieties of the hybrid molecule (TA8Amino), culminating in designing 71 avant-garde therapeutic candidates. Employing Gaussian 09 (DFT/B3LYP/6-31G(d,p)), corresponding geometry optimization studies were performed, while GaussView 5.0.8 rendered visual representations of the target entities. These novel compounds' pharmacokinetic profiles and drug-likeness attributes were assessed using the AI-powered Syntelly platform, with corroborative analyses conducted via SwissADME, OSIRIS, and Molinspiration. Toxicological assessments were executed using Toxtree software. Furthermore, molecular docking simulations conducted via the SAMSON platform (2022-R2) and OneAngstrom/AutoDock Vina Extension delineated the prospective inhibitory efficacies of the designed entities (TD1-71) against AChE (PDB ID: 5EI5) and ROCK2 (PDB ID: 6ED6).

#### Abstract

In this study, rGO-NiO-CuO three-component nanocomposite was produced with a simple, green and one-step production method using *Cetraria Islandica L. Ach* lichen extract which undertook the roles of both a green reducing agent and an effective stabilizing agent. The obtained samples were characterized by Fourier conversion fluorescence spectrophotometry (FTIR), UV-visible spectrophotometry (UV), Scanning electron microscopy (SEM) and X-ray diffraction (XRD). As a result of the strong reducing power of *Cetraria Islandica L. Ach* the chemical reduction of GO and the production of NiO and CuO nanostructures on the surface of rGO nanosheets were successfully obtained simultaneously with this one-step synthesis approach. Moreover, as an effective stabilizing agent the lichen extract provide uniform coating of rGO nanosheets with NiO and CuO nanoparticles and prevent agglomeration of the nanostructures. The rGO-NiO-CuO ternary nanocomposite was used in the photocatalytic removal of methylene blue (MB). In the study, it was determined that rGO-NiO-CuO nanocomposite removed 72% of MB in visible region irradiation in 180 minutes. It has been observed that the rGO-NiO-CuO nanocomposite, produced in a single step with an environmentally friendly method, has great potential for photocatalytic applications.

### AI-Guided ADMET Analysis and Molecular Docking in the Discovery of Novel LIM Kinase 1 Inhibitors: A Pharmacophore-Based Virtual Screening Approach

Gülbin KURTAY (ORCID: <https://orcid.org/0000-0003-0920-8409>)

Hacettepe University, Faculty of Science, Department of Chemistry, 06800, Ankara, Turkey

#### Abstract

LIM kinases (LIMKs) are a group of protein kinases that play a crucial role in regulating actin dynamics. This group consists of two members, known as LIMK1 and LIMK2. LIMK1 plays an essential function in regulating the morphology and synaptic strength of dendritic spines in a well-functioning brain. On the other hand, in patients suffering from dementia, an increased enzymatic activity of LIMK1 leads to the deterioration of the structural integrity of these dendritic spines. Consequently, the regulation of LIMK1 in the context of dementia yields enhancements in both the structural characteristics and abundance of dendritic spines, so mitigating the impact of Alzheimer's Disease (AD). In pursuit of this objective, a number of small compounds have emerged as a promising therapeutic target for Alzheimer's disease (AD).

**Figure 1.** (top) Virtual screening flowchart in Pharmit server (bottom) screened candidate with the highest binding pose along with LIMK1 receptor

In order to identify potent inhibitors of LIMK1, a diverse range of computational methodologies have been employed, including the utilization of Pharmit for pharmacophore-based virtual screening. In this study, a pharmacophore model was constructed using the co-crystallized receptor structure of STAUROSPORINE/LIMK1 (PDB ID: 3S95). The model was applied to the PubChem database, which has a vast collection of 103,302,052 compounds. After the integration of the pharmacophore and Lipinski's filter, a total of 87 compounds were identified as promising candidates for subsequent molecular docking simulations. In the subsequent analysis, the Gaussian 09 software package was employed to do geometry optimization investigations using the DFT/B3LYP/6-31G(d,p) method. Additionally, the software GaussView 5.0.8 was applied to visually represent the molecular structures. The evaluation of the pharmacological properties of the ligands was conducted using ADME analysis, employing several tools such as SwissADME, OSIRIS, and Molinspiration. In addition, the assessment of toxicity characteristics for these ligands was conducted utilizing the Syntelly platform, which is an AI-guided tool, as well as the Toxtree program. The process of molecular docking simulation was conducted utilizing the SAMSON platform/2022-R2 and OneAngstrom/AutoDock Vina Extension. This was done in order to do a detailed examination of the binding interactions and affinities of the identified candidates against LIMK1.

**Keywords:** Staurosporine, LIMK1, virtual screening, DFT, ADMET, molecular docking

### Vücut sıcaklığının düzenlenmesinde UCP1'in fonksiyonu

Hülya Yıldız<sup>1\*</sup> (0000-0001-6862-8011)

<sup>\*1</sup> Burdur Mehmet Akif Ersoy Üniversitesi, Fen Bilimleri Enstitüsü, Biyoloji Anabilim Dalı, Türkiye

\*yildizhulya1687@gmail.com

#### Özet

Mitokondriyal anyon taşıyıcı ayrılma proteinleri (uncoupling proteinler; UCP) mitokondrinin kristasında sentezlenir. Bu ayrılma proteinlerin farklı dokularda etkili ve farklı fonksiyona sahip 1-5 aralığında üyesi bulunmaktadır. UCP1 olarak adlandırılan ilk üyesi kahverengi yağ dokuya spesifiktir. UCP1, termogenez olarak bilinen vücut sıcaklığının korunmasında ve aynı zamanda adipoz dokuda depolanan enerjinin kullanılmasında işlev görür.

Kahverengi yağ dokusunun asıl görevi yağı depolamak değil, yağı yakma yoluyla vücuda ısı sağlamak yani termogenezistir. Kahverengi yağ dokusu termogenezinde  $\beta$ -adrenerjik aracılı lipoliz aktivasyonu ve yağ asitlerinin tekrarlayan yıkımı olmaktadır. Bu işlevlerini termogenin olarak da adlandırılan mitokondriyal anyon taşıyıcı ayrılma proteini (UCP1) ile yapar. Aynı zamanda kahverengi yağdaki kahverengi adipositler gibi beyaz yağ dokuda bulunan kahverengi adipositlere benzeyen bej adipositlerinde UCP1 ifadesi ile karakterize edilen termojenik özelliklere sahip olduğu bilinmektedir. Yağ asidi varlığında UCP1 üzerindeki kapanma (Shutting) dediğimiz bölgeyle ve oluşan proton gradyanına bağlı olarak ısı oluşmaktadır. UCP1 bunu, mitokondri iç membranında protonların ATP sentaz kompleksinden geçmeden mitokondri matriksine yeniden girmesine izin veren bir kanal oluşturarak yapar. Böylece solunumda ATP sentezi kısmen engellenirken, adipositlerdeki yağ asitlerinin sürekli oksidasyonu ile enerjinin ısı olarak dağılımı gerçekleşir. Soğuğa maruz kalma ve beslenme kahverengi yağ dokusunun aktivitesini ve Santral Sinir Sistemi'nden salınan norepinefrin UCP1 ekspresyonunu artırır.  $\beta$ -adrenerjik antagonistleri, tiroid hormonu, insülin ve cAMP analogları da UCP1 ekspresyonunu artırır. Kahverengi yağ dokuda UCP1 aktivasyonunun artması ile lipolizisin uyarılması hem de UCP1 gen transkripsiyonu da gerçekleşmektedir. Ayrıca mitokondriyal biyogenezis, kahverengi yağ dokunun hiperplazisi, beyaz yağ dokudan kahverengi ve bej adipozitlerin oluşması gerçekleşmektedir. Bu sebeple UCP1 sistemi, tüm vücut enerji dengesinin, yağlanmanın ve obezitenin kontrolü için bir hedef olmaktadır.

**Anahtar Kelimeler:** termogenez, ayrılma proteinleri, UCP1.

#### Abstract

*Stenotrophomonas maltophilia* is an important opportunistic pathogen that poses a considerable threat to susceptible patients. This microorganism is reported to be intrinsically resistant to most of the antibiotics and can be found in multiple sources, including water, plant root environments, animals, and various food products. This study was carried out to determine the resistance status of *Stenotrophomonas maltophilia* strains against various antibiotics and to investigate transferable plasmid resistance genes. Four *S. maltophilia* strains isolated from ready-to-eat sandwiches were used as material. In accordance with CLSI instructions, in order to determine the antibiotic resistance profiles of the isolates, disc diffusion method was used to investigate trimethoprim-sulfamethoxazole and levofloxacin resistance, and E-test method was used to investigate ceftazidime and chloramphenicol resistance. Presence of transferable antibiotic resistance genes, including *bla*<sub>CTX-M</sub>, *bla*<sub>TEM</sub>, *bla*<sub>SHV</sub>, *bla*<sub>KPC</sub>, *bla*<sub>OXA-48</sub>, *bla*<sub>NDM</sub>, *bla*<sub>VIM</sub> and *bla*<sub>IMP</sub> were investigated by polymerase chain reaction. According to the results all isolates were found resistant to ceftazidime. All isolates were susceptible to trimethoprim-sulfamethoxazole, levofloxacin and chloramphenicol. Based on PCR results, only one of the four analyzed isolates was found *bla*<sub>CTX-M</sub> positive. All remaining isolates were found as negative for the analyzed resistance genes. In the future stages of the study, it is aimed to investigate cefiderocol and minocycline resistance and to determine the presence of chromosomal genes responsible for beta lactam resistance.

#### Abstract

Cryogels are gel matrices formed by freezing polymeric solutions. Cryogels prepared by the freeze-thaw method contain a network of interconnected pores ranging from 5-100  $\mu\text{m}$ . They also have high flexibility and spongy morphology. Urease enzyme is used as a model enzyme for the detection of heavy metal ions in food samples, industrial wastewater, groundwater and environmental heavy metal ions, as well as to prevent the formation of ethyl carbamate by removing urea from fruit juices, food and wine. In this study, *Proteus app.* immobilized Poly(2-hydroxyethyl methacrylate) cryogel was synthesized as solid support. The characterization of cryogel was confirmed by swelling test and scanning electron microscopy (SEM). Besides, urease production of *Proteus* was determined by quantitative analysis based on color change in the medium.

**Keywords:** *Proteus app.*, urease, cryogel.

\*Corresponding author e-mail: aydinatakan@gantep.edu.tr

#### **Abstract**

Tomato (*Solanum lycopersicum* L.) is one of the most cultivated and consumed plants in the world. It is exposed to many biotic stress factors, especially fungi. Tomato wilt caused by *Fusarium oxysporum* f. *sp. lycopersici* (FOL) is one of the most important diseases in tomato cultivation and causes crucial yield and quality losses. miRNAs are small non-coding molecules and play also important roles in plant immunity against plant pathogens. miRNAs mediate the regulation of the expression of defense response genes by mRNA cleavage and translational inhibition. In this study, previously identified mature miRNA sequences and related *Avr* genes of FOL were retrieved from miRBase and NCBI, respectively. RNAhybrid and psRNATarget algorithms were used to predict sly-miRNAs and *Avr* targets relationships. As a result of target identification, 13 miRNAs (miR477-5p, 9471b-3p, 9469-3p, 6022, 169e-3p, 9471a-5p, 164a-5p, 164b-5p, 5303, 319a, 395a, 395b, 482c) that target *Avr1* and *Avr3* genes of FOL were determined. Their inhibition types were translation and cleavage or both. Furthermore, a phylogenetic tree was constructed by using MEGA X. The neighbour-joining (NJ) method was operated with p-distance model. It was observed that all miRNAs were divided into two main groups. Only translation, only cleavage and even both of them showed very similar homology. Because of their importance in plant-pathogen interactions, miRNAs offer new opinions on the cross-kingdom immune regulation in plant-pathogen interactions.

**Keywords:** non-coding RNA, disease control, plant immunity

#### Abstract

Hydrogels are defined as hydrophilic and water-insoluble polymeric macromolecules used in agriculture for various purposes such as reducing stress and increasing crop yield [1]. Nanoparticles (NPs) are bio-permanently small particles in the nanoscale (1-100 nm in size) and they have gained interest as alternatives in agricultural practices due to their characteristics [2, 3]. Plant pathogens cause crucial yield and quality losses in economically important crop plants. Therefore, they are a constant threat to agricultural industry [4]. To prevent negative effects of pathogens, pesticides have been widely used but excessive utilisation of them also cause negative environmental impact on animal, human and even all ecosystem. For this reason, eco-friendly control methods have gained importance in control of plant diseases. The combination of NPs and hydrogel can offer a promising alternative tool with their antibacterial and antifungal effects [5]. For this purpose, Shang et al. [5] studied the antifungal efficacy of copper oxide (CuO) embedded hydrogels against *Fusarium* wilt of lettuce. Results showed that a combination of NP and CuO NP-embedded hydrogels increased P, Mn, Zn and Mg uptake and organic acid levels compared to control. Abdelaziz et al. [6] investigated the positive effects of an eco-friendly superabsorbent hydrogel based on zinc oxide nanoparticles (ZnO-NPs) to protect the pepper plants against *Fusarium* wilt. Moreover, irrigation water usage for these pepper plants decreased by one-third after application. In addition, these materials can be successfully used as biotechnological tools in sustainable agriculture. de Oliveira et al. [7] synthesised hydrogel-based repellent systems containing botanical compounds emulsified or encapsulated in zein (Zein is a type of prolamin protein) nanoparticles. The synthesised hydrogels were reported to exhibit high repellent activity against whiteflies and spider mites, which are major agricultural pests [9]. As a result, hydrogels show promise not only for plant diseases but also in agricultural technology with their effects such as water retention capacities, water release control, soil aeration and plant development.

#### Abstract

Nitrate, the conjugate base of nitric acid, is inherently neutral in aqueous solution. However, nitrate pollution is a pervasive issue in both surface and groundwater across our country. Its primary sources can be attributed to (1) uncontrolled fertilization of agricultural lands, (2) the oxidation of ammonia resulting from the decomposition of proteins in plant and animal waste, and (3) the discharge of untreated domestic and industrial wastewater. The proliferation of these compounds in our water bodies contributes to significant environmental problems, including eutrophication, algal blooms, and adverse health effects [1,2].

This study investigated the removal of NO<sub>3</sub><sup>-</sup> from aqueous solutions using a strongly basic anion exchange resin of Shallow Shell Technology (SST). The influence of resin dosage and solution pH on removing NO<sub>3</sub><sup>-</sup> by the strong basic anion exchange resin was examined. Furthermore, modeling sorption isotherms and conducting kinetic studies determined the NO<sub>3</sub><sup>-</sup> removal mechanism and the rate-determining step. Sorption experiments were conducted at various temperatures, ranging from 15°C to 30°C, and thermodynamic analysis was performed. The NO<sub>3</sub><sup>-</sup> analysis was carried out using a UV-visible spectrometer.

**Keywords:** Anion exchange resin, Separation Techniques, Ion exchange, Water treatment

#### Abstract

In this research, some physical and chemical parameters of the soil and water properties of Lake Eber and the *Phragmites australis* species in Lake Eber were evaluated in terms of restoration ecology. In this context, physical and chemical analyzes of soil samples taken from 5 different locations on the shore of Eber Lake were made. The average pH value of the soil samples was determined as 7.54, the salt (%) value was 0.53, the lime value was 23.94%, the organic matter % value was 16.21, and the phosphorus value was 28.72, and the potassium value was 314.6. According to this, it was determined that the soil structure of Eber Lake is heavy clay, salty, and calcareous, with a very high value in terms of organic matter, phosphorus, and potassium. Average pH value of water samples taken from 4 different locations of the lake is 8.63, sodium value is 33 me/l, potassium value is 2.5 me/l, boron value is 0.6815 me/l, Ca+ Mg value is 5.1 me/l, carbonate value is 2.34m e/l, bicarbonate value is 8.57 me/l, chlorine value is 14.17 me/l, sulfate value is 15.55 me/l, RSC value is 5.77 me/l, SAR value is 20.8 me/l. Eber Lake water is alkaline and has good electrical conductivity, sulfate, chlorine, and RSC value sare very high within the scope of analysis. On the other hand, SAR, boron, sodium, potassium, calcium, and magnesium parameters were recorded within Standard criteria. With the current data obtained, contributions have been made to the identification and protection of the bioecological features of Lake Eber.

#### Abstract

Methyl orange (MO) is a kind of synthetic azo dye which is not only widely utilized in the printing and dyeing process of textile, but also used as colorant in plastics, rubber and paint, etc. Due to low reactivity and biodegradation, this type of compound is resistant to degradation in wastewater treatment. Under certain special conditions, azo dyes are able to decompose to produce more than 20 kinds of carcinogenic aromatic amines, which will change the DNA structures of the human body through the activation inducing lesions and cancer. Advanced oxidation processes (AOPs) for the removal of these pollutants from water became important technologies today. AOPs are carried out on the basis of forming hydroxyl radicals ( $\bullet\text{OH}$ ), which can oxidize many pollutants in water, and the process efficiency is evaluated depending on the formation of  $\bullet\text{OH}$ . Various AOP mechanisms are classified depending on whether  $\bullet\text{OH}$  formation occurs chemically, photochemically, sonochemically or electrochemically. In the present work degradation and mineralization of synthetic dye MO by means of various AOPs including, homogeneous Fenton (F), homogeneous photo-Fenton (PF), homogeneous electro-Fenton (EF), homogeneous photoelectro-Fenton (PEF), heterogeneous photoelectro-Fenton (hPEF), UV photodegradation (PD),  $\text{TiO}_2/\text{UV}$  photocatalytic degradation (PC),  $\text{TiO}_2/\text{UV}/\text{H}_2\text{O}_2$  photoelectrocatalytic process (PEC) were investigated.  $\text{Fe}_{2+}$  was used as catalyst in F, PF, EF and PEF processes, whereas  $\text{Fe}_3\text{O}_4$  magnetic nanoparticles synthesized by co-precipitation method was used in hPEF process. Anatase phase of  $\text{TiO}_2$  used in PC and PEC processes was synthesized by means of a hydrothermal process, where hydrolysis of titanium butoxide was taken place. Platinum anode and a carbon felt (CF) cathode was used in EF, PEF, hPEF and PEC processes. Complete degradation of MO was achieved at 5, 7, 20, 24, 30, 36 mins by PF, F, PEF, EF, hPEF and PEC processes, respectively under pH=3, 6W UVA light and 100 mA current intensity conditions.

**Keywords:** advanced oxidation processes, environmental remediation, catalysis

## ORAL PRESENTATION

### Effect of the cathode material on the efficiency of the electro-Fenton process for the electrocatalytic destruction of azo dye methyl orange

Şule Camcıoğlu<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-8983-3193>)

<sup>\*1</sup> Ankara University, Faculty of Engineering, Department of Chemical Engineering, Ankara, Turkey.

\*Corresponding author e-mail: [camcioglu@eng.ankara.edu.tr](mailto:camcioglu@eng.ankara.edu.tr)

#### Abstract

A significant amount of micropollutants from various chemical industries are continuously released into the natural water bodies, where they accumulate due to their resistance to biodegradation. Nowadays, they are detected in natural water streams, even frequently in drinking water sources. These pollutants are toxic to aquatic life as well as to humans. Conventional water treatment plants remain generally inefficient in treatment of water polluted with persistent and/or toxic organic pollutants. On the other hand, advanced oxidation processes (AOPs) which are effective water treatment technologies, were developed. Based on in-situ generation of strong oxidants such as hydroxyl radicals ( $\cdot\text{OH}$ ) with very high oxidation power and reactivity, AOPs are able to oxidize organic micropollutants until mineralization. Among them, electrochemical AOPs (EAOPs) were revealed as versatile, clean and efficient processes for degradation/mineralization of organic pollutants. The electro-Fenton process is one of the most popular EAOPs that generates  $\text{H}_2\text{O}_2$  in situ from two-electron reduction of dissolved  $\text{O}_2$  on a suitable cathode.  $\cdot\text{OH}$  produced through electrocatalytically generated Fenton's reagent ( $\text{H}_2\text{O}_2 + \text{Fe}^{2+}$ ) in the bulk react quickly with organic pollutants. Therefore, cathode material plays a crucial role for the efficiency of electro-Fenton process since it determines the yield of  $\text{H}_2\text{O}_2$  which controls the production rate of  $\cdot\text{OH}$ . For this purpose, this study focuses on the comparative efficiency of cathode materials (i.e., stainless steel, carbon felt and graphite) based on the oxidative degradation and mineralization of azo dye methyl orange as the target pollutant. Performance was compared based on the following parameters:  $\text{H}_2\text{O}_2$  generation ability, capacity of oxidation and mineralization, mineralization current efficiency and energy consumption as a function of applied current. According to the results, carbon felt showed better oxidation and mineralization efficiency, followed by graphite. Stainless steel cathode was an inappropriate material for electro-Fenton process due to its poor  $\text{H}_2\text{O}_2$  generation ability.

**Keywords:** Electrochemical advanced oxidation processes, electro-Fenton, mineralization, decay kinetics, methyl orange

\* e-mail: sefaacarli@comu.edu.tr

#### Özet

Akdeniz'e özgü bir tür olan *Pinna nobilis* (Linnaeus, 1758) deniz suyunu süzme kapasitesi ve bir çok epibiyotik türe sert kabuk yapısından dolayı ev sahipliği yaptığı için önemli bir ekolojik role sahiptir. Ancak insan aktivitelerinin sonucunda uzun yıllardan beri *P. nobilis* popülasyonları zarar görmüş ve sonuç olarak 1992 yılında itibaren Avrupa Konseyi kararları ile kırmızı listeye alınarak koruma altına alınmıştır. 2016 yılından bu zaman kadar ise, Batı Akdeniz den başlayarak *P. nobilis* popülasyonlarında %100 ölüm rapor edilmiştir. Bu kitlesel ölümlere patojenik parazit olan *Haplosporidium pinnae*'nin ve diğer potansiyel patojenlerin birlikte etkili olduğu söylenilmektedir. IUCN, *P. nobilis* türünün statüsünü karşılaşılan kitlesel ölümlerden dolayı kırmızı listede "kritik seviye"ye yükseltti. 2020 yılından itibaren ise Ege Denizi, Çanakkale Boğazı ve Marmara Denizi'nde farklı noktalarda toplu ölümlerin rapor edilmiştir. Aynı zamanda sınırlı da olsa Akdeniz'in farklı noktalarında ve Çanakkale Boğazı ile birlikte Marmara Denizinde sağlıklı popülasyonların bildirilmesi oldukça umut vericidir. Bu bağlamda hastalığa maruz kalmasına rağmen hayatta kalan dirençli bireylerin ve sağlıklı olan popülasyonların belirlenmesi, sürekli izleme çalışmalarının yapılması ve özel koruma alanlarının oluşturulması, hasarlı *P. nobilis* yataklarının rehabilitasyonuna katkı sağlayacaktır. Tüm bu yapılan çalışmalara ilaveten yapılacak olan yetiştiricilik çalışmaları yani larva üretimi, doğadan toplanan spatın büyütme alınması ve transplantasyon çalışmaları da oldukça önemlidir. Sonuç olarak bu çalışmada Akdeniz'de türün sürdürülebilir üretimine ve korunmasına yönelik yapılan uygulamaların genel bir değerlendirilmesi yapılmıştır.

**Anahtar Kelimeler:** *Pinna nobilis*, yetiştiricilik, transplantasyon, hayatta kalma

\*Corresponding author e-mail: gmzyurtdas@hotmail.com

#### Özet

Hedonik açlık fizyolojik açlığın yokluğunda yemeğe karşı aşırı duyarlılık, yemekten zevk alma ve yeme dürtüsü ile karakterize olan durumdur. Bu çalışmada adolesanlarda hedonik açlık durumunun diyet kalitesi, uyku kalitesi ve beslenme durumu ile ilişkisini değerlendirmek amaçlanmıştır. Bu çalışmada İzmir merkezde bulunan 3 ortaokulda gerçekleştirilmiştir. Araştırma verileri anket kullanılarak sınıf ortamında yüz yüze görüşme yöntemiyle elde edilmiştir. Adolesanların hedonik açlık durumu Besin Gücü Ölçeği (BGÖ) ile, uyku kalitesi ise Pittsburgh Uyku Kalitesi İndeksi (PUKİ) ile değerlendirilmiştir. Diyet kalitesi Akdeniz Diyeti Kalite İndeksi (KIDMED) kullanılarak değerlendirilmiştir. Adölesanların hedonik açlık ile çeşitli besinleri tüketmeye olan arzularını değerlendirmek amacıyla görsel analog skalası kullanılmıştır. Beslenme durumunu değerlendirmek için antropometrik ölçümler (boy uzunluğu, bel çevresi, kalça çevresi, üst orta kol çevresi, boyun çevresi) araştırmacılar tarafından uygun yöntemlerle alınmıştır. Besin alımını değerlendirmek için bir günlük besin tüketim kaydı alınmıştır. Çalışmaya katılan çocukların yaş ortalamaları 12,27±1,19 idi. Kız ve erkek öğrencilerin BGÖ ortalama toplam puanları sırasıyla 3,16±0,80 ve 2,83±0,78 puan idi (p=0,258). PUKİ kesim noktasına göre değerlendirildiğinde adölesanların %58,9'unun uyku kalitesi iyi, %71,1'inin uyku kalitesinin kötü olduğu belirlendi. Hedonik açlığı olan adolesanların çikolata, kek, çips, gazlı içecekler, fast food, patates kızartması, makarna, dondurma, hamur işleri, kremalı pasta ve pastane ürünleri tüketme isteklerinin hedonik açlığı olmayanlara göre yüksek olduğu belirlendi (p<0,05). Adolesanların hedonik açlık durumları göre antropometrik ölçümleri arasında anlamlı fark bulunmadı (p>0,05). BGÖ skoru PUKİ skoru (r=0,135, p<0,001) ile pozitif yönlü, KIDMED skoru ile (r=-0,224 p=0,001) negatif yönlü korele idi. Bu sonuçlar adolesanlarda hedonik açlık durumunun diyet ve uyku kalitesi ile ilişkili olduğunu göstermiştir. Bu bağlamda adolesanların hedonik açlık hakkında eğitilmesi önemlidir.

**Anahtar kelimeler:** hedonik açlık, adolesan, uyku kalitesi, diyet kalitesi, beslenme durumu

### Investigation of individual variation in *Macrovipera lebetinus* venom by Fourier transform infrared (FTIR) spectroscopy

Naşit İĞCİ<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0001-6151-808X>)

<sup>\*1</sup> Nevşehir Hacı Bektaş Veli University, Faculty of Science and Arts, Department of Molecular Biology and Genetics, Nevşehir, Türkiye.

\*Corresponding author e-mail: [igcinasit@yahoo.com.tr](mailto:igcinasit@yahoo.com.tr)

#### Abstract

Snake venom is a molecular cocktail that has diverse biological activities. Its main constituent is polypeptides (eg. proteins, peptides). These proteins and peptides are responsible for the toxicity of venom in the prey. Snake venom is also an important source for drug discovery. Although venoms of different species share common protein families, their abundancy in venoms show variation. Moreover, different species may have distinct proteoforms. Venom variation is important topic since this phenomenon affects the pathology of snakebite and antivenom production, as well. Fourier transform infrared spectroscopy (FTIR) is a useful analytical technique that provides qualitative and quantitative information about the bioorganic molecules in the sample. Studies regarding the venom variation of *Macrovipera lebetinus*, a medicinally important viper species, are limited in the literature. In the present study, venom variation in *M. lebetinus* was investigated using FTIR. Crude venom samples from different individuals were directly measured using attenuated total reflectance method in the mid-infrared region. Obtained absorbance spectra were analysed in the fingerprint region between 800-1800 cm<sup>-1</sup> and peaks were assigned to proteins (mainly), carbohydrates and nucleic acids. Protein secondary structures were also compared using the sub-bands of Amide I band. Qualitative and quantitative differences were observed both in the absorbance spectra and Amide I sub-bands obtained by derivatization. The results revealed that *M. lebetinus* venom shows individual variation at molecular level and FTIR is a useful technique for venom research.

**Keywords:** FTIR, snake venom, variation.

<sup>2</sup>Çanakkale Onsekiz Mart Üniversitesi, Bayramiç Meslek Yüksekokulu, Çanakkale, Türkiye

\* e-mail: harunyildiz@comu.edu.tr

#### Özet

Akdeniz Midyeleri (*Mytilus galloprovincialis*, Lamarck 1819); yüksek protein değerleri, düşük yağ içerikleri, kolay sindirilebilme ve diyetetik özellikleriyle değerli besin maddeleri olarak karşımıza çıkmaktadır. Fakat; sulardaki primer produktiviteyi süzerek beslenme (filter-feeding) özellikleri, denizlerdeki kirleticilerle kontamine olma risklerini de beraberinde getirmektedir. Dolayısıyla; toksikolojik, biyotoksikolojik ve mikrobiyolojik açıdan takip edilmeyen bölgelerden toplanan Akdeniz midyeleri, birçok sağlık sorununun da sebebi olabilmektedir. Örneğin, evsel atıkların boşaltıldığı bölgelerden toplanan midyeler tüketildiğinde; bağırsak enfeksiyonlarına sebep olan *Esheria coli*, campylobacter ve salmonella gibi bakteriler ile rotavirüs ve norovirüs gibi virüsler insanlara bulaşabilir. Özellikle endüstriyel atıkların kirlettiği bölgelerden elde edilen midyelerin tüketimi neticesinde manganez, nikel kurşun, kalay ve alüminyum gibi ağır metaller vücuda alındığında; alzheimer, kısırlık, böbrek ve karaciğer yetmezliği gibi önemli hastalıklar görülebilir. Yine DSP (Diarrhetic shellfish poisoning), ASP (Amnesic shellfish poisoning) ve PSP (Paralytic shellfish poisoning) gibi biyotoksinleri akümüle eden midyelerin tüketilmesi; bulantı, kusma, baş dönmesi, hafıza kaybı, solunum yetmezliği, mide tümörleri ve daha birçok enfeksiyona sebep olabilmektedir. Akdeniz midyelerin, bu parametreler açısından insan sağlığını tehdit etmeyecek ve tolere edilebilir limitlere sahip olması gerekmektedir. Bütün veriler bir arada değerlendirildiğinde, tüketim için en uygun ürünler kültür yoluyla elde edilen midyedir. Burada ki en önemli unsur, Akdeniz midyesi yetiştiricilik tesislerinin kurulumundan itibaren ilgili kurumlar tarafından sürekli denetim altında olmasıdır. Bu çalışmanın amacı, yetiştiricilik yoluyla elde edilen Akdeniz midyesinin üretimi ve ürün kalitesini etkileyen unsurlar değerlendirilerek insan sağlığı açısından önemini ortaya koymaktır.

**Anahtar Kelimeler:** *Mytilus galloprovincialis*, Yetiştiricilik, filter-feeding, tüketim

#### Abstract

Thiosemicarbazones are compounds obtained by the reaction of a thiosemicarbazide with carbonyl group compounds and can coordinate to metal atoms via more than one donor atom. Thiosemicarbazones and their metal complexes exhibit a wide range of biological activities such as anticancer [1], antiviral [2], antibacterial [3], antidiabetic [4], antioxidant [5], antimalarial [6], anti-HIV [7] and have capabilities of inhibition of enzyme [8] and binding to DNA [9].

In this work, mixed-ligand Ni(II) (I) and Cu(II) (II) complexes of salicylaldehyde-N(4)-phenyl thiosemicarbazone ligand were synthesized by using 3,5-lutidine as a secondary ligand. The structures of ligand and complexes were characterized by elemental analyses, IR, UV-Vis, <sup>1</sup>H-NMR, ESI-MS spectroscopies, and also the complexes by single crystal X-ray diffraction. The antioxidant activities of the compounds were investigated by CUPRAC and DPPH assays. Both the ligand and the complexes were found to have antioxidant capacity.

**Keywords:** Thiosemicarbazone, Transition Metal Complexes, Antioxidant Activity, CUPRAC, DPPH.

### Prebiotics in Aquatic Animals

Semra KÜÇÜK (ORCID: <https://orcid.org/0000-0002-9299-5986>)

Adnan Menderes University, Faculty of Agriculture, Department of Aquacultural Engineering and Fisheries,  
Aydın, Turkey,

E-mail:skucuk@adu.edu.tr

#### Abstract

The global aquaculture industry has been growing fast. Almost 1 billion people have been working in this sector. Accordingly FAO 2020, aquaculture production has formed 46% of the total world fish production. The largest aquatic animal producer is the China. And current aquaculture practices have been carrying on sustainable and environment friendly and produced safe products for the end user.

Prebiotics are long chain complex carbohydrates that give energy to beneficial microorganisms (probiotics) to increase an animal health. Prebiotics are mostly derived from plant based products (mushroom) and only a few gaining from animal dairy products. Prebiotics are actually found in vegetables, fruits, seaweed, microalgae and milk in natural. Prebiotics can protect epithelial cells against to harmful microorganisms and decrease harmful microorganisms from intestinal cells as a receptor or modulator in the host immune system. They can improve growth, enhance immune response and disease resistance and decrease stressor effects in aquaculture. There have been some studies about using prebiotics in aquatic animals. In this study, it is going to explain the definition, mechanisms and function of prebiotics and indicate the previous studies having been done on the prebiotics in aquatic animals.

**Keywords:** Probiotics, prebiotics, aquatic animals

#### Abstract

For prevention of physical injuries and easy working during applications in fish farming or for research purposes. Anesthetics substances are used for handling, artificial spawning, vaccination, sorting of specimens, taking biopsy, labeling, transportation blood collection, surgery, and for euthanasia. Some essential oils have been used for sedative and anaesthetic substances such as clove oil, lavender oil, thyme oil. The most commonly used plants for anesthesia in aquaculture are basil, thyme, mint, rosemary, lavender, citronella, verbena and camphor. They have different active substances such as eugenol, menthol, myrcene, 1,8-cineole, linalool, limonene, citronellal, thymol, carvacrol, spathulenol,  $\alpha$ - and  $\beta$ -pinene, 4-allylphenyl acetate and globulol in plants. They cause some effects on the modulation of fish behavior, physiology and biochemistry. The natural anesthetics could have potential to be more environmentally friendly, cost-effective and safer products than synthetic drugs (2-phenoxyethanol, tricaine methane-sulfonate-MS-222, benzocaine, metomidate, etomidate, quinaldine sulfate). In this study, it is going to give some information about herbal anaesthetics and explain some previous studies have been done about them in aquaculture.

**Keywords:** Herbal anaesthetics, synthetic anaesthetics, aquaculture

#### Abstract

Macroalgae are the main class of biostimulants because of the benefits of their numerous bioactive components that encourage plant development without compromising crop quality, even with small amounts. Although the brown seaweed *Cystoseira barbata*, which is common in the seas of Turkey, has a significant potential for stimulating plant development and growth, it has never been applied as a biostimulant. The high-value crop broccoli contains an array of phytochemicals and mineral minerals that support human health, so it is important to drive production toward increased organoleptic quality. The purpose of the study is to determine whether the *C. barbata* extracts, which were made as three distinct extracts and applied by irrigation at two different concentrations, may improve the growth characteristics of broccoli (*Brassica oleracea* L. cv. Maraton) grown in soil. The plants were harvested after 100 days, and their growth features were evaluated. Chlorophyll, flavonoids, and anthocyanin levels in the plants' leaves were measured during their intermediate growth stage. To further understand the possible beneficial effects of biostimulants, experiments for the biochemical characterization of seaweed extracts were also conducted. The group treated with low concentrations of acid extraction showed increases of up to 55% in the dry weight of broccoli heads. It was also noted that the application of a high concentration of hot water extraction caused the plants' total dry weight to rise by nearly 43%. This research reveals the positive biostimulating effects of different *C. barbata* extracts on broccoli growing in a soil system. It is possible to say that various amounts of potentially bioactive components can affect biostimulants in multiple ways. This study will advance sustainable agricultural methods, support global food security, and reduce broccoli production-related economic losses. This study is supported by TÜBİTAK 2244 (119C030) collaborated with GUBRETAS.

#### Abstract

In this study, we planned to examine the effect of membrane cholesterol on anionic and cationic permeabilities mediated by the P2X7 receptor, which is a purinergic receptor. In this study, RAW 264.7 cells, a mouse-derived macrophage cell line, were used. These cells endogenously express the P2X7 receptor. We grew the cells in flasks or glass coverslips and tested them after 24 hours. Flowcytometer and Fluorescent Microscopy: To monitor membrane permeability, we stimulated the cells with the receptor agonist ATP (1 mM) in the medium containing the cationic YO-PRO1 or the anionic Lucifer Yellow fluorophores. After 20 min, we calculated the ratio of the number of cells uptaking fluorophore to the total number of cells. We considered this ratio as a measure of P2X7-mediated permeability. To test the role of membrane cholesterol, we incubated cells with the membrane cholesterol inhibitor methyl- $\beta$ -cyclodextrin (M $\beta$ CD, 5 mM) for 20 min and repeated the experiments. In this study, we observed that methyl- $\beta$ -cyclodextrin, a membrane cholesterol inhibitor, did not affect the permeability rate of cationic YO-PRO-1 (M $\beta$ CD: 98.5 and M $\beta$ CD+: 2), but increased the permeability rate of anionic Lucifer Yellow (M $\beta$ CD -: 41,8 and M $\beta$ CD+ : 57.9). We also observed that the Lucifer Yellow fluorescence intensity increased. We observed that methyl- $\beta$ -cyclodextrin did not affect P2X7-mediated cytoskeleton reorganization. Although membrane cholesterol inhibition does not affect the permeability of cations, it increases the permeability of anions. This finding is very important as the first in the literature. Investigating the roles of membrane cholesterol-rich lipid rafts in P2X7-mediated functional responses will help explain the signal transduction mechanism of the P2X7 receptor. Considering that membrane cholesterol changes membrane fluidity and that membrane fluidity is of vital importance for the cell, the importance of our findings will be better understood.

\*abayrak2018@gtu.edu.tr

#### Abstract

Hydroponic systems are frequently preferred for commercial lettuce cultivation. In closed hydroponic production, ionic balance in the nutrient solution can be disturbed over time, which can cause yield loss, deficiency, or toxicity symptoms. The optimal EC (an indicator of the strength of the solution) can vary depending on environmental factors. In this study, the plants were grown in a greenhouse and a growth chamber to explore the impact of the growing environment on an EC characteristic. The treatments' ECs, which we designated EC1X, EC2X, and EC3X, were 0.8, 1.6, and 2.4 dS/m. Greenhouse plants exhibited higher fresh and dry weights than growth chamber plants. The highest fresh weight was found in EC3X greenhouse plants, while the lowest fresh weight was found in EC3X growth chamber plants. With rising EC levels, the total phenolic content increased and was higher in growth chamber plants. Statistically, EC3X-growth chamber plants had higher vitamin C content than all other applications. In all treatments, tissue nitrates were at a nutritionally safe level. The macrolelements of EC1X solution were nearly depleted in a week while the EC2X and EC3X solutions still had enough nutrients to allow for a biweekly solution change. There was a correlation between these pH dynamics and ammonium consumption in the solutions. The rate of ammonium depletion differed in two different locations. The solution pH of EC3X-growth chamber plants was low enough to negatively impact plant root development. Results indicate that EC2X is suitable for lettuce cultivation in hydroponic conditions for both locations in terms of the providing optimum pH of the solution, the advantage it creates in the frequency of changing the nutrient solution, and the nutritional quality.

#### Özet

Bitkiler, geçmişte olduğu gibi günümüzde de geleneksel tedavide ilaç olarak yararlanılan doğal kaynakların başında gelmektedir. Sentetik ilaçlarla kıyaslandığında birçok avantaja sahip olması nedeniyle, dünyada olduğu gibi ülkemizde de tıbbi bitkilere olan ilgi hızla artmaktadır. Bu çalışma Kurna Köyü'nde doğal olarak yetişen bazı tıbbi bitkileri belirlemek amacıyla yapılmıştır. Bitkilerin çiçeklenme dönemlerinde yapılan arazi çalışmaları sonucunda 21 familyaya ait 39 cins ve bu cinslere ait 40 tıbbi ve bitki taksonu tespit edilmiştir. Araştırma alanında tanımlanan familyalardan sırasıyla *Asteraceae* familyası 7 takson, *Lamiaceae* familyası 5 takson, *Brassicaceae* familyası 3 takson, *Boraginaceae* familyası 3 takson ve *Fabaceae* familyası 3 takson ile en çok takson sayısına sahip ilk beş familyayı oluşturmaktadır. Tıbbi bitkilerin bilimsel adları, yöresel adları, kullanılan kısımları ve kullanım alanları sunulmuştur. Ayrıca bu taksonların korunması, geliştirilmesi ve yaygınlaştırılarak insanlığın hizmetine sunulabilmesi konularında önerilerde bulunulmuştur. Böylece doğal kaynaklarımızın belirlenmesi, korunması ve sürdürülebilirliğine katkı sağlanacağı kanaatindeyiz.

#### Abstract

Edible flowers have had an important place in human nutrition since ancient times. Nowadays, globalization and consumer awareness and increasing interest in healthy natural foods have made edible flowers popular again. Many different types of flowers have been used as both food and medicine in alternative medicine in different cultures. Nowadays, it is used to serve buffet meals or to decorate salads, desserts, fruits, ice creams and drinks. In addition to contributing to the appearance of food, they add flavor and smell. Edible flowers can be consumed raw or cooked, hot or cold. In our country, they are often used to produce herbal tea, jam and syrup, or as colorants. Edible flowers are an excellent natural food source. They contain mineral substances, phenolic compounds and various bioactive compounds. Some of the edible flowers are important sources of pigments such as anthocyanins and carotenoids. Studies have revealed that some edible flowers have antioxidant, anti-inflammatory, antidiabetic and anticarcinogenic properties. In this review, edible flowers commonly used in our country, their uses and biological properties are discussed.

**Keywords:** Edible flowers, alternative food, functional food.

\*engin.aydin@giresun.edu.tr

### Özet

Mangiferin, mango meyvesinin kabuk, sap, yaprak, kabuk ve çekirdeklerinde bulunan bir ksantondur. Geleneksel tıpta farklı kültürler, kardiyovasküler hastalık, diyabet, çeşitli enfeksiyonlar ve kanser dahil olmak üzere bir dizi hastalığın tedavisinde mangiferin açısından zengin bitkilerinden yararlanmaktadır. Çin, Küba ve Doğu Asya'da mangiferin içermesi nedeniyle mango anti-inflamatuar, anti-viral, anti-diyabetik ve anti-kanserojen ajan olarak kullanılmaktadır. Mangiferinin bir diğer önemli kaynağı Güney Afrika'da popüler olan ve *Cyclopia sp.*'den elde edilen Honeybush çayıdır. Honeybush çay yapraklarında yaklaşık %4 mangiferin bulunduğu bildirilmiştir. Suda iyi çözünen mangiferinin ısıya dayanıklı olması, bu maddeyi değerli kılmaktadır. Son çalışmalar, önemli biyolojik aktiviteye sahip olan mangiferinin farmasötik ve kozmetik alanlar için potansiyel bir terapötik ajan olacağına işaret etmektedir. Bu derlemede, mangiferinin özellikleri ve sağlık üzerine pozitif etkileri üzerinde durulmaktadır.

**Anahtar kelimeler:** Mangiferin, sağlık, polifenol

#### Abstract

Hydrogels have been employed as support materials for the growth and proliferation of mammalian cells because they closely mirror the gel-like characteristics and, in some instances, the chemical characteristics of the extracellular matrix (ECM), which naturally surrounds the cells of any biological tissue [1]. The fields of tissue engineering and in vitro cell culture have recently shown a great deal of interest in macro-porous hydrogels, also referred to as "cryogels," that are set below the freezing point of the solvent due to their inherent interconnected macro-porous structure and ease of formation in comparison to other macro-pore forming techniques [2]. In addition, a hexaphosphate-substituted inositol ring molecule known as phytic acid is a renewable resource. It is a common plant product that is easily accessible and water soluble. Also, the primary phosphorus storage form in plant seeds and bran is phytic acid (inositol hexakisphosphate), which supports several cellular processes [3]. Mammalian cells also have abundant it, with concentrations ranging from 10 to 100 mol/L [4]. In this study, poly(2-Hydroxyethyl-methacrylate) based phytic acid containing cryogels were prepared and analyzed by various characterization methods including swelling, FT-IR, SEM. Then, the cytotoxicity of phytic acid immobilized cryogel was demonstrated on the L929 mouse fibroblasts cell line. For this purpose, cryogels were extracted (0.05 g mL<sup>-1</sup>) and diluted in a DMEM complete medium to obtain a series of dilutions with 100, 75, 50, 25, and 12.5% concentrations. Cells were plated in a 96-well plate (2.5x10<sup>3</sup> cell/well) for 24 h, and the culture medium was replaced with cryogel extracts. After 24 h incubation, the cytotoxic effect was evaluated by MTT assay.

Cell viability was similar for control and treatment groups, and extracts caused no cytotoxicity to L929 cells. In conclusion, phytic acid immobilized cryogels have appropriate biological properties and are, therefore, suitable for application in biomedicine.

**Keywords:** Cryogels, Phytic acid, cytotoxicity, MTT, L929

#### Özet

Meme kanseri kadınlarda en sık görülen malign hastalıktır. Çeşitli genomik farklılıkların, özellikle de gen ekspresyon düzeylerinin, meme kanserinde kötü prognoz ile ilişkili olduğu bilinmektedir. Meme tümörögenezinde önemli bir role sahip olan *BRCA1* ve ilişkili *WISP1*(*CCN4*) mutasyonu aktivasyonu *TP53* geni aracılı apoptozu inhibe eder. Ayrıca *WISP1*'i negatif olarak düzenleyen *TGFβ1*'in meme kanserinde terapötik bir hedef olabileceğini düşündürmektedir. *WISP1* geni kanserde ilerleme, uzak metastaz ve kötü prognoz ile ilişkilidir. Ancak bu gen bazı doku tiplerinde onkogen gibi davranmaktadır. Farklı meme kanseri hücre hatlarında, MDA-MB-231, MDA-MB-453, MCF-7 ve MDA-MB-436'da *WISP-1* gen ekspresyon düzeylerinin çeşitli gen mutasyonları ile değişimi *TGFβ1* tedavisi ile ilişkili olarak değerlendirilmiştir. *TGFβ1* uygulamasına bağlı olarak değişen *WISP-1* gen ekspresyonu düzeyi üç tekrarlı olarak gerçek zamanlı kantitatif PZR ile değerlendirildi. MDA-MB-231, MDA-MB-453 ve MCF-7 hücre hatlarının *WISP1*'de görülen ekspresyon artışı nedeniyle kanser oluşumunda onkogen görevi gördüğü gösterilmiştir. MDA-MB-436 hücre hattında *WISP1* ekspresyonu neredeyse yok denecek kadar az olduğu görülmüştür yani bu da onkogenik özelliklere sahip olmadığı anlamına geliyor. Yapılan çalışmada ER-pozitif MCF-7 hücre hattında *TGFβ1* uygulaması ile *WISP1* ekspresyonunun 6 kat arttığı gösterildi. *TGFβ1*'in MCF-7 hücre hattında hücre proliferasyonunu arttırdığı gözlenmiştir. MDA-MB-453, *CDH1* mutant bir hücre hattıdır. Bu hücre hattında *TP53* yolağının düzenli çalışmasına bağlı olarak *TGF-β1* uygulamasının *WISP-1* ekspresyonunu azalttığı düşünülmektedir. *BRCA1* ve *RB1* mutant olan MDA-MB-436 hücre hattında ise *WISP-1* gen ekspresyonu yok denecek kadar az olduğu görülmüştür. *WISP-1* geni, meme kanseri hücre hatlarında gen mutasyonlarına bağlı olarak biyolojik belirteç niteliği taşıyabilirken, *TGFβ1*'de terapötik bir hedef olabileceği gösterilmiştir, ancak daha detaylı ve klinik düzeyde çalışmalar yapılmalıdır.

**Anahtar Kelimeler:** Meme kanseri, WISP1, TGFβ1, biyobelirteç, ekspresyon.

Bu çalışma İstanbul Üniversitesi Araştırma Fonu tarafından desteklenmiştir. Proje numarası: TYL-2019-34703; ID: 34703

## ORAL PRESENTATION

### Aromataz inhibitörlerinin hayvanlarda reproduktif amaçlı kullanımı

Mehmet Buğra KIVRAK<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-4772-874X>)

<sup>1</sup>Sivas Cumhuriyet Üniversitesi, Veteriner Fakültesi, Doğum, Sivas, Türkiye.

\*Corresponding author e-mail: mbkivrak@cumhuriyet.edu.tr

### Özet

Anti-östrojenik maddeler uzun yıllardır insanlarda meme tümörü tedavisinde post-operatif olarak kullanılmaktadır. Non-steroidal anöstrojenik ilaçlardan tamoksifen ilk olarak 1967 yılında geliştirilmiş ve uzun yıllar meme tümörü tedavisinde post operatif olarak kullanılmıştır. Ancak bu tür antiöstrojenik maddeler aynı zamanda uzun vadede östrojenik aktivite de göstermektedir. Bu nedenle potansiyel yan etkileri daha az olan aromataz inhibitörleri bu amaçla kullanılmaya başlanmıştır. Aromataz CYP 450 enzim ailesinin bir üyesidir ve ovaryum, yağ doku, beyin, adrenal bez, meme, karaciğer ve plasenta gibi dokularda bulunur. Aromataz, adrenal bezden üretilen C19 androjenlerden C18 östrojenik steroidlerin oluşumunda önemli rol oynar ve bu nedenle östrojen üretiminde hız kısıtlayıcı basamak olarak kabul edilir. Aromataz maddeler östrojenik feedback mekanizmasını değiştirerek gonadotropin salınımını artırdığından insanlarda ovaryum stimülasyonu amacıyla güvenle kullanılmaktadır. Östrojenin hidroksil metabolitleri östrojen reseptör yollarını indükleyerek epidermal büyüme faktörünün aktivasyonuna neden olur ve bu da meme kanserinin başlaması ve ilerlemesinde önemlidir. Bu nedenle postmenopozal kadınlarda meme kanseri tedavisinde östrojen üretimini engellemek için aromataz inhibitörleri kullanılır. Bunun yanında azospermik ve oligozoospermik erkekler de dahil olmak üzere infertil hastalarda aromataz inhibitörlerinin olumlu etkilerini bildiren birçok çalışma bulunmaktadır. Yapılan bu çalışmaların ışığında aromataz inhibitörlerinin hayvanlar üzerindeki etkileri de son yıllarda ilgi gören bir konu haline gelmiştir. Özellikle potansiyel toksisiteyi sebebiyle steroidlerin insan tüketimine sunulan hayvanlarda kullanımı Avrupa Birliği tarafından yasaklanması nedeniyle aromataz inhibitörleri çiftlik hayvanlarda non-steroidal senkronizasyon methodları geliştirme amacıyla kullanılmıştır. Sığırlar üzerinde yapılan çalışmalarda aromataz inhibitörlerinin LH salınım ritmini değiştirerek daha büyük foliküllerin ovule olmasını ve daha büyük bir corpus luteum şekillenmesini sağlamıştır. Anöstrustaki koyunlarda kullanıldığında FSH salınımında belirgin bir artışa sebep olmuştur. İnfertil erkek keçi ve köpeklerde uzun süreli kullanımı sonucunda spermatozojik parametrelerde belirgin artışlar görülmüştür. Bu nedenle yapılan çalışmalar incelendiğinde anti-östrojenik maddelerin hayvanlarda reproduktif amaçlı kullanımının yaygınlaşacağı değerlendirilmektedir.

**Anahtar Kelimeler:** Antiöstrojen, aromataz inhibitörü, Üreme, Sığır, Koyun

#### Abstract

In order for cows to reach maximum productivity throughout their lives, their first calving must be around 24 months. To meet this reproductive parameter, heifers must be ensured to become pregnant at approximately 15 months of age. Before getting pregnant, they are required to go through several estrous cycles, provided that they are regular. However, in most farms this reproductive process does not occur as desired. In heifers, estrus either does not occur at all or is so weak that it cannot be detected. The material of this study consisted of 72 Simmental breed heifers whose ages were between 18-21 months, but whose oestrus was not determined. These heifers were first subjected to ultrasonographic examination twice consecutively, with an interval of 8 days (day -8 and day 0). Animals that did not have a corpus luteum on the ovary in both examinations were considered acyclic (not cycling). Thus, 60 heifers considered to be acyclic were included in the study. The diameters of the largest candidate follicles found on the ovaries of these 60 heifers were measured. Two groups were created, each group containing 30 heifers. In the second ultrasonographic examination (day 0), follicle diameters were measured and an intravaginal device containing progesterone was placed in the heifers in both groups. While the animals in the first group were injected with GnRH while the intravaginal device was inserted, this procedure was not performed in the animals in the second group. After 5 days (day 5), the intravaginal materials were removed from the animals in both groups and Prostaglandin F<sub>2</sub> alpha (PGF<sub>2</sub>α) injection was made. One day later, the second PGF<sub>2</sub>α injection was given to the animals in group 1, while the second PGF<sub>2</sub>α injection was not given to the animals in group 2. GnRH injection was applied to the heifers in both groups 72 hours after the intravaginal device was removed (day 8) and fixed-time insemination was performed. Pregnancy examination was performed using ultrasonographic method 35 days after the insemination date. It was determined that 14 animals in Group 1 and 16 animals in Group 2 were pregnant, and the difference was found to be statistically insignificant. In the light of this information, it was concluded that it would be more appropriate to apply the protocol applied to group 2, as it involves less hormone injection to acyclic heifers.

İstanbul, Türkiye

Sorumlu yazar e-mail: tugba.kaman@uskudar.edu.tr

#### Özet

**Amaç:** *Serin-treonin kinaz kodlayan bir gen olan TAOK1 geni*, hem nörogelişimsel bozukluk hem de otizm spektrum bozukluğu (ASD) ile ilişkilendirilmektedir. TAOK1'in beyin içindeki nöronlarda yüksek düzeyde eksprese edildiği ve fosfoinositidlerle doğrudan ilişki yoluyla plazma zarının yeniden şekillenmesinde işlevsel bir role sahip olduğunu gösterilmiştir. Bu çalışmada, TAOK1 geninde yer alan tek nükleotid varyasyonlardan (SNV) zararlı veya hastalıkla ilişkili olanların tespiti, ortak zarar verici etkiye sahip olan varyasyonların filtrelenerek protein stabilizasyonu üstüne etkileri ve üç boyutlu modellemelerinin biyoinformatik araçlar kullanılarak belirlenmesi amaçlanmıştır. Ayrıca gen-gen etkileşimleri ve protein-protein etkileşimleri değerlendirilmiştir.

**Gereç ve Yöntem:** TAOK1 genindeki SNV'ler NCBI dbSNP veritabanından 2023 yılı Mart ayında elde edilmiştir. Aminoasit değişimine sebep olduğu bilinenlerin fonksiyonel etkileri SIFT (Sorting Intolerant From Tolerant), PolyPhen-2, SNP&GO, SNAP2 ve PANTHER yazılım araçları kullanılarak tespit edilmiştir. Bu SNV'lerden ortak zarar verici etkiye sahip olanlar filtrelenerek protein stabilizasyonuna olan etkilerinin belirlenebilmesi için I-Mutant 2.0 ve MuPRO üç boyutlu modellemelerin oluşturulmasında ise Project HOPE yazılım araçları kullanılmıştır. Gen-gen etkileşimleri için GeneMANIA, protein-protein etkileşimleri için STRING yazılım aracından veri sağlanmıştır.

**Bulgular:** TAOK1 geninde 462 missense SNV, SIFT, PolyPhen-2, SNP&GO, SNAP2 ve PANTHER yazılım araçları ile taranmış olup 9 SNV'nin ortak zarar verici etkiye sahip olduğu tespit edilmiştir. I-Mutant 2.0 sonuçları, 9 SNV'den 6 tanesinin protein stabilizasyonunu azalttığı 3 tanesinin ise artırdığını, MuPRO sonuçları ise tüm SNV'lerin protein stabilizasyonunu azalttığını göstermiştir. Project HOPE yazılım aracı ile yabancıl ve mutant rezidülerin yük, boyut, hidrofobiklik ve yapısal özelliklerine ait bilgilerine ulaşılmıştır.

**Sonuç:** Biyoinformatik araçlar kullanılarak yapılan taramalar sonucunda TAOK1 geninde 9 SNV'nin protein yapısı ve stabilizasyonu üzerine zarar verici etkisi olabileceğini göstermiştir. Elde edilen sonuçların ileri yapılacak deneysel çalışmalara veri sağlayacağı öngörülmektedir.

**Anahtar Kelimeler:** TAOK1 geni, nörogelişimsel bozukluk, tek nükleotid varyasyon (SNV), biyoinformatik

### Boron-complexed polyloipoic acid as metal-free self-healing polymer

Efdal Teknikel<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0003-3218-9437>)

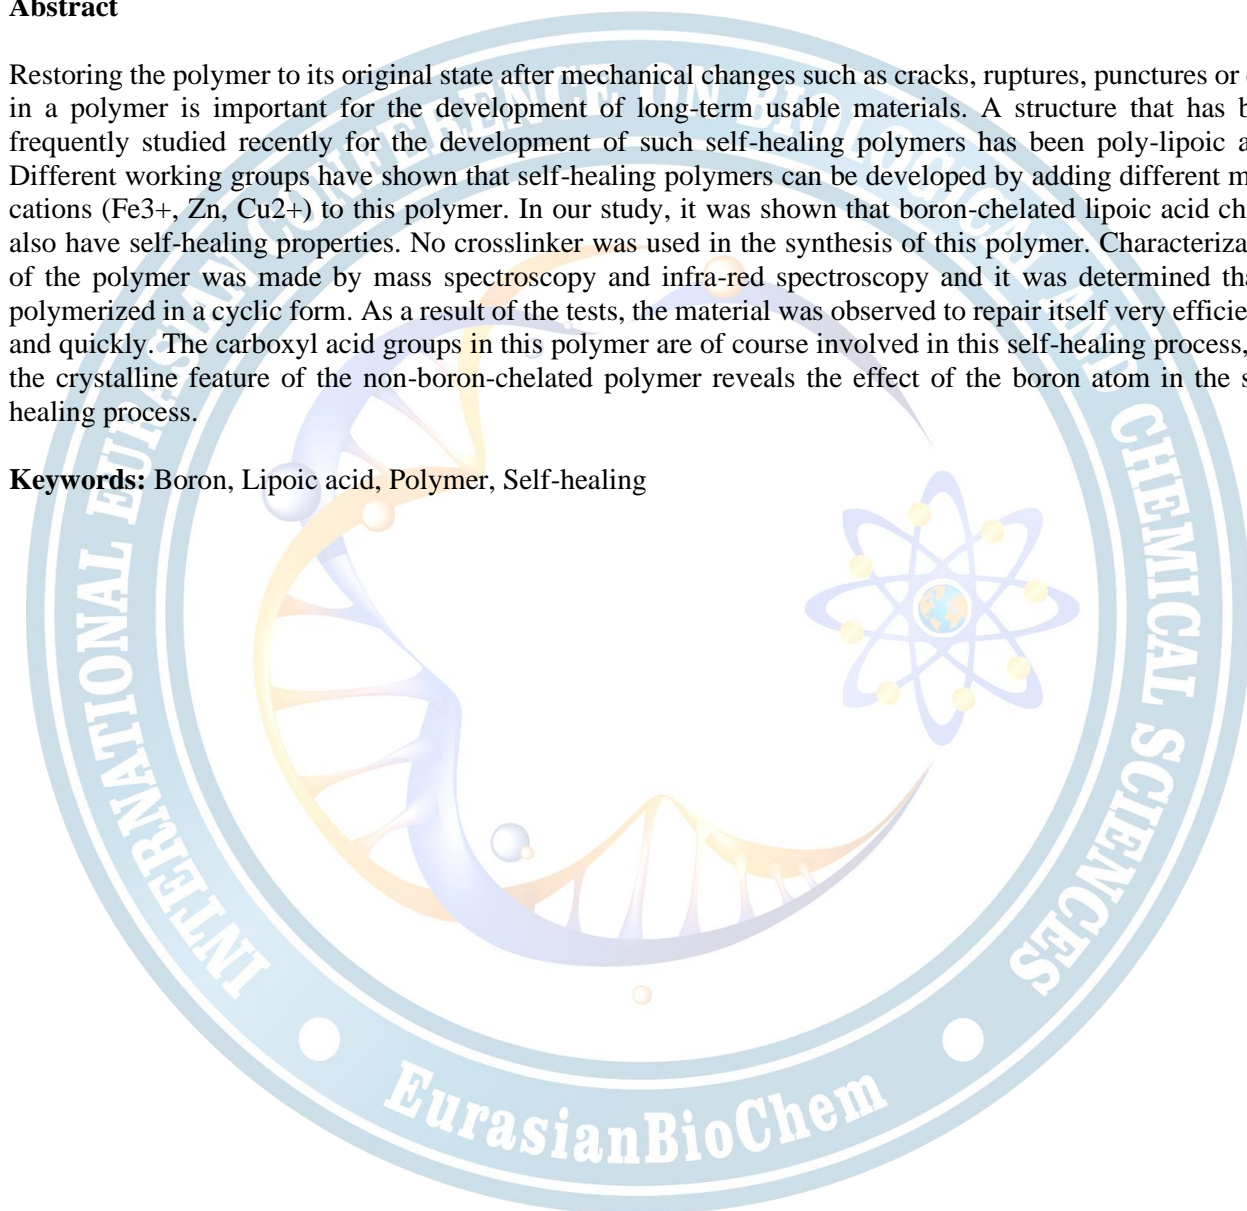

<sup>1</sup>HacettepeUniversity, Faculty of Science, Department of Chemistry, Ankara, Türkiye.

\*Corresponding author e-mail: [efdalt@hacettepe.edu.tr](mailto:efdalt@hacettepe.edu.tr)

#### Abstract

Restoring the polymer to its original state after mechanical changes such as cracks, ruptures, punctures or cuts in a polymer is important for the development of long-term usable materials. A structure that has been frequently studied recently for the development of such self-healing polymers has been poly-lipoic acid. Different working groups have shown that self-healing polymers can be developed by adding different metal cations (Fe<sup>3+</sup>, Zn, Cu<sup>2+</sup>) to this polymer. In our study, it was shown that boron-chelated lipoic acid chains also have self-healing properties. No crosslinker was used in the synthesis of this polymer. Characterization of the polymer was made by mass spectroscopy and infra-red spectroscopy and it was determined that it polymerized in a cyclic form. As a result of the tests, the material was observed to repair itself very efficiently and quickly. The carboxyl acid groups in this polymer are of course involved in this self-healing process, but the crystalline feature of the non-boron-chelated polymer reveals the effect of the boron atom in the self-healing process.

**Keywords:** Boron, Lipoic acid, Polymer, Self-healing

### Abstract

Plants have been preferred for many different purposes from past to present. Plants that have been widely used throughout human history attract attention with their nutritional properties. In addition to its nutritional properties, many plant species are also very important medicinally thanks to the bioactive compounds they produce. In this study, the biological activities of *Ceratonia siliqua* L. reported in the literature were compiled. *C. siliqua* is known as "Carob". Carob, which belongs to the Fabaceae family, is widely distributed in the Mediterranean region. The pod-shaped fruits of carob are edible. Carob is in the form of evergreen shrubs and trees. As a result of literature research, *C. siliqua* has been shown to have activities such as antioxidant, antimicrobial, cytotoxic, anti-inflammatory and antiproliferative. As a result, it is thought that the carob plant can be used in different studies in the field of pharmacology.

**Keywords:** Biological activities, Carob, *Ceratonia siliqua*, medicinal plants

#### Abstract

In addition to their nutritional importance, mushrooms are also used in the field of health to treat different ailments and problems. In this study, the biological activities of *Cantharellus cibarius* Fr. reported in the literature were compiled. *C. cibarius* is known as "girolle". Girolle is in the Cantharellaceae family. It is widespread from Europe across the Mediterranean to Scandinavia, especially in deciduous and pine forests. As a result of literature research, *C. cibarius* has been shown to have biological activities such as antioxidant, antimicrobial, anti-inflammatory, antihyperglycemic, cytotoxic, anticancer and pesticidal. As a result, it is thought that *C. cibarius* can be preferred as a natural source in the field of pharmacology.

**Keywords:** Antimicrobial, antioxidant, girolle, medicinal mushroom, *Cantharellus*

### Abstract

Plants are indispensable elements of diet lists that stand out with their nutritional properties. Many plant species have been used by humans for many purposes such as shelter, heating, equipment, food and medicine. It is known that different plant species are used as tools in the fight against different diseases. In this study, the biological activities of *Pistacia lentiscus* L. reported in the literature were compiled. *P. lentiscus* is known as the "gum tree". It is generally distributed in the Mediterranean region, does not shed its leaves in winter and has a shrub form. The fruits are round, small and reddish black in colour. As a result of literature research, *P. lentiscus* has been shown to have activities such as antioxidant, antimicrobial, anticancer, cytoprotective, antiparasitic, anti-inflammatory, hepatoprotective and antidiabetic. As a result, it is thought that the use of the gum tree plant can be expanded in many areas.

**Keywords:** Biological activities, Gum tree, medicinal plants, *Pistacia lentiscus*

### Abstract

Natural products are preferred in traditional medicine, and plants are the most important of these natural products. Plants are the most commonly used natural products by humans. In this study, the biological activities of *Crataegus monogyna* Jacq. reported in the literature were compiled. *C. monogyna* is known as "Hawthorn". It is in the Rosaceae family. Hawthorn usually grows in forest areas. Its flowers, which bloom in spring, are white and pink. The fruits are red or dark red, 6-10 mm in diameter. Jam, marmalade and paste are made from its fruits. As a result of literature research, it has been observed that the *C. monogyna* species has activities such as antioxidant, antimicrobial, antidiabetic, antihyperglycemic, anti-inflammatory and antiproliferative. As a result, it is thought that the common hawthorn plant can be used as a natural product in the field of health.

**Keywords:** Biological activities, *Crataegus monogyna*, Hawthorn, medicinal plants

#### Abstract

Plants are important natural products responsible for many biological activities. Many studies have shown that plants have different biological activities. In our study, the biological activities of *Rubus idaeus* L. reported in the literature were compiled. *R. idaeus* (Rosaceae) is known as raspberry or raspberry. It is a plant species that produces red and sweet fruits in summer and autumn. They develop in places where forests are open or in areas previously cleared by fire or logging. They grow at altitudes of 900-2200 m, under forests, on the edges of meadows and on stony slopes. According to literature data, *R. idaeus* has been reported to have many biological activities such as antioxidant, antimicrobial, anticancer, cytotoxic, antiproliferative and anti-inflammatory. Important findings have been found in the literature, especially in terms of antioxidant and antimicrobial activity. It is thought that this plant species, which stands out with its nutritional properties, may also be an important natural material from a medical perspective.

### Abstract

Plants; It has been used in different areas such as shelter, nutrition, dressing and alternative medicine. These features put the plants at the top of functionally used natural products. Many studies have shown that plants have important biological activities. In this study, the biological activities of *Elaeagnus angustifolia* L. reported in the literature were compiled. *E. angustifolia* is known as "bird oleaster". It is in the Elaeagnaceae family. Buckthorn grows as a native species in Western and Central Asia, including Turkey and Iran. Its fruit, whose leaves resemble willow leaves, is generally orange yellow in color and reaches up to 7-8 meters in length. As a result of literature research, *E. angustifolia* has been shown to have activities such as antioxidant, antimicrobial, antimutagenic, antitumor, insecticidal, anticancer and anti-inflammatory. As a result, it is thought that the bird oleaster plant can be used in different subjects by expanding its biological activity areas.

**Keywords:** Biological activities, *Elaeagnus angustifolia*, medicinal plants, silverberry

#### Abstract

Mushrooms, like plants, are evaluated nutritionally by humans. Apart from its nutritional aspects, its use in the field of pharmacology has recently become widespread. In this study, the antioxidant and antimicrobial activities of *Ramaria stricta* (Pers.) Quél. species reported in the literature were compiled. *R. stricta*, commonly known as tight branch coral, is a coral fungus of the genus *Ramaria*. Tight branch coral is in the Gomphaceae family. It has a cosmopolitan distribution and grows on dead wood, logs, trunks and branches of both deciduous and coniferous trees. As a result of literature research, *R. stricta* was found to have antioxidant and antimicrobial activities. As a result, it is thought that *R. stricta* mushroom can be preferred as a natural source of antioxidant and antimicrobial properties in pharmacological designs.

**Keywords:** Antimicrobial, antioxidant, coral, medicinal mushroom, *Ramaria*

### Abstract

Plants have been used for different purposes, from the most primitive societies to the most developed societies. The most important of these different purposes is the treatment of diseases. In this study, the biological activities of *Lycium barbarum* L. reported in the literature were compiled. *L. barbarum* plant is known as Chinese wolfberry, Goji berry, barbary matrimony vine, red medlar or matrimony vine. It is in the Solanaceae family. The homeland of Goji berry is known as China. It is a deciduous woody shrub that usually grows to a height of 1-3 meters. Its fruits are bright orange-red. As a result of literature research, *L. barbarum* has been shown to have activities such as antioxidant, antimicrobial, anti-inflammatory, anti-tumor and anti-diabetic. As a result, it is thought that the wolfberry plant can be used for different purposes in the field of health apart from its nutritional properties.

**Keywords:** Biological activities, Goji berry, medicinal plants, wolfberry

### Silsesquioxane-based nanoadsorbent for the wastewater treatment

Asuman Celik-Kucuk\* (ORCID: 0000-0002-3509-1497)

\*Marmara University, Metalurgical and Materials Engineering 34722 Istanbul, Turkey

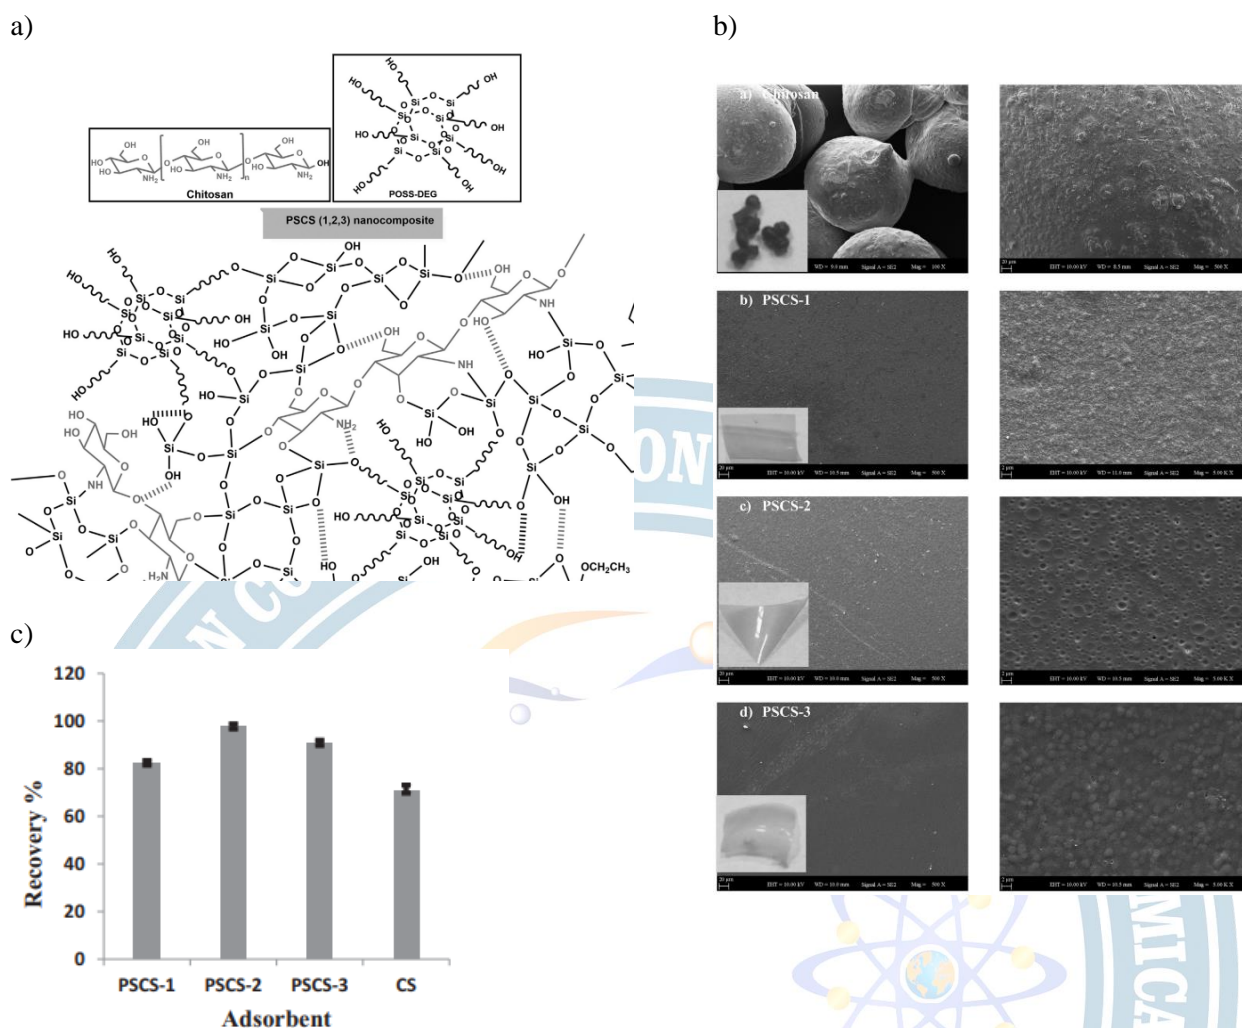

\*Corresponding author e-mail: asumancelikkucuk@gmail.com

#### Abstract

In this study, polyhedral oligomeric silsesquioxanes (POSS) and chitosan based nanocomposite materials (PSCS-(1,2,3)) as nanoadsorbents were prepared and investigated for the first time. POSS with eight arms of di(ethylene glycol) oxides units (POSS-DEG) has been synthesized by direct hydrosilylation reaction of POSS-SiH with di(ethylene glycol)vinyl ether.<sup>1</sup> POSS-DEG has been characterized by FT-IR, <sup>1</sup>H and <sup>13</sup>C NMR. POSS-DEG and chitosan based nanocomposite materials (PSCS-(1,2,3)) were prepared by varying the cross-linker ratio while keeping POSS and chitosan quantities constant. The sol-gel method was used to develop nanocomposites (PSCS-(1,2,3)) by using POSS-DEG and chitosan as precursors. TEOS has been preferred to utilize as a cross-linking agent due to the having potential to keep the active amine groups as in pristine chitosan. The prepared nanocomposite materials (PSCS-(1,2,3)) have been characterized (Figure 1a) by FT-IR spectroscopy, TGA and SEM (Figure 1b). The effectiveness of PSCS-(1,2,3) nanocomposites in wastewater treatment has been investigated and compared to the chitosan beads. It is well known that chitosan beads cross-linked by TEOS showed efficient cationic Cd (II) adsorption. Among the prepared nanocomposites, PSCS-2 was found to be the most effective nanoadsorbent for the treatment of wastewater containing cadmium (Cd (II)) because of having a balance between the availability of functional sites and the stability of the nanocomposites (Figure 1c). The influence of pH, saturation time, initial metal concentration was determined under the optimum conditions. The adsorption property of the nanocomposite material was investigated by the Langmuir and Freundlich adsorption isotherms. Characterization and analytical results demonstrated that Cd (II) ions were adsorbed by functional groups available in nanocomposite (PSCS;1,2,3). PSCS-2 showed higher adsorption capacity of 98.6% compared to chitosan (70%), PSCS-1 and PSCS-3 due to the good balance between the availability of functional sites and the stability of the nanocomposites.<sup>2</sup> The contribution of nanohybrid POSS on the adsorption of Cd (II) is probably due to the having extra OH groups and increasing surface area of nanoadsorbant. Although the availability of functional sites of OH decrease with increasing the amount of TEOS, the stability of nanocomposite composite increases. Therefore, PSCS-2 has showed higher recovery than PSCS-1 due to the stability of PSCS-2. The lower capacity of PSCS-3 compared to PSCS-2 might be because of lowering functional sites and nonhomogeneous film formation. From this result, it can be emphasized that the balance between the stability and availability of the functional sites have significant role on the adsorption. Moreover, competitive adsorption test showed that PSCS-2 exhibited high selectivity for Cd (II), Cu (II), and Ni (II) ions. Good fitting with the Langmuir model was attributed to succeeding a smooth surface morphology thanks to the good solubility and dispersibility of POSS molecules in organic environments. Therefore, a high adsorption capacity value (98.6%) with incorporation of POSS (for PSCS-2) compare to that of chitosan (70%) was succeeded. It can be concluded that the use of POSS reinforced chitosan nanocomposite to treat heavy metal pollutants in wastewater is promising and deserves further investigation.

**Keywords:** Polyhedral oligomeric silsesquioxanes (POSS), POSS/chitosan based nanocomposite, Sol-gel method, AAS, Cadmium (II) Adsorption

**Figure 1** (a) Proposed interactions for PSCS-(1,2,3) nanocomposites. POSS-DEG and chitosan have been expected to bind to each other directly and also through TEOS. Expected hydrogen bonds are marked by dotted line. (b) SEM images for chitosan and the nanocomposites (PSCS-(1,2,3)) obtained after the sol-gel by using POSS-DEG and chitosan as precursors. (c) Cd (II) adsorption capacity of PSCS-1, PSCS-2, PSCS-3 and chitosan at pH 7 and room temperature.

### Assessing Generation-Specific Chemical Profiles of Calliphora Adult Flies

Canan KULA

Hacettepe University, Graduate School of Science and Engineering, Department of Forensic Science,  
Ankara, Turkey

#### Abstract

The discipline of forensic entomology plays a pivotal role in the estimation of the post-mortem interval (PMI) through the examination of colonising insect species. Calliphoridae (Diptera) occupies an interest among insects due to their well-defined life cycle and close association with decaying organic matter. Species identification is a fundamental aspect of forensic entomology, as it provides valuable information about the location and circumstances surrounding a death. Estimating the age of adult flies is another critical element in determining the PMI. Traditional methods rely on morphological changes. Nevertheless, the chemical composition of the cuticle is species-specific, like a fingerprint, and undergoes systematic changes over a period of time, which can be used as an indicator of species and their age. The cuticle is coated with a waxy layer consisting of hydrocarbons, fatty acids, and alcohols.

This research aims to examine variations in Calliphora adult flies throughout different generations. This will be achieved via the use of gas chromatography-mass spectrometry (GC-MS) and principal component analysis (PCA) to analyse cuticular hydrocarbons. PCA, a statistical methodology, is used to examine and interpret intricate patterns seen in the cuticular hydrocarbon profiles and facilitates the identification of notable distinctions between several generations of adult Calliphora flies by lowering the dimensionality of the data. This methodology facilitates a more complete comprehension of changes peculiar to different generations.

The aforementioned results provide significant contributions to the field of forensic entomology. However, they also underscore the need for more study to better understand the complex correlation between generation-specific chemical profiles and their possible influence on PMI prediction. The acquisition of these findings has the potential to significantly improve the accuracy and reliability of the use of cuticular hydrocarbon analysis in criminal investigations, hence providing valuable assistance to law enforcement organisations in the resolution of complex criminal cases.

**Keywords:** Calliphoridae, cuticular hydrocarbon analysis, generation differences

#### Abstract

Feeding fatty acids to lactating dairy cows improve milk yield, milk fat, energy balance, reproduction and other biological functions. Protecting fats from ruminal bio-hydrogenation provides concentrated energy without reducing total tract digestibility. This study will discuss a recent experiment feeding calcium salts of palm fatty acids (CSPF) on nutrient digestibility and milk production. Forty multiparous dairy cows (Jersey × Holstein) producing  $20 \pm 1.69$  kg of milk/d and  $20 \pm 5.0$  d in milk were assigned to 1 of 4 treatments using a randomized complete block design. Feeding increasing CSPF amounts linearly decreased dry matter intake (1.20 kg/d), while linearly increasing neutral detergent fiber digestibility (3.90%), and quadratically increasing total fat digestibility (6.30% at 0.4 kg/d CSPF). Increasing CSPF feeding rate increased energy-corrected milk (ECM; 3.30 kg/d), milk fat (0.11 kg/d), and feed efficiency (ECM/dry matter intake, 0.34 kg/kg) compared with cows fed no CSPF. Palm fatty acid, which is a 16-carbon saturated fatty acid is known to increase milk fat concentration and production. In controlled research studies, the increase in milk production has been greater than 1 kg per cow per day. Another important fatty acid is oleic acid, an 18-carbon fatty acid having one double bond. Previously, feeding oleic acid increases NDF digestibility, probably through stimulating fiber digesting bacteria. Oleic acid is easily absorbed as a micelle in the small intestine and the first fatty acid attached to glycerol when synthesizing a triglyceride for export as milk fat by the mammary gland. Oleic acid is thought to influence metabolism while increasing the sensitivity to insulin. Reducing oleic acid concentrations in the rations during Mid- to Late-lactation could be advantageous by minimizing the increase in body condition scores. Fatty acids are more than just an energy source for milk fat, they also impact immunity, metabolism, and body condition score.

**Keywords:** Fatty acid, Milk, Milk fat, Dairy cow, Energy, Yield.

#### Özet

Bu araştırma sağlık profesyonellerinin genetik ve genetik uygulamalara yönelik tutum ve anlayışlarının belirlenmesi amacı ile yapılmıştır.

Araştırma tanımlayıcı ve kesitsel olarak yürütülmüştür. Bu araştırma Türkiye’de bulunan bir üniversite hastanesinde görev yapan 350 sağlık profesyoneli ile yapılmıştır. Araştırmada veriler, tanıtıcı özellikler formu ve Genetik ve Genetik Uygulamalarına Yönelik Tutum ve Anlayış Ölçeği kullanılarak toplanmıştır. Verilerin değerlendirilmesinde Student t testi ve Anova testi kullanılmıştır.

Bu araştırmada katılımcıların %54.90’ının kadın olduğu, %79.70’inin 18-30 yaş aralığında olduğu, %51.43’ünün bekar olduğu, %17.70’inin idari birimde görev yaptığı saptanmıştır. Yine katılımcıların %33.10’unun mesleğinin ebe/hemşire olduğu, %49.40’ının eğitiminin ön lisans/lisans düzeyinde olduğu, %50.00’sinin 5-10 yıl süre ile çalıştığı ve %61.70’inin genetik ve genetik uygulamalarına yönelik eğitim almadığı bulunmuştur. Sağlık profesyonellerinin Genetik ve Genetik Uygulamalarına Yönelik Tutum ve Anlayış Ölçeği puan ortalamaları ile cinsiyet, yaş, medeni durum, eğitim durumu, görev yapılan birim, meslek ve genetik konusunda eğitim alma durumu arasında istatistiksel olarak anlamlı fark olduğu belirlenmiştir (p<0.05).

Bu araştırmanın sonuçlarına göre sağlık profesyonellerinin genetik uygulamalarına yönelik tutum ve anlayış düzeylerinin orta düzeyde olduğu ve cinsiyet, yaş, medeni durum, eğitim durumu, görev yapılan birim, meslek ve genetik konusunda eğitim alma durumu ile istatistiksel olarak anlamlı bir ilişki olduğu bulunmuştur.

**Anahtar Kelimeler:** sağlık, genetik, tutum, anlayış, sağlık profesyonelleri

#### Abstract

With the Coronavirus disease-2019 (Covid-19) showing its effect all over the world, a pandemic was declared by the World Health Organization in March 2020. The lack of a specific treatment method for the disease has led all researchers to seek new drug molecules that can be curative or inhibit the activity of the virus. With the urgent need for a specific antiviral drug, Computer Aided Drug Design (CADD) technology gains more attention due to its time and cost effective characteristic. Demonstrating the structure of the virus with experimental methods accelerated CADD processes even more. Researchers performed molecular docking with different herbal compounds using the AUTODOCK program to inhibit the main non-structural protein Mpro of the virus, compared the docking results with the existing antiviral drugs, and made inferences on the effectiveness of plant compounds on the virus function. After the SARS-CoV-2 virus enters the human body, it can transform and reproduce itself. During this replication process, the virus expresses itself with different non-structural proteins and those are used as important targets in process of therapy. The most important of these are 3CLpro, PLpro, RNA polymerase RdRp, endoribonuclease, 2'-O-methyltransferase, and helicase. In the current study, some herbal compounds known to have antiviral effects will be computationally investigated using all non-structural proteins of the SARS-CoV2 listed above. The important binding parameters like energy, and bonds will be examined for recommendation of further experimental investigation of covid-19 therapeutics.

**Keywords:** CADD, covid-19, docking, non-structural protein, binding energy

### Removal of Copper (II) from Mining Waste Water by Adsorption onto Activated Carbons Produced from Hazelnut Shell

Pınar BOZBEYOĞLU (Orcid ID: 0000-0002-3704-2701)

Gümüşhane University, Gümüşhane Vocational School, Electronics and Automation  
Department, Gümüşhane, Turkey

pinarbozbeyoglu@gumushane.edu.tr

#### Abstract

Mining wastewater is one of the most important environmental problems today with the heavy metal ions they contain. Waste waters containing heavy metal pollution are generally acidic waters with low BOI (Biochemical oxygen demand) value. Various processes such as mineral processing waste disposal, illegal mining, domestic waste disposal and others result in the release of heavy metals into waters.

One of the heavy metals that cause problems in terms of environmental pollution is copper. Copper (Cu) metal is commonly found in metal and metal plating industry wastewater. Although metal industry wastewater is low in quantity, they are toxic wastes. For this reason, industrial wastewater must be treated before being discharged into the receiving environment.

In this study, the amount of Cu in wastewater of the mining operation in Gümüşhane was determined. Heavy metal pollution was eliminated with an adsorbent produced from agricultural biowaste. It has been tried to determine the amount of adsorbent, contact time and treatment efficiency of wastewater at different pHs of activated carbon produced by chemical activation.

As a result of the study, an average of 88.7% efficiency was obtained with activated carbon activated with KOH, while 22,4% copper removal efficiencies were obtained with raw material (hazelnut shell) used without activation. It was determined that the appropriate working pH was 5.5, the amount of adsorbent was 0.05 g. Due to the high ionexchange capacity of activated carbon, the process result on the recovery of Copper bound on activated carbon works are in progress. After recovery, processed the reusability of activated carbon will be examined.

**Keywords:** Activated carbon, Chemical activation, adsorption, wastewater, hazelnut Shell

#### Abstract

The eye is one of the most important organs of the body. Therefore, especially laboratory and drug research for ophthalmology is gaining importance. Studies conducted in recent years have shown that a more functional working environment is required in this field. For this reason, there are approaches to apply organ-on-chip technology for ophthalmological studies. This study aimed to compile and examine eye-on-chip applications. In this study, 'Eye-on-chip, microfluidic chip, neuroscience, ophthalmology, biophysics' are utilized in Web of Science, Scopus, Pubmed and Google Scholar databases in order to reach the relevant articles about nutrition and biophysical effects on eye health.

The organ-on-chip should be manufactured using materials that do useful affect the cellular microenvironment components and provide a regular fluid connection such as polydimethylsiloxane (PDMS), Polymethylmethacrylate (PMMA). In addition, it is very popular to use 3D software to be able to use a chip together the scaffold. Pressure generators and different pumps such as a compressor, a pressure regulator and a manometer, to measure the current pressure value are used. Eye-on-chip models designed for eye studies such as various neurodegenerative diseases and retina-blood barrier have been planned considering all these methods. Studies conducted in the literature includes, designs on cornea, retina, retinal stem cells and organoids, blood-retina barrier, neurodegenerative diseases and they were seemed to have modelled within the scope of eye-on-chip.

Retina-on-a-chip designs promise to reduce reliance on animal models in retinal drug testing. Retina-on-a-chip systems can be used to study the effects on human retinas before starting clinical trials of new drugs. In the future, retina-on-chip model could have a huge impact on drug discovery and safety testing.

**Keywords:** Eye-on-chip, microfluidic chip, neuroscience, ophthalmology, biophysics.

#### Abstract

The dairy cow's energy requirements during the close-up period are increased due to fetal development and colostrum production. After calving, the mammary glands demand for glucose increases 3-fold, amino acids 2-fold and fatty acids 3-fold compared to the late lactation period. High protein rations can be fed to fresh cows to maximise milk and milk protein yields, however over feeding protein to meet energy requirements increases ration costs and reduces N efficiency. Most studies have focused on fresh cows evaluating dietary crude protein (CP) whereas this study discusses a recent experiment on metabolizable protein (MP) amounts fed during early lactation on milk yield, blood parameters, and health. Three rations containing 17.0, 16.2, 15.3% CP to supply 114, 107, and 101 g MP/kg were fed in different combinations to 100 multiparous Holstein cows during weeks 1-3 or 4-13 of lactation. All rations were considered deficient in MP. Milk yield, dry matter intake, and feed efficiency were similar for lactating dairy cows fed all treatments except for cows fed 101MP producing lower energy corrected milk and feed efficiency during week 1-3 compared with cows fed 114MP. Milk composition and yields were similar except for cows fed 101MP being lower during week 1-3 compared cows fed 114MP. Body weight, body condition score, and disease incidences were similar for cows fed all treatment combinations. Serum concentrations of total fatty acids, albumin, and aspartate aminotransferase were similar for cows fed all ration combinations, however, serum  $\beta$ -hydroxybutyrate concentrations were lower in cows fed 101MP during the first 3 weeks of lactation indicating reduce ketosis incidences. Feeding lower MP ration combinations sustained lactational performance and improved milk N efficiency without negatively affecting the frequency of diseases in dairy cows during early lactation. Reducing ration MP fed to early lactation dairy cows improves N efficiency, reduce ration costs and ammonia excretion.

**Keywords:** Crude protein, Metabolizable protein, Milk yield, Early lactation, Milk components.

#### Abstract

In this study, we reported the green synthesis of SeNPs (selenium nanoparticles) by simply mixing *Rosa damascena* Herrm. leaf extract and sodium selenite ( $\text{Na}_2\text{SeO}_3$ ) salt. This mixture was stirred to give a dispersion of SeNPs conjugate. The use of plant extracts in green synthesis has become very popular because no toxic solvents or high temperatures are required. The synthesized PdNPs were characterized by UV-Vis spectrophotometer, Fourier transform infrared spectroscopy (FTIR), transmission electron microscope (TEM), and scanning electron microscope (SEM). The synthesis of SeNPs determined by the UV-vis spectrum showed an SPR peak at 315 nm. The prepared nanoparticles had a spherical and polydisperse shape and a size of 40-60 nm. These green synthesized SeNPs showed significant activity against both antibacterial and antifungal species. The present results highlight the advantages of the green method for the synthesis of SeNPs with potential activities.

**Keywords:** Antibacterial and antifungal activity; green synthesis; *Rosa damascena*; selenium nanoparticles

#### Abstract

Plants are among the most significant sources of natural products. Moreover, plants with medicinal uses play a vital role in numerous indigenous and rural communities worldwide, particularly in areas where government-provided medical services are limited or non-existent, and where herbal remedies are preferred over allopathic medicine. Such practices are especially prevalent in traditional Chinese and Indian medicine. These uses have historical roots, and plants like orchids have been employed for medicinal purposes in nearly every geographic region. In Turkey, for instance, orchid tubers have been used for centuries in the production of salep, a traditional beverage. However, the overharvesting of these tubers poses a threat to the survival of these plant species. This study aimed to determine the antioxidant activity of methanol extracts from the leaves and flowers of *Anacamptis coriophora*, a species grown sustainably from seeds, and to measure the total content of flavonoids, flavanols, tannins, and proanthocyanins. The results indicate that both the leaves and flowers of *A. coriophora* contain a high level of bioactive compounds and exhibit a strong DPPH free radical scavenging effect (IC<sub>50</sub> values of 44.77 and 47.79 mg/ml, respectively). This research makes a significant contribution to the understanding of the preservation and sustainability of natural resources, as well as the exploration of their medicinal potential.

#### Abstract

In organic synthesis, the irradiation by UV light has attracted many researchers, so several reactions were performed using the photocatalytic route as the conversion of alcohol to aldehyde <sup>[1]</sup>. The UV visible light is considered as an energy source that can reduce the reaction temperature and modify the metal capacity by the excitation of its electrons leading to strong interaction between molecules and metal <sup>[2]</sup>. Propargylamines are interesting intermediates to synthesize built and heterocycled molecules such as pyrrole, oxazoles, pyrazoles <sup>[3]</sup>. Furthermore, a number of propargylamines derivatives were used to treat Parkinson's and Alzheimer's disease such as rasagyline <sup>[4]</sup>. Their preparation method has drawn the attention of a significant number of researchers. In view of the synthetic procedure, the three coupling component of alkyne, aldehyde and amine (A3) was used in the presence of catalysts<sup>[5]</sup>.

In the present study, two types of mesoporous materials were synthesized: the mesoporous Fe<sub>2</sub>O<sub>3</sub> was prepared with the hard template using SBA-15, while the mesoporous Au/Fe<sub>2</sub>O<sub>3</sub> was prepared by DP-NaOH, and DPU. With the last one, different content of gold were used. Then, the effect of preparation method and nanoparticles size on the catalyst activity was demonstrated. The catalyst which gives the best yield was used also to synthesize propargylamines via AHA coupling under ordinary condition and UV light irradiation.

#### Abstract

It is crucial to transform fossil-based energy resources into energy using renewable and clean energy technologies since fossil fuel reserves are depleting and environmental degradation is a real threat. Utilizing coal and lignite effectively through gasification technologies can result in energy efficiency of 40% or more when compared to burning. The gasification of lignite coal using waste biomass (tea bush hazelnut shells), which was also used in this study, is one of the most significant of these technologies. The structure of the bio-char samples was attempted to be clarified through the application of brief analyses, calorific values, SEM, BET, and XRD analyses of bio-char samples produced from co-gasification studies carried out at 700 °C. In the experiments, the value found for bio-char with the highest calorific value was found to be 7141 cal/g. The porous structure and holes on the surface of bio-char created during pyrolysis with volatile matter production will provide more adsorption areas for ions. Both open and closed vesicle formations were observed in the produced bio-char samples due to the gradual release of different volatile compounds as the temperature increased during evaporation at a high heating rate. When the BET analysis results of biochar samples are examined, the adsorption capacity can be improved by increasing the surface areas and pore diameter through activation processes, which can contribute to the production of graphene-type conductive activated carbon. In the XRD analysis spectra of the bio-char samples, peaks belonging to crystalline regular stacking could not be seen and it was determined that the structure was generally amorphous.

**Keywords:** Gasification, biomass, lignite, bio-char, characterization

#### Abstract

Monosodium glutamate (MSG) is a flavour-enhancing compound that elevates the flavour profiles of various foods. However, concerns have been raised about potential health effects from excessive MSG consumption, including cardiovascular diseases, obesity, diabetes, kidney damage, hypertension, anxiety, and memory impairment. To address these concerns, the Turkish Food Codex has established regulations to protect public health by limiting the amount of MSG in foods to a maximum of 10 g/kg. This study aims to develop a method for analysing MSG content in various food products, such as seasonings, spices, and flavourings sold in Turkish local markets. Chromatographic determination was performed with the gradient program on the Mediterranean Sea 18 (15x0.46 cm, 5µm) column. The optimal method conditions were determined by analysing different formic acid percentages, mobile phase flow rates, column temperatures, and MSG:OPA ratios. The validation parameters of the developed method were examined and it was found that the developed method corresponds to the recommended values. LOD and LOQ values were calculated as 0.075 µg/mL and 0.251 µg/mL, respectively. Recovery % was determined 100.96% in intra-day and 132.22% in inter-day analyses for the precision of the method. The developed and validated method showed that it is accurate and rapid for determining MSG in both qualitative and quantitative analysis. The results compared to the values specified in the Turkish Food Codex Food Additives Regulation and MSG was detected in samples that claim not to contain MSG on their labels.

**Keywords:** HPLC-DAD, Method validation, Food additives, Monosodium glutamate

This study was funded by Scientific Research Projects Coordination Unit of Istanbul University (Project number: FLO-2022-39584).

#### Abstract

Sweet chestnut (*Castanea sativa* Mill.) is an essential species in Turkey. Chestnut blight or canker caused by *Cryphonectria parasitica* (Murrill) Barr is one of the most significant diseases affecting this tree. In this study, the efficacy of applying phosphorous acid (PA) to the foliage was examined in the control of chestnut canker caused by *C. parasitica* on chestnut saplings under field conditions. An isolate of *C. parasitica* for artificial inoculations were selected. Foliage treatment of PA which is the only practical option for saplings was employed onto ten healthy chestnut saplings for each treatment group. Effect of PA was determined in two ways. The initial treatment for the first group involved spraying the chemical (4 mL/L of Agrifos) onto the saplings, followed by inoculation with the pathogen after one weeks. For the second group, the pathogen was inoculated first, followed by the application of the chemical one week later. Additionally, positive control was conducted by placing a culture disk of *C. parasitica* without any treatment. After 28 and 35 days from inoculations, evaluation of the treatment was assessed by measuring the lengths of the cankers. Foliage application of PA done on two ways did not provide any protection against chestnut canker caused by *C. parasitica*.

#### **Abstract**

This study aimed to investigate the potential of newly synthesized sulfonyl hydrazone (SH) derivatives to modulate contractions in isolated rat myometrium. For this purpose, the structures of SH compounds were characterized by elemental analyses and spectroscopic methods. Virgin female rats were obtained from KONUDAM Experimental Animal Research Centre (Konya, Turkey). Longitudinal myometrial strips, rapidly isolated post-decapitation, were rapidly inserted into a tissue bath containing Krebs' solution to monitor spontaneous contractions. Separate strips from each rat were treated with two different compounds. Control contractions were initially recorded, followed by the assessment of SH effects at different concentrations (0.5-2 mg/ml) over 10-minute intervals. Despite the tendency of all SH derivatives to decrease contraction, SH 2.2 (4-diethylaminobenzaldehydepropanesulfonylhydrazone) at 2 mg/ml significantly reduced both contraction frequency and amplitude ( $p < 0.01$ ) compared to control. No statistically significant differences were found with SH 1.2 (4-nitrobenzaldehydepropanesulfonylhydrazone) and SH 3.2 (2-hydroxy-5-chloro-benzaldehydepropanesulfonylhydrazone) on spontaneous contractions. Following the determination that SH 2.2 was efficacious among the compounds, the effect of SH 2.2 on oxytocin-induced contractions was examined. SH 2.2 decreased the frequency of oxytocin-induced contractions ( $p < 0.05$ ) dose-dependent but did not significantly change the amplitude. Taken together, these findings indicate that SH 2.2 may effectively regulate uterine contraction activity. This could potentially be a promising therapeutic target for abnormal uterine contractions. Further research is needed to understand the effects of sulfonyl hydrazones on uterine contractions.

#### Abstract

A superior Green Fluorescent Protein (GFP) mutant, known as superfolder GFP (sfGFP), is more soluble, faster folding, and is the brightest of the known GFP mutants. GFP mutants have been widely used as visual marker proteins in developmental and cell biology studies. A superior Green Fluorescent Protein (GFP) mutant, known as superfolder GFP (sfGFP) (GenBank accession no. HI069813.1) was developed, which has superior features among GFP mutants, such as higher solubility, brighter fluorescence, faster folding, and higher resistance to denaturants such as urea and formamide. Therefore, an efficient overexpression method of sfGFP to obtain sufficient amount of protein is required for further investigations. In this regard, the current study focused upon production of recombinant sfGFP in a large scale in inducible pBAD *E. coli* expression system using bioreactor. *E. coli* pBAD expression vector that inserted sfGFP gene transformed to *E. coli* BL21-AI competent cells for expression of target protein by heat shock. Transformed cells cultured in bioreactor includes 3L LB triple medium. Protein expression induced with arabinose. Purification of recombinant sfGFP was performed with affinity chromatography. The protein is engineered with 6xHis-tag on the N-terminus, which can be used for purification/removal by using Ni<sup>++</sup> beads easily. Recombinant protein analyzed SDS-PAGE and UV spectroscopy. mCherry was produced recombinantly in bioreactor in high yield (12,8 g protein/L culture) by the induction of arabinose concentration (0.04 %) for 4 hours induction result observed high levels of fluorescent protein expression. Therefore, this method provides a quick, high-yield production route for any soluble fluorescent protein that is needed for further research.

#### Abstract

Non-structural protein 16 (Nsp16) is an important target for SARS-CoV-2. It facilitates capping of viral mRNA to disable the recognition of the viral mRNA by host immune system. Nsp16 transfers a methyl group from S-adenosylmethionine (SAM) to 2' hydroxyl of ribose sugar in the viral mRNA. Thus, inhibiting methyl transferase activity could be a way for the treatment of SARS-CoV-2. Therefore, we screened 400.000 molecules drug-like molecule obtained from ZINC database using AutoDock Vina program. Top-ranked 5000 molecules were redocked using Schrödinger glide program. Top 200 molecules having highest docking score were selected and then clustering was applied to prevent working on very similar molecules. From 200 molecules we obtained 165 clusters and selected cluster centroids for further operation. After that ADME/T analysis was performed on these selected molecules. 100 ns long MD simulations of 10 molecules predicted to have good human oral absorption properties were performed. We selected 5 molecules exhibiting the highest stability in the MD simulation trajectories. RMSD fluctuation of some molecules were less than ~1.0 Å. Based on the analysis of the trajectories, residues Leu 6898, Cys 6913, Met 6929, Tyr 6930, Pro 6932 and Phe 6947 form hydrophobic interactions with ligands. Also, residues Asp 6897, Asp 6928 and Lys 6968 make hydrogen bonds with molecules of the interests.

#### Abstract

Grapes (*Vitis vinifera* L.) are among the most commonly cultivated horticultural crops on the earth covering an area of 7.5 million hectares with around 70 million tons production. Grapes being highly nutritious are majorly utilized in making beverages or used as fresh and raisin. In today's world, the most concerned topic in agriculture is continuous change in climatic conditions leading to several negative social, ecological, economical and biological problems. Grapes are delicate fruits, their vines are sensitive towards extremes in temperature, water, heat, duration and intensity of light exposure as well as carbon dioxide and humidity alterations. Hence, one can shift to drought and heat tolerant varieties and certain training and pruning methods suitable to the prevailing environmental conditions. Vineyard management practices, including farm mechanization can be amended for improving the gains, while reducing the input. Control over temperature and proper water supply are needed to help the vines against stress. Wind machines in areas facing speedy, chilling winds mix the cold and warm air, reducing the freezing injuries to plants. An old method is to cover the young plant with soil mound to conserve the heat but this can expose the plant to microbes, causing vine rots and damaging their fragile roots. In areas where summer heat is insufficient for conversion of vegetative buds into reproductive ones, it is needed to conserve the heat by covering plants with some insulator like polyethylene sheets. Mulch is also used to conserve soil moisture in drylands. Also, certain organic amendments can protect the plant from under-nutrition. Climate change renders the plants more sensitive for certain disorders so we use some pesticides or growth promotors to counteract those abnormalities. The best approach is to combine all the environment-friendly sustainable strategies and apply a joint integrated crop management (ICM) approach for successful viticulture.

#### Abstract

1,3-diaryl-2-propene-1-ones and chalcones have more than one different biological activity. These compounds are formed by natural means or are easily synthesized [1]. The flavonoid-type phenolic phytochemicals called biosynthesized and open-chain flavonoids are chalcones [2]. They are considered biosynthetic precursors of flavonoids. Chemically, chalcones are usually  $\alpha$ ,  $\beta$ -unsaturated ketones consisting of two aromatic rings (A and B rings) bonded by a three-carbon alkenone unit, but they also contain some saturated ketones, mostly known as dihydrochalcones. Instead of a three-carbon alkenone unit, there is a three-carbon alkanone unit. Decoction of one or more phenolic hydroxyl functions is present at every point between naturally occurring chalcones, and prenyl and geranyl substituents on aromatic rings are also commonly observed. There are thousands of naturally occurring chalcones in the current literature [3]. In this study, biotransformation of chalcone derivative which was synthesized with acetophenone and aldehyde using *Aspergillus glaucus* 200914 was investigated. The chalcone derivative compound was incubated with *A. glaucus* 200914 for five days in a shaker. Metabolite obtained after the biotransformation experiments was examined by thin layer chromatography. The structure of the resulting metabolite was determined by the spectra of <sup>1</sup>H NMR, and <sup>13</sup>C NMR. Accordingly, it was determined that the chalcone derivative was hydrogenated.

**Keywords:** Chalcone, biotransformation, *Aspergillus glaucus*

#### Abstract

The chemistry of chalcones has provided intensive scientific studies around the world. The name "Chalcones" was given by Kostanecki and Tambor [1]. Another well-known name for chalcones is benzylidene acetophenone or benzyl acetophenone. In chalcones, two aromatic rings and an aliphatic are connected to each other by three carbon chains. Chalcones (trans-1, 3-diaryl-2-propene-1-ones) are  $\alpha$ ,  $\beta$ -unsaturated ketones comprise of two aromatic rings (ring A and B) with diverse substituents. The rings are connected to each other by a highly electrophilic three-carbon  $\alpha$ ,  $\beta$ -unsaturated carbonyl system, which estimates a linear or almost planar structure [2, 3]. They include the ketomethylene group (-CO-CH=CH-). Chalcones have conjugated double bonds and there is a  $\pi$ -electron system completely embedded in both benzene rings. In chalcones, the purpose of use of intermediates is for decoction of compounds with therapeutic value. [4, 5]. Chalcones have been described as different compounds associated with various biological activities. In this study, biotransformation of (E)-1-phenyl-3-(p-tolyl)prop-2-en-1-one with *Aspergillus glaucus* 200914 fungus culture was performed. The chalcone compound was incubated for five days in a shaker. Metabolite was examined by thin layer chromatography. The structure of the resulting metabolite was determined by the spectra of <sup>1</sup>H NMR, <sup>13</sup>C NMR. Accordingly, the hydrogenation of the chalcone was detected.

#### Abstract

The aim of this study is to obtain composite polymeric film surfaces consisting of chitosan (CHT), silk sericin (SS) and silver nanoparticles (AgNPs). In the study, firstly, composite polymeric film surfaces consisting of CHT/SS polymers containing different amounts of AgNPs were obtained by solvent casting method. For the synthesis of CHT/SS membranes, CHT and SS solutions were prepared separately. To prepare SS solution, 2 grams of SS was added to 100 mL of hot water and the pH of the mixture was increased above 7 with NaOH to increase the solubility of SS. To prepare CHT solution, 2 grams of CHT were taken and dissolved in 100 mL of 1% acetic acid by stirring for 24 hours. First of all, for the synthesis of AgNPs, 10 mM silver nitrate and SS solution were mixed in equal volumes and the mixture was heated at 100 °C for 2 hours. At this stage, a color change was observed and the color of the silver nitrate-SS mixture turned dark brown. With this color change, it was confirmed that AgNPs were synthesized. Afterwards, SS-AgNPs solution and CHT solution were mixed in different proportions and 10 mL of this mixture was taken and transferred to petri dishes and the petri dishes were incubated at 37 °C for 24 hours to obtain CHT/SS/AgNPs composite film surfaces by solvent casting method. The chemical structure of the film surfaces was examined by fourier transformed infrared spectroscopy (FTIR), it was confirmed that the membranes consisted of CHT and SS. The morphological structure of the membranes was examined by field emission scanning electron microscopy (FESEM) analyses, and the presence of AgNPs in the structure of films containing AgNPs was proven by energy dispersive spectroscopy (EDS) analyzes taken on FESEM images. The thermal properties of membranes were investigated by thermogravimetric analysis (TGA) and it was confirmed that AgNPs addition increased the thermal stability of the membranes. The antibacterial and cytotoxic properties of membranes will also be examined in our ongoing studies. The resulting film surfaces will have the capacity to be used in medical applications such as wound dressing or antibacterial packaging materials.

#### Abstract

Erythropoietin is a hormone which has protective activity. The aim of this study was to investigate the possible anxiolytic effect of Darbepoetin alpha (DEPO), a derivative of erythropoietin, a neuroinflammation model induced by lipopolysaccharide (LPS). Adult male 40 Wistar albino rats were divided into four groups (n=10), (Control; LPS ; DEPO; DEPO+LPS). Rats were treated with 5 mcg/kg DEPO once a week for four weeks, followed by neuroinflammation with 2 mg/kg LPS. Anxiety-like behaviors were assessed by elevated plus maze, open field, and light dark box test. TNF- $\alpha$ , IL-1 $\beta$ , brain-derived growth factor (BDNF), and serotonin levels were analyzed by ELISA in the prefrontal cortex and striatum. Cortisol and total oxidant/antioxidant (TAS/TOS) levels were analyzed in serum and brain regions. Total/free thiol levels were analyzed in serum. Increased Harderian gland secretion in stress was analyzed observationally according to an existing scale. Anova and Tukey tests were performed statistically. Anxiety-like behavior decreased in the both naive rats group and the LPS group. In the neuroinflammation group, serotonin and BDNF decreased, whereas cortisol, TNF- $\alpha$ , and IL-1  $\beta$  increased significantly compared to the control group (p<0.001). Serotonin and BDNF levels increased in the neuroinflammation group treated with prophylactic DEPO compared to the neuroinflammation group (p < 0.01), while cortisol, IL-1 $\beta$ , and TNF- $\alpha$  decreased (p<0.0001). While there was no significant difference between all groups in terms of TAS, TOS increased in prefrontal cortices and serum after DEPO administration compared to the control group. Free thiol increased in serum after DEPO administration compared to the control group. Harderian gland secretion is increased in the inflammation group. Furthermore, 20 percent mortality occurred in the neuroinflammation group. There were no deaths in the prophylactic DEPO group. DEPO as an erythropoietin derivative has been found to have anxiolytic effects in terms of many physiological mechanisms in the neuroinflammation model.

<sup>3</sup>Kırşehir Ahi Evran University Medicine Faculty, Department of Physiology, Kırşehir, Turkey

#### Abstract

The aim of this study is to examine the self-care and self-care-related grooming behavior patterns of high-intensity interval exercise. 8-week-old Wistar Albino 16 male rats were divided into Control (n=8), and Exercise (n=8). The animals in the Exercise group was exercised for 38 minutes a day, five days a week, for 8 weeks. The animals were then subjected to open field test and splash test, and the behaviors were video recorded. Splash test was conducted by spraying a 10% sucrose solution on the dorsal body surface of the rats for 5 minutes. Total distance traveled in the open field test, grooming time/frequency, and latency were analyzed in the splash test. Student t-test and Shapiro Wilk test were used as statistical tests. In the exercise group, splash-induced grooming behavior increased significantly in terms of duration and frequency ( $p < 0.001$ ). High-intensity intermittent exercise increased self-care behaviors. No significant difference was observed in the latency of grooming ( $p > 0.05$ ). In the open field test, the total distance traveled, which is a locomotor activity parameter, did not change between the groups ( $p > 0.05$ ). Intermittent high-intensity exercise increased self-care behaviors. This Exercise type can be a new option to improve depression-associated behavior. More studies are needed.

**Keywords:** Exercise, grooming behavior, self-care, splash test

### Pd-modified waste based activated carbon materials as a catalyst in hydrodeoxygenation reaction

Yusuf Osman DONAR (<https://orcid.org/0000-0003-1672-4540>)

Ankara University, Faculty of Science, Department of Chemistry, Ankara, TURKEY

yodonar@ankara.edu.tr

#### Abstract

Bio-oil is an important product, obtained from thermal conversion (pyrolysis or liquefaction) of biomass. One of the obstacle on the usage of bio-oil as a potential transportation fuel is its higher oxygenated compound content. Hydrodeoxygenation of bio-oil is the very attractive method for the removal of oxygenated compounds on the last years. HDO catalyst is mainly consist of metal that serves as the active site and support material. In this two-component system, the metallic region activates molecular hydrogen and catalyzes the hydrogenation reaction. In addition the support material catalyzes dehydration, hydrogenation, isomerization, cracking reactions as well as provides substrate adsorption. For this purpose, there are studies conducted with many different metals immobilized on a support material. However, in order achieve high activity, noble metals must be well dispersed on the support material. Otherwise, agglomeration or post-reaction sintering cause the activity decreasing. Due to the large surface area and adjustable pore size activated carbons serve as a perfect support material for HDO reactions. Waste based carbon materials can be prepared via different techniques such as pyrolysis or hydrothermal/ionothermal carbonization. The surface areas of carbon materials obtained with these techniques can be increased to over 1000 m<sup>2</sup>/g with a further activation methods. In this study carbon materials obtained from corn leaf by hydrothermal carbonization activated in the presence of KOH as an activation agent. Obtained activated carbons decorated with Pd particles via wet impregnation method. The activity of prepared catalyst was tested in hydrodeoxygenation reaction of carboxylic acids using batch type high pressure and high temperature autoclave.

**Keywords:** waste utilization, carbon, hydrodeoxygenation, catalyst

#### Abstract

Phenolic compounds encompass a wide variety of plant substances having an aromatic ring bearing one or more hydroxyl groups. Since all phenolic compounds are aromatic, these compounds are known to have absorption in the UV region. The presence of phenolic compounds in all plant organs makes them a vital component of the human diet [1][2]. An antioxidant is a substance that delays or prevents the oxidation of a substrate [3]. Phenolic compounds show antioxidant activity and prevent oxidative damage to biomolecules through free radical-mediated reactions [4]. Extracts of rosehip (*Rosa canina*) species, one of the members of the Rosaceae family, are potential phytochemicals for the reduction reaction due to their hydroxyl groups [5]. Solvent-assisted extraction of bioactive compounds from solid plant materials is of great interest in the production of phytochemically rich products. Since conventional extraction methods have long processing times and low extraction yields, environmentally friendly extraction techniques that provide automation, reduce organic solvent consumption, and shorten extraction times have attracted interest in recent years [6]. Since the seeds of this fruit become waste after being used in the food industry, this study focuses on the evaluation of rosehip seeds. Rosehip fruit seeds will be extracted by accelerated solvent extraction, which is one of the advanced extraction techniques. Antioxidant capacity, total phenolic and flavonoid content of the obtained extract will be determined spectrophotometrically.

**Keywords:** Phenolic compounds, antioxidant, rosehip, accelerated solvent extraction

## Özet

Kanser tedavisi ile ilgili bilimsel çalışmalar devam ederken, tedavi süreci kemoterapi, radyoterapi ve cerrahi yöntemlerle sürdürülmektedir. Kanser hastalıklarının tedavisine yönelik klasik ilaçlar, kanser hücrelerinin DNA replikasyonunu önleyerek etki gösterirler. Fakat bilimsel verilere göre, ilaçların kanser hücrelerine seçici bir etki yarattığını söylemek güçtür. Çoğunlukla sağlıklı hücrelere de aynı etkiyi gösterdikleri için, alternatif yöntem arayışları, yüzyıllar boyunca geleneksel olarak tedavi amaçlı kullanılan ve doğal kaynaklardan elde edilen biyotoksinlerle antikanser ilaç geliştirilmesi çalışmalarına yönelmiştir. Bu çalışmalar kapsamında, çeşitli hayvan türlerinin (yılan, akrep, kurbağa, arı ve deniz anemonu gibi) venom proteinleri kansere karşı terapötik potansiyel göstermiştir. Bu bakış açısından yola çıkarak önerilen bu çalışmanın ilk aşamasında, Muğla kıyılarında literatürde dağılım gösterdiği saptanan denizanası türlerinden biri olan *Aurelia aurita* türünün örneklenmesi hedeflendi. Denizanası örneklerinin ekstraksiyonu ile ham venom elde edildi. Bu aşamayla eş zamanlı olarak gerçekleştirilecek diğer aşamada, ZrO<sub>2</sub> kaplı MnFe<sub>2</sub>O<sub>4</sub>/aljinat kompozitler üretildi. Manyetik kompozitlere ham venom enkapsülasyonu gerçekleştirilip, salım deneyleri, farklı metabolik pH'larda ayrı ayrı yürütüldü ve salımlarının kinetik modeli belirlendi. Venom kinetikleri, Peppas, Higuchi, sıfırıncı ve birinci merteye modellerine ait grafikler çizilerek belirlendi. Hazırlanan venom salım sistemlerinin tüm salım modellerine uyduğu yani polimerik yapılardan oluşan taşıyıcıların salımı geciktirmediği, ani salıma neden olmadığı, salınmayan etken madde miktarının zamanla logaritmik olarak azaldığı, gözenekliliğinin yani yüzey alanlarının yüksek olduğu, salınan etken madde miktarını zamana bağlı olarak sabit tutmayı başardığı görüldü ve venom ile hazırlanan sistemin kontrollü bir salım sistemi sonucuna ulaşıldı. Bu çalışma sırasında sentezlenen ZrO<sub>2</sub> kaplı MnFe<sub>2</sub>O<sub>4</sub>/aljinat manyetik kompozitlerle ilgili literatürde, ilaç veya venom salımıyla ilgili bir çalışmaya rastlanmamıştır. Ayrıca, denizanası venomuyla yapılan herhangi bir salım çalışması da mevcut değildir. Bu yönleriyle bu çalışmada elde edilen verilerin, özgünlüğü yönüyle literatüre önemli katkılar yaptığı düşünülmektedir.

**Anahtar kelimeler:** Kanser, venom, manyetik kompozit, salım sistemi.

**Teşekkür:** Bu çalışma MSKÜ-BAP 22/134/07/1/4 no'lu proje ile desteklenmiştir.

## Özet

Bisfenol-A (BPA), endokrin bozucu bileşiklerden biridir. Biyolojik uzaklaştırma işlemlerinde enzimlerin kullanılması, toksik olmama, yüksek katalitik verimlilik, yüksek substrat spesifikliğı ve kısa reaksiyon süreleri gibi avantajlar sunar. Ancak bu enzimlerin çözünür formlarında kullanılması pratik uygulamalarını sınırlandırmakta ve tekrar kullanılmama, denatüre edici ajanlara karşı hassasiyet ve düşük stabilite gibi bazı dezavantajlara sahiptir. Enzim immobilizasyonu bu sınırlayıcı özelliklerin üstesinden gelmek için önemli bir yöntemdir. Çalışmada BPA'nın uzaklaştırılması enzimatik bir işlemle gerçekleştirildi. Lakkaz yüklenmiş manyetik  $CuFe_2O_4$ /aljinat boncukların sentezi ilk kez gerçekleştirildi ve sentez optimize edilerek, taramalı elektron mikroskopu ile termal analiz yapılarak karakterize edildi. Optimum koşullar altında sentezlenen lakkaz yüklenmiş boncukların sıcaklık, pH, tekrar kullanım ve kinetik özellikleri gibi enzimatik özellikleri serbest lakkazla kıyaslanarak araştırıldı. Lakkazın katalitik performansı immobilizasyondan sonra artarak, aktivite gösterdiği sıcaklık profili genişledi ve alkali bölgede daha iyi aktivite gösterdi. Düşük sıcaklıklarda (30°C ve altı) serbest lakkaz aktivite göstermezken, immobilize lakkaz % 40 aktivitesini sabit tutmayı başardı. 60°C'de ise serbest lakkazın aktivitesi %45'e düşerken immobilize lakkaz %87 oranında aktive göstermiştir. pH kararlılığı çalışmasında pH 7.5'dan itibaren serbest lakkaz aktivite göstermezken, immobilize lakkaz aktivitesini %76 oranında korudu. Ayrıca, 7 kullanımdan sonra immobilize lakkaz aktivitesi %64 oranında korundu ve BPA giderimi için 120 dakika sonra %50 BPA giderimi sağlandı.

**Anahtar Kelimeler:** BPA, lakkaz, immobilizasyon, enkapsülasyon

**Teşekkür:** Bu çalışma TÜBİTAK 2209/A kapsamında desteklenmiştir.

## ORAL PRESENTATION

### Invertebrate iridescent virus 6 (IIV6)'ya ait helikaz geninin kodon kullanım eğilimi analizi

Yeşim AKTÜRK DİZMAN<sup>1\*</sup> (ORCID: 0000-0003-0185-502X)

<sup>\*1</sup>Recep Tayyip Erdoğan Üniversitesi, Fen Edebiyat Fakültesi, Biyoloji Bölümü, Rize, Türkiye

\*Sorumlu yazar e-mail: yesim.akturk@erdogan.edu.tr

#### Özet

Invertebrate iridescent virüs 6 (IIV6), *Iridoviridae* familyasının *Betairidovirinae* alt familyasında yer alan *Iridovirus* cinsinin tip türüdür. IIV6, 215 açık okuma zinciri (ORF) kodlayan, yaklaşık 212 kbp büyüklüğünde lineer çift zincirli DNA genomuna sahiptir. IIV6 genomu, *Saccharomyces cerevisiae*'nin PIF1 helikaz proteinine homolog bir protein kodlayan açık okuma zinciri (ORF 030L, IIV6 helikaz geni) içerir. IIV6 helikaz geni sadece viral DNA replikasyonunda rol oynamakla kalmaz, aynı zamanda viral konak seçiciliğinde de rol oynar. Bu çalışmada, IIV6 ve 9 referans iridovirüsün helikaz genindeki kodon kullanım eğilimi (CUB), nükleotid içeriklerini, görelî sinonim kodon kullanımını (RSCU), kodonların etkili sayısını (ENC), kodon adaptasyon indeksini (CAI), dinükleotid içeriklerini ve diğer indeksleri karşılaştırarak analiz edilmiştir. Hem nükleotid içeriği hem de RCSU analizi, IIV6'nın helikaz geninde çoğunlukla A ve T ile biten kodonların tercih edildiğini göstermiştir. ENC değeri 36.20 olan IIV6 helikaz geninde düşük bir kodon kullanım eğilimi (CUB) olduğu belirlenmiştir. ENC grafiği, neutrality grafiği ve parity rule 2 grafiği, hem mutasyon baskısının hem de doğal seçilimin IIV6 ve referans iridovirüslerin helikaz genlerinin kodon kullanım eğilimi üzerinde etkisi olduğunu ortaya koymuştur. Kodon adaptasyon indeksi analizi, IIV6 DNA helikaz geninin konakçısına güçlü bir şekilde adapte olduğunu göstermiştir. Ayrıca, correspondence analizi (COA) ve korelasyon analizleri, nükleotid bileşimlerinin, dinükleotid içeriğinin, mutasyon baskısının ve doğal seçilimin helikaz genlerindeki kodon kullanım eğilimini şekillendirdiğini ortaya koymuştur. Bu bulgular, IIV6 helikaz geninin ve referans genlerinin kodon kullanım eğilimini anlamamıza katkıda bulunacak ve bu genlerin temel evrimsel analizi için gerekli bilgileri sağlayabilecektir.

**Anahtar Kelimeler:** Invertebrate iridescent virus 6, ORF 030L, Helikaz, Kodon kullanım eğilimi

### Tıp fakültesi öğrencilerinin genetik okuryazarlık konularına yönelik tutumlarının incelenmesi

Derya Batmaz (<https://orcid.org/0009-0008-1795-7307>), Nevin Karakuş

Gaziosmanpaşa Üniversitesi, Lisansüstü Eğitim Enstitüsü, Tıbbi Biyoloji Anabilim Dalı, Tokat, Türkiye

Patoloji2173@gmail.com

#### Özet

Genetik okuryazarlık: genetik kavramını anlama, algılama ve bunu yaşamla ilişkilendirilme şeklinde ifade edilir (Acra, 2006). Hızla gelişmekte olan gen teknolojisindeki gelişmelerin sebep olduğu sorunları çözen, sonuç verme kısmına dahil olan ve bunu bir sonraki nesillere aktaracak genetik okuryazar bireylerin yetiştirilmesi savunulmaktadır (Tsui & Treagust, 2010).

Genetik ve genetik uygulamalar kapsamında alınan görüşlere bakıldığında, ilgili literatür kapsamında genetik okuryazarlığın, genelde genetik uygulamalara yönelik bilgi ve tutum ölçmek adına yapıldığı görülmüştür (Bowling, vd., 2008; Cebesoy ve Öztekin, 2018; Henneman, Timmermans, & Wal, 2006; Shaw III & Bassi; Smith, Wood, & Knight, 2008). Sınırlı sayıda araştırma dahilinde yapılan bu çalışma tıp fakültesi öğrencilerinin genetik okuryazarlık düzeyinin belirlenmesi amacı ile yazılmaktadır.

Bütün bu tanımlar, genetik okuryazarlığa sahip öğrencilerin yetiştirilmesinin önemini vurgulamaktadır. Özellikle lisans düzeyinde verilecek eğitime önem taşımaktadır (Erdoğan, Özsevgeç, & Özsevgeç, 2014). Eğitim, öğrencilerin toplumu yakından ilgilendiren konularda etkin karar verme ve genetik bilimi ile ilgili kavramlar hakkında yeterli bilgi düzeyine ulaşması açısından da oldukça önem arz etmektedir (Acra, 2006).

**Anahtar Kelimeler:** Genetik okuryazarlık, Tıp fakültesi öğrencileri, Anlayış

### Determination of oxidative stress levels (malondialdehyde), and some antioxidant activities (superoxide dismutase, glutathione peroxidase and reduced glutathione) in unoperated breast cancer patients

Safa Ali Ahmed AMAR , Halit DEMİR, Canan DEMİR , Mehmet Naci ALDEMİR , Kasım TURAN

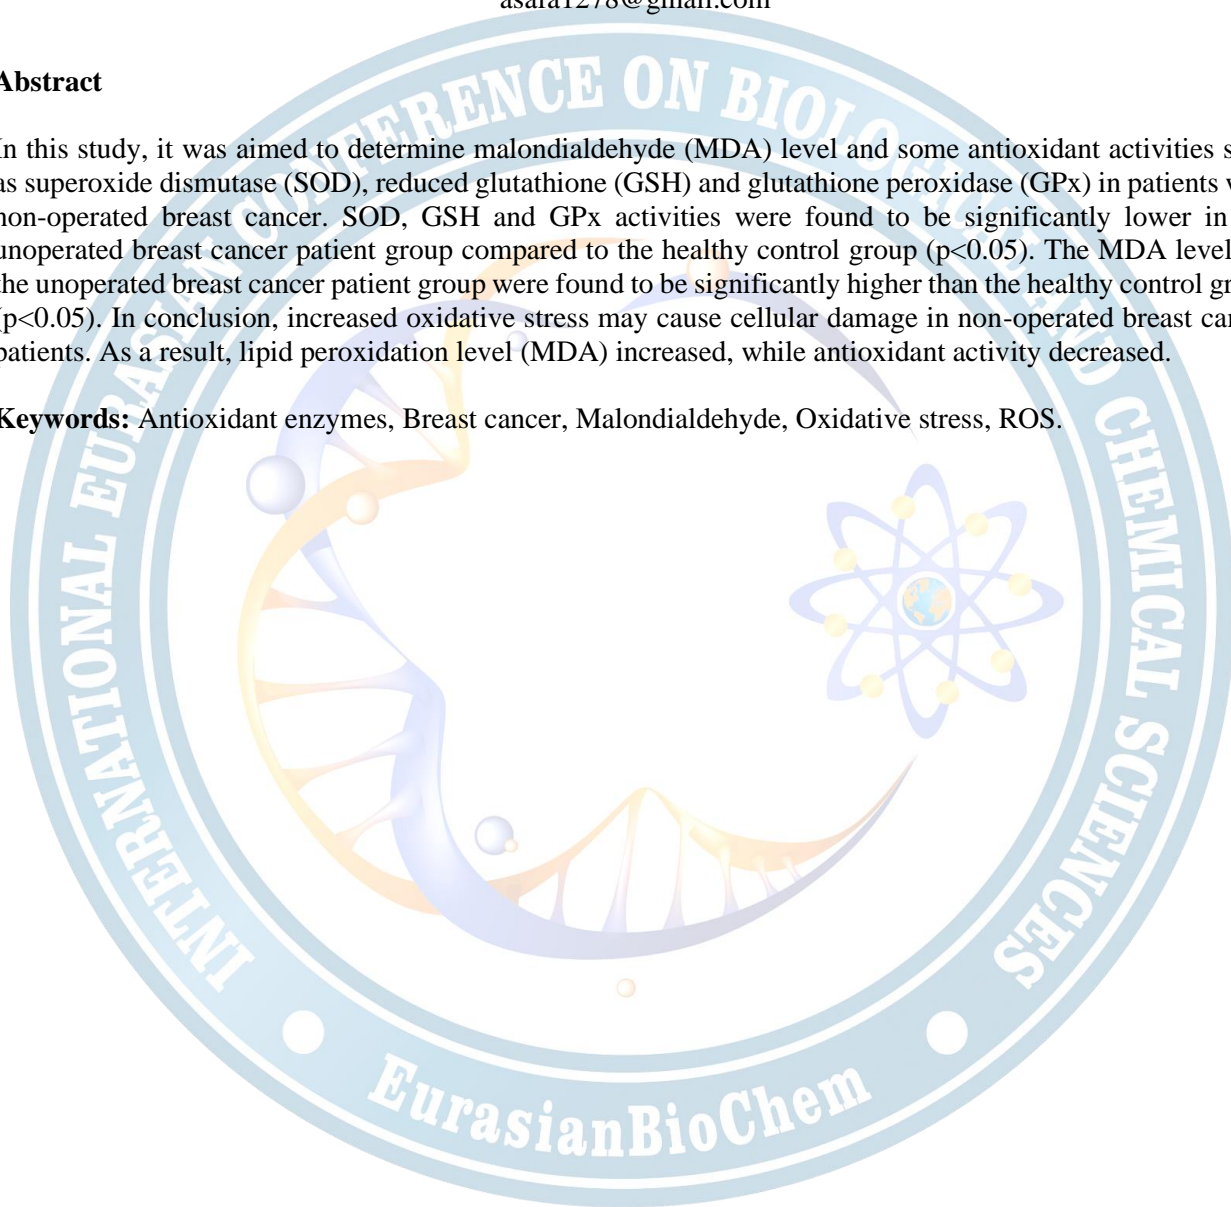

\* Van Yüzüncü Yıl University Institute of Science and Technology

asafa1278@gmail.com

#### Abstract

In this study, it was aimed to determine malondialdehyde (MDA) level and some antioxidant activities such as superoxide dismutase (SOD), reduced glutathione (GSH) and glutathione peroxidase (GPx) in patients with non-operated breast cancer. SOD, GSH and GPx activities were found to be significantly lower in the unoperated breast cancer patient group compared to the healthy control group ( $p < 0.05$ ). The MDA levels of the unoperated breast cancer patient group were found to be significantly higher than the healthy control group ( $p < 0.05$ ). In conclusion, increased oxidative stress may cause cellular damage in non-operated breast cancer patients. As a result, lipid peroxidation level (MDA) increased, while antioxidant activity decreased.

**Keywords:** Antioxidant enzymes, Breast cancer, Malondialdehyde, Oxidative stress, ROS.

#### Özet

HMGA2 (The mammalian high-mobility-group protein AT-hook 2 )1970'li yıllarda izole edilen ve üzerinde bir çok çalışma yapılan HMGA2 geninin ürünü olan bir proteindir. Bu protein DNA üzerindeki ceplere yerleşerek konformasyonel değişikliğe sebep olur. Bu değişimlerin sonucunda ise; embriyonik kök hücrelerinin regülasyonunun sağlanması ve preadiposit hücrelerden adipositlerin sentezlenmesinde rol oynadığı ileri sürülmektedir. Son yıllarda yapılan çalışmalarda ise nadir hastalık olarak kabul edilen ailesel multiple lipomatozis ile de ilgili olabileceği ileri sürülmüştür (1-2). Yeni çalışmalar, bu proteine özgü ilaç geliştirmeyi önemli hale getirmiştir. Bununla ilgili çalışmalar mevcut olsa da daha çok araştırma yapılmaya ihtiyaç vardır. Bu çalışmada; proteinin yapısı veritabanlarından alınarak incelenmiş ve mevcut piyasadaki ilaçlarla olan etkileşimi in silico olarak araştırılmıştır. Çalışmanın sonucunda mevcut ilaçlarla, protein arasındaki etkileşimin zayıf olduğu görülmüştür. En iyi etkileşime sahip ajanın (Masoprocol) kenetlenme enerjisi -5.8kcal/mol olarak tespit edilmiştir. Bununla beraber doğal ürün kökenli moleküller ile yapılan in silico çalışmada ise rottlerin isimli molekülün -7.0kcal/mol değerinde bir bağlanma enerjisi verdiği tespit edilmiştir. Bu çalışmanın sonucunda rottlerin isimli kimyasal ajanın bu protein üzerine etkili olabileceği düşünülmektedir. Tüm bu hesaplamalı biyolojik çalışmalara göre HMGA2 proteini önemli biyokimyasal reaksiyonlarda görev almakta olup, üzerine daha çok çalışmanın yapılmasına ihtiyaç duyulmaktadır.

**Anahtar Kelimeler:** HMGA2, İlaç yeniden konumlandırma, Moleküler docking

#### Abstract

In this study, new ion-selective electrodes using 1-(3-carboxyphenyl)-2-thiourea as an ionophore were prepared and their potentiometric properties were tested. As a result of the potentiometric studies, it was determined that the ionophore exhibited a highly selective behaviour towards copper(II) ions. The developed copper(II)-selective electrode had a wide working range, lower detection limit, fast response time, good stability and repeatability. Surface images of the prepared electrodes were examined with a scanning electron microscope (SEM). Additionally, energy dispersive X-ray (EDX) and mapping studies of the electrodes were performed. According to the results obtained, it was determined that copper(II) ions adhered to the porous areas on the electrode surface, and in mapping studies, copper(II) ions showed a wide distribution on the electrode surface. This result shows that the ionophore can interact with copper(II) ions. Finally, the newly developed electrode detected copper(II) ions in various water samples with very high recoveries.

**Keywords:** Scanning electron microscopy, ion-selective electrodes, potentiometry, thiourea.

#### Abstract

Fishery cooperative is defined as a form of organization focused on the development of the fisheries industry and the improvement of the welfare of fishermen, with objectives such as increasing income, increasing the standard of living and increasing production, and bringing together those involved in fishing, processing, aquaculture or marketing activities in the sector. Fisheries cooperatives exist in almost every country where fishing is carried out. These cooperatives are generally active in inland fisheries and marine fisheries, with a focus on capture fisheries, but they also play an active role in aquaculture. Çanakkale has coastlines to the Çanakkale Strait, the Aegean Sea and the Marmara Sea. There are a total of 26 fisheries cooperatives established in Çanakkale and affiliated to the Çanakkale Region Fisheries Cooperatives Union. The total number of members of these cooperatives is 1207. The total number of members of the fishery cooperatives in Çanakkale varies between 7 and 328. While the number of cooperatives whose members mostly fish in the Çanakkale Strait is 9, there are 14 cooperatives in the Aegean Sea and 3 cooperatives in the Marmara Sea. Fisheries cooperatives play an important role in the social, cultural and economic survival of fisheries. Fisheries can be more efficient and sustainable if fisheries cooperatives play a more active role.

**Keywords:** Fisheries, Fishery cooperation, Fisheries management.

### The Atherton-Todd reaction for functionalization of DOPO-derivatives

Nese Cakir Yigit<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-4714-4488>)

<sup>\*1</sup> Yalova University, Faculty of Engineering, Department of Polymer Materials Engineering, Yalova, Turkey.

[nese.cakir@yalova.edu.tr](mailto:nese.cakir@yalova.edu.tr)

#### Abstract

Atherton–Todd reaction is a versatile tool, as defined by Atherton, Openshawand, and Todd in 1945, as a new way of synthesizing phosphoramidates from dialkylphosphite with a primary amine in the presence of a base in carbon tetrachloride in mild reaction conditions. These reaction conditions are appropriate for nucleophiles such as amines, alcohols, and phenols. Each reaction demonstrates stereospecific behavior, leading to the inversion of configurations at the phosphorus centers. Given the importance and versatility of phosphorus compounds in various applications, innovative synthetic methods interest academic and industrial communities across various fields. For instance, phosphorus-based flame retardants have been preferred over halogenated ones for an extended period due to their ability to generate a protective char during combustion. In particular, 9,10-dihydro-9,10-oxa-10-phosphaphenanthrene-10-oxide (DOPO) derivatives are significantly interested in developing halogen-free flame retardant additives. Studies in the literature reported the modification of DOPO to react with the P-H bond (phosphinate) to introduce nitrogen or oxygen-containing groups. Despite the mechanism of the Atherton–Todd reaction is not fully understood, especially the alteration in the oxidation state of the P-atom, the Atherton–Todd reaction of DOPO is highly efficient and straightforward, yielding a high quantity of products.

Herein, we reported the thiol-based nucleophiles for the functionalization of DOPO by adapting the Atherton–Todd reaction conditions. The optimum reaction conditions were determined by changing reaction time, solvent, and reactant amounts. The success of the reaction was confirmed by both <sup>1</sup>H NMR and <sup>31</sup>P NMR spectrums. In addition, to confirm the purity of the obtained thiol-functional DOPO compounds further coupling reactions and characterizations were performed.

**Keywords:** Atherton–Todd reaction, phosphorous groups, DOPO, coupling reactions.

## Özet

Ericaceae ailesinin bir üyesi olan *Arbutus* cinsi içinde yer alan *Arbutus unedo* L. (kocayemiş) ve *Arbutus andrachne* L. (sandal) ülkemizin doğal florasında bulunan ve ekonomik öneme sahip olan iki önemli türdür.

Çalışmada, Antalya florasında yetişen kocayemiş ve sandal bitkisinin farklı kısımlarının bazı fiziksel ve kimyasal özelliklerinin belirlenmesi, üstün özelliklere sahip genotiplerin tespit edilmesi amaçlanmıştır.

Bu amaçla 60 adet sandal ve 9 adet kocayemiş genotipinin yaprakları, meyveleri ve çiçekleri kullanılmıştır. İncelenen özellikler bakımından genotipler arasında önemli farklılıklar olduğu ortaya konulmuştur. Her iki türde de en düşük fenolik ve flavonoid madde miktarı meyvelerde görülmüş, bunu çiçekler ve yapraklar takip etmiştir. Antioksidan aktivite DPPH ve FRAP yöntemleri ile değerlendirilmiş, her iki yöntemde de en fazla aktivite yapraklarda gözlenmiştir. Sandal türünün meyvelerinin ortalama 103.16 mg/100 g, kocayemiş meyvelerinin ise ortalama 108.12 mg/100 g C vitamini, sandal yapraklarının ortalama 0.87 g/100 g, kocayemiş türünün yapraklarının ise ortalama 0.79 g/100 g arbutin içerdiği belirlenmiştir.

**Anahtar Kelimeler:** *Arbutus* L., fenolik madde, flavonoid madde, antioksidan aktivite, arbutin

#### Abstract

Exosomes are the smallest known group of extracellular vesicles secreted by all cells in the body. They are 40-100 nm in size and surrounded by a double phospholipid layer. Exosomes are also found in the body fluids, such as blood, urine, amniotic fluid, breast milk, serum, and plasma. They can carry proteins, lipids, messenger RNA, micro RNA, long non-coding RNA, and DNA fragments. Through these biomolecules, exosomes regulate gene expression in recipient cells and play a role in many biological functions, such as immune regulation, cell differentiation, intercellular communication, and cell migration. Human amniotic membrane (HAM) is the innermost placental membrane. It is used as a biomaterial that supports wound healing. It has anti-inflammatory, antiangiogenic and antimicrobial properties and can promote epithelialization and inhibit fibrosis. This study aimed to increase the therapeutical effects of HAM by ensuring the attachment of breast milk-derived exosomes to HAM. In the first stage of this study, the fat layer was removed from the breast milk by centrifugation. Then, exosomes were isolated by ultracentrifugation. The total protein level was determined. The exosomes were then analyzed using flow cytometry for the presence of the most frequent exosomal membrane proteins: CD9 and CD63. Particle counting was also performed. Commercially produced lyophilized HAMs (22 × 40 mm) were placed in petri dishes and incubated with different concentrations of exosomes. The presence of exosomes on the membrane was visualized using scanning electron microscopy. In conclusion, exosomes derived from breast milk will further contribute to the use of amniotic membranes for therapeutic purposes, as they successfully bind to HAM.

**Keywords:** Exosomes, breast milk, amniotic membrane

#### Abstract

This study was conducted to determine the effects of myrtle extract added to drinking water on performance, blood physiology, biochemical and small intestine histomorphological parameters in rats. 80 Wistar albino rats were used and divided into 5 groups and each group had 8 subgroups. Myrtle plant extract was supplemented at 0% (Control group), 2.5%, 5%, 7.5%, 10% levels. The research was continued for 35 days. Weekly body weights and feed consumption were measured to calculate Feed conversion ratios (FCR). To determine the water consumption, the water given to the rats and the refusal were measured daily. At the end of the experiment, blood, liver and small intestine samples were taken to perform analyses. Myrtle extract at different levels did not influence performance parameters. The glucose level was the lowest in the 2.5% group ( $p=0.005$ ) and there was a cubic effect among the groups. The blood bilirubin level was determined at the highest level in the group given 2.5% ( $p=0.008$ ). There was a statistical significance in serum urea ( $p=0.017$ ) and BUN ( $p=0.022$ ) values; In both parameters, quadratic effects of myrtus are also observed. There were significant differences, between the treatment groups and control group for Basophil ( $p=0.001$ ), Mean Corpuscular Hemoglobin (MCH) ( $p=0.009$ ), Mean Corpuscular Hemoglobin Concentration (MCHC) ( $p=0.017$ ) and platelete ( $p<0.001$ ) also P-LCR ( $p=0.045$ ) values among treatment groups. Liver cytokine and heat shock protein mRNA abundance were not influenced. Myrtus extract had a statistically significant effect on histomorphological traits of small intestines both between control and treatment groups and among treatment groups. As a result, it was concluded that the addition of myrtle extract has a cubic effect on the blood serum glucose also intestinal morphology was affected positively. Some of hemogram parameters were influenced in dose dependent pattern also water consumption increased without adversely affecting performance parameters.

**Key words:** Rat, Myrtle, performance, metabolism, cytokine

#### Abstract

In this study, the interaction of (*E*)-1-((2-chloro-4-nitrophenylimino)methyl)naphthalen-2-ol (see Scheme, abbreviated as CNPIMN) with human serum albumin (HSA) has been investigated at pH 7.40 by means of square-wave voltammetry technique. Under the applied experimental conditions, CNPIMN has given two cathodic peaks, attributed to the reduction processes of nitro and imine moieties, respectively. On the other hand, it has been observed that the currents of these peaks have decreased in the presence of HSA. It has been also found that the decreases in peak current depend on the concentration of HSA. These peak current decreases have been sourced from the intermolecular interactions between CNPIMN and HSA. By using of the peak current values of CNPIMN in the absence and presence of HSA, the stoichiometry and formation constant values of CNPIMN-HSA molecular complex have been determined.

**Keywords:** Schiff base, HSA, interaction, voltammetry.

Scheme. Molecular structure of CNPIMN

\*Corresponding author e-mail: [aksoz@balikesir.edu.tr](mailto:aksoz@balikesir.edu.tr)

## Özet

**Amaç:** Nefrotoksisite, aminoglikozidlerin, özellikle de gentamisin en önemli yan etkilerinden biridir. Aminoglikozid kullanımı ile %25'e varan oranda nefrotoksisite gelişme riski bulunmaktadır. Literatürde D vitamininin gentamisin nefrotoksisitesindeki etkileri ile ilgili az sayıda çalışma bulunmaktadır. Bu çalışmalarda D vitamini farklı dozda ve farklı sürelerde uygulanmıştır. Çalışmaların sonuçları çelişkilidir. Bu çalışmada, gentamisin ile birlikte veya öncesinde verilen D vitamininin gentamisin neden olduğu nefrotoksisite üzerine etkilerinin karşılaştırılması ve D vitamininin olası nefroprotektif etkisinin araştırılması amaçlandı.

**Yöntem:** Gentamisin ile nefrotoksisite oluşturulan sıçanlara, gentamisinle aynı anda ve 1 hafta öncesinden başlanarak D vitamini uygulandı. Gentamisin dozu 100 mg/kg/gün, D3 vitamini dozu 1000 IU/kg/gün olarak belirlendi. Wistar Albino 28 adet sıçan rastgele 4 gruba ayrıldı: 1. Kontrol; 2. Gentamisin (1 hafta boyunca) uygulandı; 3. D vitamini + Gentamisin (1 hafta boyunca eşzamanlı başlanarak) uygulandı; 4. D vitamini (gentamisin 1 hafta önce başlanarak 2 hafta boyunca) + Gentamisin (2. hafta eklenerek 1 hafta boyunca) beraber uygulandı. İlaç uygulamalarının bitiminde tüm sıçanlar sakrifiye edildi; biyokimyasal analizler için kan ve doku örnekleri alındı.

**Bulgular:** D vitamini toksisitesini ekarte etmek için değerlendirdiğimiz kan kalsiyum düzeylerinde gruplar arasında fark görülmedi. Lipid peroksidasyonunun göstergesi olan MDA'da gentamisine bağlı artış, D vitamini uygulaması ile her iki grupta da kontrol değerlerine geri döndürülürken; oksidatif strese karşı savunmanın ilk basamağı olan SOD'da gentamisine bağlı oluşan azalma sadece gentamisin 1 hafta önce başlanarak iki hafta D vitamini uygulanan grupta kontrol değerlerine döndü. TNF- $\alpha$  ve IL-6'da gentamisine bağlı artış D vitamini uygulaması ile her iki grupta da anlamlı olarak geri çevrildi. Kreatinin ve üre seviyelerinde gentamisine bağlı yükselme bir haftalık D vitamini uygulaması ile azalmakla birlikte kontrol değerlerine getirilemezken, iki haftalık uygulamada üre değerleri kontrol değerlerine döndü.

**Tartışma ve Sonuç:** D Vitamini, gentamisin nefrotoksisitesini önleme potansiyeli göstermekle birlikte, bu vitaminin uygun doz ve uygulama şemasının belirlenmesi için daha fazla çalışmaya ihtiyaç bulunmaktadır.

**Anahtar Kelimeler:** Gentamisin, D vitamini, nefrotoksisite

#### Abstract

There are a lot of studies that show dysregulation of histone deacetylases (HDACs) is related to cancer development and progression. HDAC enzymes catalyze the removal of the acetyl group from lysine residues in the N-terminal tails of histones and non-histone proteins. HDACs are fascinating therapeutic targets because they are overexpressed in cancer cells, and their inhibition offers hope for the treatment of cancer and other diseases related to them. Because of this relation between HDACs and development of cancer, scientists have been quite interested in HDACs as a target to battle against cancer. Four HDAC inhibitors, vorinostat, romidepsin, belinostat, and panobinostat have been approved by the Food and Drug Administration (FDA) so far. In this study, a series of novel compounds that contains hydroxamic acid Zn<sup>2+</sup> binding group, N-acyl hydrazone linker, and pyrrolopyrimidine or purine cap region were designed for targeting class I and class IIb HDAC enzymes (Figure 1). Through the use of molecular docking studies and molecular dynamics (MD) simulation analysis, the potential interactions between ligands and enzymes were revealed. Molecular Mechanics-Poisson-Boltzmann Surface Area (MM-PBSA) scores were calculated to predict the binding affinity.

### Development of Electromagnetic Field Exposure System in Zebrafish Embryos

Derya CANSIZ (ORCID:0000-0002-6274-801X)

Istanbul Medipol University, Istanbul, Turkey

cansizderya@yahoo.com

#### Abstract

Electronic devices such as mobile phones, computers and tablets cause disruption of many systems in living organisms with the radiofrequency-electromagnetic field (RF-EMF) they emit. Nowadays, with the advancement of technology and the inclusion of electronic devices in every aspect of our lives, the RF-EMF created by these devices has also increased. RF-EMF plays a role in the formation of various diseases (such as, headache, cancer, heart disease, obesity) by penetrating into the tissues, causing the movement of charged particles such as electrons and ions within the cell and the formation of radicals, preventing the synthesis of various proteins by disrupting enzyme activity, and causing apoptosis and cell differentiation. Zebrafish embryo is accepted as a suitable model organism in modeling human diseases because zebrafish genes have 70% genetic homology with humans, they can be monitored under a microscope during the development period, and experiments can be completed in a short time. We established a special RF-EMF exposure system to examine the effects of RF-EMF exposure on zebrafish embryos. With this system developmental, behavioral, and molecular changes that occur as a result of RF-EMF exposure can be demonstrated in zebrafish embryos. Although many studies have been conducted on RF-EMF exposure, studies on the effect of RF-EMF exposure on fetal development are limited. The first 120 hours of zebrafish after fertilization refer to the embryonic period. Accordingly the RF-EMF exposure system we established allows the examination of the effects of RF-EMF exposure on the embryonic development of zebrafish embryos.

**Key words:** Radiofrequency-Electromagnetic field, embryonic development, Zebrafish embryos

#### Abstract

Pulmonary arterial hypertension (PAH) is a serious condition that occurs when high blood pressure builds up in pulmonary arteries, affecting blood circulation from the heart to the lungs, which can ultimately lead to heart failure and death. COVID-19 pandemic exhibits genuine challenges for PAH patients. Therefore, novel strategies for the management of PAH patients with COVID-19 are needed. However, molecular mechanisms underlying the crosstalk between two diseases have not been fully understood. In the current study, we elucidated similarities and differences in the re-organization of transcriptional response in the presence of PAH and COVID-19 and identify molecular substrates of both diseases by constructing signalling networks. For this purpose, gene expression data obtained from lung tissues of PAH and COVID-19 patients were comparatively analysed and differentially expressed genes (DEGs) were identified. Then, reporter molecules (i.e., metabolites, transcription factors (TFs) and microRNAs (miRNAs)) were discovered by integrating transcriptome data with human metabolic and regulatory networks. Consequently, signalling networks were constructed by merging the interactions between regulatory molecules and DEGs. COVID-19 network contained 2546 interactions between 558 DEGs, 89 metabolites, 6 TFs and 128 miRNAs, whereas PAH network contained 29266 interactions between 3955 DEGs, 112 metabolites, 22 TFs and 356 miRNAs. A total of 207 reporter molecule-DEG interactions were found to be common in both diseases. Functional enrichment analysis of these reporter molecules was performed via interacting DEGs, and revealed significant alterations in cardiac muscle contraction, oxidative phosphorylation, non-alcoholic fatty liver disease, diabetic cardiomyopathy, thermogenesis, and several cardiovascular, infectious, and neurodegenerative disease pathways. Moreover, gene-based drug repositioning analysis revealed candidate drugs including cardiac glycosides, insulin sensitizers, and drugs with antifibrotic, anti-inflammatory, and antiproliferative effects, for consideration in future clinical drug development.

#### Abstract

Aluminum (Al) has a wide range of uses in many industries with its low cost, high conductivity and easy processing properties. AA7075 is the most commonly used Al alloy in submarines, aircraft and rail vehicles with its high corrosion resistance, fracture toughness, ductility and low density. These alloys are used as an excellent material to produce marine vehicles, especially in the maritime industry. In this study, the corrosion performance of AA7075 alloy used as submarine material under seawater environment was examined. For this purpose, seawater samples were taken from MD24 and MD26 stations in the Sea of Marmara and the corrosion performance of AA7075 alloy exposed to these environments was determined using corrosion potential, potentiodynamic polarization and electrochemical impedance spectroscopy (EIS) methods. The coupons were abraded from 600 up to 1200 grit using abrasive paper then cleaned with isopropanol and dried under UV light before testing. Only the top 1 cm<sup>2</sup> surface was exposed to the solutions. All experiments were carried out in corrosion cell. In this work, AA7075 alloy exposed to seawater taken from MD24 and MD26 stations has different corrosion behavior. The corrosion potentials of AA7075 alloy were found as -433 mV/s and -746 mV/s in the MD24 and MD26 stations, respectively. The corrosion rate of AA7075 alloy was found lower in MD26 than in MD24. AA7075 alloy showed high impedance resistance in both environments. All the results indicated that AA7075 alloy is an excellent material against corrosion in the Sea of Marmara environments.

#### Özet

Oksidatif stres, beynin enerjiye duyduğu yüksek ihtiyaç ve oksijenli solunum nedeniyle nöronların özellikle açık olduğu bir tehlikedir. Nörodejeneratif hastalıklar dışında, oksidatif stresin kanser oluşumuyla, yaşlanmayla ve koroner kalp hastalığı ile ilişkili olduğu tespit edilmiştir. Antioksidanlar, “Bir maddenin oksidatif hasar görmesini geciktiren, engelleyen ya da oksidatif hasarı ortadan kaldıran tüm maddeler” olarak tanımlanmıştır. Hücrelerin, serbest radikallerin etkisini azaltmak için kullanabileceği iki antioksidan sistem vardır: antioksidan enzimler ve küçük moleküllü antioksidan maddeler. Enzimatik olmayan antioksidan maddeleri vücut kendisi üretebildiği gibi (metabolik antioksidanlar), beslenme yoluyla dışarıdan alınan antioksidanlar da bulunmaktadır (besinsel antioksidanlar). Önerilen çalışma, sinir hücresi benzeri hücrelere çeşitli antioksidan maddeler uygulayıp, sonrasında bu hücreleri çeşitli oksidatif strese bağlı apoptoz modellerine maruz bırakarak uygulanmış olan antioksidan maddelerin oksidatif strese karşı hücreleri koruyup korumadığını incelemeyi hedeflemektedir. Antioksidan uygulaması yapılmamış hücrelerde de apoptoz modellenecek bu maddelerin hücreleri kontrole göre ne oranda koruduğu anlaşılacaktır. Antioksidan maddeler olarak literatürdeki çalışmalara dayanarak askorbik asit,  $\alpha$ -tokoferol ve bu vitaminlerin beraber kullanılması seçilmiştir. Oksidatif stress yaratması amacıyla da C2-seramid maddesi seçilmiştir. C2 seramidin yaratacağı oksidatif stresi ölçebilmek adına ise literatürde negative kontrolü olarak bilinen dihidroseramid maddesi kullanılmıştır. Öncelikli olarak seramidin yaratacağı oksidatif stresin dihidroseramide kıyasla yarattığı etki canlılık testi ve elektrofizyolojik metotla ölçülmüş. Sonrasında yapılan çalışmada ise seçilen vitaminlerin koruyucu etkisi yine yapılan canlılık testleriyle (alamar blue assay) ve elektrofizyoloji deneyleriyle kanıtlanmıştır. Bu çalışma kapsamında, askorbik asit ve  $\alpha$ -tokoferol’un retinoik asit ve beyin kaynaklı nörotrofik faktör kullanılarak farklılaştırılmış insan nöroblastoma hücrelerinde indüklenmiş apoptozu karşı koruyucu etkisi olup olmadığı ilk kez incelenmiştir.

**Anahtar Kelimeler:** Oksidatif stres, Seramid, A-tokoferol, Askorbik asit, SH-SY5Y, Antioksidan

#### Abstract

Schiff base ligands constitute an important class of synthetic phenolic compounds and are known for their biological and pharmacological activities [1]. Additionally, the presence of hydroxyl groups attached to the aromatic ring makes them effective agents for some diseases caused by free radical damage [2]. In this research, 2-[(2-hydroxybenzilidene)amino]phenol and its some metal complexes were designed and synthesized. The structures of these compounds were elucidated using various spectroscopic techniques [3] and investigated as therapeutic agents against Alzheimer's disease [4,5]. After screening the acetylcholinesterase and butyrylcholinesterase inhibitory activities, Mn(II)- and Co(II)-complexes (IC<sub>50</sub>s of 36.24 ± 1.63 nM and 90.60 ± 6.86 nM, respectively) were determined as potent inhibitors of cholinesterases.

#### Abstract

Arrhythmia is a general term for the heartbeat to be abnormal in any other than normal sinus rhythm. The sinus rhythm is obtained via depolarization with the opening of Na<sup>+</sup> channels and Na<sup>+</sup> influx, repolarization with the opening of K<sup>+</sup> channels, and efflux of K<sup>+</sup> and Ca<sup>2+</sup> ions as the electrical signal generated in the brain. Like neuronal action potential generation, serum Na<sup>+</sup>, K<sup>+</sup>, and Ca<sup>2+</sup> levels also affect a cardiac action potential. Even though ion channels have the same purpose and mechanism, they have different subgroups according to their protein chemistry. Many voltage-gated ion channel subgroups are in the brain and heart. This phenomenon affects the central nervous system (CNS) from drugs that target cardiac voltage-gated ion channels and vice versa. This effect is observed with some of the antiarrhythmic drugs. Patients who took the drugs show side effects related to CNS, such as tremors, sleep disorders, disorientation, confusion, abnormal taste and smell, chronic anxiety, and even psychosis. However, each drug has a different side effect and frequency due to its ability to penetrate BBB. This research studies the BBB penetrative ability of class III antiarrhythmic channel blockers to shed light on their potential effects on the central nervous system. Their popularity is increasing, and they are preferred over the other classes due to their safety profile.

#### Abstract

Rice (*Oryza sativa* L.) is one of the most important staple foods along with wheat, barley, and maize in the world. Rice is the main daily nutrition for approximately three billion people. It also has essential minerals and vitamins as nutritional supplements and contains the highest digestible proteins. The present study emphasized the profiles of miR156a, miR159a, miR169b, miR393a, miR398a and miR820a under salinity stress in rice. Experiments were conducted on 90 mM NaCl tolerant rice mutant which was previously obtained from Osmancık-97 variety induced by using gamma radiation. Also, target gene expressions of SPL16, MYB, HAPC2, AFB2, TIR1, CSD2 and DRM2 were evaluated in response to selected miRNAs. The original variety and its resistant mutant were grown in salt-free conditions for 14 days. Perlite filled plastic pods were watered with Yoshida nutrient solution. 14 days old seedlings were subjected to 150 mM NaCl stress for 7 days by adding corresponding amount of NaCl to Yoshida solution. miRNA isolations and cDNA conversions were performed from the fresh leaves of plants after the end of the stress period. Probe-based real-time PCR analysis was performed for miRNA evaluation. All selected miRNA groups presented alteration in response to the salinity stress. There was a decrease in gene regions associated with methylation targeted by miRNA groups, transcription factor HAPC2, root development and flowering. However, an increase was found in the gene region associated with SOD pathways. Since the mutant material was derived through forward genetics approach, we associated salinity tolerant phenotype to specific miRNA expression alterations compared to the original rice variety.

**Keywords:** miRNA, *Oryza sativa*, salinity, mutation breeding

#### Abstract

Cordierite ( $2\text{MgO}\cdot 2\text{Al}_2\text{O}_3\cdot 5\text{SiO}_2$ ) is a promising ceramic material for microwave-millimeter wave dielectric and wide-band radome material due to its outstanding mechanical, thermal and electrical properties. These properties directly related with raw materials used during the production of cordierite ceramics. In this study, three different alumina sources were used to obtain cordierite ceramics. A cordierite composition (13.70 MgO - 34.90  $\text{Al}_2\text{O}_3$  - 51.40  $\text{SiO}_2$  in wt.%) were designed and pure oxides were selected as raw materials.  $\text{Al}_2\text{O}_3$  were supplied by using three different sources. The first two foreign sources have high purity and fine particle size, the last local source consisting of coarser particles with lower purity. The compositions were designated as A1, A2 and A3. Prepared ceramics from each composition were sintered at  $1350^\circ\text{C}$  for 3 h. The density values of all three compositions were directly affected by alumina source. The bulk density and open porosity values of A1 and A2 were measured as  $2.45\text{ g/cm}^3$  - %0.13 and  $2.40\text{ g/cm}^3$  - %0.22, respectively. Lower bulk density and higher open porosities with the values of  $1.85\text{ g/cm}^3$  and %25.54 were obtained for A3. The dielectric constant and loss values of all three compositions were measured as 3.74 and 0.0082 for A1, 3.86 and 0.0027 for A2, and lastly 3.0041 and 0.0064 for A3, correspondingly. According to X-ray diffraction (XRD) analysis, finer  $\text{Al}_2\text{O}_3$  particles accelerates cordierite formation. Sample A1 and A2 composed of single cordierite in indialite form. For A3, secondary phases such as mullite and corundum were detected besides indialite. The formation of pure cordierite grains also proved by microstructures from scanning electron microscopy (SEM) images. Results showed that the source of oxides directly affected cordierite synthesis. The finer and purer oxide eases formation of cordierite during sintering. By using proper type of oxide, the properties of cordierite can be improved.

#### Özet

Yaban hayatının önemli bileşenlerinden olan memeliler, besin zincirinde hem av hem de avcı rolündedirler ve farklı iklim koşullarında ve oldukça farklı habitatlarda yaşamlarını sürdürebilirler. Büyük memeliler, birçok ekosistemdeki temel unsurlardır. Büyük etoburlar sıklıkla avlarının sayısını, dağılımını ve davranışını şekillendirirler. Büyük otçullar ise bitki örtüsünün yapısı ve tür bileşimini etkileyen ekolojik mühendisler olarak işlev görürler. Yaban hayvanların geniş alanlarda izlenmesi, periyodik kayıtlarının alınması, günlük aktivitelerinin izlenmesi oldukça zordur. Bu sebeple, memelilerin belirli bir alanda tespiti, aktivitelerinin ve bazı davranış özelliklerinin belirlenebilmesi, yayılış sınırlarının belirlenebilmesi için harekete ya da ısıya duyarlı tuzak kameralar (fotokapanlar) kullanılmaktadır. Fotokapanlar, özellikle mevcut arazi ve çevre koşullarının doğrudan gözlem yöntemine imkân vermemesi ya da dolaylı gözlemin daha etkili ve güvenli olması durumlarında kullanılmaktadır. Özellikle sarp arazilerde, yoğun vejetasyonla kaplı alanlarda ya da hedef türün geceleri daha aktif olması durumlarında fotokapanlar yaban hayatı araştırmalarında başarılı bir şekilde kullanılmaktadır.

Bu çalışmada, Sinop İli Erfelek ve Ayancık ilçeleri ormanlık alanlarında ağaç gövdelerine sabitlenen tuzak kameralar (fotokapan kameralar) (JUO JH-770 ve JUO JH-780) kullanılmıştır. 15 farklı kapan özellikle ormanlık bölgelerin geçit noktalarına yerleştirilmiş ve haftada bir veri kaydı alınmıştır. Çalışmalar 2022-2023 yılları arasında yürütülmüştür. Fotokapanlar, 20 farklı noktaya kurularak, toplam 304 gün arazide bırakılmıştır. Çalışma süresi içerisinde memeli hayvanlara ait değerlendirilebilir 117 adet video- resim elde edilmiştir. Fotokapan çalışmaları neticesinde Ayancık ve Erfelek ormanlık alanlarında, Carnivora, Cetartiodactyla ve Lagomorpha takımlarına dahil 8 büyük memeli yaban hayvanı tespit edilmiştir. Kaydedilen bu türler, Çakal (*Canis aureus*), Karaca (*Capreolus capreolus*), Tilki (*Vulpes vulpes*), Porsuk (*Meles meles*), Sansar (*Martes foina*), Tavşan (*Lepus europaeus*), Yaban domuzu (*Sus scrofa*) ve Yaban kedisi (*Felis silvestris*)'dir. Alanda en çok kaydedilen türler, *Vulpes vulpes* (tilki) ve *Martes foina* (sansar) iken en az kayıt *Felis silvestris* (yaban kedisi)'e aittir. Bu çalışma, alandaki büyük memeli çeşitliliğinin tespitini sağlayarak, tür koruma çalışmalarına altlık sağlayacaktır.

#### Abstract

Dementia is a syndrome with neurodegenerative characteristics which leads to a decrease in cognitive and intellectual functions. The number of medications approved for the treatment of dementia is fairly limited; thus, there is a prominent need for discovering and developing new agents beneficial for its pharmacotherapy. Reboxetine is a noradrenaline reuptake inhibitory drug prescribed for the treatment of major depression. In this study, it was aimed to investigate the anti-amnesic effect of this drug on rats and also the changes induced by reboxetine on the brain-derived neurotrophic factor (BDNF) levels in the hippocampal subfields. Male Sprague-Dawley rats (adult, weighted 250-300 g) were used in the experiments. The animals received reboxetine treatment at doses of 5 and 10 mg/kg/day (*i.p.*) for 14 days. Scopolamine (0,5 mg/kg, *i.p.*) was used to induce experimental amnesia model. Following the treatment procedure, spatial learning and memory parameters of the rats were evaluated by the Morris water maze test, while locomotor activity was assessed by activity cage test. Subsequently, alterations of the BDNF levels in the CA<sub>1-2</sub>, CA<sub>3</sub>, and dentate gyrus subfields of the hippocampus were investigated by immunohistochemical analyses. In the water maze test, escape latency values of the scopolamine-treated group were higher than the control group. On the other hand, reboxetine treatment reduced these values of the amnesic animals at both doses. Moreover, it was observed that reboxetine administrations significantly prolonged the time spent in the target quadrant when compared to the amnesic rats. Data from the immunohistochemical evaluations indicated that reboxetine also increased the reduced BDNF levels induced by scopolamine administration in the hippocampal formations of the amnesic rats. Obtained results pointed out that reboxetine treatment ameliorated the scopolamine-induced impairments and may have a potential to improve cognitive disorders if confirmed with validated clinical studies.

#### Abstract

Invasive fungal infections (IFI) pose a serious threat to immunocompromised patients and are associated with high mortality rates. The eukaryotic cell structure of fungal species makes it difficult for antifungal agents to provide selective toxic effects and many antifungal drugs with a broad spectrum cause serious side effects. In addition to the side effect profile like antibiotics, fungal species may develop natural or acquired resistance against antifungal drugs. Lack of knowledge about invasive fungal infections, uncertainties about the treatment strategies, and formulation deficiencies, as well as the drug resistance and associated side effects lead to the discovery of new antifungal agents in the treatment. Azoles (itraconazole, fluconazole etc.), which are the most widely used antifungal drugs in clinical practice today, show their effects by inhibiting ergosterol synthesis, a component of the fungal cell membrane. Within the scope of this study, synthesis, purification, and structure elucidation studies of potentially antifungal compounds bearing azole moieties. Additionally, minimum inhibitor concentrations (MIC) values have been determined against *Candida albicans* and *Candida parapsilosis*.

**Keywords:** invasive fungal infection, azole, drug discovery, antifungal

#### Abstract

Critically ill coronavirus disease 2019 (COVID-19) patients are characterised by significantly elevated neutrophil counts and a severely dysregulated cytokine profile. Importantly, given that neutrophil counts are significantly increased in severe COVID-19 cases, TNF- $\alpha$ -mediated necroptosis are important host defence strategies, which could possibly contribute towards augmenting inflammation, endothelial damage, and tissue injury in these patients. The FAS/ FAS ligand (FASL) axis has recently gained much attention in COVID-19 pathogenesis. FASL can occur as soluble FASL (sFASL), acting as a pro-survival signal for neutrophils upon TNF- $\alpha$ -mediated necroptosis, whereas membrane-bound FASL (mFASL) induces cell death. Recent studies suggest that concentration of sFASL was significantly lower in plasma from COVID-19 cases as compared to healthy donors. The FASL -844T/C polymorphism was located in a binding site for CAAT enhancer protein. The C allele of this polymorphism had a 3-fold increased binding capacity to enhancer protein and hence increased the its expression. We aimed to investigate whether the FASL (rs763110) gene polymorphism may contribute to COVID-19 pathogenesis and/or the individual risk for COVID-19 infection and outcome. The present project was performed on 25 COVID-19 cases and 25 unaffected individuals without history of exposure to COVID-19 cases admitted to Tokat state hospital. COVID-19 was confirmed in all cases through quantitative real-time PCR method on nasopharyngeal swab samples. Genotyping of rs763110 gene polymorphism was detected using polymerase chain reaction–restriction fragment length polymorphism (PCR-RFLP) method. Our study has shown that the allele frequencies and genotype distributions of FASL (rs763110) gene polymorphism were significantly different between the COVID-19 patients and healthy donors, suggesting that rs763110 gene polymorphism might be used as genetic determinant for COVID-19 susceptibility.

#### Abstract

In the recent years, carbon dot (CD) materials serve as a mediator to improve photocatalytic efficiency of TiO<sub>2</sub> nanomaterial derivatives by the way of Z-scheme heterojunction mechanism. The new type fluorescence CD samples possess photoluminescence and photoexcitation properties, photostability, excellent biocompatibility/environmental sustainability, low toxicity, and unexpensive of production of CD solution. As a starting carbon source, potato peel samples were utilized to synthesize the potato carbon dots (P-CD), since tons of potato peels wastes are being generated owing to increasing the consumed of potatoes and expansion of the chip industry. A novel potato peel carbon dot (P-CD) and CD impregnated TiO<sub>2</sub> nanorod photocatalyst (P-CD/TiO<sub>2</sub> NRs), which are used to yield good photocatalytic for degradation of Methyl Blue (MB), Hexavalent Chromium (Cr(VI)), Escherichia-Coli (e-coli) and Candida Albicans (C. albicans) in wastewater, were synthesized with fixed-bed pyrolysis and hydrothermal process without adding any kind of extra chemical reagent. The photocatalytic activity and photokilling effect of P-CD decorated TiO<sub>2</sub> nanorods were investigated under visible light. The structure, optical and electrochemical properties of as-prepared samples were characterized by means of TG-DTA, FTIR, UV-vis and fluorescence properties, XPS, TEM, SEM-EDS, and XRD analyses. The results showed that the photocatalytic performance of the P-CD/TiO<sub>2</sub> composite is slightly increased compared to that of pristine TiO<sub>2</sub> NRs after optimum conditions have been established.

#### Abstract

Cholangiocarcinoma (CCA) is a heterogeneous group of malignancies formed by the differentiation of epithelial cells in the biliary tract and is the second most common primary liver tumor. The heterogeneity of CCA and its resistance to chemotherapy is one of the main reasons for treatment failure. Chemotherapy drugs used in cancer treatment either directly bind to DNA or target proteins necessary for cell division, causing cell death. Cisplatin is the most widely used chemotherapy drug among them. However, it has cytotoxic properties and the response of platinum in its structure is high, the disease will result in relapse. Glutathione-S-transferase (GST) is overexpressed in tumor cells, and its activity enhances chemotherapeutic drug detoxification. Ethacrynic acid (EA), a diuretic agent, is a GST enzyme inhibitor. By inhibiting GST in hematological malignancies and solid tumors, EA makes cells more sensitive. In this study, the effects of cisplatin combination with EA on CCA cell lines are examined for the first time. In order to investigate the cytotoxic effects, the CCA cell lines, TFK-1 and EGI-1, were treated with increasing concentrations of cisplatin and EA for 48h by MTT assay. Treating TFK-1 and EGI-1 cells with 2-100 $\mu$ M cisplatin reduced the growth of both cell lines in a dose-dependent manner by up to 64% and 85%, respectively. Besides, 10-150 $\mu$ M EA treatment decreased the proliferation of both cell lines in dose-dependent manner by up to 92% and 89%, respectively. The cells were treated with the IC<sub>50</sub> of cisplatin (9,2 $\mu$ M for EGI-1 and 32 $\mu$ M for TFK-1) and increasing concentrations of EA (10 $\mu$ M-150 $\mu$ M). A significant decrease was observed in a concentration-dependent manner in response to increasing concentrations of EA in both cell lines compared to the control cells and only cisplatin. This study suggests a novel combination therapy approach for CCA after further studies are performed to reveal the mechanism of action.

**Keywords:** cholangiocarcinoma, cisplatin, ethacrynic acid, combination treatment

#### Özet

*Asplenium* L. cinsi Dünya'da 700'den fazla eğrelti türü ile temsil edilmektedir. Bu çalışmada Türkiye'de 17 türü doğal olarak yayılış gösteren *Asplenium* cinsine ait iki türün (*Asplenium ceterach* L. ve *Asplenium trichomanes* L.) spor morfolojileri incelenerek taksonomilerine katkı sağlanması amaçlanmıştır. Erdtman metodu ile hazırlanan spor preparatları, ışık mikroskobu (LM) ile incelenerek sporların morfolojik özellikleri belirlenmiştir. Yapılan incelemeler sonucunda her iki türün spor şeklinin oblat olduğu gözlemlenmiştir. *A. ceterach* monolet ve trilet sporlara sahip olup heteromorftur. Monolet sporlarda apertür uzunluğu 33-45 µm arasında değişkenlik göstermektedir. Boyut olarak orta büyüklükte sınıflandırılan sporların polar eksenleri ortalama 35 µm, ekvatorial eksenleri ise ortalama 48 µm'dir. *A. ceterach*'ın sporları, *A. trichomanes*'in sporlarından nispeten daha büyüktür. *A. trichomanes* ise yalnızca monolet sporlara sahiptir. Apertür uzunluğu 25-35 µm arasında değişkenlik göstermektedir. Sporların polar eksenleri ortalama 29 µm, ekvatorial eksenleri ise 42 µm'dir. Her iki türün sporlarının ekzin tabaka kalınlıkları birbirine yakın olup 1-2 µm aralığında değişiklik göstermektedir. Yapılan çalışmalar sonucunda elde edilen bulgular ilgili türlerin taksonomik sınıflandırılmasında spor morfolojilerinin de ayırt edici karakter olarak kullanılabilceğini göstermektedir.

**Anahtar Kelimeler:** *Asplenium*, *Asplenium trichomanes*, *Asplenium ceterach*, Eğrelti, Spor morfolojisi.

<sup>2</sup> Kocaeli Üniversitesi, Mühendislik Fakültesi, Kimya Mühendisliği Bölümü, Kocaeli, Türkiye

\*Sorumlu yazar e-mail: bilgecebislitr@gmail.com

#### Özet

Gümüş nanoparçacıklar (nanoAg'ler) optik, ısı ve elektrik özelliklerinin yanı sıra antimikrobiyal etkileri sayesinde çok ilgi görmektedir. Gümüşün yüzyıllardır bilinen antimikrobiyal özelliğinin, nano boyutlarda görülen geniş yüzey alanı ve küçülen parçacık boyutu ile arttığı kanıtlanmıştır. Özellikle antibakteriyel lif olarak yara örtüsü, doku mühendisliği, gıda ambalajı, hava temizleme ve su arıtma sistemleri gibi alanlarda [1], ayrıca cerrahi, anesteziyoloji alanlarında kullanılan tıbbi alet ve malzemelerin kaplanması, tanı, yanık tedavisi, ilaç dağıtımı, kimyasal ve biyolojik sensörler, biyo-ilaçlar, biyo-işaretler ve medikal cihazlar dahil olmak üzere birçok tıbbi uygulamada, elektronik devreler ve kozmetikte de nanoAg'ler kullanılmaktadır. Elektroçekim yöntemi ise nanoAg katkılı nanoliflerin üretimini için kullanılan ve çeşitli alanlarda yüksek performans sağlayan bir uygulamadır. Bu çalışmada, eş-zamanlı elektroçekim yöntemi ile nanoAg katkılı ve katkısız içi boş Polibütilen Süksinat (PBS)/Termoplastik Poliüretan (TPU) nanoliflerinin üretimi ve karakterizasyonu yapılmıştır. Elde edilen iki-bileşenli nanoliflerin içyapısında saf polivinilpirolidon (PVP), dış yapısında ise nanoAg eklenmiş PBS/TPU polimer karışımı bulunmaktadır. PBS/TPU (60/40 a/a) çözelti karışımlarına kütlece farklı yüzde oranlarında (2; 4; 6) nanoAg eklenerek çeşitli parametrelerde çözünme işlemi gerçekleştirilmiş, ardından bu çözeltiler elektroçekim sürecinde kullanılmıştır. NanoAg katkılı nanolifler üretildikten sonra, saf etanol ile içyapıdaki PVP'nin çözünmesi sağlanarak, yapıdan uzaklaştırılmıştır. Dolayısıyla, içi boş polimer nanolifler üretilmiştir. Üretilen nanoliflerin yapısal özelliklerini ve antimikrobiyal aktivitelerini belirlemek için Fourier Dönüşümlü Kızılötesi Spektroskopisi (FTIR), Termo Gravimetrik Analiz (TGA) ve Antimikrobiyal Aktivite Analizi (AAA) testleri uygulanmıştır. FTIR ve TGA sonuçlarından, nanoliflerin çekirdeğindeki PVP'nin uzaklaştırıldığı ortaya koyulmuştur. Nanoliflerin antibakteriyel etkinliği *Escherichia coli* ve *Staphylococcus aureus* bakterilerine agar plak koloni sayma metodu uygulanarak belirlenmiştir. AAA sonuçlarına göre, karışımlarda nanoAg miktarının artmasına bağlı olarak antibakteriyel etkinlik artış göstermiştir. Katma değerli, nanoteknoloji ürünü PBS/TPU/nanoAg nanolifi biyomedikal uygulamalar için gelecek vaat etmektedir.

Bu çalışma Türkiye Bilimsel ve Teknolojik Araştırma Kurumu (TÜBİTAK) tarafından desteklenmiştir (Proje No: 122M880).

**Anahtar Kelimeler:** Nanolif, polimer, elektroçekim, gümüş nanoparçacık.

#### Abstract

Pancreatic cancer is a type of aggressive cancer which progresses rapidly and has a significantly low survival rate. It was observed that, in patients, Type II Diabetes also develops before or after pancreatic cancer pathogeny. Metformin, a drug that is frequently used for Type II Diabetes, has been proved for anticarcinogenic effects besides its antidiabetic effects. It is also stated in literature that, elevated glucose level is related with epithelial-mesenchymal transition in tumor cells. Anthocyanins are edible plant secondary metabolites and found in red-purple fruits and vegetables in abundance. Cyanidine-3-glucoside (C3G) is an anthocyanin which has many significant roles as antioxidant, hepatoprotective, anti-inflammatory, antidiabetic and antiobesity. Its anticarcinogenic effect was also observed but the underlying mechanism has not been enlightened. In this study, metastatic (MIA PaCa-2) and non-metastatic (Capan-2) pancreas cancer cells were grown in low and high glucose media in order to *in vitro* mimic the glucose level elevation due to obesity or Type II Diabetes. Cell viability was assessed by MTT assay in response to C3G and metformin treatment. Cells were stained with H<sub>2</sub>DCFDA and observed in order to see the intracellular reactive oxygen species (ROS) formation after treatment. Lipid droplets were observed by Bodipy staining. As a result, it was confirmed that, high glucose levels increased cell viability and cell survival in MIA PaCa-2 and Capan-2 cells in different manner. C3G and Metformin impedes not only cellular proliferation, but also 2D and 3D colony formation. When the cells were treated with both drugs, they showed synergistical effect. C3G and Metformin treatment also induced intracellular ROS generation. To conclude with, C3G and metformin co-treatment repress cellular proliferation and colony formation whether triggering ROS formation.

**Keywords:** Pancreas cancer, cyanidine-3-glucosite, metformin, type II diabetes, reactive oxygen species (Use commas to separate words.).

#### Abstract

Phosphorus-containing polymers have long been regarded as highly advantageous in the field of polymer research, primarily due to their extensive utilization across different fields, notably in applications related to biology. Therefore, it is of vital importance for synthetic and industrial polymers to have phosphorus units. This not only expands their potential applications in the field of biology but also enhances their ease of processing and simplifies their operation for a wide range of applications. In this study, polymers containing phosphorus units in the main chain were synthesized and characterized. As a result of the reaction of the phenylphosphonic dichloride compound with various dithiol compounds, polymers containing S-P-S bonds in the main chain were obtained, respectively. First, 1,6-hexanedithiol was selected as a representative dithiol compound and reacted with the compound phenylphosphonic dichloride in the presence of triethylamine. The progress of the reaction was monitored, and polymerization was terminated after 6 hours. The obtained polymer had both P and S atoms in the main chain. Then, other dithiol compounds were used to obtain various polymer chains. All polymers were characterized with NMR and GPC techniques.

**Keywords:** phosphorus, dithiols, phenylphosphonic dichloride

#### Abstract

This study was conducted to reveal the physicochemical properties of different muscle types from Central Anatolian Merino (CAM) and Ramlic (RAM) lambs that were raised under producer conditions. For this purpose 7 CAM and 7 RAM lambs were slaughtered at 42kg live weight and meat samples were taken from the semimembranosus (SM), longissimus dorsi (LD), and semitendinosus (ST) muscles after the carcasses had been chilled at 4°C for 24 hours. Both muscle type and breed did not affect meat color parameters, however, interaction between studied breeds, muscle types, and time has been observed for L\* and H° color parameters. Additionally, interactions between breed x muscle types and between time x muscle types were determined for meat a\*, b\*, and C values. It was determined that pH at 24 h. (pH<sub>24</sub>) were lower in CAM lambs compared to RAM lambs (p<0.05). Breed had no effect on water holding capacity (WHC), as well as thawing loss (TL). However, LD muscle had a higher value in both traits when compared to other muscles. CAM lamb had a higher cooking loss value, whereas SM muscle expressed higher CL (p<0.05). Meat hardness, springiness, and cohesiveness were not affected by breed or muscle type, chewiness was higher only in ST muscle. Drip loss (DL) was not affected by breed, however, both LD and ST muscles expressed higher DL values on day 7. Chemical analysis revealed that, despite the absence of substantial differences in certain characteristics, in general meat from RAM lambs showed better quality measures. Examining and comparing the meat quality of these breeds at different slaughter ages/weights will make it possible to reveal the meat quality of the breeds more clearly and to reveal the correct slaughter weights of the breeds for higher quality meat production.

**Keywords:** Muscle type, Meat quality, Ramlic, Central Anatolian Merino.

#### Abstract

Alzheimer's disease (AD) is a progressive neurodegenerative disorder marked by the gradual deterioration of cognitive function, including memory loss and difficulty with language, reasoning, and perception. It stands as the predominant etiological factor behind dementia, accounting for approximately 60-70% of the cases. Although its etiology remains incompletely elucidated, it is recognized that AD has a complex interplay of genetic, environmental, and lifestyle factors. AD's current treatments are primarily symptomatic and include the inhibition of acetylcholinesterase (AChE) and butyrylcholinesterase (BChE) enzymes, which are involved in the breakdown of acetylcholine. However, there is a need to develop more efficacious treatments capable of delaying or halting the progression of the disease. This study aims to investigate the potential of lomefloxacin, a fluoroquinolone antibiotic commonly used to treat bacterial infections in AD. Results indicate that lomefloxacin exhibits low inhibition as a noncompetitive inhibitor of AChE and BChE at micromolar concentrations, with  $K_i$ s of  $3.19 \pm 0.21 \mu\text{M}$  ( $R^2$ : 0.9845) and  $4.21 \pm 0.20 \mu\text{M}$  ( $R^2$ : 0.9890), respectively, compared to the reference drug tacrine. Additionally, molecular docking studies have been conducted to elucidate lomefloxacin's binding interactions and affinities at the active site of AChE and BChE, offering detailed insights into its potential effects on AD.

**Keywords:** Alzheimer's disease, Acetylcholinesterase, Butyrylcholinesterase, Lomefloxacin.

#### Özet

Bu çalışmada Gaziantep ili Oğuzeli ve Karkamış ilçelerine ait 10'ar köy tespit edilerek 147 katılımcı ile yapılan görüşmeler sonucunda bu bölgede yayılış gösteren Asteraceae ve Lamiaceae familyalarına ait taksonların yerel adları ve kullanım amaçları ve kullanım şekilleri belirlenmiştir. Çalışma alanında Asteraceae familyasından doğal yayılış gösteren 20, yetiştirilen kültür bitkisi olarak 4 olmak üzere 24 taksonun, Lamiaceae familyasından ise doğal yayılış gösteren 10, yetiştirilen kültür bitkisi olarak 3 olmak üzere 13 taksonun etnobotanik açıdan kullanım alanına sahip olduğu belirlenmiştir. Asteraceae familyasındaki taksonların tıbbi (15), gıda (10), eşya (5) ve yem (2) amaçlı kullanıldığı tespit edilmiştir. En yaygın kullanımın *Gundelia tournefortii* L. var. *tournefortii* L., *Silybum marianum* (L.) GAERTNER, *Anthemis hyalina* DC., *Centaurea solstitialis* L. subsp. *solstitialis* L., *Tragopogon pterocarpus* DC. taksonlarına ait olduğu görülmüştür. Lamiaceae familyasındaki taksonların ise tıbbi (11), gıda (6) ve yem (1) amaçlı kullanıldığı tespit edilmiştir. *Thymbra spicata* L. var. *spicata* L., *Sideritis syriaca* L. subsp. *nusairiensis* (POST) HUB.-MOR., *Mentha longifolia* (L.) HUDSON subsp. *typhoides* (BRIQ.) HARLEY var. *typhoides* (L.) HUDSON, *Teucrium polium* L. taksonlarının en yaygın kullanıma sahip oldukları belirlenmiştir.

#### Abstract

Cancer remains a significant global health challenge, with traditional treatments facing limitations such as postoperative recurrence, harm to normal tissues, and the emergence of resistance. However, advancements in genomics, proteomics, and bioinformatics have paved the way for the development of new anticancer agents. These innovations aim to minimize drug misuse, improve the safety and precision of treatments, and offer more efficient and targeted therapies for cancer patients. Theranostics, which integrates therapy and diagnosis, presents an attractive approach for chemotherapy in medicine. It offers improved biodistribution, selective cancer targeting, reduced toxicity, masked drug efficacy, and minimal side effects. In this approach, diagnostic tools play a crucial role by collecting information about the diseased state before and after specific treatment, enabling effective cancer region targeting. The overexpression of reactive oxygen species (ROS), glutathione (GSH), thiols, acidic pH, and various enzymes within the tumor microenvironment provides valuable insights for refining the chemical structure of theranostics. This refinement enhances therapeutic efficacy and diagnostic tools, such as bioimaging, in comparison to healthy cells.

**Keywords:** Theranostic, cancer cell, overexpression, small molecules.

musaalkan1@gmail.com

#### Abstract

Schiff bases are important chemical compounds in various fields such as inorganic, analytical and medicinal chemistry due to their versatilities. Schiff bases are formed by the condensation of aldehydes or ketones with primer amines. Their active group called azomethine (CH=N) or imine (C=N) makes them ideal candidates for developing new drugs. They can form numerous stable complexes when they are coordinated with different transition metal ions. Thus, metal complexes of Schiff bases have been studied extensively due to their various applications and chemical activities. And also, the compounds containing triazole derivatives possess chemotherapeutic effects including antibacterial activities against drug-sensitive as well as drug-resistant pathogens. 1,2,4-triazoles are a very important class of compounds that have attracted the attention of many scientists in medical and pharmaceutical fields due to their various biological activities such as anticancer, antimicrobial, anticonvulsant.

In this study, we synthesized Schiff base derived from 3-amino-1,2,4-triazole-5-thiol (ATT) and 5-chlorosalicylaldehyde (5CISA), and characterized using spectroscopic method. In theoretical studies, the molecular structure of Schiff base was optimized using the density functional theory (DFT) with B3LYP/6-31+G (d,p) level of theory. In addition, the frontier molecular orbitals (FMOs:HOMO and LUMO) and the molecular electrostatic potential (MEP) map were performed by the same basis set using Gaussian 09 software. The global reactivity descriptors such as electronegativity ( $\chi$ ), hardness ( $\eta$ ), softness (S), chemical potential ( $\mu$ ) and electrophilicity ( $\omega$ ) were also calculated by using HOMO and LUMO energies. The optimized molecular structure and electronic properties of schiff base was determined by computational studies using Gaussian 09 package program.

**Keywords:** Schiff bases, triazoles, DFT calculations, HOMO and LUMO energies

#### Abstract

Sulfonamides are ones of the oldest synthetic antimicrobial agents and used in the treatment of many bacterial, protozoal and fungal infections. Although the use of penicillin and other antibiotics is increased, sulfonamides are still used actively in ophthalmic, urinary and gastrointestinal infections. Due to significant usage of sulfonamides/sulfonylhydrazines/sulfonylhydrazones in pharmacological applications, they have gained importance in medicinal chemistry as sulfa drugs. Sulfisoxazole is well known sulfonamide derivative as sulfa drug that are most commonly used in combination with trimethoprim as is the drug Bactrim. Schiff bases are known as imines or azomethines containing C=N moiety which is present in various natural and nonnatural compounds and responsible for their biological activities including antifungal, antibacterial, antiproliferative, anti-inflammatory, antiviral and antipyretic.

In this study, Schiff base; 4-methoxybenzaldehydesulfisoxazole was synthesized by the reaction of sulfisoxazole with 4-methoxybenzaldehyde and characterized by spectroscopic methods (<sup>1</sup>H-NMR, <sup>13</sup>C-APT and FT-IR). In theoretical studies, the ground state geometry of Schiff base was obtained by Density Functional Theory (DFT) with B3LYP/6-31+G(d,p) basis set at Gaussian 09 package program. Frontier molecular orbitals (HOMO and LUMO), global reactivity descriptors and the molecular electrostatic potential surface (MEP) map were determined by this set. Also, antimicrobial activities of Schiff base were evaluated against reference bacterial and yeast strains (two Gram-negative bacteria; *Escherichia coli* ATCC 8739 and *Pseudomonas aeruginosa* ATCC 27853, two Gram-positive bacteria; *Staphylococcus aureus* ATCC 29213, and *S. epidermidis* ATCC 35984), and one fungus; *Candida albicans* ATCC 10231). Antibacterial activities of S2M-4-MetBA compound were found higher than the reference drugs. But, it was observed that the antifungal activity of the compound against *C. albicans* yeast is lower than the reference drug Fluconazole (Figure 1).

### Phosphate adsorption study on activated Albanian montmorillonite

Sonila Vito<sup>1\*</sup>, Ilirjana Boci<sup>1</sup>, Maria Hoxhaj, Sidorela Vishkulli

<sup>1</sup>Department of Industrial Chemistry, Faculty of Natural Sciences, Tirana University, Albania

#### Abstract

This paper presents the experimental results of the removal of aqueous phosphate ions through adsorption on activated clay. The selected clay is montmorillonite from the area of Prrenjas, Albania, while synthetic phosphate containing water is used. The clay is subjected to chemical and thermal activation to increase the adsorption capacity. Therefore, the impact of the activation method, as well as treatment parameters, on the adsorption capacity is studied. The influence of temperature and acid concentration is taken into consideration. First the kinetics and then the adsorption model is evaluated. The experimental results show that, among the considered models, the pseudo second order model describes better the process suggesting that the process is controlled by chemical adsorption. Both thermal and chemical treatment have a positive effect on increasing the adsorption capacity of phosphates from clay. The chemically treated clay exhibits better adsorption capacity, compared to the thermally treated one. In addition, the increase in the treatment temperature and acid concentration lead to improvement of phosphate removal efficiency by the clay. At all cases, a favourable multilayer adsorption on heterogeneous sites is noticed.

**Keywords:** montmorillonite, activation, adsorption, phosphate.

#### INTRODUCTION

In recent years, due to eutrophication concerns, treatment of liquid discharges containing phosphate compounds has taken on most of the scientific and technological interest. In this regard, various methods have been investigated and developed. They are based on the processes of sedimentation, coagulation/flocculation, filtration, biodegradation, adsorption, chemical precipitation, etc. Practiced alone or in combination with each other, to increase the cleaning efficiency, they have resulted efficient in removing not only phosphate concentrations but also a myriad of other pollutions. Among these technologies, adsorption is a simple, sustainable, cost-effective, and environmental-friendly technique (Rashid et al., 2021). It involves the use of a variety of adsorbents, with distinctive properties, from the conventional to novel materials, such as activated carbon, natural-sorbents (clay, zeolite), nano-sorbents, bio-sorbents, etc. (Chai et al., 2021).

Among the sorbents being studied for water treatment clays appear to be highly promising. It is found that they have distinctive ability to adsorb various water pollutants, being attributed to the high surface area, porosity, surface electrical charge, cation exchange capacity, acidity, and different types of active sites (Barakan and Aghazadeh, 2021). Many studies have documented this extraordinary ability of theirs for antibiotics (Chauhan et al., 2020), biocidal compounds, dyes (Teġin and Saka, 2021), other organic pollutants (Fairós et al., 2020), oils, heavy metals (Obayomi and Auta, 2019), nutrients (phosphates) (Huo et al., 2021), and so on. There are various types of clays used for this purpose: natural clays, activated clays (Komadel and Madejová, 2006), organo-clays, nano-clays (Annan et al., 2018), and each of them has been investigated for treatment of synthetic and real wastewater purposes. Among the many kinds of natural clay minerals, bentonite or montmorillonite has been most often used in adsorption due to large surface area, high CEC, and strong adsorption capacity (Barakan and Aghazadeh, 2021). They can be very effective in the natural state but may also need pre-treatment. There are different treatment techniques, but thermal and chemical (acid/base) activation have been reported the most effective ones, mostly acid than alkaline or thermal treatment. During the treatment procedure occurs the enlargement of the pore volume, specific surface area, and the number of surface acid sites able to sorb pollutants (Teġin and Saka, 2021).

Albania, although with a relatively small area, is rich in clays. They are widespread and found among sedimentary rocks, mostly terrigenous being part of molasses deposits. The largest clay deposits are found in the Near Adriatic Lowlands (UPA) and in inner lowlands. The most common clay formation eras are those of the Neogene, Pliocene and Quaternary. The most widespread are the clays in the Lower and Middle Miocene

to which are associated the largest sources of Tirana (Vora), Elbasan (Bradashesh), Alarup, Bilisht, etc. While in terms of quality, the best clays are the Piacesian clay deposits in Koplík, as well as the clays in Currila, Mamel, Polovina, in the valley of Shkumbin (Peqin), Prrenjas, Vlora, Shushica, etc. Despite their optimal characteristics, the use of clay in our country has been mostly for construction practices (to produce cement, brick or tile). Although the environmental benefits of using clays are universally recognized in principle, in Albania industrial exploitation for these purposes has not yet started. Even the research studies in this direction have only developed in recent years (Xhaxhiu et al., 2013) (Mele et al., 2018) (Prifti and Xhaxhiu, 2021). From the literature review these studies are based on the structure characterization of Prrenjasi, Brari, Currila, Dardha clays and evaluation of the adsorptive capacity for some metals (Pb dhe Cd) and pesticides (dimethionate and methomyl). The effect of their activation by thermal (Keri et al., 2017) and acidic methods (Mele et al., 2018) (sulphuric acid) has been investigated. From the batch experiments for synthetic water samples the adsorption isotherm of the cited pollutants and the clay adsorption capacity were observed. It is worth noting that the clays behaved very well towards acidic activation. The authors concluded that their use for surface or groundwater treatment to remove the studied pollutants would be of great environmental interest.

Based on these scientific study circumstances, the contribution in this direction is considered interesting. Thus, further on, it is presented the experimental work, which aims at the determination of the ability of Albanian montmorillonite to adsorb phosphate ions present in synthetic wastewaters. Furthermore, in order to understand the mechanisms according to which the process occurs, the kinetics and adsorption isotherms are also studied. This information would be necessary for the conventional wastewater treatment systems design (Ho and McKay, 1999).

## MATERIALS AND METHODS

**Clay sampling and pre-treatment:** The clay used for this study is montmorillonite of the region of Prrenjas in Albania. It is sampled according to ISO 22475-1:2021 standard method, at 20cm depth. Firstly, it is subjected to pre-treatment for the sand fraction removal by water rinsing and sedimentation technique. For that, clay and distilled water are mechanically mixed at 100g/l ratio for 2 hours. After mixing, the suspension is left to rest for 10 min for sand particles sedimentation. Upon separation of the sediment from the supernatant, the later one is subjected to the same procedure for other 3 minutes of sedimentation. The suspension is then left to settle for 24 hours. The decanted material (the clay) is filtered and dried at 90°C until constant weight.

**Thermal and chemical treatment of Clay:** The thermal treatment of clay is performed at temperatures 500°C and 600°C for 2 hours. Whilst the chemical treatment was achieved through sulphuric acid contact for 3 hours and in the presence of heat. The process is carried out in a flask equipped with a refrigerant, to capture the acid vapours. After treatment the flask is cooled and the clay is separated from the liquid by decantation. It is then rinsed with distilled water until the natural pH is reached. Further, it is dried until constant weight, ground to less than 100µm particle size diameter and used for the evaluation of adsorption capacity. The acid concentrations used in the study are 15, 27 and 40% (evaluated as mass of acid/mass of clay).

**Batch experiments for the study of phosphate adsorption on clay:** All clay-synthetic wastewater treatment experiments are realized after the same protocol. In a series of chemical flasks, 50ml of phosphate solutions (synthetic wastewater), with certain concentration, are treated with 1g clay, under mechanical stirring. After a certain contact time, they are subjected to centrifugation and the supernatant is analysed for phosphate content.

The synthetic wastewater samples, of different phosphate concentration, are prepared by dilution of the 200mg/l  $\text{KH}_2\text{PO}_4$  stock solution. The latter one is prepared by dissolving 0.2865g  $\text{KH}_2\text{PO}_4$  in 1l distilled water.

The kinetics study batch experiments are performed for same initial aqueous phosphate concentration and different contact times. Whilst, the adsorption isotherm experiments are performed for different initial phosphate concentration and same contact time as that evaluated as the equilibrium time by the kinetics studies.

**Aqueous phosphate spectrophotometric determination method (APHA, 1998):** The reagents used are: ammonium molybdate solution (9.5 g of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24}\cdot 4\text{H}_2\text{O}$  dissolved in 100ml water); 4.5M sulphuric acid; ascorbic acid solution (7g  $\text{C}_6\text{H}_8\text{O}_6$  diluted in 100ml water); potassium antimonile tartrate solution (3,25g of  $\text{K}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6\cdot 1/2\text{H}_2\text{O}$  diluted in 100ml water); mixed reagent (45ml of ammonium molybdate solution is added in 200mL sulphuric acid and 5mL of potassium antimonile tartrate solution).

In 20ml of water sample is added 0.5ml of ascorbic acid, 1ml of combined reactive and water till 25ml volume. After 15 minutes the absorption value in the wave length 880nm is determined. Measurement are performed using UV 1200 spectrophotometer.

**Data analysis for adsorption kinetic model evaluation:** Three adsorption kinetic models have been taken in consideration: pseudo first-order model; pseudo second-order model; Elovich model; and intraparticle diffusion model. Nonlinear regression is applied for all cases, as strongly recommended by literature (Kostoglou and Karapantsios, 2022), and the analyses have been made based on the regression coefficient ( $R^2$ ).

$$\text{The pseudo first-order model: } q_t = q_e(1 - e^{-K_1 t}) \quad (1)$$

$$\text{The pseudo second-order model: } q_t = \frac{q_e^2 * K_2 * t}{1 + K_2 * q_e * t} \quad (2)$$

$$\text{Elovich model: } q_t = \frac{1}{\beta} \ln(\alpha \beta t) \quad (3)$$

$$\text{Intraparticle diffusion model: } q_t = c + t^{0.5} K_{diff} \quad (4)$$

Where:  $t$  is the time of adsorption (hour);  $q_t$  is the amount of phosphate adsorbed at time  $t$  (mg/g clay);  $q_e$  is the amount of phosphate adsorbed until equilibrium time is reached (mg/g clay);  $K_1$  is the pseudo first-order model constant ( $\text{min}^{-1}$ );  $K_2$  is the pseudo second-order model constant ( $\text{min}^{-1}$ );  $\alpha$  is the initial adsorption rate (mg/g.min) and  $\beta$  is adsorption constant;  $c$  and  $K_{diff}$  are the intraparticle diffusion model constants.

Evaluation of  $q_t$  and  $q_e$  is done according to equations:

$$q_t = \frac{(C_0 - C)V}{M}; q_e = \frac{(C_0 - C_e)V}{M} \quad (5)$$

Two adsorption isotherms has been considered for this purpose: Langmuir isotherm and Freundlich isotherm; as two of the most used ones in the literature. Linear regression has been considered for both of them.

$$\text{Linear Langmuir isotherm: } \frac{C}{q_e} = \frac{1}{ab} + \frac{1}{a} C \quad (6)$$

$$\text{Linear Freundlich isotherm: } \ln(q_e) = \ln(K_F) + \frac{1}{n} \log(C) \quad (7)$$

Where:  $C$  is the concentration of phosphate in solution at time  $t$  (mg/l) of adsorption;  $q_e$  is the amount of phosphate adsorbed until equilibrium time is reached (mg/g clay);  $a$  and  $b$  are the Langmuir constants;  $K_f$  and  $n$  are the Freundlich constants.

## RESULTS AND DISCUSSION

### Adsorption kinetics study. Evaluation of the adsorption equilibrium time

The study of sorption kinetics in wastewater treatment is important to understand the detailed mechanism and characteristics of the pollutant removal process. Since it provides information about the solute uptake rate, it determines very important process parameters such as the time required for reaching the adsorption equilibrium (adsorbate-adsorbent residence time). Furthermore, it enables the mathematical modelling of the process, facilitating the prediction of the behaviour of the system in different conditions (Ho and McKay, 1999).

For that, 50ml of synthetic phosphate wastewater, with initial concentration 3ppm, is treated for varying contact time, in the range of 0.5-24hours, with 1g of 500°C thermally activated clay. The experimental results of the phosphate removal over time are presented in figure 1.

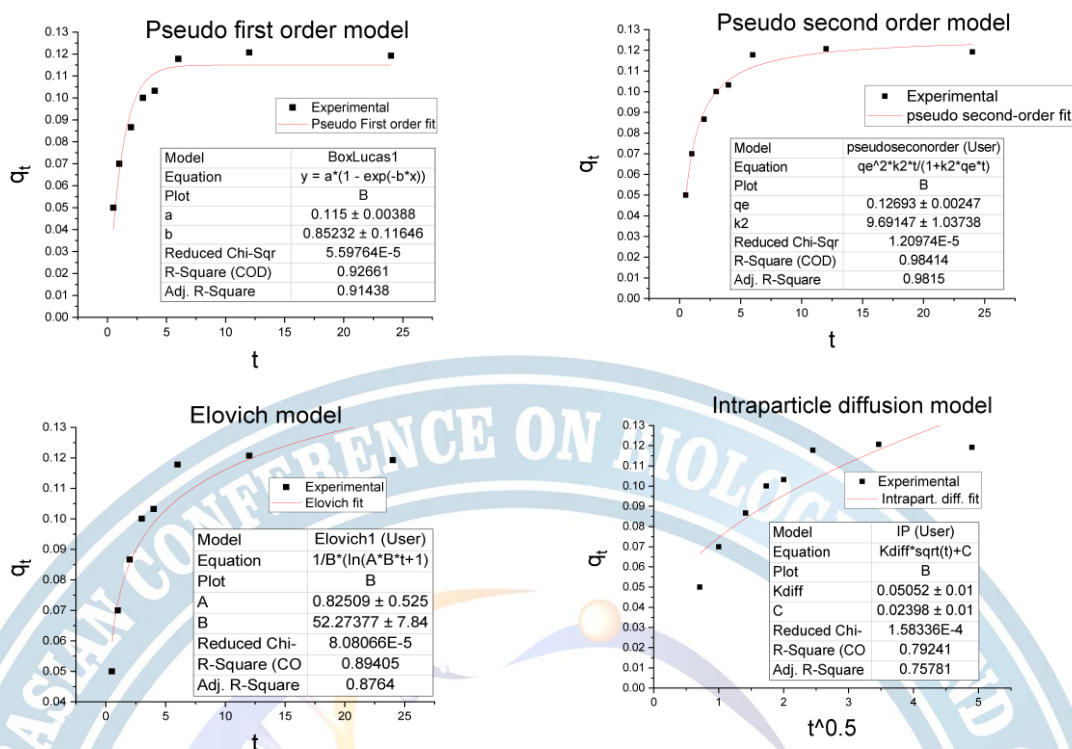

**Figure 1.** The phosphate removal,  $\text{mgPO}_4^{3-}/\text{g}$  clay, over time.

It is observed that with the increase of the contact time, the amount of phosphate ions adsorbed by the clay increase, due to the presence of the abundance free adsorptive sites in the clay surface, to asymptotically approach the maximum value of  $0.12\text{mgPO}_4^{3-}/\text{g}$  clay at times greater than 6 hours. After this time the adsorption capacity remains constant, indicating that all the adsorptive sites have been fully occupied. Thus, the minimum time that clay needs to show maximum adsorption capacity (adsorption equilibrium time) is 6 hours. All the following experiments are carried out at this contact time.

Further, to understand the mechanism according to which the process occurs, as well as to evaluate the mathematical model that best describes it, four kinetic models are taken in consideration: Pseudo first-order model, pseudo second-order model, Elovich model, and intraparticle diffusion model. Nonlinear regression methodology is used. The experimental results are presented in figure 2.

It can be seen that the adsorption of phosphate ions in thermally treated clay corresponds better to the pseudo second-order model, as similarly by other studies (Edet and Ifelebuegu, 2020): (Cheng et al., 2018), with a correlation coefficient,  $R^2$ , of 0.9815. This indicates that the removal of phosphate from the solution to the clay is due to physicochemical interactions between the two phases. Thus, the process is controlled by chemical adsorption and the adsorption rate is dependent on adsorption capacity of the clay (not on concentration of phosphate) (Ho and McKay, 1999). The pseudo second order rate constant,  $k_2$ , resulted  $9.69\text{hour}^{-1}$ . Furthermore, the experimental results also fit the Elovich model, with a correlation coefficient,  $R^2$ , 0.8764. The initial adsorption rate and the adsorption constant,  $\alpha$  and  $\beta$ , resulted respectively  $0.82\text{mg/g}\cdot\text{hour}$  and 52.27.

**Figure 2.** The kinetic models for the adsorption of phosphate ions in montmorillonite.

### Evaluation of adsorption isotherms

The aim of these experiments is to evaluate the adsorption capacity of the clay samples taken in consideration, as well as the mathematical approach that represents the process. Thus, the influence of the initial concentration of the phosphate aqueous solution on the adsorption capacity of clays has been studied. The batch experiment series consist on the treatment of 50ml of phosphate solution, with an initial concentration of 2-6mg/l, with 1g of clay, for a contact time of 6 hours. After this time, the solution is centrifuged and the supernatant is analysed for phosphate content. The experimental results of the dependence of phosphate adsorbed, in mg/g clay and %, versus the initial concentration are presented in figure 3 and 4. The thermal activation is realized in two temperatures 400 and 500°C. While chemical activation is achieved by treatment of the clay with sulphuric acid at concentrations, in mass percentage with respect to the mass of clay, 15%, 27% and 40%.

As can be seen, for all cases, the increase in the solution initial concentration (for the considered concentration range) results in an increase of the adsorbed phosphate amount. It seems that the initial concentration of phosphate ions in the solution is so low that the number of active positions on the surface of the clay is sufficient to adsorb them. Therefore, the effect of ion competition is not relevant. It is also established that both thermal and chemical treatment have a positive effect on increasing the adsorption capacity of phosphates from clay. More specifically, the chemically treated clay exhibits better adsorption capacity, compared to the thermally treated one. In addition, both the increase in the treatment temperature and acid concentration lead to increase of the adsorption capacity of the clay. Thus, clay activated with 40% sulphuric acid exhibits better adsorption capabilities, with 0.28mg/g of clay maximum adsorption and 99.5% phosphate removal rate, compared to the 500°C clay, with 0.21mg/g clay maximum adsorption and 81.78% removal rate, and natural clay, with 0.15mg/g clay maximum adsorption and 57% removal rate. However, it should be noted that, although the increase in acid concentration leads to an increase in phosphate removal capacity, the rate of increase decreases with increasing concentration. The curves for Clay 27 and Clay 40% are close to each other. Apparently, as stated by literature (Teĝin and Saka, 2021), calcination has caused dihydroxylation of the structure. It has changed the structure of the clay from a uniform thickness distribution and thick layer firmly stacked on the surface to a more heterogeneous and rough one, thus increasing the porosity and therefore the adsorption sites density.

**Figure 3.** Experimental results of phosphate adsorption efficiency vs initial concentration.

**Figure 4.** Experimental results of phosphate adsorption capacity in mg/g clay vs initial concentration.

While the explanation for the behaviour of chemically activated clay can be explained by the fact that because of the acid treatment of the clay surface, the reaction of the surface cations (like  $\text{Al}^{3+}$ ,  $\text{Fe}^{3+}$  and  $\text{Mg}^{2+}$  from the octahedral and tetrahedral sites as well as  $\text{Na}^+$ ,  $\text{K}^+$ , and  $\text{Ca}^{2+}$ ) with the acid has occurred to give sulphates, easily leached from the structure, and living behind active sites readily to adsorb. The reduction in phosphate removal from clays activated at higher acid concentrations may be a result of the excessive leaching of  $\text{OH}^-$  groups and central Al cations from the tetrahedral layers due to the deeper penetration of the acid, providing a solid surface that contains unchanged layers and amorphous silica (Teġin and Saka, 2021).

To evaluate the adsorption isotherm, the dependence of the adsorbed phosphate amount against the equilibrium concentration of the solution is graphed, figure 5. Langmuir and Freundlich isotherms are taken into consideration, figure 6, 7, 8, 9. Linear regression has been applied and analysis are been made upon  $R^2$  correlation coefficient. Table 2 summarizes the data of the isotherm coefficients and the respective correlation coefficients. It is noticed that, in most cases, adsorption takes place after Freundlich isotherm, with  $R^2$  greater than 0.93. For clay chemically activated with sulphuric acid of concentration 27 and 40%, it happens that the adsorption also matches the Langmuir isotherm with  $R^2$  slightly higher than that of Freundlich, respectively 0.97 and 0.95 for clay 27%.

**Figure 5.** Experimental results of adsorption isotherm of phosphate ions in clays.

However, it can be generalized that in all cases, a multilayer adsorption on heterogeneous sites occur. In addition, it could be concluded that phosphate adsorption on these clays is advantageous, as the Freundlich constant values,  $1/n$ , are in the range 0-1, implying for a multilayer chemical adsorption process.

Clay	Langmuir Isotherm			Freundlich Isotherm		
	a	b	R <sup>2</sup>	K <sub>F</sub>	1/n	R <sup>2</sup>
Natural Clay	0.54	0.12	0.40	0.06	0.79	0.947
400	0.78	0.16	0.26	0.11	0.81	0.932
500	0.35	0.80	0.97	0.15	0.59	0.99
15%	0.30	23.57	0.69	0.36	0.28	0.94
27%	0.51	0.87	0.97	0.23	0.65	0.95
40%	0.44	4.07	0.98	0.41	0.47	0.98

## CONCLUSIONS

The experimental results of synthetic phosphate wastewater treatment by Albanian activated montmorillonite concluded that this clay is very effective in water depollution from phosphates. This characteristic is reinforced even more through thermal and chemical treatment of the clay. The chemical treatment (with sulphuric acid) resulted much more effective than the thermal one. Furthermore, the adsorption efficiency is a factor of the temperature and the acid concentration used for activation. The dependence of the change in their value (within the studied limits) is proportional to the change in adsorption effectiveness. Meanwhile, the adsorption process of the thermally treated clay at 500°C, corresponds to the pseudo second-order model, indicating that the removal of phosphate from the solution to the clay is due to physicochemical interactions between the two phases. Thus, the process is controlled by chemical adsorption and the adsorption rate is dependent on adsorption capacity of the clay. In addition, it is noticed that, adsorption takes place after Freundlich isotherm indicating for a multilayer adsorption on heterogeneous sites and it is advantageous.

#### Abstract

The term 'transcript variants' refers to different mature mRNAs generated from the same precursor mRNA during post-transcriptional modifications. It is an established fact that these variants can acquire important roles in cancer pathways and can have opposing effects despite being produced from the same gene. In this study, the effects of capsaicin on protein, total mRNA and transcript variant levels of human telomerase (hTERT) and tensin homolog (PTEN) were examined in a cancerous [glioblastoma cell line (YKG-1)] and a healthy [(human umbilical vein endothelial cells (HUVEC)] human cell population. Firstly, the cells were treated with capsaicin for 24 hours, and IC<sub>50</sub> values for YKG-1 and HUVEC were determined as 351.1 µM and 365.5 µM, respectively, through MTS assay. According to the statistical analysis, the healthy HUVEC cells were found to be significantly resistant to capsaicin than YKG-1 (p<0.05). Subsequently, Western Blotting was performed to observe the changes in human telomerase and PTEN protein levels. It was found that capsaicin treatment caused a slight decrease in PTEN levels while triggering an increase of approximately 20% in hTERT protein levels in both cell types. When the relative levels of total mRNAs were examined by qRT-PCR, a statistically significant increase was observed in PTEN and hTERT for both cell types (p<0.05), except for the PTEN in YKG-1, which turned out to increase by ethanol, the solvent used to solve capsaicin. Subsequently, an attempt was made to determine the changes in the variants expressed from the PTEN and hTERT gene regions, respectively consisting of 3 and 4 variants. As a result, it was found that capsaicin treatment led to an increase in variant expressions in all cases, and this increase was statistically significantly higher than both the control group and the ethanol-treated group (p<0.05).

#### Kapsaisin Muamelesi Sonrası YKG-1 ve HUVEC Hücrelerinde hTERT ve PTEN Protein, Toplam mRNA ve Transkript Varyant Seviyelerinin Belirlenmesi

#### Özet

Transkript varyantları, DNA'da kodlanmış tek bir genden üretilen öncül mRNA'nın post-transkripsiyonel değişimler sırasında, bazı ekzon kısımlarının çıkarılması ile oluşturulan farklı olgun mRNA'ların her birine verilen isimdir. Bu varyantların, kanser yolaklarında önemli görevler edinebildiği ve aynı genden üretilmelerine rağmen farklı varyantların birbirlerine zıt etkilere neden olabildiği bilinmektedir. Bu çalışmada, kapsaisin bir glioblastoma hücre hattı (YKG-1) ile sağlıklı hücreleri temsil ettiği düşünülen HUVEC hücrelerinde insan telomeraz (hTERT) ve tensin homolog (PTEN) genlerinden üretilen protein, toplam mRNA ve transkript varyantlarına nasıl etki ettiği gösterilmeye çalışılmıştır. Bunun için öncelikle hücreler kapsaisinle 24 saat muamele edilerek YKG-1 ve HUVEC hücreleri için IC<sub>50</sub> değerleri MTS testi aracılığıyla sırasıyla 351,1 ve 365,5 µM olarak tespit edilmiştir. Yapılan istatistiksel analizde kapsaisin hücreler üzerindeki etkisinin istatistiksel olarak anlamlı derecede farklı olduğu (p<0.05) ortaya konulmuştur. Sonrasında, IC<sub>50</sub> değerinde kapsaisinle muamele edilen hücrelerde insan telomeraz ve PTEN protein seviyeleri Western Blotlama ile incelenmiş; çalışılan iki hücre tipinde de kontrol grubuna kıyasla, PTEN protein seviyesinde küçük bir azalma, hTERT protein seviyesinde %20 dolaylarında bir artış gözlenmiştir. hTERT ve PTEN gen bölgelerinden ifade edilen toplam mRNA'ların bağıl seviyelerine qRT-PCR yöntemiyle bakıldığında, yine her iki hücre tipi için hem PTEN hem de hTERT mRNA seviyelerinde kontrol grubuna kıyasla istatistiksel olarak anlamlı bir artış gözlenmiştir (p<0.05). Ancak, PTEN'in YKG-1 hücrelerindeki artışı dikkatle incelendiğinde, gözlenen bu değişimin, kapsaisin çözünürü olarak kullanılan etanolden kaynaklandığı ortaya çıkarılmıştır. Ek olarak,

PTEN ve hTERT gen bölgelerinden ifade edilen transkript varyantlarının kapsaisin uygulamasıyla nasıl değiştiği saptanmaya çalışıldığında; hücre tipine ve çalışılan varyanta bağlı olarak şiddetlerinde farklılıklar görünse de tüm durumlarda kapsaisin uygulamasının varyant ifadelerinde artışa neden olduğu ve bu artışın hem kontrol grubundan hem de etanol ile muamele edilmiş gruptan istatistiksel olarak anlamlı ölçüde yüksek olduğu tespit edilmiştir ( $p < 0.05$ ).

## INTRODUCTION

Messenger RNA (mRNA) is produced through a process called transcription, which converts the genetic information of a gene into an RNA molecule. In eukaryotic cells, following transcription, post-transcriptional modifications are carried out to prepare the precursor mRNA molecules for translation and to regulate their movement within the cell. One of these modifications involves the removal of introns present in the precursor mRNA chain. During the process of intron removal, occasionally exons can also be removed, resulting in the production of different mature mRNA molecules from the same precursor mRNA. This process, which can be summarized as alternative splicing (AS), leads to different forms of mature mRNAs being generated. Each of these mRNAs is named as a transcript variant. Transcript variants can have different functions and activities, and they can vary depending on the cell's role and environmental conditions. These variants are also important for regulating gene expression levels and tissue specificity such that their misregulation can lead to diseases (Keren et al., 2010).

Cancer is a group of diseases that share certain common characteristics, such as uncontrolled cell division, evasion of apoptosis, production of their own growth signals, insensitivity to growth inhibitory signals, or the ability to create their own blood vessels (Hanahan and Weinberg, 2011). Despite significant advancements in treatment methods in recent years, cancer remains one of the leading causes of death worldwide (World Health Organization, 2023).

The uncontrolled and unlimited capacity for cell division in cancer cells, also known as immortality, has been attributed to the high activity of an enzyme called telomerase. Telomeres are non-coding "TTAGGG" repeat DNA sequences located at the terminal ends of all vertebrate chromosomes (Montpetit et al., 2014). Telomere length decreases by 50-150 base pairs (bp) per cell division in human somatic cells in culture. While telomerase activity is very low in somatic cells due to tight regulation of hTERT (Cifuentes and Shippen, 2012), the majority of malignant tumors exhibit significantly elevated levels of telomerase (Kim et al., 1994; Koziel et al., 2011; Shay and Wright, 1996). The hTERT gene in humans produces four different transcript variants, and the roles of these variants are not yet fully understood (Khosravi-Maharlooie et al., 2015).

PTEN is another signaling molecule known to play an important role in cancer development. Its role in limiting the cell proliferation in healthy cells makes it an important tumor suppressor (Guo et al., 2018). In cancer cells, the PTEN gene is either completely lost or its function is vastly reduced (Dillon and Miller, 2014). Three transcript variants expressed from the PTEN gene have been identified, and ongoing discussions revolve around the roles of these variants in cancer cells (Hasle et al., 2019).

Capsaicin is a sharp-smelling, pungent phenolic (8-methyl-N-vanillyl-6-nonenamide) compound synthesized in plants of the Capsicum genus (Cao et al., 2015). Numerous studies conducted thus far have demonstrated that capsaicin has diverse biological and physiological functions, such as pain relief (Maihofner and Heskamp, 2013), anti-obesity (Baboota et al., 2014) and anti-inflammatory properties (Toyoda et al., 2016). In addition, the anti-cancer properties of capsaicin have also drawn the attention of researchers in recent years (Cao et al., 2015; Helvacı and Comertpay, 2018; Comertpay and Ozelik Demirbanka, 2020). In this study, YKG-1 glioblastoma cancer cell line and HUVEC (Human Umbilical Vein Endothelial Cells), which could represent human healthy tissue, were treated with capsaicin. Telomerase (hTERT) and PTEN proteins in the cells were detected using Western blotting, and the relative quantities of total RNA were measured using qRT-PCR. In the same cells, the changes in the expression of four hTERT (hTERT1, hTERT2, hTERT3, and hTERT4) and three PTEN (PTEN1, PTEN2, and PTEN3) transcript variants upon capsaicin treatment were also determined using qRT-PCR technique. As far as our knowledge is concerned, this study is the first attempt to explore the effects of capsaicin application on transcript variants in glioblastoma and HUVEC cells.

## MATERIALS AND METHODS

### Cell Culture

YKG-1 (ATCC, USA) and HUVEC (ATCC, USA) cells available in our laboratory were cultured in DMEM (Dabelco's Modification of Eagle's Medium; Hyclone, USA) supplemented with 10% FBS (Fetal Bovine Serum; Hyclone, USA) and 1% Penicillin-Streptomycin (invitrogen, USA). The cells were grown in an incubator (Panasonic, Japan) at 37°C with 5% CO<sub>2</sub>.

### Determination of IC<sub>50</sub> Values

After cell counting, the wells of a 96-well plate were seeded with 5,000 cells per well. To achieve the desired concentration of capsaicin, different concentrations including 0 were used. Each concentration was seeded in a column with 4 replicates. The cells were seeded with 100 µL of culture medium. In each concentration, two wells without cells were reserved to measure the absorbance of the culture medium. The concentrations for YKG-1 cells were 0-100-150-200-225-250-275-300-325-350-400 µM, and for HUVEC cells, the concentrations were 0-100-150-200-250-300-350-400-450-500-550-600 µM. The continuation of the process was carried out following the method described by Helvacı and Comertpay (2018) to obtain the IC<sub>50</sub> values.

### Treatment of Cells with Capsaicin

The calculated IC<sub>50</sub> value for each cell type was used for the treatment. The treatment was carried out as described by Turan (2019). In summary, 1,173,000 cells were seeded in three T75 flasks. After overnight incubation at 37°C and 5% CO<sub>2</sub>, the medium in the flasks was replaced with capsaicin-containing medium at the IC<sub>50</sub> concentration (M2028; Sigma-Aldrich, Germany) (C), medium containing an equivalent amount of ethanol (E), or plain medium (K). After 48 hours, live cells were counted and re-seeded into capsaicin-containing (or ethanol-containing) medium. This process was repeated after 96 hours, and live cells were harvested at 120 hours.

### Western Blotting (WB)

The procedure was carried out following the method described by Comertpay and Ozcelik Demirbanka (2020). Briefly, protein was isolated from the cells collected after capsaicin treatment, and 50 µg portions of these proteins, along with a protein marker (abcam, USA), were loaded onto an SDS-PAGE gel, with each in a separate well. Subsequently, the proteins were electrophoretically separated based on their sizes, transferred onto a PVDF membrane, and the membrane was incubated with antibodies against telomerase (abcam-ab32020, USA), PTEN (abcam-ab133532, USA), mTOR (abcam-25880), and GAPDH (ThermoFisher, PA1-9046, USA) as a control. Following incubation, specific secondary antibodies were applied to each primary antibody, and chemiluminescence was generated using an ECL Substrate (Huang et al., 2009). The membranes were then photographed using a UVP device, and the obtained images were analyzed using Image J software. The intensities of the observed bands were expressed numerically. Band values obtained for the studied proteins (Telomerase, PTEN) were normalized by dividing them by the values of GAPDH obtained from the same membrane, and then they were further normalized by dividing them by the value obtained for the control group.

### Measurement of Relative mRNA Levels by qRT-PCR

This step was performed following the method described by Comertpay et al. (2022). After total RNA isolation from the cells in the C, E, and K groups, cDNAs were synthesized. Specific primers were designed to determine the total amount of human telomerase reverse transcriptase (hTERT) and PTEN mRNAs, obtained from the National Center For Biotechnology Information (NCBI) (2023a, 2023b). These primers can be seen in Table 1. The beta-actin (β-Actin) primer, generated using the same method, was used as an internal control. After performing qRT-PCR, the Ct values obtained from triplicate measurements for each sample were compared, and the 2<sup>-ΔΔCt</sup> formula was used to calculate the relative mRNA levels (Schmittgen and Livak, 2008).

**Table 1. Sequences of primers used in RT-PCR analysis and the expected product length (bp)**

Primer Name	Sequence	Expected Product Length (bp)
Beta-Actin (Forward)	CCCTGGACTTCGAGCAAGAG	323
Beta-Actin (Reverse)	GATCTTCATTGTGCTGGGTGC	
PTEN (Forward)	CACACGACGGGAAGACAAGTTC	161
PTEN (Reverse)	CCTCTGGTCCTGGTATGAAGAATG	
Telomerase (Forward)	CCACATAGGAATAGTCCATCC	220
Telomerase (Reverse)	TTTACTCCCACAGCACCTC	

### Variant-Specific Analysis

Variant-specific analysis was conducted as described above, after determining the relative quantities of total RNA expressed from each gene region. qRT-PCR was performed using the primers listed in Table 2 to determine how the levels of each transcript variant produced from the PTEN and hTERT gene regions, according to the NCBI database, changed. It was assumed that the designed primers would enable the discrimination of variants.

**Table 2. a. Primers designed for the separation of 4 variants transcribed from the hTERT gene region and the resulting variant after the relevant amplification.**

PRIMER			Recognized Variants	Amplified Variants	
hTERT	1	Forward	TCTTCCTACGCTTCATGTG	1, 2	1
		Reverse	AGTAGTCGCTCTGCACCT	1	
	2	Forward	TCTTCCTACGCTTCATGTG	1, 2	1, 2
		Reverse	GCAAGACCCCAAAGAGTT	1, 2, 3, 4	
	3	Forward	ACGGGCGCGTACGACACC AT	1, 2, 3	1, 2, 3
		Reverse	AAACAGCTTGTTCTCCATG T	1, 2, 3, 4	
	4	Forward	TGAAGGCACTGTTTCAGCG T	1, 2, 3, 4	1, 2, 3, 4
		Reverse	AAACAGCTTGTTCTCCATG T	1, 2, 3, 4	

**Primer designed for the separation of the variant transcribed from the PTEN gene region and the resulting variant after the relevant amplification.**

PRIMER			Recognized Variants	Amplified Variants	
PTEN	1	Forward	GCTGGCACATCCAGGGA	1	1
		Reverse	GATTGTATATCTTGTAATG G	1, 2	
	2	Forward	GCGGCACATCCAGGGA	2	2
		Reverse	GATTGTATATCTTGTAATG G	1, 2	
	3	Forward	GATGTAGTAAGTTGTGCTG	3	3
		Reverse	TTAGCCTTGGCCTCTACA	3	

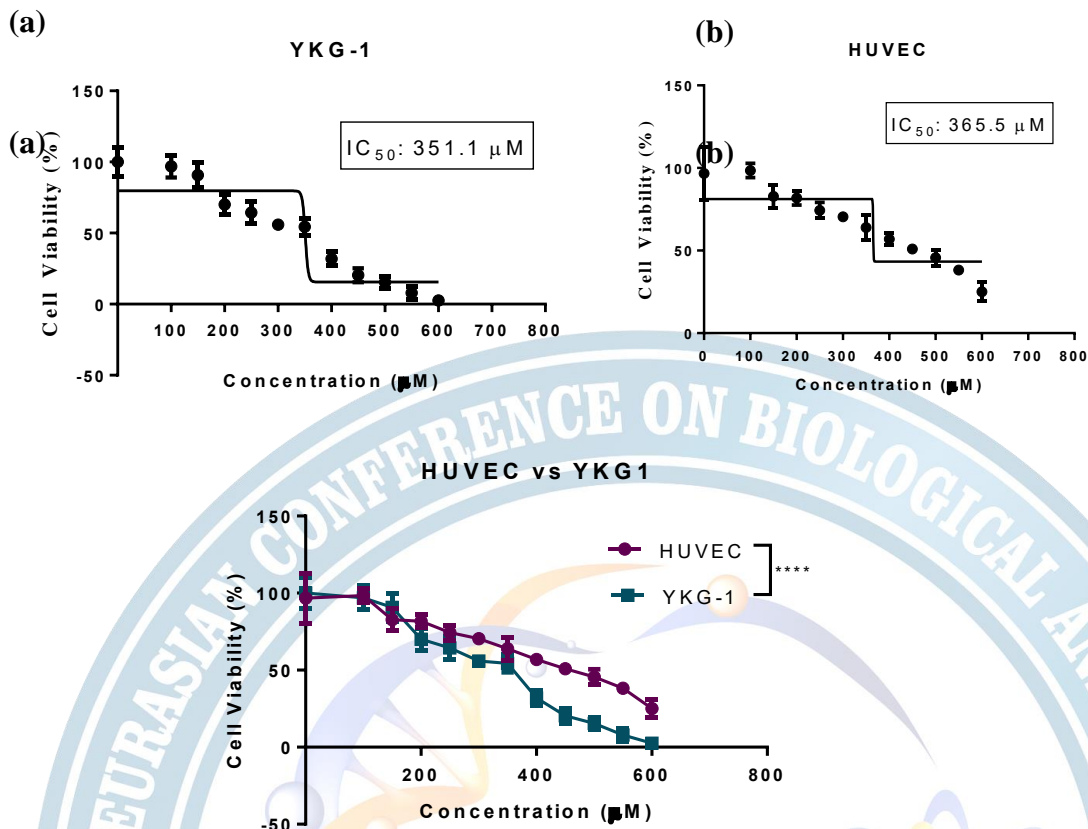

### Statistical Analysis

Graphs representing the  $IC_{50}$  values of the cells were generated based on the MTS results, and they were compared using two-way ANOVA with GraphPad Prism software (CA, USA). The p-value given under the "interaction" heading in the results table was taken into consideration. Numerical results obtained from the qRT-PCR experiments were compared between groups ("C," "E," and "K") or treatments using the Student's t-test, also with GraphPad Prism software. In all comparisons where the p-value was equal to or less than 0.05, the difference between the compared groups was considered statistically significant, and this data was indicated with an asterisk (\*) on the generated graphs. If the p-value was less than 0.01, 0.001, or 0.0001, the corresponding symbols (\*\*, \*\*\*, \*\*\*\*) were placed on the graph at the respective points.

## RESULTS

### Calculation of $IC_{50}$ values for cell sensitivity to capsaicin

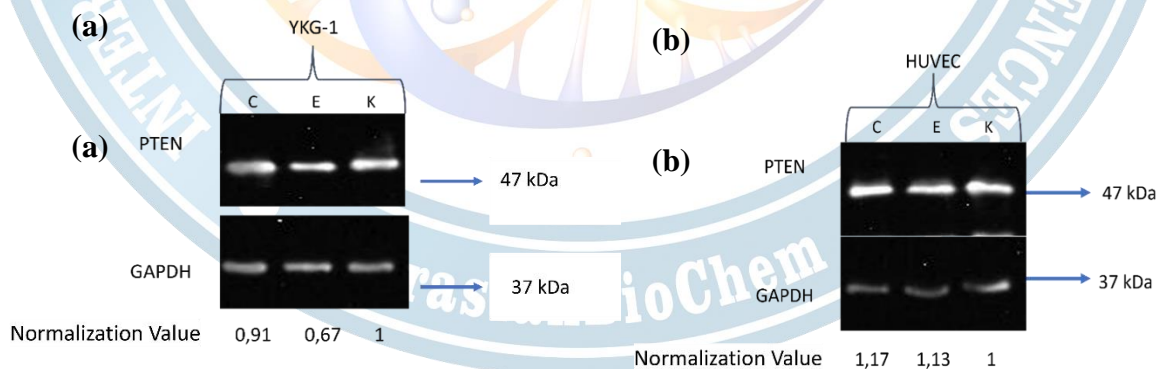

Previous studies have determined  $IC_{50}$  values for cancer cell lines, which formed the basis of our study. However, considering that the passage of time may have led to differences in cytotoxicity, and in order to achieve simultaneous results with the healthy cell line HUVEC,  $IC_{50}$  values for capsaicin were determined for all cells. The results are shown in Figure 1.

**Figure 1.** Measurement of cytotoxicity of capsaicin on (a) YKG-1 and (b) HUVEC cell lines using MTS and the corresponding IC<sub>50</sub> values determined. (c) Comparison of differences in cell viability vs. concentration graphs between the cells using two-way ANOVA.

### PTEN Protein Levels

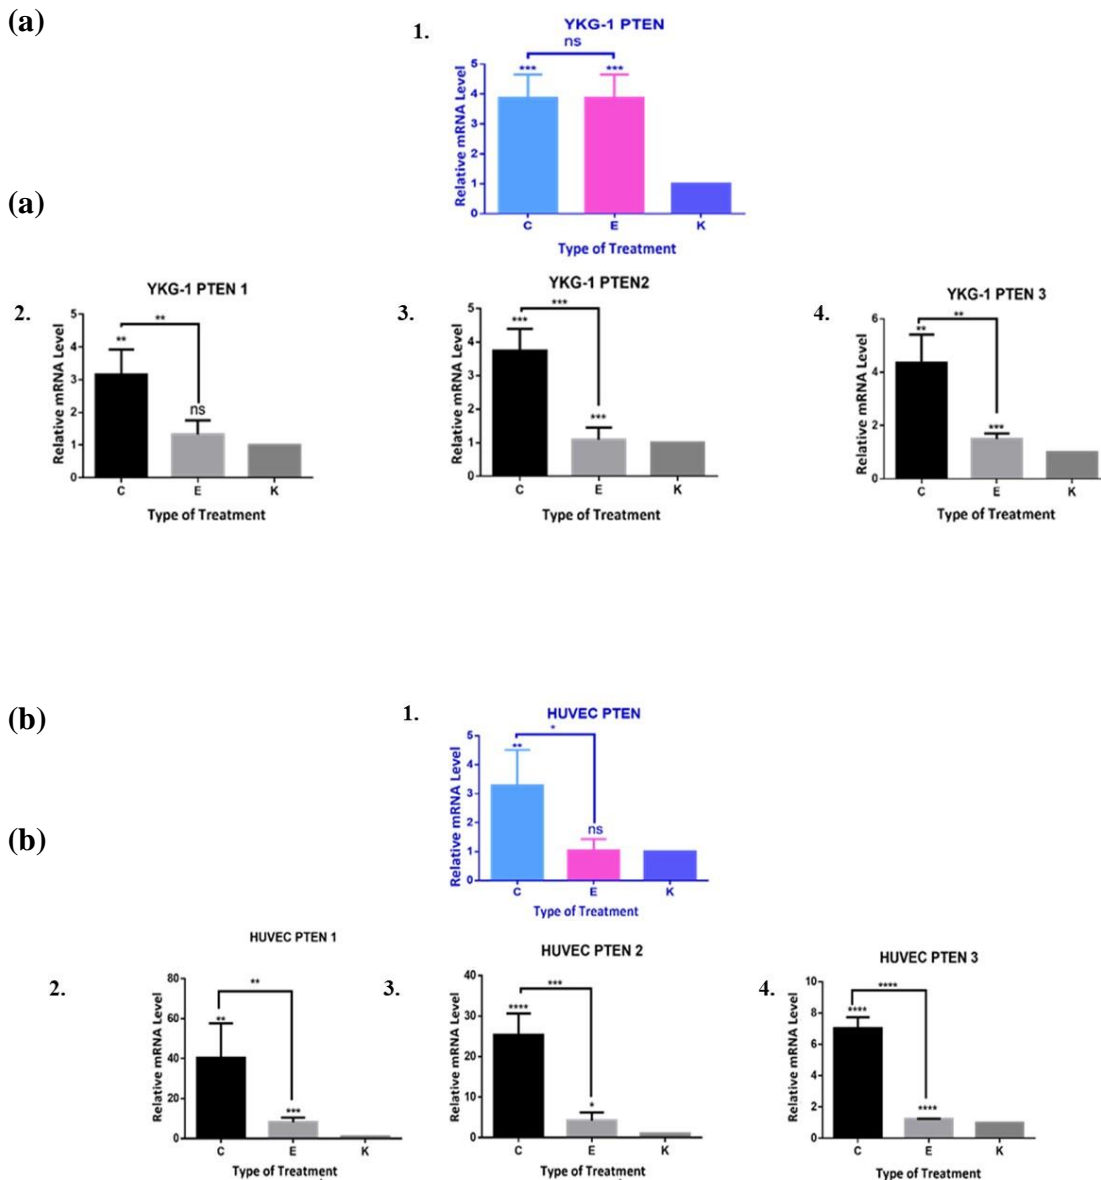

Cells treated with capsaicin (C), cells treated with ethanol (E), and experimental control cells (K) were used to isolate proteins based on the calculated IC<sub>50</sub> value for each cell line. PTEN protein levels were evaluated using Western Blot technique. The results are presented separately for each cell line (Figure 2).

**Figure 2.** Relative levels of PTEN protein in (a) YKG-1 and (b) HUVEC cells treated with capsaicin. GAPDH was used as a loading control, and the calculated value in the Control Group was set as 1.00, representing the levels in other groups. Normalization values reflect the relative level of the protein.

### Relative PTEN mRNA Levels

The relative evaluation of the total PTEN levels in the mRNA obtained from YKG-1 and HUVEC cells in groups (C), (E), and (K) is shown in Figure 3. The relative evaluations of the quantities corresponding to each variant are presented below.

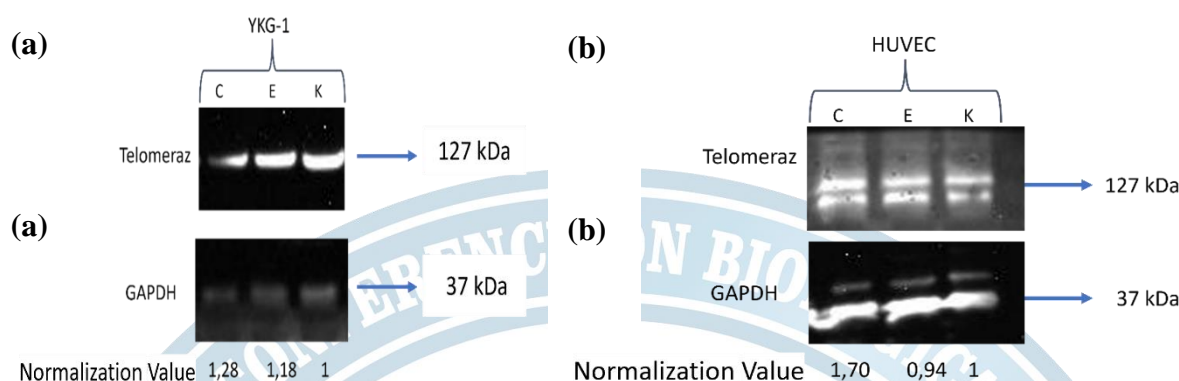

**Figure 3.** (a) Relative mRNA levels of (1) total PTEN, (2) PTEN1, (3) PTEN2, (4) PTEN3 in YKG-1 cells after capsaicin treatment. (b) Relative mRNA levels of (1) total PTEN, (2) PTEN1, (3) PTEN2, (4) PTEN3 in HUVEC cells after capsaicin treatment. C: Cells treated with capsaicin, E: Cells treated with ethanol, K: Control cells grown in regular medium. Experiments were repeated twice. C and E groups were compared to K, and the indicator bar representing the p-value was placed on the bar. The comparison between the C and E groups is represented by a line that appears to merge the two bars. \* $p < 0.05$ , \*\* $p < 0.01$ , \*\*\* $p < 0.001$ , \*\*\*\* $p < 0.0001$ , ns: not statistically significant.  $\beta$ -Actin was used as an internal control.

### hTERT Protein Levels

Proteins were isolated from cells treated with capsaicin, cells treated with ethanol, and experimental control cells based on the calculated  $IC_{50}$  value for each cell line. hTERT protein levels were evaluated using Western Blot technique. The results are presented separately for each cell line (Figure 4).

**Figure 4. Relative levels of hTERT protein in YKG-1 and HUVEC cells treated with capsaicin.**

C: Cells treated with capsaicin at the  $IC_{50}$  value for 120 hours. E: Cells treated with ethanol at the same volume as capsaicin. K: Control cells grown in regular medium without any additions. GAPDH was used as a loading control, and the value calculated in the Control Group was accepted as 1.00, representing the levels in other groups. Blue arrows indicate the size of observed protein bands in kilodaltons. Normalization values reflect the relative levels of the protein.

### Relative mRNA Levels of hTERT

Following the protein measurements, the relative levels of both total hTERT and each hTERT variant were measured in the RNA isolated from cells subjected to the same treatments (Capsaicin, Ethanol, Control) (Figure 5.). Since hTERT has 4 different variants according to the NCBI database (Materials and Methods; 3.6. Variant-Specific Analysis), the results are presented based on these variants.

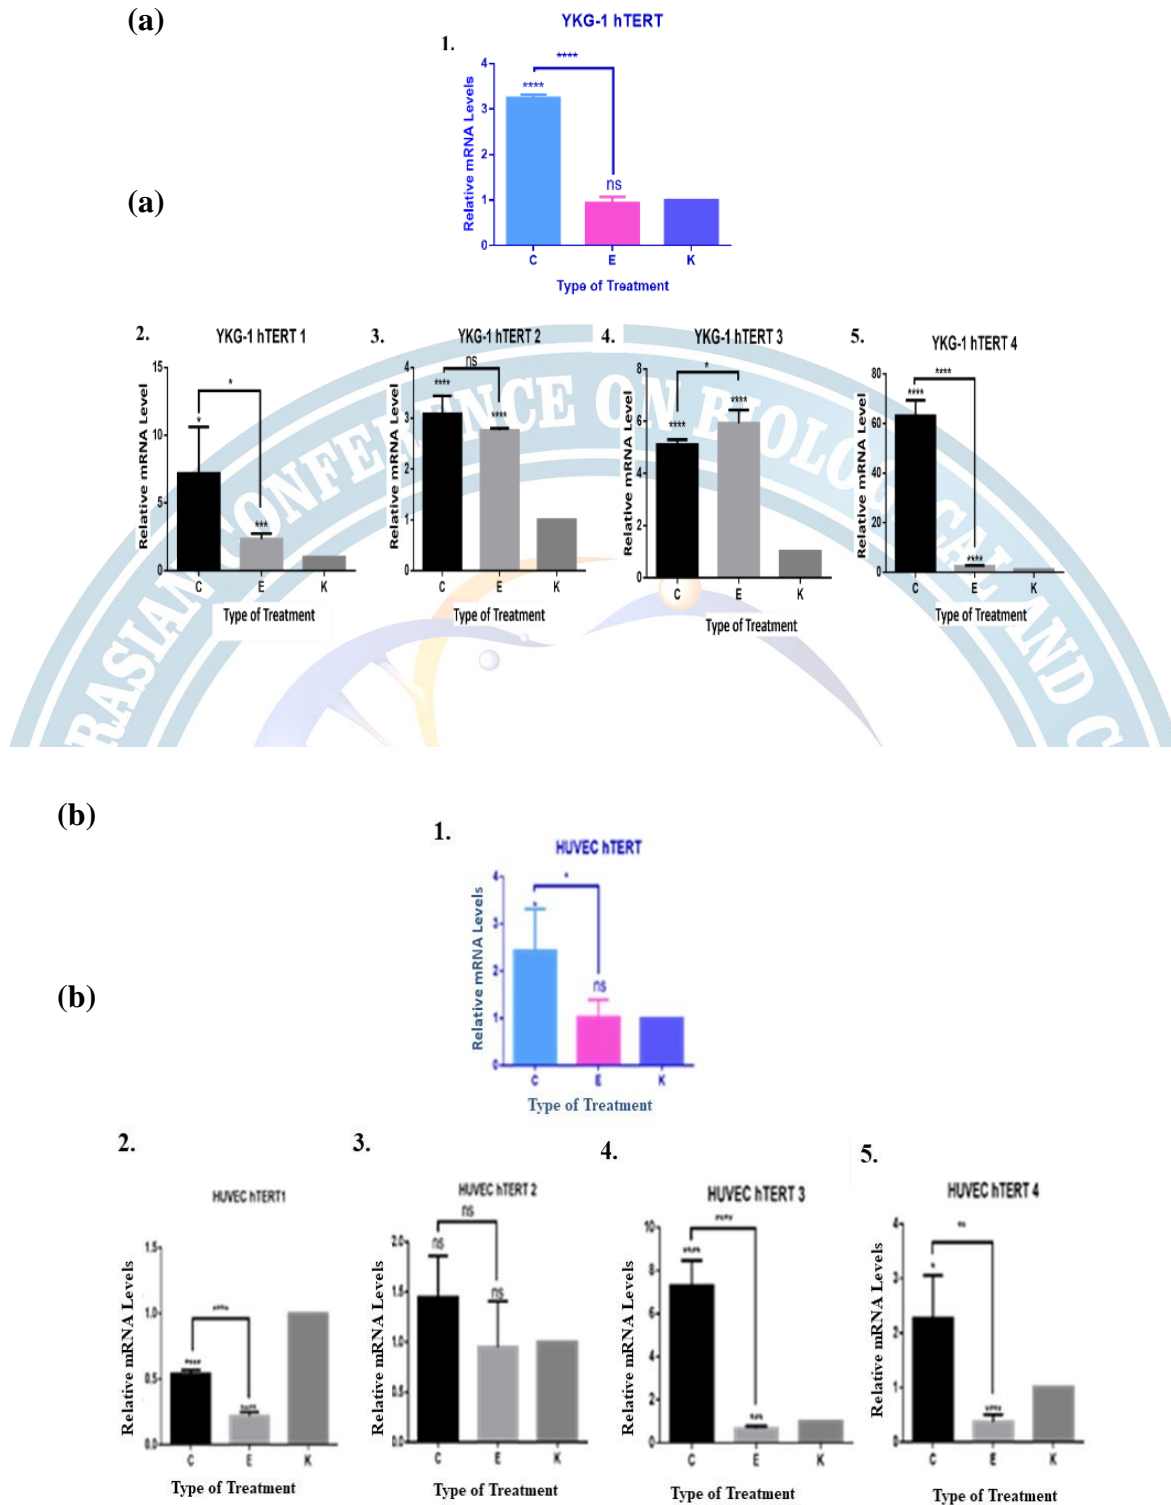

### DISCUSSION

Our study is the first to investigate the effect of capsaicin at the  $IC_{50}$  level in HUVEC and YKG-1 cells in terms of transcript variants expressed from the hTERT and PTEN coding gene regions in response to capsaicin treatment in the cell lines used.

The first phase of our study involved determining the cytotoxic effects of capsaicin. Commercially obtained capsaicin was dissolved in ethanol and applied to our cell lines at varying concentrations. Subsequently, the MTS assay was performed to determine the  $IC_{50}$  value for each cell line. This approach has been demonstrated previously for the cell lines used in our study. When the  $IC_{50}$  values were evaluated together, a significant difference was found among them ( $p < 0.05$ ). Specifically, glioblastoma cells were highly sensitive to capsaicin, while HUVEC cells were less affected in terms of sensitivity to capsaicin.

Finding evidence for the use of YKG-1 cells in capsaicin studies is difficult in the literature. In a master's thesis completed by Alsayed (2019), the  $IC_{50}$  value for this cell line was determined to be 280  $\mu M$ . In the present study, this value was measured as 351.1  $\mu M$  (Figure 1). This difference can be understood with the explanation provided by Ben-David et al. (2018). According to their explanation, cells maintained in culture can behave differently towards the same agent due to genetic and transcriptional changes they undergo.

Regarding HUVEC cells, the cytotoxicity of capsaicin has been evaluated in different studies. For example, Chularojmontri et al. (2010) reported that 25  $\mu M$  capsaicin did not induce cytotoxic effects in HUVEC cells. Although the direct determination of capsaicin  $IC_{50}$  was not reported in their study, Chularojmontri's report aligns with our observations. Indeed, the  $IC_{50}$  value for HUVEC was found to be high, at 365.5  $\mu M$ .

**Figure 5.** (A.) Relative mRNA levels of total hTERT and hTERT1, hTERT2, hTERT3, and hTERT4 variants in YKG-1 cells after capsaicin treatment. (B.) Relative mRNA levels of total hTERT and hTERT1, hTERT2, hTERT3, and hTERT4 variants in HUVEC cells after capsaicin treatment. C: Cells exposed to capsaicin; E: Cells exposed to ethanol treatment; K: Control cells grown in regular medium. Experiments were repeated twice. C and E groups were compared with K group, and the significance level (p-value) was indicated on the error bars. The comparison between C and E groups was represented by a line that appears to merge the two bars. \* $p < 0.05$ , \*\* $p < 0.01$ , \*\*\* $p < 0.001$ , \*\*\*\* $p < 0.0001$ , ns: not statistically significant.  $\beta$ -Actin was used as an internal control.

In the next phase, capsaicin was applied to the cells at the determined IC<sub>50</sub> value, and mRNA and protein were isolated from the cells along with those treated with ethanol, and untreated control group. No significant changes were observed in PTEN protein levels following capsaicin treatment. Our findings contradict the literature information indicating the suppression of the PTEN pathway in capsaicin-treated cancer cells (Sánchez et al., 2019), suggesting that PTEN suppression may not exist, at least in the studied cells. However, it is also possible that the decrease in PTEN protein levels observed by Sánchez et al. can be explained by a substantial halt in protein synthesis or the degradation of certain unstable proteins. Another possibility is that the differences between our results and the literature can be attributed to the cell type studied and the behavioral differences developed by cells depending on their environmental conditions, as mentioned by Ben-David et al. (2018).

On the other hand, the observed PTEN levels in HUVEC will be evaluated solely based on our results since there is no study specifically examining PTEN levels in response to capsaicin in this cell type. Our observation of a roughly 17% increase in PTEN aligns with the role of this molecule in cell survival (Kuo et al., 2017), suggesting that, although slight, the increased PTEN levels in cells that survived capsaicin stress resulted from a population selection in which cells with higher PTEN levels resisted the treatment and were subsequently subjected to protein and RNA isolation.

In all cells studied, an increase in the relative value of total PTEN mRNA was observed using a common primer recognizing all variants. This observation is consistent with our previous findings in YKG-1 cells (Alsayed, 2019). For HUVEC cells, since no such study has been conducted before, it is challenging to compare our results. However, the fact that both the protein and mRNA levels point the same direction suggests that HUVEC cells might have activated suitable molecular pathways for cell survival.

The protein level of telomerase in YKG-1 cells exhibited an increase of approximately 28%. Considering the role of telomerase in cell survival (Cifuentes et al., 2012), this increase suggests that the upregulation of the relevant enzyme in cells that survived capsaicin treatment may enhance cell viability. A similar observation was made in HUVEC cells, where the difference was calculated to be around 70%.

As for the limiting factors of our study, it was not possible to design separate hTERT primers for each variant due to the high similarity between the variants (NCBI, 2023a). The analysis of hTERT variants was generally weaker compared to the analysis of PTEN variants. This can be attributed to the difficulty in distinguishing hTERT variants solely based on primer design and the susceptibility of Nested PCR to errors. Therefore, it is crucial to have the results related to hTERT confirmed through repeated studies in the conclusion section of the article.

## CONCLUSION

- i. The IC<sub>50</sub> value of capsaicin was determined as 351.1 µM for YKG-1 cells and 365.5 µM for HUVEC cells.
- ii. Capsaicin treatment does not seem to significantly affect PTEN and but increase the telomerase protein levels in cells.
- iii. Capsaicin treatment increased the relative levels of total hTERT and PTEN mRNA in both cell types. However, this affect might be the result of ethanol for PTEN in YKG-1.
- iv. Capsaicin treatment led to an increase in all PTEN variants in HUVEC and YKG-1 cells.
- v. In YKG-1 cells, capsaicin treatment increased the levels of all hTERT transcript variants compared to control. However, ethanol also increased the hTERT2 and hTERT3 levels.
- vi. Capsaicin treatment resulted in a decrease in hTERT1 variant and an increase in hTERT3 and hTERT4 variants in these cells while hTERT2 remained unaffected.

## ACKNOWLEDGEMENT

This study was supported by the Scientific and Technological Research Council of Turkey (TÜBİTAK) under Project No. 120 Z 775.

#### Abstract

This study aims to evaluate for the first-time bilirubin lowering activity of an Algerian *Ecballium elaterium*. The juice was pressed from the mature fruits. The decoction method was used to prepare aqueous powder fruits extract. The current study examined the bilirubin-lowering activity of powder fruit extract (300mg/kg) and fruits juice at 0.2 mL/kg and 0.7 mL/kg for three days in jaundiced Wistar rats administrated phenylhydrazine 0,05 ml/kg (I.P). The biochemical parameters included albumin, bilirubin, alkaline phosphatase, were restored to a normal level and the liver damage was improved in rats treated with *Ecballium elaterium*. Therefore, both juice and fruits aqueous extract can be used for their hepatoprotective

**Key words:** *Ecballium elaterium* (L), Rats, Jaundice, Hepatoprotective activity, Biochemical parameters

#### INTRODUCTION

Jaundice is also known as icterus (Muhammad et al.,2016) is one of the most common medical condition affecting infants, children, and adults (Janghel et al., 2019). It results from a liver disorders or hyperbilirubinaemia consequently lead to a yellow pigmentation in the skin, sclera and mucous membranes (Arthur et al.,2012; Ayeni et al., 2017) the eyes, tongue and urine (Bipin Kumar et al.,2016). Which is developed in relation to several diseases or abnormal condition such as hepatitis, liver cancer, hemolytic anaemia...etc (Abbasi et al.,2009). Medicinal plants and their natural products are being used long ago by our ancestors for the treatment of such hepatic disorders (Tewari et al.,2017; Janghel et al., 2019). *Ecballium elaterium* (E. Elaterium) or squirting cucumber (Attard and Scicluna-Spiteri 2001;Toker et al.,2003; Uslu et al., 2006; Bourebaba et al.,2018) commonly known as Fegous el hemir is a species of herbaceous plant (Bizid et al.,2015) with sub-succulent, hairy leaves and stems belonging to the Cucurbitaceae family (Greige-Gerges et al., 2007;Christodoulakis et al.,2011; Bizid et al.,2015) mainly distributes in the Mediterranean regions (Uslu et al., 2006; Greige-Gerges et al., 2007). It is reported that squeeze fruit gives a juice with an excellent therapeutic remedy effect known as elaterium. It also contains proteins, lipids, cucurbitacins (B, D, E, I and L,) and cucurbitacin derivatives such as glycosylcucurbitacins and triterpenoids glycosides (Touhiri et al.,2019). Many studies have been carried out to explore the therapeutic effect of this plant, particularly its anti-inflammatory, rhinosinusitis, analgesic, antipyretic and antiphlogistic (El Naggar et al.,2015; Bourebaba et al.,2018) hepatitis, cancer, rheumatism, hemorrhoids, liver disorders, earache, and uroclepsia, antimalarial, antimicrobial, anti-jaundice and anti-proliferative properties and anti-cancer effects (Toker et al.,2003; Touhiri-Barakati et al.,2016; Bourebaba et al.,2018). Based on the traditional use of E. Elaterium fruits in Algerian folk medicine to treat jaundice. The present study is the first has been carried out to investigate its antioxidant and anti-jaundice activities by using in vitro and in vivo studies.

#### MATERIALS AND METHODS

##### Juice and aqueous extract preparation

The green fruits of E. elaterium was collected from Jijel (Northeast Algeria) in February 2020 and identified by Dr. Halice.Y at (CRSTRA. Touggourt. Algeria), then air-dried at room temperature in the shade. Fruits were ground to a fine powder using domestic blunder and used for the preparation of aqueous extract. The juice was pressed from the green fresh fruits and then filtered in till yielded a clear crude fruit juice that was conserved in sterile tubes at 4 °C. 10g of E. elaterium powder fruits was boiled in 100 ml distilled water for 20 minutes according to traditional practitioners (data not shown here). After cooling the extract was filtered and concentrated by rotary evaporator (Büchi Rotavapor R- 200), stored away the light and humidity for further analysis.

## Blood biochemical and histopathological evaluation

All animals were sacrificed on day 8 after an overnight fast. At sacrifice, blood was obtained from the heart and liver was taken and recorded after rinsing in normal saline before remaining it in formol 10% for histopathological study. The serum total bilirubin, glutamic pyruvate transaminase (SGPT), glutamic oxaloacetate transaminase (SGOT), and alkaline phosphatase (ALP) levels were estimated using commercial kits.

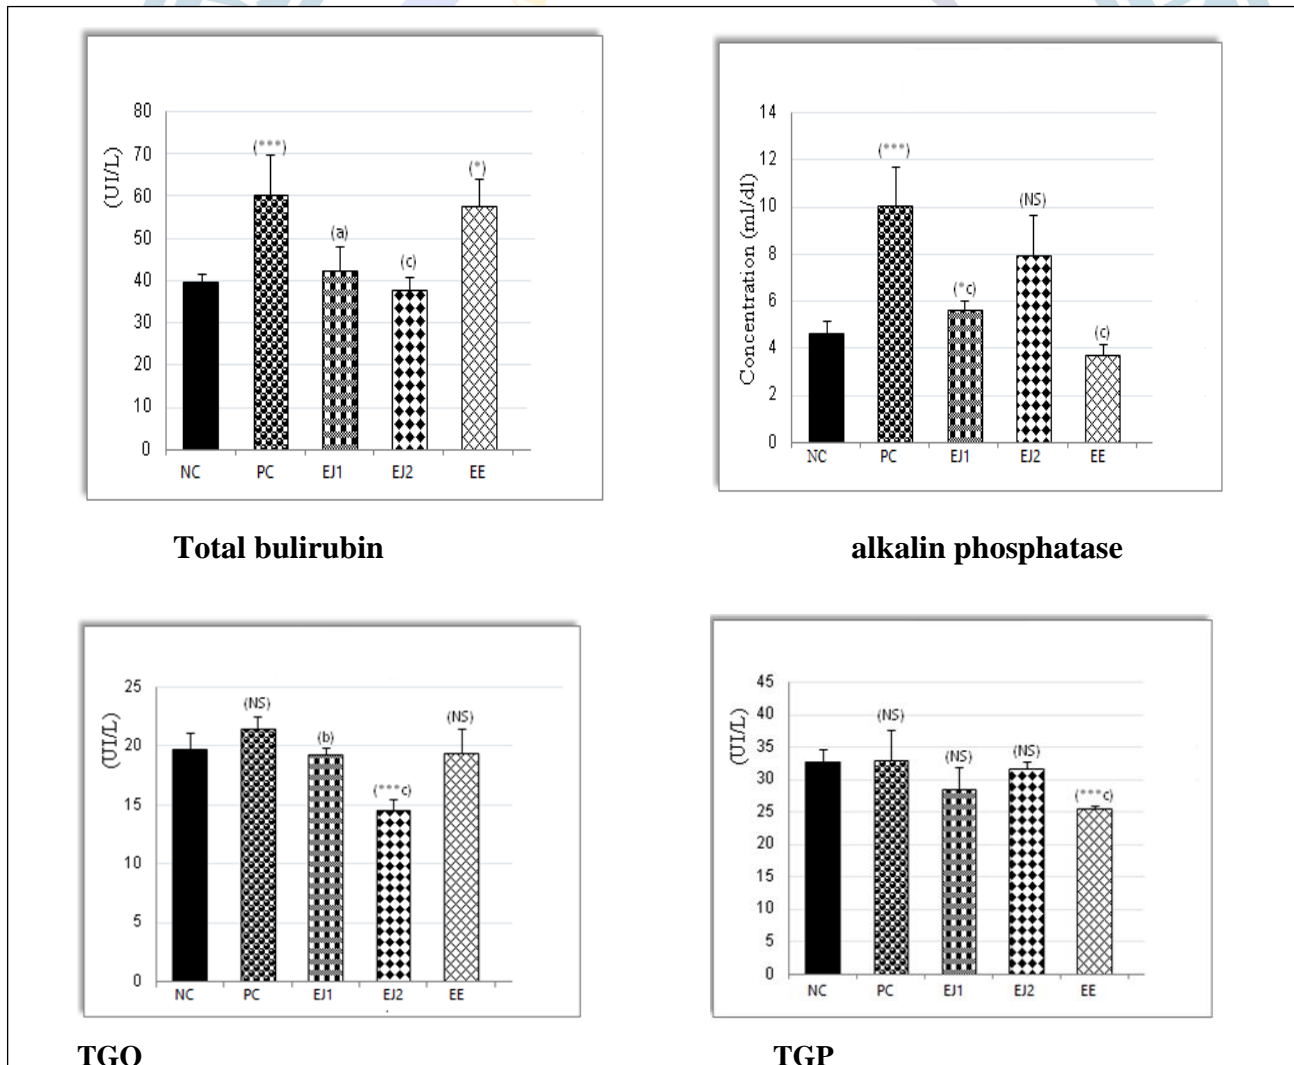

### Statistical analysis

Statistical analysis was done in triplicate and represented as the mean  $\pm$  SEM using MINITAB17. ANOVA process was adopted for the analysis of variance. Statistical comparisons between means were determined by Student test. P values < 0.05 were considered as significant.

## RESULTS

### Blood biochemical parameters evaluation

The biochemical parameters are illustrated in Figure1. Total bilirubin concentration in group treated with phenylhydrazine (PC) was highly significantly increased when compared with the normal group (NC). However, The level of total bilirubin of the *E. elaterium* treated groups (EJ1,Ej2.EE) were significantly lower than PC. The enzymatic activity of SGPT, SGTO and alkaline phosphatase (ALP) were significantly higher only in this later in the (PC) when compared with (NC) and has been decreased significantly in the groups administred the juice or aqueous extract compared with jaundiced group (PC) nevertheless this activity was significantly lower in EGJ2,EE for SGTP and SGTO respectively when compared to group (PC) .

**Figure 1:** Liver enzymes and biochemical parameters variation in all groups

Values represent the means  $\pm$ SEM of three measures. Student test.

(\* \*\* \*\*\*) P < 0.05 compared with negative control.

(a,b,c) P < 0.05 compared with positive control

**Figure2.** Histopathological results for all groups

Section of hepatocyte was stained with haematoxylin and eosin and observed under optical microscope ( $\times 400$ )

A: Negative control: central veins, normal hepatocytes B: Positive control, dilated veins, bile pigment, vascular congestion

C: EJ1, bile pigment, cholangitis.

D: EJ2, bile pigment

E: EE, bile pigment, cholangitis.

## DISCUSSION

The present research summarized the antijaundice activity of *E. elaterium* juice and aqueous extract, this plant belong to the cucurbitaceae family. This latter contains about 965 species and 120 genera (Omokhua-Uyi and Van Staden, 2020). Phenylhydrazine induces hyperbilirubinaemia by increasing enzymatic transformation of haemoglobinhaem to bilirubin (Arthur et al., 2012; Maity et al., 2013). However, the current study revealed the decrease of the bilirubin and enzymatic activity of ALP, SGPT and SGTO after administration of phenylhydrazine on rats using *E elaterium* juice (EJ1, EJ2) and aqueous extract with difference effectiveness on these biochemical parameters. These latter were the basis of hepatocyte functions (Maity et al., 2013). Results are in agreement with those of (Greige-Gerges et al.,2007), the juice contains proteins, lipids and several active compounds known as cucurbitacins (Touihri et al.,2019) responsible for this activity mainly cucurbitacin B by modification of the complex albumin-bilirubin binding (El Naggar et al.,2015).

Histopathological analysis of hepatic sections of all groups was presented in (Fig.2). In the jaundice group some changes were noted such as dilation of central veins, congestion, and the presence of bile pigments compared to the control. *E. Elaterium* juice and extract restored the structure damage of the liver.

## CONCLUSION

The effect of *E. elaterium* aqueous extract juice fruits on hyperbilirubinemia has been studied. Results demonstrate that *E. elaterium* juice and aqueous extract are effectively able to decrease the levels of bilirubin in human plasma. Therefore, this is the first study of the Algerian *E. elaterium* may serve to the development of new potent drugs in the treatment of jaundice.

## ACKNOWLEDGEMENTS

Authors thank Dr Halice.Y (CRSTRA. Touggourt. Algeria) for plant identification

## ORAL PRESENTATION

### Recent advances in wound healing using silk fibroin-based microparticles

Chidi Wilson Nwekwo (ORCID: <https://orcid.org/0000-0001-7621-3019>)

Near East University, Faculty of Engineering, Department of Biomedical Engineering, Nicosia, TRNC.

#### Abstract

Silk fibroin, a biopolymer obtained from the silkworm cocoon, has been extensively studied for its potential applications in medical devices, drug delivery systems, and tissue engineering scaffolds. Its biodegradable, non-toxic, and biocompatible properties make it a promising candidate for wound healing. Silk fibroin offers significant advantages by allowing drug delivery to the site of injury, controlling the release rate of drugs, and minimizing toxicity. Additionally, silk fibroin microparticles show promise in targeted delivery of anticancer agents and gene therapies. This review explores the potential of silk fibroin-based microparticles loaded with antibiotics to enhance wound healing outcomes.

**Keywords:** silk fibroin, microparticles, wound healing

#### INTRODUCTION

Wound healing plays a crucial role in restoring tissue integrity and preventing infections (Niederstätter et al., 2021). A retrospective analysis of Medicare claims from 2014-2019 revealed that wound prevalence increased by 13% from 14.5% to 16.4%, especially among individuals under 65 who are disabled in the United States (Carter et al., 2023). Traditional methods for wound healing often face challenges such as delays in recovery time, scarring issues, and susceptibility to infection (Kim et al., 2019). Therefore, there is a need for novel approaches that can enhance the effectiveness and efficiency of healing treatments.

Extensive research has been conducted on the use of silk fibroin, which is biocompatible and biodegradable to expedite wound healing and promote skin regeneration (Ceccarini et al., 2023; He et al., 2019; J. Liu et al., 2021; Tariq et al., 2021; Vidya & Rajagopal, 2021; W. Zhang et al., 2017)

Studies have demonstrated that silk fibroin films can effectively improve wound healing and facilitate skin regeneration (J. Liu et al., 2021). This is because these films possess properties such as biocompatibility and minimal inflammatory response, making them an excellent choice for various wound healing applications. However, their limited permeability has posed challenges in some scenarios (Stoica et al., 2020). To address this limitation, researchers have devised techniques to incorporate micro/nano-sized pores into silk fibroin films, enhancing their permeability and effectiveness in promoting wound healing (J. Liu et al., 2021).

In addition to films, extensive research has been conducted on using silk fibroin hydrogels for wound healing. Animal studies have discovered that hydrogels from silk fibroin loaded with growth factor 1 (FGF1) promote or facilitate wound healing. Furthermore, these hydrogels create an environment that supports cell adhesion, proliferation, and migration, thus aiding skin tissue regeneration (He et al., 2019; Mazurek et al., 2022).

Moreover, researchers have explored the potential of silk fibroin for 3D printing materials used in wound healing. They have successfully 3D printed grid piezoresistors using inks composed of functionalized silk fibers and peptide patterns. In vitro tests have shown that these materials contribute to skin healing and improved cell adhesion (Ceccarini et al., 2023).

#### A Brief Overview of Silk Fibroin Microparticles

Silk fibroin microparticles are biocompatible and biodegradable nanoparticles derived from silk protein sources such as silkworm cocoons or spider webs (Bobrova et al., 2022). These particles possess mechanical strength, adjustable degradation rates, and excellent drug-carrying capacity (Lehmann et al., 2022). In recent years, silk fibroin microparticles have garnered attention for their application in various biomedical fields, including wound healing drug delivery systems (Sabarees et al., 2023).

## Silk Fibroin Microparticles and Their Potential in Wound Healing and Drug Delivery

Hemostasis, inflammation, proliferation, and remodeling are the four interconnected stages of wound healing (Tottoli et al., 2020). Hemostasis aims to stop bleeding by forming blood clots at the injury site (Pourshahrestani et al., 2020). Inflammation follows as immune cells infiltrate the area to clear debris and prevent infection (Koh & DiPietro, 2011). During the proliferation phase, cells grow to restore tissue structure and functionality (Landén et al., 2016). Lastly, collagen fibers undergo reorganization during remodeling to strengthen the formed tissue (Frantz et al., 2009).

**Figure 1.** The 4 stages of the wound healing process

Due to the intricacies involved in the process, conventional wound healing methods have their limitations. These include delayed healing, risk of infection, and insufficient regeneration due to scar formation (Kim et al., 2019; Xu et al., 2020). The increased risk of infection at the injured site further complicates the healing process (Raziyeva et al., 2021).

Silk fibroin microparticles loaded with antibiotics improve wound healing outcomes by enabling sustained drug delivery at the injury site. This allows control over drug release rates and minimizes systemic toxicity risks (Pacheco et al., 2020). These antibiotic-loaded silk fibroin microparticles can be directly injected into the wound site, where they gradually disintegrate over days or weeks while releasing the medication (Wani et al., 2022). Additionally, these microparticles possess outstanding mechanical strength, allowing their integration into wound dressings or scaffolds without compromising their overall structure (Bobrova et al., 2022; Vidya & Rajagopal, 2021).

These microparticles offer advantages such as targeted delivery of anticancer agents and gene therapies because they can carry a range of molecules, including proteins, peptides, oligonucleotides, and small molecules (Tomeh et al., 2019). Moreover, silk fibroin microparticles are biodegradable and non-toxic, making optimizing their properties easy (Florczak et al., 2020). Another benefit is their capability to accommodate drugs within a delivery system, which can be valuable for combination therapies (C. Li et al., 2019). When transformed into nanoparticles, silk fibroin microparticles hold the potential for nanomedicine by enabling interaction with specific body parts and delivering therapeutic molecules effectively (Lehmann et al., 2022).

This opens up possibilities for delivering drugs to targeted locations within the body. In summary, silk fibroin microparticles offer a solution for drug delivery due to their biocompatibility and versatility in tailoring properties (Wani et al., 2022).

Hence, further exploration into the use of silk fibroin microparticles to deliver drugs could be beneficial in developing safe treatments for various diseases.

## Antibiotics in Wound Healing

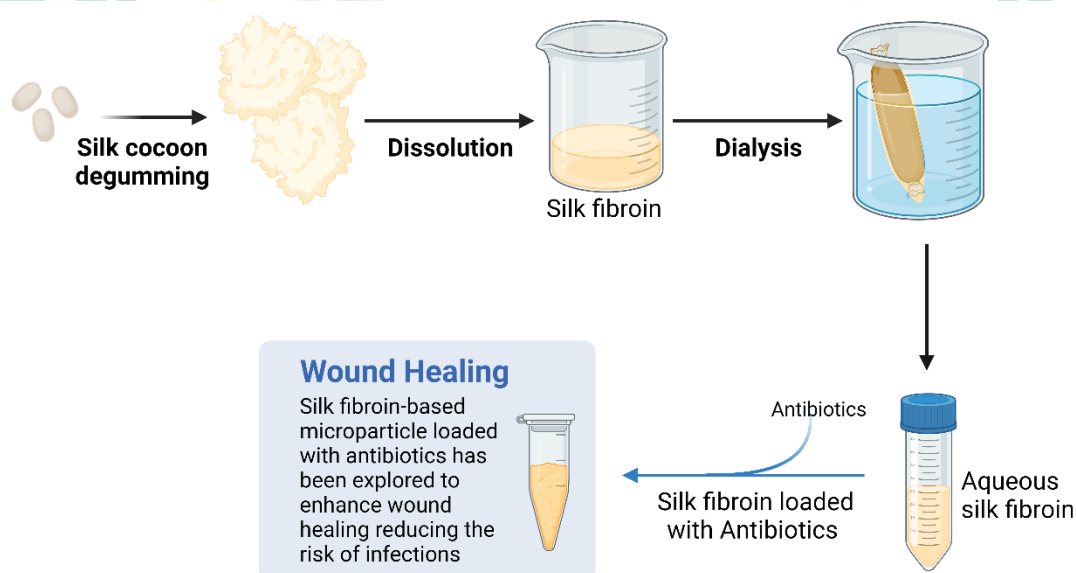

Antibiotics play a role in preventing infections during the process of wound healing. They can hinder growth and eliminate bacteria, thus reducing the risk of complications (Lehmann et al., 2022). Commonly used antibiotics include penicillin, erythromycin, and tetracycline. Each antibiotic has its mechanism of action, such as inhibiting cell wall synthesis or protein synthesis, which effectively combats infections (Nguyen et al., 2019).

## Benefits of Silk Fibroin Microparticles Loaded with Antibiotics

Silk fibroin microparticles loaded with antibiotics offer advantages over other antibiotic drug delivery systems. Silk fibroin offers an advantage in delivering antibiotics to wounds by providing sustained release, ensuring a long-lasting therapeutic effect (Zheng et al., 2022). This sustained release feature allows for dosing and better patient compliance. Moreover, silk fibroin is highly biocompatible with the body (W. Zhang et al., 2017).

## Techniques for Fabricating Silk Fibroin Microparticles Loaded with Antibiotics

Scientists have developed techniques to fabricate silk fibroin microparticles loaded with antibiotics. The methods include solvent evaporation/dispersion and emulsion-based approaches (Bobrova et al., 2022). In the evaporation/dispersion method, silk fibroin and antibiotics are dissolved in an organic solvent and precipitated through rapid desolvation or coacervation techniques (Tudora et al., 2013). On the other hand, emulsion-based approaches involve dispersing a solution containing silk fibroin and antibiotics within an organic phase before solidifying it (Amirifar et al., 2022).

**Figure 2.** Silk fibroin-based microparticles loaded with antibiotics: fabrication and application

## In Vitro Studies on Silk Fibroin Microparticles Loaded with Antibiotics

Laboratory studies have examined the effectiveness and compatibility of silk fibroin microparticles loaded with antibiotics in controlled environments. These studies often use laboratory models with cells to evaluate

factors like the ability to kill bacteria, the health of the cells, and the response to inflammation. The findings from these studies show that silk fibroin microparticles are effective in delivering antibiotics over periods while maintaining their ability to fight against bacteria (S. Li et al., 2022; C. Liu et al., 2019).

### **In Vivo Studies on Silk Fibroin Microparticles Loaded with Antibiotics**

Researchers have also conducted experiments on animals to assess how well silk fibroin microparticles loaded with antibiotics can work for wound healing. These experiments involved applying the microparticles onto wounds in animal models and evaluating aspects such as how fast wounds close, analyzing tissue samples under a microscope, and observing any inflammatory response. Encouraging results demonstrated wound healing, reduced infection rates, and improved tissue regeneration when using silk fibroin microparticles loaded with antibiotics (Sang et al., 2023; P. Zhang et al., 2023).

### **CONCLUSION**

Using silk fibroin microparticles loaded with antibiotics shows promise in improving wound healing outcomes in biomedical engineering. These microparticles can enhance treatment effects while reducing the need for doses and addressing compliance concerns due to their unique properties like sustained release of drugs, compatibility with living tissues, and mechanical strength. Future research should focus on refining manufacturing techniques, conducting trials, and exploring opportunities for clinical use to fully realize the potential of using silk fibroin microparticle based antibiotic delivery systems in wound healing applications.

## ORAL PRESENTATION

### The innovation of the student's portfolio in the competency-based curriculum, an instrument measuring the level of students' knowledge, as well as their self-esteem in the subject of biology

Gëzim Bara<sup>1</sup>, Brilanda Berdica<sup>2</sup>, Enkelejda Bara<sup>3</sup>

<sup>1</sup>University of Tirana, Faculty of Natural Sciences, Department of Biology, Tirana, Albania

<sup>2</sup>University of Shkodra 'Luigj Gurakuqi', Faculty of Natural Sciences, Shkoder, Albania

<sup>3</sup>Curriculum specialist at the University of Tirana, Tirana, Albania

#### Abstract

Teaching and learning involve the teacher, the learner and the curriculum. All three of these elements work in unison inseparable from each other. This is due to the fact that if one of these elements is missing, then the chain is disconnected and no longer functions as a process. Assessment as an important component from which the level of students' knowledge is derived is of several forms. In addition to the continuous evaluation, the evaluation by means of tests has been implemented today and the evaluation called "Student's Portfolio". The student's portfolio serves as a bridge between the process of teaching, learning and the reflection of the teacher and the students. In order to carry out an accurate study of this problem, we managed to do a case study in the "Partizani" gymnasium in Tirana and in the "Ibrahim Rugova" gymnasium in Kamëz. The purpose of the study is to bring out the importance of the "Student's Portfolio" in the evidence of its level, at the same time how it is valued and recognized by the teacher as one of the important alternatives in the evaluation. In the realization of this study, we relied on research studies where we browsed the relevant literature as well as on the qualitative method where we studied biology teachers and students of class X-XI at the "Partizani" gymnasium in Tirana and at the gymnasium " Ibrahim Rugova" in Kamez. From the study as well as the analysis of the case study, it results that the teachers had adequate knowledge about this assessment alternative, argued its importance, knew what the student's portfolio contains, but what emerges from this study is that there is negligence in the importance of this evaluation by means of the portfolio. The student's portfolio, as one of the student assessment techniques, occupies an important place in the teaching and learning process, because through it the quality of curriculum implementation is achieved, teaching and learning are documented, and student achievements can be monitored.

**Keywords:** Portfolio, competence, instrument, criteria, teaching, learning.

#### INTRODUCTION

In the study that is used to evaluate the students, there is also the "Student's Portfolio". A portfolio is a student-organized body of work that represents the student's learning outcomes.

The correctly designed and well-organized portfolio proves the students' abilities to participate in the entire learning process and expresses the level of students' activity in independent work.

From the interviews conducted in addition to the evaluation given to this evaluation, such opinions appear that the portfolio is considered a waste of time, because according to them the information is readily available on the Internet.

Chang states, "The portfolio in its entirety is seen as a stimulus for students' multiple intelligences, self-reflection, critical thinking, responsibility for learning, as well as a stimulus for the creation of skills and knowledge in a certain field (2003). The content of the portfolio should meet all the evaluation criteria and standards. The benefits of the "Student's Portfolio" are for the student, the teacher, the parents.

For the student, the "Portfolio" is a panorama of his work, where from the evaluation and analysis of the students' works, the achievements, the knowledge they have acquired, and the reflection on the future are highlighted.

For the teacher, the "Portfolio" in its entirety shows the level of knowledge of the students, where this knowledge serves as an indicator to discover the abilities, tendencies, weaknesses, deficiencies as well as the needs of the students.

For parents, the "Portfolio" is a documented record of their children's level, observing how their child is progressing, relying on the record that the teacher makes with his notes.

According to Diane Hart, "Portfolio" is like a "container" that holds evidence of students' knowledge, ideas, interests and achievements.

According to Nunan, in "Portofol students tell about their progress and progress"

"The use of the portfolio as an assessment tool is related to teaching, as long as portfolios are seen as one of the most widely used alternatives in assessment". (Broën.H.D.2004).

The portfolio as an instrument supports the achievement of student results, encourages teachers and supports the reflection of parents, increases the range of elements that are evaluated and manages to evaluate their abilities. The quality of the portfolio is very important, where an important role in its quality the teacher plays, but also other factors such as: How much it refers to the curriculum, the type of methodology used for its design, the criteria that are set for evaluation, transparency in evaluation and communication of results. In order to monitor the quality of the "Portfolio", we must rely on several criteria, such as:

The content which must be precisely defined, to which field it belongs, which are the materials to be presented, and do these materials represent the progress of the students.

The collection of materials has been made accurate in order to reflect the evaluation criteria and materials.

Reflection and self-evaluation. All materials refer to the function, content, as well as the degree of reflection by students, teachers, parents. Today, in the framework of curriculum reform, (Student's Portfolio) occupies an important place in the evaluation of students' knowledge, where this is supported by instruction No. 34 of the Ministry of Education and Sports dated 11.09.2015, which states that: "Student portfolio" is a tool for evaluating students, in basic education, in the curriculum based on competences in our country. Finally, "Portfolio of students" is a document that provides necessary information to students, teachers, and parents.

### **MATERIALS AND METHODS**

The "Student's portfolio" which accounts for 20% of the student's evaluation in the entire volume that is realized is a very important tool because it proves the progress of the students and their abilities, giving the teacher and parents information about the level of the students theirs. Recently, portfolio assessment is taking an important place in the teaching process. In daily practice, three portfolios are used to carry out a quality assessment of students.

The portfolio of work which contains completed or unfinished work but which is systematized daily by the students. With the help of this portfolio, the students' performance is monitored every day.

The document portfolio contains the finished works that are used to prepare the products. Its purpose is to evaluate products.

The exhibition portfolio contains the best quality works of the student, with the help of which the best quality students are identified.

The importance of this study is to obtain information on how this assessment is known and applied by teachers, what is the performance of students who demonstrate this assessment. With the help of the conducted research as well as the case study with the interviews of teachers and students, we managed to get a detailed information as well as identify some problems in terms of evaluation with the "Portfolio". The study was conducted within ethical rules and norms, both in the way interviews were conducted, and in data collection and analysis. During the conduct of the study, the teachers were willing to give their explanations and arguments for this form of assessment, and from the students' interview conducted with this questionnaire, we were able to identify some problems and finally give recommendations for this problem.

*Population and sample:* The two gymnasiums "Partizani" in Tirana and the "Ibrahim Rugova" gymnasium in Kamëz were studied as the population. Samples were taken in the study through interviews, biology teachers of two high schools as well as students of classes X - XI, selecting the best classes.

*Instrument and data collection:* Pre-prepared interviews with teachers and students served as an instrument for this study. An oral interview was conducted with the teachers and a written interview with the students. At the same time, the control and evidence of this assessment by the teachers during the school year served as an instrument, as well as the study of some of the best quality portfolios of the students. The collection and conclusion of the data was carried out after the analysis of the responses of the interviews witnessed by the teachers and students. Based on the data analysis, discussions and recommendations have been made.

### **RESULTS AND DISCUSSION**

The results and discussions of this paper are derived from the analysis of the case study, where two gymnasiums, more specifically, "Partizani" Tirana and "Ibrahim Rugova" Kamëz gymnasiums, where with a predetermined theme, the biology teachers were interviewed as and students of grades 10 and 11, selecting the best classes. The topic presented in this interview was about some essential issues for the "Student's Portfolio", where from the answers of teachers and students, we were able to create a panorama clear for this study, where in the end we concluded with concrete conclusions and recommendations. During the research I studied some of the best quality students' portfolios, where from their analysis I identified the level of the portfolios, the types of works, are the works in accordance with the realization competences. The results are concentrated

from the evidence of the answers of the interviews of biology teachers and students of these high schools of grades 10 and 11, the best quality classes were selected. In general, from the answers of teachers and students, some problems are evident, in addition to the achievements that are visible. We are presenting a summary of the questions and answers of teachers and students.

Interview with high school biology teachers:

-What place does the "Student's Portfolio" take in the evaluation of his skills? Which elements of the "Portfolio" are valued the most?

In general, teachers give this answer; In general, they show interest in this type of evaluation, where they emphasize that "Portfolio" is an effective form of evaluation, but they also show opinions that there are cases that they don't evaluate it so much, since the volume of work it contains creates a little subjectivity.

For the second part of the question, they say that they value more the works related to projects, experiments and multimedia presentations.

-In giving the task where are you based? Why? What are the rubrics that the portfolio is built on? How much time do you spend checking a portfolio?

As you can see, the question had to do with the orientation that should be given to the students, the construction of the portfolio, as well as the importance of time devoted to its correction.

The summary answer of the teachers was: In determining the tasks of the teacher, as an orientation we took the curriculum, the key competencies, as well as the teaching topics, in order for the student to be more clear and dedicated in the work that will be presented. The main headings to focus on in the design of the portfolio are: Projects, written works, experiments, videos, etc. While the time spent on evaluating the portfolio depends on its volume, as well as the quality of the tasks. But it varies from 30 min to an hour.

-Should key competencies be included in the construction of the portfolio? During the evaluation of the student, which of the qualities do you see as primary, its content or creativity?

In the answer to the first part of the question, all teachers agree that the inclusion of key competencies in the portfolio curriculum is a curricular obligation, since the motto of the new curriculum is learning based on competencies. But they also accept the fact that there are times when a such request. As for the second part of the question, their answer is different, where 60% of them prefer creative demonstrations, while 40% prefer educational content.

-During the evaluation, how do you manage to evaluate each element of the portfolio? What about correspondence and scoring? During the evaluation, are you objective, focusing on the level of the portfolio, or do you consider its performance during the year?

Regarding the first part of the question, they all give the same answer, where the placement of points is based on two criteria. First, the amount of total points that the portfolio should have, and secondly, setting the amount of points for each element of the portfolio is conditioned by the weight of each element in the weight of the portfolio. As for the grading, this is determined by a table where from the total points of the portfolio it is possible to determine the points for each grade based on a correctly calculated table. As for the third part of the question, their answer with 2 exceptions was that they thought that the performance of the students should be taken into consideration as it could be a corruption or underestimation of the moment. The others say that the portfolio is an individual work and should not be taken considering other assessments or student performance.

So evaluation only according to the real condition of the work.

- In the works listed, which of the following works will you give priority in the evaluation of the portfolio:

Essays, projects, presentations, experiments, certificates, tests, videos, written assignments, creative work, multimedia presentations.

In their answers, they give different opinions, in the selection of works, specifically:

40% prefer more: Projects, collections, written assignments.

30% prefer more: Presentations, essays, experiments.

30% prefer more: Created videos, multimedia videos, tests, creative work.

### **Student survey**

- What is (Portfolio) for you? Are you interested in this learning innovation? For each 3-month period, how many assignments should you submit?

In the first part of the question, 100% of the students in their answer show that they had the necessary knowledge about this problem and admit that the portfolio is a job where we demonstrate our knowledge and skills. For the second part of the question, 80% say that they accept it as an evaluation technique, where through it they manage to express the learning information in the way they like. While for the 3rd part of the question, they say that for every 3 months they have to submit 4 papers determined by the subject teacher.

-Are you given clear instructions by the teacher about the portfolio? Is the level of the task given easy, difficult, or beyond your ability?

To the first part of the question, 80% of the students answer that the teachers give clear and sufficient instructions to complete the portfolio. While 20% say that they are not very clear in the instructions given by the teacher. For the second part of the question we get this answer: 80% of the students state that their level is within their abilities, 20% state that there are also cases that the tasks are difficult, beyond their abilities, there are also cases that the tasks are difficult, beyond their abilities, but this does not stop them from engaging, on the contrary, according to them, it helps them to increase their skills.

-In the realization of the "Portfolio" work, where do you get the source of information? Give your opinion on this assessment?

For the first part of the question, they give this answer: 50% from the Internet, 40% from the teacher, 10% from other sources. As for the second part of the question, they answer: 70% evaluate it as a valid and important assessment, while 30% not very valid.

- In the jobs you want to plan for "Portfolio", who guides you?

We get this answer: 60% agree that they are guided by the teacher, 20% together with the teacher, while 20% agree that they determine it themselves.

-Are you satisfied with the teacher's assessment of the portfolio? How informed are you by this assessment? For the first part of the question, they say: 70% are satisfied and aware of the evaluation, while 30% express dissatisfaction. As for the information, they say: 80% admit that they are regularly informed about the evaluation, while 20% express dissatisfaction.

Give your opinion on the usefulness of the wallet? What can you specify from this assessment?

Regarding the answer to this question, they have different approaches. 80% of them say that the portfolio is important in assessing their skills, while 20% say that it is a waste of time, because it is simply a printout of some materials from the Internet. While in terms of the specification of this assessment, in general they use the "Portfolio", an important form of assessment, which affects their creative and research work, makes them more active in digital work, as well as affects the increase in the quality of the final grade.

## CONCLUSIONS

From an analysis and expertise of this study, we reached some conclusions, relying on the issues arising from this study where the analysis of the problem was at the center, relying on the qualitative methods where it was focused on the survey of teachers and students.

From the interviews of teachers and students, we come to the following conclusions:

In many cases, the "Portfolio" turned into a routine process, turning into tedious and unproductive work.

There were sporadic cases where the purpose and content were not made clear from the start

A part of the students saw it as a waste of time, seeing it as a form of assessment only to increase the average, and not as their creative work.

They also showed objections in the way of evaluation as well as in giving results.

In the student's "Portfolio" the key competences achieved must be documented.

The "portfolio" should be an incentive for students' awareness of their level and achievements.

The teacher uses portfolio data to promote learning, record and demonstrate their progress, and document student performance.

The design of the portfolio should be guided by the function it has, take into account the age and abilities of the students, as well as document the learning process.

## RECOMMENDATIONS

Teachers should give due importance to the "Student's Portfolio", especially biology teachers, where in its design they should cooperate with students, parents, to be clear about the purpose, content and organization of the work for its design.

In the work that should be done for the portfolio, the students should be oriented to the biological teaching topics, such as cells, reproduction, organisms and the environment, DNA,

To focus more on creative, proactive and experimental work, where they concretize the topic with concrete means.

The students should have the necessary spaces in the preparation of the materials, both for the volume of the tasks and for the degree of difficulty.

During the evaluation of the "Portfolio", students' abilities in the way of using information resources should be taken into account.

To encourage students' self-esteem

During the evaluation, each element of the portfolio should be evaluated, giving importance to the evaluation according to the weight of the element in the portfolio. At the same time, the assessment is made known to students and parents.

Training of teachers on how to design and evaluate the "Portfolio"

The portfolio should contain important elements of the curriculum, where the learner compares, reflects and analyzes the strengths and weaknesses of his level

#### Abstract

Due to its essential floristic, faunistic, and landscape diversity, Morocco has a significant and unique beekeeping potential, making it one of the most fascinating biological and biogeographical plans. Moroccan culture reserve an important place to the benefits of honey, the product is widely consumed by the population, and its quality control is important before it is put on the market to protect consumers. In order to study their physico-chemical quality, four types of honey samples were collected from Beni Mellal-Khenifra region in Morocco: agrume honey, euphorbe honey, anis honey and carob honey. Nine physico-chemical parameters were analysed: Moisture content, electrical conductivity, ash content, pH, free acidity, hydroxymethyl furfural, diastasis activity and sugar content. The results showed differences from one honey sample to another. However, the mean values of the studied physio-chemical properties of the honey samples were within the ranges of international standards.

**Keywords :** Honey, Beni Mellal-Khenifra region, Physico-chemical characteristics.

#### INTRODUCTION

Due to its essential floristic, faunistic, and landscape diversity, Morocco has a significant and unique beekeeping potential, making it one of the most fascinating biological and biogeographical plans (Moujanni et al., 2017). Thus, Moroccan beekeeping is supported actively by the Government through the Green Morocco Plan (GMP), with the objective of reaching 16,000 tons of production annually (Belahsen et al., 2016). Moreover, Moroccan culture reserve an important place to the benefits of honey, and the consumption of the product by the population (0,520 à 0,750) kg/ person/year) is relatively high compared to the countries neighbors including Algeria with an average of 0.200 kg/person/year and Tunisia with a range of (0.170 at 0.200) kg/person/year (Haderbache and Mohammedi, 2015 ; Hussein, 2000 ; Moujanni et al., 2017). According to the High Commission for Planning (HCP), Beni Melal-khenifra region ranks third nationally in terms of honey production place with an annual production of 274 tons (HCP, 2017). Nevertheless, 50% of this production is marketed through traditional informal channels without quality control (Moujanni, 2017). In this context, the present study aims to determine the physico-chemical characteristics of four honey samples that were collected from the Beni Mellal-Khenifra region in Morocco, to assess their quality and verify their compliance with international standards.

#### MATERIAL AND METHODS

##### Samples collection

Four pure crude honey samples were obtained directly from beekeepers from different localities of Beni Mellal-Khenifra region during March to October 2021 (Tbles 1). All honey samples were filtered with sterile gauze to remove debris, and stored in sterile glass containers at 4 ° C in the dark until analysis (Bogdanov and Blumer 2001).

**Table 1** : Honey samples according to their botanical origin, localities and harvest date

Honey samples	Botanical origin	Localities	Harvest date
Citrus honey	<i>Citrus</i>	Tadla	24/3/2021
Spurge honey	<i>Euphorbia</i>	Tagzirt	14/07/2021
Anise honey	<i>Pimpinella anisum</i>	Souk sebt	06/09/2021
Carob honey	<i>Ceratonia siliqua</i>	Tagzirt	05/10/2021

### **Physico-chemical analysis**

In order to study the quality of honey samples, nine physicochemical parameters were analyzed (Water content, electrical conductivity, ash content, pH, free acidity, hydroxymethylfurfural (HMF) content, diastasis activity and sugar content) because they were most frequently used as indicators of quality and stability of honey and having a great influence on its organoleptic properties. The parameters: Water content, electrical conductivity, ash content, pH and free acidity were carried out in the Ecology and Environment laboratory (Faculty of Sciences Ben M'sik, Hassan II University, Casablanca). However, HMF content, diastasis activity and sugar content were realised by the National Center for Scientific and Technical Research (NCSTR) in Rabat.

Physicochemical endpoints were analyzed using official analytical methods from the Association of Official Analytical Chemists (AOAC, 1990) and harmonised methods from the European Honey Commission (Bogdanov et al., 2002). To ensure uniform conditions and comparability, the samples were examined in triplicate and over a period of time.

#### **Water content (g/kg of honey)**

The water content is determined by measuring the index of refraction at 20°C using an Atago type refractometer.

#### **Electrical conductivity**

To determine the electric conductivity of all honey samples, the resistance of 20 g of honey was measured in 100 ml of distilled water at 20°C. we use a portable conductivity meter (HI99300).

#### **pH and free acidity**

The pH is measured using a Digital pH meter (Sension+ MM 374 GLP). calibrated by standard solutions on a 10% honey solution.

Free acidity was determined by titration of 10 g of honey dissolved in 75 ml of distilled water, using phenolphthalein as indicator and 0.1 N NaOH as titrator. The results are presented as milliequivalents (meq) of acid per kg of honey as 10 times the volume of NaOH used in titration.

#### **Ash content**

Ash content is based on incineration of honey in an oven. 5 g of honey are added with a few drops of olive oil and the whole was put in a crucible and heated to 350- 400°C for 1 hour. These measurements were expressed as a percentage (%).

#### **Diastase activity**

Spectrophotometry was utilized to determine the diastatic activity by incubating a buffered solution of soluble starch and honey in a thermostatic bath at 40°C. The results were expressed in Gothe degrees as the amount (ml) of 1% starch hydrolysed by the enzyme in 1 g of honey in 1 h (de Almeida-Muradian *et al.* 2013).

#### **HMF content**

To determine the HMF content, HPLC-UV was utilized, with absorption maximum at 285 nm. The GraceSmart RP-C18 column (250 × 4.6 mm, 5 µm) was used; water/methanol mobile phase (90 : 10, v/v) with flow rate of 1 ml/min and total analysis time of 7 minutes. Injection volume was 10 µl, and column temperature 30°C.

## Sugar content

The chromatographic separation is carried out using a Shodex Asahipak NH2P-504E column (C18, 250 nm x 4.6 nm) and acetonitrile:water (78:22, v/v) as mobile phase (1 ml/min). The injection volume was 10  $\mu$ l, the temperature is set at 35°C and the analysis time was 30 min.

## RESULTS AND DISCUSSION

The physico-chemical characteristics parameters of the honey samples studied are summarised in table 2.

**Table 2** : Physico-chemical parameters of the honey samples studied

Physico-chemical parameters	Honey samples				Codex Alimentarius
	Citrus honey	Spurge honey	Anise honey	Carob honey	
Moisture content	17.4 $\pm$ 0.125	18.92 $\pm$ 0.196	19.55 $\pm$ 0.113	20.8 $\pm$ 1.041	17,5<H<21,0 g/100g
conductivity ( $\mu$ s/cm)	121,2 $\pm$ 0.55	74,4 $\pm$ 1.15	93 $\pm$ 1.15	117,5 $\pm$ 1.5	< 800
% Ash	0,50 $\pm$ 0.036	0,34 $\pm$ 0.015	0,38 $\pm$ 0.036	0,38 $\pm$ 0.032	<0,6 g/100g
pH	3,49 $\pm$ 0.055	3,78 $\pm$ 0.215	3,58 $\pm$ 0.055	3,66 $\pm$ 0.005	3,5 < pH <4,5
Free Acidity (meq/kg)	12,0 $\pm$ 0.5	18.5 $\pm$ 1.1	19,7 $\pm$ 0.5	19,4 $\pm$ 0.3	<50 meq/kg
HMF (mg/kg)	20,96 $\pm$ 0.11	25,23 $\pm$ 0.755	19,95 $\pm$ 0.216	13,39 $\pm$ 0.15	<60 mg/kg
DA	12,2 $\pm$ 0.2	8 $\pm$ 0.1	10,0 $\pm$ 0.5	12,0 $\pm$ 0.2	$\geq$ 8
Glucose %	38,4 $\pm$ 1.2	38,3 $\pm$ 1.5	39,2 $\pm$ 0.5	36,2 $\pm$ 1.2	Glucose 26 à 36 %
Fructose %	41,57 $\pm$ 0.1	40,1 $\pm$ 0.6	32,7 $\pm$ 0.2	29,1 $\pm$ 0.2	Fructose 32 à 42 %
Saccharose %	3,3 $\pm$ 0.2	5,0 $\pm$ 0.1	2.8 $\pm$ 0.2	2,2 $\pm$ 0.4	Saccharose 0 à 5 %

DA : Diastase activity

HMF : Hydroxyméthylfurfural

The water content is a parameter linked to the degree of maturity. It is responsible for the stability of honey during storage (Bagdanov et al., 1999). Honey with high humidity is more likely to ferment, making storage more difficult (Rostislav et al., 2016). In our study, the values obtained are between 17.4% and 20.2%. These values were less than 21%, the maximum recommended by the European standards (Thrasylvoulou et al., 2018). These results were indicative of a good storage of the studied honeys.

The electrical conductivity expresses the ability of the aqueous solution to conduct an electric current. It is positively correlated with the concentration of mineral salts, organic acids and proteins (Bettar et al., 2019). This parameter varies greatly depending on the floral origin, it is regarded as one of the parameters used to differentiate between floral honeys and honeydew honeys. In this study, the electrical conductivity showed values between 74,4 and 121,2  $\mu$ s/cm, and they were within the bounds of the European legislation (under 800  $\mu$ s/cm) (Thrasylvoulou et al., 2018).

The ash content is a parameter of quality that depends on the botanical origin of honey. The mineral matter in the analyzed honey samples ranged between 0,34% and 0,50%. These values were in line with the European legislation (less than 0.6%) (Thrasylvoulou et al., 2018).

Honey pH is impacted by conditions processing and storage. moreover, an extreme pH reveals a biochemical degradation due to poor conditions harvesting or conservation. The pH values of our studied honey samples tend towards acidity, they were between 3.49 and 3.78. These values were in accordance with the recommendations of the *Codex Alimentarius* (3,5 < pH <4,5) (Thrasylvoulou et al., 2018).

The free acidity of honey depends on the presence of organic acids, or internal esters, and certain inorganic ions, such as phosphate (Gomes et al., 2010). High acidity can be indicative of fermentation of sugars into organic acids (Rostislav et al., 2016). The values of free acidity of the investigated samples ranged between 12.0 and 19.7 meq/kg, and they were within the limits of the European legislation (less than 50 meq/kg) (Thrasylvoulou et al., 2018), indicating no undesirable fermentation.

The HMF content is largely recognized as a freshness parameter for honey samples, it is absent from the fresh honey immediately stored by bees and tends to increase by aging of honey (Gomes et al. 2010). In this study, spectrometric analysis of honey samples revealed HMF contents which were between 13,39 and 20,96 mg/kg.

These values comply with the standards set by the *Codex Alimentarius*, which is less than 60 mg/kg (Thrasylvoulou et al., 2018).

Diastase is an enzyme in honey, it is an index of freshness and overheating the honey. Spectrophotometry showed that the DA values of honey samples studied vary from 8 to 12.2. These values were within the normal range set by the *Codex Alimentarius*, which is  $\geq 8$  (Thrasylvoulou et al., 2018).

Sugars were the main components of honey types. Fructose and glucose were considered as a major constituents of honey (Küçük et al., 2007). The glucose and fructoses values of the samples studied vary successively from 36,2 to 39,2% and from 29,1 to 41,57%. These values meet the standards required by the *Codex Alimentarius*, which is 26 to 36% for glucose and 32 to 42% for fructose (Thrasylvoulou et al., 2018).

Briefly, The results of this study showed that honey samples analyzed were good quality and according to international standards.. Nevertheless, there were differences from one honey sample to another in studied physiochemical properties. These differences can be explained by different environmental conditions such as the climate, the botanical origin of the honey samples, (Nandaa et al., 2003; Bogdanov et al., 2004), the conditions storage (Ozcan et al., 2006), and the harvest season (Pe'rez-Arquillue et al., 1995).

## CONCLUSION

It appears from this study that the honey samples analyzed exhibited variable physiochemical properties. They comply with international standards. Future studies will be necessary to analyze other honey types produced at the regional or national level. In addition, It will be crucial that the quality control of the product be systematic before it is put on the market in order to protect consumers.

## ACKNOWLEDGEMENTS

We are thankful to the National Center for Scientific and Technical Research (NCSTR) for the contribution to the realization of this study.

#### Özet

Bu araştırma Kırklareli ili, Babaeski ilçesi, Taşköprü köyü üretici arazisinde, USDA' dan temin edilen ve yöreden toplanan yem börülcesi genotiplerinin bazı morfolojik ve tarımsal özelliklerinin belirlenmesi amacıyla sulu koşullarda yürütülmüştür. Araştırma ilk yılında (2021) temin edilen az miktardaki tohumun çoğaltılması amacıyla 120 cm sıra arası ve 66 cm sıra üzeri mesafede 4,2 m uzunluğundaki sıralara elle ocak usulü ekim yapılarak, ikinci yılında (2022) ise tesadüf blokları deneme desenine göre 3 tekrarlamalı olarak, sıra arası 25 cm ve 5 m uzunlukta 8 sıradan oluşan parsellere her parselde 400 bitki olacak şekilde ekim yapılmıştır. Araştırmada yem börülcesi genotiplerinin bitki boyu (cm), dal sayısı (adet), ana sap kalınlığı (mm), yeşil ot verimi (kg/da), kuru ot verimi (kg/da) ile bazı kalite özellikleri (ham protein oranı, NDF, ADF, Ca, Mg, P, K oranları) belirlenmiştir. En yüksek bitki boyu İ.H.K. genotipinde (100.30 cm) ölçülmüştür. Dal sayısı en fazla 6.3 adet ile İ.H.B. genotipinde bulunurken, ana sap kalınlığı en fazla 40 genotipinde (8.87 mm) ölçülmüştür. En yüksek yeşil ot verimi 40 genotipinden (4845.00 kg/da), en yüksek kuru ot verimi ise 1 genotipinden (1038.00kg/da) elde edilmiştir. Araştırma sonuçları incelendiğinde, 40 ve 1 genotipleri genetik ıslah materyali olarak değerlendirilerek silaj ve kaba yem üretimine fayda sağlayacağı sonucu ortaya çıkmaktadır.

**Anahtar Kelimeler:** Yem Börülcesi, Genotip, Ot Verimi, Kalite Özellikleri

#### Comparison of some morphological and agronomic traits of cowpea (*Vigna unguiculata* (L.) Walp.) genotypes

#### Abstract

This research was conducted in the village of Taşköprü, Babaeski district, Kırklareli province, Turkey, with the objective of assessing the morphological and agronomic traits of forage cowpea genotypes obtained from the USDA and collected from the local region. The study involved two consecutive years: the first year (2021) focused on seed multiplication, while the second year (2022) involved a randomized complete block design with three replications. The planting method in the first year included manual sowing in rows measuring 4.2 m in length, with a spacing of 120 cm between rows and 66 cm between plants. In the second year, the experiment was conducted under irrigated conditions, with each plot consisting of 8 rows, 5 m in length, and a spacing of 25 cm between rows. A total of 400 plants were sown in each plot. The investigated traits of the forage cowpea genotypes included plant height (cm), number of branches (pcs), main stem diameter (mm), fresh forage yield (kg/ha), dry forage yield (kg/ha), some quality parameters (crude protein ratio, NDF, ADF, Ca, Mg, P, K). Among the genotypes studied, the highest plant height of 100.30 cm was observed in the İ.H.K. genotype. The İ.H.B. genotype exhibited the highest number of branches with 6.3 branches, while the genotype 40 had the greatest main stem diameter of 8.87 mm. The highest green forage yield of 4845.0 kg/ha was obtained from genotype 40, while the highest dry forage yield of 10380.0 kg/ha was recorded in genotype 1. Based on the research findings, genotypes 40 and 1 can be considered promising genetic breeding materials for the production of silage and forage due to their superior performance in terms of yield and other agronomic traits. These genotypes have the potential to contribute positively to forage production systems in the region.

## GİRİŞ

Dünyada tarım ve hayvancılık faaliyetleri ülkelerin gelişmeleri ve kalkınmaları açısından önemli bir yere sahiptir. Ülkelerin ekonomik bağımsızlığının güçlendirilmesi, yoksulluğun azaltılması, gelir ve refah düzeyinin artırılması için tarım ve hayvancılık sektöründe sürdürülebilirliğin sağlanması gerekmektedir. Bu sektörün en temel işlevi insanların besin ihtiyacını karşılamaktır. İnsan beslenmesinde kullanılan hayvansal ürünlerin üretilebilmesi için yem bitkileri yetiştiriciliği ve çayır meraların etkin kullanımı önem arz etmektedir. Ancak ülkemiz meraları üzerinde uzun yıllardır devam eden ağır ve kontrolsüz otlatma sonucu hayvanlar tarafından tercih edilen yem bitkileri ya tamamen kaybolmuş ya da hayvanların otlamadıkları yerlerde az miktarda kalmış durumdadır. Meralar üzerinde yıllardan beri devam eden aşırı ve erken otlatma, bu alanların verim kapasitesinin büyük oranda azalmasına neden olmuştur. Yurdumuz hayvancılığının ana sorunlarından birisi de yem bitkileri üretimidir. Hayvanların ihtiyacı olan kaba yemlerin çok büyük bir bölümünün çayır-mera ve anız otlatılmasıyla veya besleme değeri çok düşük tahıl sap ve samanından karşılanması, hayvansal ürünlerdeki verim düşüklüğünün başlıca nedenleri arasında yer almaktadır (Açıkgöz, 2001). Ülkemizde yetiştirilen hayvanlar yeterli ve kaliteli kaba yemlerle beslenemedikleri için et ve süt verim ortalamaları düşük olduğu gibi hayvansal ürünlerin kalitesi de düşük düzeydedir (Yücel ve ark., 2004). Bu sebeple ülkemizde var olan kaliteli kaba yem eksikliğini gidermek için yem bitkileri ekim alanları artırılmalıdır.

Yem bitkileri üretimi tarımsal faaliyetleri hayvansal üretim açısından çok önemli bir yere sahiptir. Tarım arazilerinde üretilen otlar öncelikle hayvanlar tarafından kullanılmakta, et, süt vb. ürünlere dönüştürülerek bu ürünlerden de insanlar faydalanmaktadır (Soya ve ark., 2004). Hayvancılık işletmelerinin kaba yemlerini kendilerinin üretmeleri işletmenin karlılığı açısından önemlidir. Tarım ve Orman Bakanlığı tarafından verilen desteklerle yem bitkileri ekim alanlarının artırılması hedeflenmektedir. Hayvancılık işletmeleri ihtiyaçları olan kaba yemi karşılayabilmek için yonca, korunga, yem bezelyesi, hayvan pancarı, burçak, fiğ türleri ve silajlık mısır dışında farklı yem bitkileri arayışı içerisindeyler.

Börülce tek yıllık bir sıcak iklim baklagil bitkisi. Genel karakteri gereği sıcaktan hoşlanır. Sıcaklığın 20-30 °C olduğu bölgelerde börülce bitkisinin çok rahat yetiştirildiği, yaz mevsiminde 1,5-2 ay gibi bir sürede gelişmesini tamamlayarak yeşil ot oluşturduğu, toprak yüzeyinde su buharlaşmasını azaltarak, köklerini çok derine gönderip susuzluğa karşı dirençli olduğu bilinmektedir (Günay, 1992). Küresel iklim değişikliği nedeniyle sıcaklığın arttığı ve su kaynaklarının azaldığı günümüz ve gelecekte börülce yem bitkileri arasında daha çok talep edilen bir bitki olacaktır. Çünkü börülce baklagiller içerisinde sığağa ve kurağa dayanıklılığı en yüksek olan bitkilerden biridir. İklim istekleri mısıra benzerdir. Fakat kurak koşullara dayanıklılığı ve sıcaklık isteği mısıra göre daha fazladır (Şehirli, 1988).

Hayvancılık sektöründe hayvanların verimliliğinin yıl boyunca sağlanabilmesi için silajlık yemler kullanılmaktadır. Mısır silajı, üretim maliyetinin düşük olması, depolamanın kolay olması, içerdiği yüksek enerji, yüksek verim kapasitesi ve hayvanlar tarafından sevilerek tüketilmesi nedeniyle en çok tercih edilen silo yemi olmuştur. Mısır, fermentasyon ve yem değeri açısından hamur olum ya da süt olum döneminde hasat edilerek silaj yapılır. Kolay fermente olabildikleri için, yalın olarak silolanma yetenekleri az olan, protein yönünden zengin baklagil yem bitkileri ile birlikte silolanarak katkı maddesi olarak kullanılabilir. Mısır silajının ham protein oranı %7.65, börülce silajında ham protein oranı %17.36, mısır+börülce karışımı silajının ham protein oranı ise %9.57' dir (Alaca ve Özasan Parlak, 2017). Baklagil yem bitkileriyle mısır karışımından elde edilen silajın ham protein oranı artarak silaj kalitesini olumlu yönde etkilemektedir. Börülce yüksek protein içeriğiyle mısır ile karışık yetiştirilebilecek önemli bir baklagil yem bitkisi olarak dikkat çekmektedir.

İstatistikler incelendiğinde, 1962 yılında ülke nüfusumuz 28.23 milyon iken bu nüfusa karşılık gelen büyük baş hayvan birimi (BBHB) 13.47 milyon adettir (Düzgüneş ve ark., 1965). Türkiye İstatistik Kurumu 2022 yılı verilerine göre ise büyükbaş hayvan varlığı 17 024 000 adet, küçükbaş hayvan varlığı 56 266 000 adet olsa da geçen 60 yıla göre ülkemizin nüfus artışına paralel olarak hayvan sayımız artmadığı gibi hayvancılık yapan çiftçi sayısı azalmış ve azalmaya devam etmektedir. Ayrıca, günümüzde tarım ile uğraşan çiftçilerin büyük çoğunluğu hayvancılık yapmadığı gibi hayvancılık yapan çiftçi ve işletmelerinde kaba ot ihtiyacını yeteri kadar üretecek arazilerinin olmaması, hayvancılık ile buna bağlı olan hayvansal üretimi sınırlandıran ve azaltan faktörlerin başında gelmektedir. Tarımsal desteklemeler planlanırken, tarım ve hayvancılığı bir arada yürüten ve toprakların organik madde miktarını artıracak şekilde ekim nöbeti uygulayan çiftçilerimize kat sayılı bir destek sistemi getirilerek, hayvancılık sorunu ile birlikte toprak koruma ve ıslahı, yetiştiriciliğinden kaçınılan bitkilerin üretimi konularıyla, bu faaliyetlerle bağlantılı birçok sorun da çözüme kavuşturulabilir. Bu şekilde, geniş arazi varlığına rağmen sadece bitkisel üretim yapan ve üretimden kalan hasat artıklarını (saman vb.) kendi hayvanlarına yedirmeden satan çiftçilerin hayvan bakmaları da teşvik edilmiş olacaktır (Baş ve Ateş, 2022). Ülkemizde var olan kaliteli kaba yem açığını kapatmak için ekolojik koşulları uygun olan bölgelerdeki

tarım alanlarında özellikle 2. ürün olarak yem bitkisi üretimi yapılmalıdır. Trakya’da 1. ürün olarak yetiştirilen serin iklim tahıllarından ve yeşil/kuru ot üretimi amacıyla yetiştirilen fiğ+buğdaygil, yem bezelyesi+buğdaygil karışımlarının hasadından sonra sulama imkânı olan tarım arazilerinde yem bürülcesi yeşil/kuru ot üretimi için yalın olarak veya yüksek protein içeren kaliteli silaj elde etmek için mısır ile karışık olarak yetiştirilebilir.

Bu araştırma, farklı yem bürülcesi genotiplerinin bazı morfolojik ve tarımsal özellikleri ile kimi kalite parametrelerinin belirlenmesi amacıyla yürütülmüştür.

## MATERYAL VE METOT

Araştırma, Kırklareli ili Babaeski ilçesi Taşköprü köyü üretici arazisinde 2021-2022 yılları arasında iki yıl süreyle tesadüf blokları deneme desenine göre 3 tekrarlamalı olarak sulu koşullarda yürütülmüştür. Materyal olarak USDA’dan temin edilen ve yöreden toplanan bürülce genotipleri kullanılmıştır. Her parsel 25 cm sıra arası açıklıkta, 5 m uzunluğunda, 8 sıradan oluşmuştur. Parsellerde 400 bitki olacak şekilde elle ekim yapılmıştır. Toprak hazırlığı yapılırken tabana 5 kg/da saf azot ve 5 kg/da saf fosfor olacak şekilde 20-20-0 kompoze gübre ile gübreleme yapılmıştır. Yabancı ot mücadelesi kültürel yöntemlerle gerçekleştirilmiştir. İlk yıl tohum çoğaltmak amacıyla 12.05.2021 tarihinde, ikinci yıl ise 15.05.2022 tarihinde ekim yapılmıştır. Çalışmada toprak nemi ve bitkinin su ihtiyacına göre yağmurlama sulama yöntemiyle sulama uygulanmıştır.

Yeşil ot veriminin (kg/da) belirlenebilmesi için hasatlar ilk baklanın olgunlaştığı dönemde (Ayan ve ark., 2012), Gazioğlu ve İ.H.K. genotiplerinde 24.07.2022, İ.H.B. genotipinde 29.07.2022, 30 numaralı genotipte 07.08.2022, 5 numaralı genotipte 09.08.2022, 11 numaralı genotipte 23.08.2022, 40 numaralı genotipte 12.09.2022, 1 numaralı genotipte 18.09.2022 tarihlerinde parsellerin kenar tesirleri dışında kalan 2 m<sup>2</sup>’lik kısmı 7,5 cm yukarıdan orak yardımı ile elle biçilerek yapılmıştır. Aynı dönemde her parselden rastgele seçilen 10 bitkide bitki boyu (cm), ana sap kalınlığı (mm) ve bitkide dal sayısı (adet/bitki, ana sap dışındaki dallar sayılmıştır) saptanmıştır. Ana sap kalınlığı dallanmanın başladığı noktada ölçülmüştür. Parsellerden biçilen yeşil otlar gölgede kurutulduktan sonra tartılıp dekara kuru ot verimi (kg/da) hesaplanmıştır.

Kuru örnekler 0.5 mm elek açıklığında öğütülmüş ve kimyasal analizler iki paralel olarak (ham protein, asit deterjanda çözünmeyen lif (ADF), nötr deterjanda çözünmeyen lif (NDF), kalsiyum (Ca), potasyum (K), magnezyum (Mg) ve fosfor (P) oranları) yapılmıştır. Ham protein (%) oranı (%) AOAC (2019)’a göre, NDF ve ADF oranları (%) ise Van Soest ve ark. (1991)’nin belirttikleri yöntem kullanılarak tespit edilmiştir. Ca, K, Mg oranları (%) fleymfotometrede, P oranı (%) ise vanadamolibdofosforik sarı renk yöntemine göre spektrofotometrede okunmuştur (AOAC, 2019). Elde edilen veriler TARİST (Açıkgöz ve ark., 1993) istatistik programında değerlendirilmiştir.

## BULGULAR ve TARTIŞMA

En uzun bitki boyu 100.30 cm ile İ.H.K. yem bürülcesi genotipinde ölçülmüştür (P<0.05, Tablo 1). Bitkideki dal sayısı en fazla İ.H.B. (6.3 adet) ve 1 (6.1 adet) genotiplerinde belirlenirken, ana sap kalınlığı 8.87 mm ile yem bürülcesi genotipi 40’da ölçülmüştür (Tablo 1). En yüksek yeşil (4382.0-4845.0 kg/da) ve kuru ot (966.0-1038.0 kg/da) verimleri 40 ve 1 nolu genotiplerde saptanmıştır (P<0.01, Tablo 1).

**Tablo 1.** Farklı yem bürülcesi genotiplerinin bazı morfolojik özellikleri ile ot verimleri

Genotipler	Bitki Boyu (cm)	Dal Sayısı (adet/bitki)	Ana Sap Kalınlığı (mm)	Yeşil Ot Verimi (kg/da)	Kuru Ot Verimi (kg/da)

Otu hayvanlar ihtiyaları olan proteinin byk blmn doęadaki bitkilerden karřımlarken, yetiřtiricilięi yapılan hayvanlar bu ihtiyalarını kaba yemler ile hazırlanan kesif yemlerden karřılamaktadır (Tenikecier, 2019). Ruminantların beslenmesinde rasyonların protein dzeyi nemli bir kriterdir. Hayvanların kaliteli ve yksek enerjili yem rasyonlarıyla beslenebilmeleri iin protein deęeri yksek olan yem bitkilerinin retilmesi gerekmektedir. Bununla birlikte, yem bitkilerinden elde edilen kuru otların NDF ierikleri yemin kalitesini ve sindirilebilirlięini ortaya koyan bir deęerdir. NDF oranı %41-46 arasında olan kuru otlar ok iyi, % 47-53 arasında olanlar iyi, %54-60 arasında olanlar orta, %61-65 arasında olanlar ise ktu kalite olarak sınıflandırılmaktadır (AFGC, 2009). Yem brlcesinde NDF oranını Beycioęlu (2016) % 24.51-42.55, Ayan ve ark. (2017) % 29.42-37.25 arasında tespit etmiřlerdir. alıřmada tespit edilen NDF oranı Beycioęlu (2016) ile Ayan ve ark. (2017)'nin sonualarıyla benzerdir. Hayvan bnyesinde bulunan fosfor iskelet bymesinde, diř, kıl-ty oluřumunda, kanın kimyasal yapısında, bazı organların iřlevlerinde, besinlerin enerjiye dnřtrlmesinde, vitamin ve enzimlerin aktivitesinde nemli rol oynamaktadır. Hayvan bnyesinde beraber iřlev gsteren Ca/P oranının 2:1 veya 1:1 olması arzu edilmektedir (Ates ve Tekeli, 2005). Hayvanların bnyesinde bulunan toplam mineral maddenin yaklařık olarak %4-5' ini oluřturan potasyumun byk blm kas sisteminde bulunmaktadır. İřkembeli hayvanlar iřkembe mikroorganizmalarının faaliyetleri iin iřkembesiz hayvanlara gre daha fazla potasyuma ihtiya duyarlar. Hayvan vcudundaki enzimlerin aktivasyonunda rol oynayan, kas ve iskelet sistemi iřlevleri aısından nemli bir elementte magnezyumdur. Sinir ve kas fonksiyonlarının dzenlenmesi ve kemięin mineral yapısının oluřumunda grev almaktadır. Bu nedenle, hayvanların beslenmesinde kullanılan otlardaki K ve Mg oranları ile birlikte dięer besin elementi ieriklerinin de bilinmesi olduka nemlidir (Ateř, 2009). Ayan ve ark. (2012) yem brlcesinde Mg, Ca, K ve P oranlarını sırasıyla %0.46-0.51, % 1.04-1.32, % 1.30-1.65 ve %0.34-0.37 aralıęında belirlemiřtir. Saptanan makro element ierikleri bu arařtırıcıların sonuaları ile benzerlik gstermektedir.

## SONUÇ

Elde edilen sonuçlar ışığında; araştırmada kullanılan 40 ve 1 nolu yem börülcesi genotipleri ıslah materyali olarak değerlendirilerek, kaba yem üretimine katkı sağlayacak çeşitlerin geliştirilmesinde kullanılabileceklerdir.

## TEŞEKKÜR

Bu makale Tekirdağ Namık Kemal Üniversitesi Fen Bilimleri Enstitüsü tarafından 2023 yılında kabul edilmiş olan Serkan BAYAZİT'a ait Yüksek Lisans Tezinin bir bölümü olup sağladığı destek ve katkılardan dolayı adı geçen enstitüye teşekkür ederiz.

## Özet

Makine, kimya, elektronik ve daha pek çok endüstriyel alanda kullanılan polimer bazlı yapıştırıcı kimyasal maddelerin üretim prosesleri su tüketiminin yüksek miktarlarda olduğu sistemlerdir. Üretim ve işleme proseslerinde kullanılan yüksek su miktarı bu endüstrilerden yüksek oranda atık su oluşumunu tetiklemektedir. Yüksek oranda organik kirlilik yüküne sahip bu atık suların arıtılmadan yüzeysel su kaynaklarına deşarj edilmesi alıcı ortamda çözülmüş oksijen oranını azaltmakta, ötrofikasyon meydana gelmekte, suyun rengi ve kokusu bozulmakta ve sucul sistem yoğun olarak etkilenmektedir. Yapıştırıcı kimyasal üretim atık suları çeşitli yöntemler ile arıtılsa bile uygulamada bazı sınırları bulunmaktadır. Biyolojik ayrışabilirliği düşük olan bu atık suların tekil veya hibrit ileri arıtma yöntemleri vasıtasıyla arıtılması gerekmektedir. Bu çalışmada, askıda ve koloidal partikül gideriminde etkin koagülasyon prosesi ile onu takiben ileri arıtma teknikleri ile yapıştırıcı kimyasal üretim atık sularının arıtılabilirliği araştırılmıştır. Koagülasyon prosesi için poli alüminyum klorür (PAC) koagülant olarak kullanılmış ve KOİ, AKM, UV<sub>254</sub> ve renk giderim verimleri sırasıyla %73.8, % 75, %87.3 ve %88.4 olmuştur. PAC ile koagülasyonun ardından elektrokimyasal proses olarak elektrooksidasyon (EO) ve persülfat ile iyileştirilmiş elektrooksidasyon (EO/PS) uygulanmıştır. PAC ile koagülasyonu takiben yapılan elektrokimyasal prosesler ile KOİ giderimi EO ile %36.5 ve EO/PS ile % 40'ı bulmuştur. PAC ile koagülasyonun ardından fotokimyasal proses olarak UV bazlı persülfat (UV/PS) ve UV bazlı perkarbonat (UV/PC) prosesleri uygulanmış ve degradasyon potansiyelini arttırmak üzere Fe<sup>+2</sup> katalizör olarak ilave edilmiştir. PAC ardından fotokimyasal prosesler ile KOİ giderimi UV/PC ile %41 ve UV/PS ile %34.2 iken Fe<sup>+2</sup>'nin katalizör olarak kullanılması sonucu KOİ giderimi UV/PC/Fe ile % 46.5 ve UV/PS/Fe ile %44'e yükselmiştir. Her ne kadar kanala deşarj kriterleri sağlanmış olsa da proseslerin detaylı optimizasyonu ile KOİ konsantrasyonunun alıcı ortam deşarj kriterlerine indirgenmesi mümkün olabilir.

### Investigation of Treatment of Adhesive Chemical Production Wastewater by Sequential Coagulation-Electrochemical/Photochemical Processes

## Abstract

The production processes of polymer-based adhesive chemicals used in machinery, chemistry, electronics and many other industrial fields are systems with high water consumption. The high amount of water used in the production and processing processes triggers the formation of wastewater at high rates from these industries. The discharge of these wastewaters with high organic pollution load to surface water resources without treatment reduces the dissolved oxygen content in the receiving environment, eutrophication occurs, the color and odor of the water deteriorates and the aquatic system is intensely affected. Even if adhesive chemical production wastewater is treated with various methods, there are some limits in practice. These wastewaters with low biodegradability should be treated by single or hybrid advanced treatment methods. In this study, effective coagulation process for the removal of suspended and colloidal particles followed by advanced treatment techniques was investigated for the treatment of adhesive chemical production wastewater. Poly aluminium chloride (PAC) was used as coagulant for the coagulation process and COD, UV<sub>254</sub> and color removal efficiencies were 83.8%, 97.3% and 98.4%, respectively. Coagulation with PAC was followed by electrochemical processes of electrooxidation (EO) and persulfate enhanced electrooxidation (EO/PS). COD

removal by electrochemical processes following coagulation with PAC reached 36.5% and 40%. After coagulation with PAC, UV-based persulfate (UV/PS) and UV-based percarbonate (UV/PC) processes were applied as photochemical processes and  $Fe^{+2}$  was added as a catalyst to increase the degradation potential. While COD removal by photochemical processes after PAC was 41% with UV/PC and 34.2% with UV/PS, COD removal increased to 46.5% with UV/PC/Fe and 44% with UV/PS/Fe when  $Fe^{+2}$  was used as a catalyst. Although the discharge criteria to the canal were met, with detailed optimization of the processes, it may be possible to reduce the COD concentration to the receiving environment discharge criteria.

## GİRİŞ

Çeşitli malzemeleri yapıştırma amacıyla; mobilya, denizcilik, otomotiv ve havacılık gibi pek çok alanda kullanılmakta olan polimer bazlı kimyasal maddeler yapıştırıcı olarak adlandırılmaktadır. Endüstriyel uygulamalar için yapıştırıcı üretimi, her formülasyon için temiz karışım kapları gerektirmektedir. Kapların yıkanma işlemi sonrasında, oldukça kirli bir atık su akışı elde edilmekte dolayısıyla yapıştırıcı maddelerin üretim prosesleri sonrasında çok büyük miktarda ve kirlilik yüküne sahip yıkama atık suyu açığa çıkmaktadır. Yapıştırıcı kimyasal üretim atık suyu esas olarak polimerler ve inorganik dolgu maddeleri, çözücüler ve deterjanlar gibi yapıştırıcıların seyreltilmiş bileşenlerini ve yüksek oranda metakrilat, ksilen, sodyum lauril sülfat, stiren ve reçine gibi organik bileşenleri içermektedir. Bu organik maddeler atık suda yüksek KOİ değerine ve amonyak azotu konsantrasyonuna sebep olmaktadır. KOİ 60.000 ile 150000 mg/L arasında değerlere ulaşırken BOİ<sub>5</sub> 15000 mg/L'yi aşmamaktadır (Kleine, Peinemann, & ark., 2002). Toplam kütle akışının yaklaşık %3-10'u arasında yüksek katı madde fraksiyonuna sahiptir. Bu nedenle yapıştırıcı kimyasal üretim atık suyunun, uygun arıtma yöntemleri vasıtasıyla arıtılmadan bir alıcı ortama deşarj edilmesi son derece tehlike arz etmektedir. Yapılan deşarj sudaki çözünmüş oksijenin azalmasına dolayısıyla su kütlesinin ötrofikasyonuna yol açarak siyah ve kötü kokulu su kütlesine ve balıkların ölümüne neden olmaktadır.

Yapılan çalışmalarda yapışkan malzeme üretim prosesinden kaynaklanan atık suların arıtımı için pek çok arıtma yöntemi denenmiştir. Bunlar; fotokataliz (Kleine, Peinemann, & ark., 2002), biyolojik arıtma (Posey, Cyr, & ark., 2014), kimyasal flokülasyon, fenton prosesi, aktif karbon adsorpsiyonu ve membran filtrasyonudur. Fakat bu teknolojilerin uygulama aşamasında pek çok sorunla karşılaşmaktadır. Örneğin membran filtrasyonu ya da adsorpsiyon uygulamaları bu atık suların yüksek katı madde içeriği nedeniyle kullanışlı değildir. Buna ek olarak atık suyun düşük biyolojik parçalanabilirliği ve değişken karakterizasyonu nedeniyle biyolojik arıtma yönteminin de uygulanması tercih edilmemektedir (Lu, Zhuo, & ark., 2022). Arıtma veriminin diğer yöntemlere kıyasla daha yüksek olduğu kimyasal koagülasyon ve fenton prosesleri ise alüminyum tuzu, demir tuzu ve  $H_2O_2$  gibi çok sayıda madde gerektirmektedir. Nakliye maliyetlerinin artması, depolama alanı ihtiyacı ve kullanım sırasında yaşanmakta olan güvenlik riskleri nedeniyle bu teknolojiler su arıtımında sınırlı kalmaktadır.

Elektrokimyasal arıtma yöntemleri; kolay işletilebilirliği, yüksek verimliliği ve ilave oksidatif madde ihtiyacı duymaması nedeniyle son yıllarda hızla gelişmiştir. Elektrokoagülasyon (EC), elektrooksidasyon (EO), elektro-fenton (EF) gibi prosesler atık su arıtımında kullanılmaktadır. Elektrokoagülasyon teknolojisi geniş uygulama yelpazesi ve düşük maliyeti nedeniyle en yaygın kullanılan elektrokimyasal teknolojilerden biridir (Lu, Zhuo, & ark., 2022).

EC prosesinin temel prensibi elektrolizdir. Elektroliz; elektrik akımının kullanılmasıyla bileşiklerin parçalanması işlemidir (Boinpally, Kolla, & ark., 2023). EC prosesinin kirleticileri uzaklaştırmadaki prensibi alüminyum ve demir gibi metal anotların anodik çözülmeye uğraması ve hidrolizi ile çok az çözünen  $Al(OH)_3$ ,  $Fe(OH)_2$  ve  $Fe(OH)_3$  gibi metal hidroksitlerin oluşması şeklindedir (Özyonar & Karagözoğlu, 2012). Son olarak ortaya çıkan bu metal hidroksitlerin metal-polimer kompleksleri oluşturmasıyla birlikte kirleticiler adsorplanarak koagüle olmaktadır.

EC prosesinin kirleticilerin atık su içerisinde uzaklaştırılmasında çok etkili olduğu kanıtlanmıştır ve çamur üretiminin azalması, kimyasal kullanımına gerek olmaması, kullanım kolaylığı, basit ekipman, düşük maliyet ve daha az reaksiyon süresi gibi çeşitli avantajlara sahiptir. Bununla birlikte, tekniğin 'kurban elektrotların' atık suda çözünmesi ve düzenli olarak değiştirilmesi gerekmesi ve elektrik kullanımı nedeniyle bazı dezavantajları da vardır (Negash, Tibebe, & ark., 2023). EC prosesinde genellikle Al ya da Fe elektrotlar kullanılmaktadır. Al elektrot kullanıldığı takdirde meydana gelecek reaksiyonlar şu şekildedir (Yakamercan, Bhatt, & ark., 2023):

Elektrooksidasyon, çeşitli endüstriyel sektörlerden açığa çıkan atık suların arıtılması amacıyla yaygın olarak kullanılan elektrokimyasal yöntemlerden biridir. EO prosesi ile amaçlanan atık su içerisindeki kirletici maddelerin daha az toksik ve biyolojik parçalanabilirliği daha yüksek olan CO<sub>2</sub> ve H<sub>2</sub>O gibi nihai ürünlere dönüştürülmesidir. EO doğrudan veya dolaylı oksidasyon yoluyla gerçekleşmektedir (Titchou, Zazou, & vd., 2021). Dolaylı anodik oksidasyon sırasında aşağıdaki reaksiyonlar meydana gelmektedir (Saeed, Hameed, & ark., 2023):

Bu yöntemin en büyük dezavantajı yüksek oranda askıda katı madde içeren atık suların arıtılmasında uygulanamaması ve uzun çalışma süresidir. Bu nedenle EO prosesini kullanmak için atık sudaki askıda katı maddelerin ilk önce farklı teknikler kullanılarak giderilmesi gerekmektedir (Asfaha, Tekile, & ark., 2021). Önerilen en yaygın teknik EC' dir.

Hibrit EC-EO prosesinde atık sudaki askıda katı maddeler EC ile giderilmekte, ardından EO ile kalan kirleticiler okside edilmektedir. EC ve EO' nun hibrit prosesi sadece EC veya sadece EO kullanılarak etkili bir şekilde elde edilemeyen KOİ, TOK, NH<sub>4</sub><sup>+</sup>-N, nitratlar ve fenol giderimini artırmaktadır (Asfaha, Tekile, & ark., 2021). Bu nedenle, hibrit yöntem hem askıdaki ve koloidal hem de kararlı kalıcı organik bileşikler pratik bir sürede izin verilen sınıra kadar giderebilir. Böylece elektrotların ömrünü arttırırken enerji tüketimini azaltabilir (Almukdad, Hafiz, & ark., 2021). Yapılan bazı çalışmalarda ilaç, deri, tekstil, boya üretimi, yapıştırıcı üretimi, otomotiv, kimya, metal terbiye ve gıda işleme gibi çeşitli endüstri atık sularının, hibrit elektrokoagülasyon-elektrooksidasyon prosesi ile yüksek verimlilikle arıtıldığı gösterilmiştir (Asfaha, Tekile, & ark., 2021), (Saeed, Hameed, & ark., 2023), (Hernández, Díaz, & ark., 2010), (Lu, Zhuo, & ark., 2022).

Parçalayıcı prosesler olarak tanımlanan ileri oksidasyon prosesleri, hidroksil ve sülfat radikalleri gibi yüksek reaktif oksijen türleri üretimi esasına dayanmaktadır ve üretilen reaktif serbest radikaller organik moleküllerin büyük kısmını parçalamaktadır (Ghanbari, Khatebasreh, & ark., 2021). Reaktif oksijen türlerinin üretimi için hidrojen peroksit, peroksidisülfat (PS), peroksimonosülfat (PMS) ve perkarbonat (PC) gibi farklı oksidantlar kullanılmaktadır (Eslami, Mehdipour, & ark., 2020) (Hassani, Eghbali, & ark., 2020). Peroksitlerin bağları ultraviyole (UV), ultrases (US), plazma, mikrodalga gibi yöntemler ile ayrılarak reaktif serbest radikaller meydana getirmektedir (Zhang, Zhang, & ark., 2015), (Ghanbari, Moradi, & ark., 2014). UV, kuvvetli oksidantların varlığında organik kirleticilerin gideriminde iyi performans göstermektedir (Lin, Qin, & ark., 2020). Oksidantların UV ile etkili bir şekilde aktive olması sonucu OH<sup>·</sup>, O<sub>2</sub><sup>·-</sup>, SO<sub>4</sub><sup>·-</sup> reaktif türleri oluşmakta ve organik bileşikler toksik olmayan düşük moleküler ağırlıklı ürünlere ayrışmaktadır. UV bazlı ileri oksidasyon prosesleri çamur oluşumunun olmaması, ikincil bir kirletici oluşmaması, faz transferi problemi olmaması, kolay işletim, düşük yatırım maliyeti gibi avantajlara sahiptir (Gorito, Pesqueira, & ark., 2021).

Son zamanlarda PC hidrojen peroksitine alternatif olarak kullanılmaktadır. Sodyum perkarbonat perkarbonatın en yaygın olarak kullanılan kaynağıdır.

Buna ilave olarak aktivatör olarak UV uygulandığında hidrojen peroksit bikarbonat ile reaksiyona girerek peroksikarbonat oluşur (14) ve UV etkisi ile peroksikarbonattan hidroksil ve karbonat radikalleri üretilir (15).

Sodyum perkarbonat iyi derecede termal stabilite ve suda çözünürlük özelliklerine sahip katı fazlı oksidanttır. Katı fazlı olduğu için sıvı peroksit göre depolanması, taşınması ve işlenmesi daha güvenilir ve daha kolaydır (Fu & Chen, 2015). Geniş pH aralığında etkin olup aynı zamanda organik kirleticileri ayrışması esnasında oluşan ara ürünlerin sebep olduğu pH düşüşlerine karşı tampon görevi yapmaktadır (Zhang, Zhang, & ark., 2017). Ayrıca sodyum perkarbonat toksik bir bileşik değildir (Zhang, Ren, & ark., 2017). Diğer peroksitlere oranla maliyeti de düşüktür (Gao, Song, & ark., 2020). Sodyum perkarbonat kirleticilerle doğrudan da reaksiyona girmekte ancak aktive olduğunda performansı artmaktadır. PC aktivasyonu sonucu hidroksil, süperoksit ve karbonat radikalleri oluşmaktadır (Zhan, Kuang, & ark., 2021).

Son yıllarda ultraviyole (UV) bazı ileri oksidasyon prosesleri de atık su arıtımında kullanılmakta olan en etkili teknolojilerdendir. Fiziksel bir dezenfeksiyon işlemi olan UV dezenfeksiyon, kimyasal girdi olmaması, zararlı dezenfeksiyon yan ürünlerinin düşük oluşumu, düşük maliyet ve küçük ayak izi gibi çeşitli avantajlara sahiptir (Sun, Li, & ark., 2022). Bunlardan UV/hidrojen peroksit (UV/H<sub>2</sub>O<sub>2</sub>) yaygın olarak uygulanmaktadır. Ancak sıvı H<sub>2</sub>O<sub>2</sub>, nakliye ve depolama sırasında hızlı ayrışma ve patlama nedeniyle güvenlik tehlikesi oluşturmaktadır (Wu, Chi, & ark., 2010). Bu nedenle sıvı H<sub>2</sub>O<sub>2</sub>'nin sodyum perkarbonat veya persülfat ile değiştirilmesi önerilmiştir (Gao, Song, & ark., 2021).

Bu çalışmada yüksek askıda katı madde içeriğine sahip yapışkan kimyasal üretim atık suları ilk olarak koagülasyon prosesine tabi tutulup, ardından dirençli kirleticilerin giderimi için elektrokimyasal ve fotokimyasal yöntemler ile arıtılabilirliği incelenmiştir. İlk arıtma kademesi olan koagülasyon prosesi PAC koagülantı kullanılarak gerçekleştirilmiştir. Böylece askıda katı madde konsantrasyonu düşürülen atık suyun hibrit ileri arıtma yöntemleri ile organik kirlilik yüklerinin indirgenmesi araştırılmıştır.

## MATERYAL VE METOT

### Atık Su Karakterizasyonu

Yapıştırıcı kimyasal üretim atık suyu, İstanbul Haramidere'de işletilen bir kimyasal üretim fabrikasının kazan yıkama suyundan alınmıştır. Tek seferde alınan atık su numunesi laboratuvara getirilerek, deneysel çalışmalar boyunca biyolojik reaksiyonları engellemek için +4 °C'de muhafaza edilmiştir. Atık su karakterizasyonu Tablo 1'de verilmiştir.

Tablo 1. Tutkal Atık Suyu Karakterizasyonu

Parametre	Birim	Değer
pH	-	7,1
İletkenlik	µS/cm	1900
KOİ	mg/L	11209
UV <sub>254</sub>	ABS	75
Renk	mg/L	65400
AKM	mg/L	2193

### Kullanılan Kimyasallar

Deneysel çalışmalarda kullanılan tüm kimyasallar analitik saflıktadır. Atık suyun pH seviyesini ayarlamak için 1 N sülfürik asit (H<sub>2</sub>SO<sub>4</sub>) ve sodyum hidroksit (NaOH) kullanılmıştır. Koagülasyon prosesinde poli alüminyum klorür (PAC), elektrooksidasyon ve fotokimyasal oksidasyon proseslerinde potasyum peroksidisülfat (K<sub>2</sub>S<sub>2</sub>O<sub>8</sub>, PS) ve sodyum perkarbonat (Na<sub>2</sub>CO<sub>3</sub>·1.5H<sub>2</sub>O<sub>2</sub>, PC) kullanılmıştır.

## Deneysel Çalışma

### a. Koagülasyon Prosesi

Yapıştırıcı kimyasal üretim atık suyu PAC ile koagülasyon prosesine tabi tutulmuştur. Koagülasyon prosesi 100 mL atık su hacmi alınarak, ham pH değerinde 1 dk 200 rpm hızla hızlı karıştırılıp, 20 dk boyunca 30 rpm hızla yavaş karıştırılarak gerçekleştirilmiştir. Ardından, 30 dk sedimentasyona tabi tutulup üst fazdan alınan atık su numunesinde analizler yapılmıştır.

### b. Elektrokoksiasyon Prosesi

Deneysel çalışmalar laboratuvar ölçekli ve 200 cm<sup>3</sup> hacme sahip pleksiglass malzemeden yapılmış dikdörtgen prizma reaktörde yürütülmüştür. Elektrokoksiasyon çalışmasında 100 mL atık su içerisine, monopolar bağlı biri anot (Pt/Ti) ve biri katot (Grafit) elektrotlar, aralarında 2 cm mesafe olacak şekilde yerleştirilmiştir. PS eklenen prostese 0.5 g/L oranında PS eklenmiş ve diğer tüm şartlar tek başına EO prosesi ile aynı tutulmuştur. Reaksiyon başlamadan önce atık su pH değeri 5 seviyesine ayarlanmıştır. Atık suya 90 dk reaksiyon süresi boyunca 0.3 A elektrik akımı verilmiştir. Reaksiyon süresi sonunda elektrik bağlantıları kesilerek alınan atık su numunelerinde analizler yapılmıştır.

### c. Fotokimyasal Oksiasyon Prosesi

Deneysel çalışmalar laboratuvar ölçekli ve 8 cm çapında 16 cm yükseklikte silindirik quartz reaktörde gerçekleştirilmiştir. 100 mL atık suyun pH değeri 5'e ayarlanarak 90 dk boyunca fotoliz yürütülmüştür. Oksidan olarak prostese PS ve PC 0.5 g/L eklenmiştir. Katalizör olarak 0.1 g/L Fe<sup>+2</sup> ilavesi yapılmıştır. Manyetik karıştırıcı ile atık suyun reaksiyon boyunca homojen bir şekilde dağılımı sağlanmıştır. Her bir deney seti sonunda Al(OH)<sub>x</sub> ve Fe(OH)<sub>x</sub>'lerin çökebilirliğini arttırmak üzere pH seviyesi 7-8 aralığına çıkarılmış ve numuneler 4000 rpm'de 5 dakika santrifüjlenmiştir. Santrifüj sonrası üst fazdan numune alınarak muhafaza edilmiş ve analizler yapılmıştır.

## Analitik Yöntemler

Koagülasyon, elektrokoksiasyon ve fotokimyasal oksiasyon prosesleri ile KOİ, UV<sub>254</sub> ve renk giderim verimleri (%) aşağıda verilen eşitlik kullanılarak hesaplanmıştır:

$$R \text{ giderim verimi (\%)} = \left( \frac{(R)_i - R_t}{R_i} \right) \cdot 100 \quad (16)$$

Burada (R)<sub>i</sub> t anındaki kirletici konsantrasyonunu, (R)<sub>t</sub>, başlangıç anındaki kirletici konsantrasyonunu ve t reaksiyon süresini (dk) ifade etmektedir.

Optimum koşullarda elektrokoagülasyon prosesi maliyetini hesaplamak için aşağıda yer alan formüller kullanılmıştır (17-18).

$$SEC \text{ (kWh/m}^3\text{)} = \frac{U \times i \times t}{10^3 \times V} \quad (17)$$

$$SEC \text{ (kWh/kg KOİ)} = \frac{U \times i \times t}{10^3 \times V \times (KOİ_0 - KOİ_t)} \quad (18)$$

Burada KOİ<sub>0</sub> ve KOİ<sub>t</sub> sırasıyla t<sub>0</sub> ve t<sub>t</sub> zamanlarında KOİ konsantrasyonlarını (kg/L), U uygulanan voltaj miktarını, i akım değerini (A), t arıtma süresini (saat) ve V atık su hacmini temsil etmektedir.

## BULGULAR ve TARTIŞMA

### Koagülasyon Prosesi

Atık su arıtımında koagülasyon-flokülasyon işlemi oldukça pratik ve kontrol edilebilir bir teknik olup, özellikle ön arıtmada yaygın olarak kullanılmaktadır. Toplam askıda katı madde miktarının, organik içeriğin ve rengin azaltılması için gerekli bir adım olduğu gibi, pıhtılaşma işleminden sonraki ikinci işlemin verimliliğinin artırılması açısından da önemlidir (Amor, Torres-Socias, & ark., 2015). Koagülasyon çalışmasının temeli partikül destabilizasyonunu içermektedir. Bu çalışmada parçacık kararsızlaştırması için koagülant olarak PAC ilave edilerek gerçekleştirilen deneysel çalışmanın sonuçları Şekil 1'de verilmiştir. Ham atık su pH değerinde (pH=7.1) ve 1 g/L PAC dozlanarak gerçekleştirilen koagülasyon prosesi sonucu % 75

AKM, % 73.8 KOİ, % 87.3 UV<sub>254</sub> ve % 88.4 renk giderimi sağlanmıştır. Koagülasyon prosesi yüksek oranda pH'a bağlıdır. Atık suyun pH değeri, atık suya metal bazlı pıhtılaştırıcılar ekleyerek çözünebilir ve çözünmeyen polimerik metal türlerinin doğasını doğrudan etkiler. Koagülasyon işlemindeki pH dengesi, birbiriyle yarışan iki kuvvetin dengesine dayanır. Bu kuvvetlerden biri H<sup>+</sup> iyonları ile metal hidroliz ürünleri arasında organik ligandlarla etkileşime giren kuvvet, diğeri ise hidroksit iyonları ile organik anyonlar arasında metal hidroliz ürünleriyle etkileşime giren kuvvettir (Maleki & Zazouli, 2009). Düşük pH değerlerinde H<sup>+</sup> iyonları, organik ligandlar için metal hidroliz ürünleriyle rekabet eder. Bu nedenle oluşan organik asitlerin bir kısmı çökelmez ve giderim verimleri düşük kalır. Bununla birlikte, yüksek pH değerlerinde, hidroksit iyonları, metal adsorpsiyon bölgeleri için organik bileşiklerle rekabet eder ve metal hidroksitlerin çökeltilmesi, temel çökeltme işlemi yerine ağırlıklı olarak yarı çökeltme işlemiyle gerçekleşir. Bu nedenlerden dolayı ham atık su pH değerleri olan nötr seviyede çalışılmıştır.

Koagülant dozu artışı ile oluşan çamur hacminin de artacağı düşünüldüğünden ve uygulanacak hibrit sistemin ilk adımı için elde edilen kirletici giderimi yeterli görüldüğünden optimum doz çalışmaları yürütülmemiştir. Ayrıca, kolloidal parçacıklar negatif yüklüdür. Uygun dozda koagülant ilavesi ile kationlar optimum oranda verilir ve negatif yüklü kolloidler nötralize edilir. Ancak optimum değer üzerinde bir koagülant eklendiğinde ortamda daha fazla pozitif yüklü iyon olacak ve buna bağlı olarak yük itmesi sonucu kolloidler tekrar stabil hale gelecektir. Bunlara bağlı olarak seçilen koagülant PAC için 1 g/L dozlama ile arıtma işlemi yapılarak, 2. kademe arıtma işlemi için koagüle edilmiş atık su biriktirilmiştir.

Şekil 1. PAC kullanılan koagülasyon prosesi ile kirletici giderimi

### Hibrit Koagülasyon – Elektrooksidasyon Prosesi

Yapıştırıcı kimyasal atık suyu 2. kademe olarak elektrooksidasyon prosesine tabi tutulmuştur. Elektrooksidasyon ile organik madde ve renk giderim verimleri incelenmiştir. Elde edilen verimleri iyileştirebilmek için persülfat gibi çevre dostu oksidan ilavesi yapılmıştır. Hem tek başına EO hem de persülfat ilaveli EO prosesi sonuçları Şekil 2'de verilmiştir.

Elektrooksidasyon prosesinde atık su pH değeri, doğrudan ve dolaylı oksidasyonun iki mekanizması üzerinde meydana gelen etkili bir parametredir. Asidik pH değerlerinde hidroksil radikalleri üzerinde temizleyici etki yapan karbonat ve bikarbonat iyon konsantrasyonu azaltılarak istenmeyen oksijen oluşum reaksiyonları azaltılır (Anglada, Urtiaga, & ark., 2010). Buna bağlı olarak reaksiyon hızı artar. Atık sudaki klorür iyonunun şekli doğrudan pH ile ilişkilidir (Anglada, Urtiaga, & ark., 2010), (Mandal, Dubey, & ark., 2017). Sulu klor, 3,3'ün altındaki pH seviyelerinde elektroliz sırasında oluşan aktif klor türleri arasında baskın olan türdür. pH 3,3'ün altında elektroliz sonucunda klorlu organik bileşiklerin oluşumu artacaktır ki bu da istenmeyen bir durumdur. Bu nedenle EO prosesinde pH'ın 3,3'ün altında olmaması gerekir. Ham atık su pH değerinin nötr seviyelerde olması ve kimyasal ilavesini minimize etmek için bu çalışmada atık su pH değeri 5'de sabit tutulmuştur. Şekil 2'den de anlaşıldığı gibi EO prosesi ile %36.5 KOİ, %58 UV<sub>254</sub> ve %74.1 renk giderimi sağlanmıştır.

Bu çalışmada elektrolitik reaktöre oksidan olarak PS ilave edilmiş ve PS ilavesinin DSA anotları kullanılarak EO prosesi ile atık sudan KOİ, UV<sub>254</sub> ve renk giderilmesine etkisi araştırılmıştır. Dirençli organik maddelerin giderim potansiyelini arttırmak için yüksek reaktif türlerin oluşmasını sağlayan persülfat ilavesi gerçekleştirilmiştir. Persülfat ilaveli EO prosesinde %40 KOİ, %65 UV<sub>254</sub> ve %80.6 renk giderimi elde edilmiştir. Tek başına EO prosesine kıyasla EO/PS prosesi ile her bir kirletici parametrenin giderim verimi en az yaklaşık %5 oranında artış göstermiştir. Burada, sistem içerisinde gerçekten dolaylı oksidasyonun (sülfat radikallerinin oluşumu) pozitif etkisi görülmektedir.

Hibrit koagülasyon – EO/PS prosesi ile toplam kirletici giderim verimleri %84.3 KOİ, %95.6 UV<sub>254</sub> ve % 97.7 renk olarak hesaplanmıştır.

Şekil 2. PAC ile koagülasyon sonrası elektrooksidasyon prosesi ile kirletici giderimi

### Hibrit Koagülasyon - Fotokimyasal Oksidasyon Prosesi

Bir diğer 2. kademe arıtma prosesi olarak fotokimyasal oksidasyon prosesi çalışılmıştır. Fotokimyasal oksidasyon prosesi için oksidan olarak PS ve PC iki tür seçilmiştir. PS ve PC oksidanlarının organik maddeyi oksitlemesi için daha uygun pH değerlerinin asidik koşullar olduğu pek çok çalışmada kanıtlanmıştır (Li, Xiao, & ark., 2019), (Can-Güven, Daniser, & ark., 2022), (Türk, Adalar, & ark., 2023). Bu sebeple fotokimyasal oksidasyon deneyleri pH 5 değerinde sabit tutularak yürütülmüştür. UV/PS ve UV/PC proseslerinde meydana gelen mekanizma yüksek oksidasyon potansiyeline sahip serbest radikallerin oluşmasıdır. UV/PS prosesi radikal türleri olarak hidroksit ve sülfat radikalleri oluşurken, UV/PC prosesinde hidroksit ve karbonat radikalleri oluşmaktadır. Farklı radikal türlerin etkin olduğu bu prosesler ile kirletici giderim verimleri de farklılık göstermektedir. Şekil 3 fotokimyasal oksidasyon prosesi sonuçlarını göstermektedir. Şekil 3'ten de anlaşıldığı gibi UV/PC prosesi KOİ giderim verimi %41, UV/PS prosesi ile KOİ giderim verimi %34.2'dir. Karbonat radikallerinin daha yüksek organik madde parçalama etkisi gösterdiği anlaşılmaktadır. Ayrıca, UV ışınlarının yanı sıra ortamda Fe<sup>+2</sup> iyonlarının bulunması durumunda ikincil bir aktivatör etkisi göstererek serbest radikallerin oluşumunu desteklemektedir (Rivas, Gimeno, & ark., 2010), (Hassani, Scaria, & ark., 2023).

Bu çerçevede Şekil 3'e bakılarak Fe<sup>+2</sup>'nin katalizör olarak kullanıldığı her iki fotokimyasal oksidasyon proseslerinde KOİ giderim verimlerinde artışlar gözlenmiştir. UV/PS/Fe prosesi ile KOİ giderim verimi %44'e, UV/PC/Fe prosesi ile KOİ giderim verimi %46.5'e yükselmiştir.

Hibrit koagülasyon – UV/PC/Fe prosesi toplam KOİ giderim verimi %85.9 olmuştur. Ancak diğer kirletici parametrelerin ölçümleri spektrofotometrik olarak yapıldığından ve Fe kullanıldığında suya kendisi de renk verdiği için negatif girişim meydana getirmektedir. Bu sebeple fotokimyasal oksidasyon prosesleri sadece KOİ giderim verimi üzerinden değerlendirilmiştir.

Şekil 3. KOİ giderim verimi üzerine fotokimyasal proseslerin etkisi

## SONUÇ

Bu çalışmada yapıştırıcı kimyasal üretim atık sularının alternatif arıtma yöntemleri kullanılarak kirletici parametrelerinin indirgenmesi amaçlanmıştır. Yüksek askıda katı madde ve organik madde konsantrasyonunu sahip bu atık suların öncelikle koagülasyon prosesi ve ardından elektrooksidasyon/fotokimyasal oksidasyon proseslerini içeren hibrit arıtma sistemleri ile arıtılabilirlikleri araştırılmıştır. Koagülasyon prosesi ile AKM, KOİ, UV<sub>254</sub> ve renk giderim verimleri sırasıyla %75, %73.8, %87.3 ve %88.4 olmuştur. Ardından sırasıyla EO ve EO/PS prosesleri ile %36.5 ve %40 KOİ giderimleri elde edilirken, sırasıyla UV/PS/Fe ve UV/PC/Fe ile prosesleri ile %44 ve %46.5 KOİ giderimleri elde edilmiştir. Hibrit koagülasyon – EO/PS prosesi ile toplam KOİ giderimi %84.3 ve hibrit koagülasyon – UV/PC/Fe prosesi ile toplam KOİ giderimi %85.9 olarak hesaplanmıştır. Her iki hibrit sistem de her ne kadar yüksek oranlar organik madde giderimi sağlamış olsalar da organik madde konsantrasyonu için alıcı ortam deşarj kriterlerine indirilememiştir. Proseslerin hem kirletici konsantrasyonu bakımından hem de maliyet analizleri bakımından işletme parametrelerinin optimizasyonu gerekmektedir.

## TEŞEKKÜR

Bu araştırma Yıldız Teknik Üniversitesi-Bilimsel Araştırma Projeleri Koordinatörlüğü tarafından FBA-2023-5541 araştırma projesi numarasıyla desteklenmiştir.

#### Özet

Biyobelirteç; normal biyolojik süreçler, patolojik süreçler veya terapötik bir işleme karşı farmakolojik cevabın göstergesi olabilen, objektif olarak ölçülüp değerlendirilmesi yapılabilen özelliktir. Temel olarak biyobelirteçler hastalığın tanı ve takibinde kullanılır. Bu nedenle biyobelirteçler ucuz, kolay ulaşılabilir, tekrar edilebilir ve objektif olmalıdır.

Kardiyovasküler Hastalıklar dünya genelinde mortalite ve morbiditenin önde gelen nedenidir. Tanı tedavi ve prognozda önemli ilerlemeler kaydedilmiş olmakla birlikte özellikle teşhis için yani biyobelirteçlere ihtiyaç duyulmakta, yeni terapötik yöntemler için çalışmalar yapılmaktadır.

Kardiyovasküler Hastalık prevalansı yaşla birlikte artmaktadır. Bunun yanında sigara ve alkol kullanımı, fiziksel inaktivite, dengesiz beslenme ve obezite gibi faktörler de kardiyovasküler hastalık riskini artırmaktadır. Kardiyovasküler Hastalıklar için standardize ve valide edilmiş kardiyovasküler risk skorları bulunmaktadır. Bunlar temel olarak, yaş, cinsiyet, hipertansiyon ve diabetes mellitus varlığı ile total kolesterol, düşük ve yüksek yoğunluklu kolesterol (LDL-K, HDL-K) değerleridir.

Kardiyovasküler Hastalıklar için yeni biyobelirteçler arasında; myokard hasarı için Kardiyak Troponinler, Kalp-tipi yağ asidi bağlayıcı protein ve Kardiyak myosin bağlayıcı protein-C, myokard stresi için A ve B tip Natriüretik peptidler, Orta bölgesel pro-adrenomedullin ve Kopeptin, inflamasyon için C-reaktif protein, İnterlökin-6, Büyüme farklılaşma faktörü 15, Tümörjenisitenin çözünebilir baskılanması 2 ve Galektin-3, platelet aktivasyonu için çözünebilir CD40 ligandı ve P-selektin, plak değişkenliği için Lipoprotein ilişkili fosfolipaz A2 ve Matriks Metaloproteinaz-9, sistemik stres için Katekolaminler ve Granin proteinleri kalsiyum homestazi için Sekretonörin sayılabilir. Bunun yanında son çalışmalarda kardiyovasküler hastalıklar için teşhis ve tedavide kullanılmak üzere potansiyel biyobelirteç olarak mikro RNA'ların da kullanılabileceği ortaya konmuştur.

**Anahtar Kelimeler:** Kardiyovasküler Hastalıklar, Biyobelirteç, Teşhis, Tedavi, Prognoz

#### Novel biomarkers in cardiovascular diseases

#### Abstract

A biomarker is a property that can be objectively measured and evaluated, which can be an indicator of normal biological processes, pathological processes, or a pharmacological response to a therapeutic procedure. Basically, biomarkers are used in the diagnosis and follow-up of the disease. Therefore, biomarkers should be inexpensive, easily accessible, reproducible and objective.

Cardiovascular Diseases are the leading cause of mortality and morbidity worldwide. Although significant progress has been made in diagnosis, treatment and prognosis, biomarkers are needed especially for diagnosis, and studies are carried out for new therapeutic methods.

The prevalence of cardiovascular disease increases with age. In addition, factors such as smoking and alcohol use, physical inactivity, unbalanced diet and obesity increase the risk of cardiovascular disease. There are standardized and validated cardiovascular risk scores for Cardiovascular Diseases. These are basically age, gender, presence of hypertension and diabetes mellitus, and total cholesterol, low- and high-density cholesterol (LDL-C, HDL-C) values.

Among the new biomarkers for Cardiovascular Diseases; Cardiac Troponins, Heart-type fatty acid-binding protein and Cardiac myosin-binding protein-C for myocardial injury, A and B-type Natriuretic peptides for myocardial stress, Mid-regional pro-adrenomedullin and Copeptin, C-reactive protein for inflammation, Interleukin-6, Growth differentiation factor 15, Soluble suppression of tumorigenicity 2 and Galectin-3, soluble CD40 ligand and P-selectin for platelet

activation, Lipoprotein-associated phospholipase A2 and Matrix Metalloproteinase-9 for plaque instability, Catecholamines for systemic stress, and Granin proteins Secretoneurin for calcium homeostasis. In addition, recent studies have shown that microRNAs can be used as potential biomarkers for use in the diagnosis and treatment of cardiovascular diseases.

**Key words:** Cardiovascular Diseases, Biomarkers, Diagnosis, Treatment, Prognosis

## Giriş

Biyobelirteç; normal biyolojik süreçler, patolojik süreçler veya terapötik bir işleme karşı farmakolojik cevabın göstergesi olabilen, objektif olarak ölçülüp değerlendirilmesi yapılabilen özelliktir. Temel olarak biyobelirteçler hastalığın tanı ve takibinde kullanılır. Bu nedenle biyobelirteçler ucuz, kolay ulaşılabilir, tekrar edilebilir ve objektif olmalıdır (Aronson ve Ferner 2017; Lyngbakken ve ark. 2019)

Kardiyovasküler hastalıklar (KVH) dünya genelinde mortalite ve morbiditenin önde gelen nedenidir (Zhou ve ark. 2018). KVH'lar kalp ve damar bozuklukları ile karakterize olan ve kanın kalbe, beyine ve vücudun periferik bölgelerine akışını etkileyen bir grup hastalıktır. KVH'lar içerisinde koroner kalp hastalığı, serebrovasküler hastalık, romatizmal ve doğumsal kalp hastalıkları yer almaktadır (Hijová 2023).

## Kardiyovasküler Hastalıklar

KVH'lar dünya genelinde prematüre ölüm nedenlerinin başında gelmektedir (Van Camp 2014). KVH prevalansı yaş ve bunun yanında tütün kullanımı, alkol tüketimi, obezite ve fiziksel inaktivite gibi modifiye edilebilir faktörler ile artmaktadır (Lyngbakken ve ark. 2019).

KVH subklinik ateroskleroz gelişimi ile karakterize bir yaşam boyu hastalıktır (Santhakumar, Battino, ve Alvarez-Suarez 2018) İnflamasyon aterosklerozun başlangıcı ve gelişiminde son derece önemli bir rol oynar. Aterosklerotik kardiyovasküler hastalıklar kronik inflamatuvar hastalıklar arasında yer almaktadır (Irwandi ve ark. 2022).

KVH'lara sebep olan faktörler önlenemez ve önlenemez olmak üzere iki gruba ayrılır. Yaş, cinsiyet ve genetik yatkınlık gibi faktörler değiştirilemeyen etkenler olduğu için önlenemez değildir. Bunun yanında değiştirilebilir etkenler olan yaşam tarzı, beslenme alışkanlıkları, fiziksel aktivite, kan glukoz ve lipid düzeyleri ise önlenemez faktörlerdir (Hijová 2023). Dengeli beslenmenin KVH riskinin önlenmesinde önemli rol oynadığı yapılan çalışmalar ile ortaya konulmuştur (Anon 2013; Anon n.d.; Llorente-Cortés ve ark. 2010; De Lorgeril ve ark. 1999; Widmer ve ark. 2015)

## Kardiyovasküler Hastalıklarda Kullanılan Biyobelirteçler

Yapılan çalışmalara göre birçok biyobelirteç artmış KVH riski ile ilişkilendirilmiştir. Bu biyobelirteçler arasında C Reaktif protein (CRP), B tip natriüretik peptid (BNP), Lipoprotein (a), Homosistein ve fibrinojen bulunmaktadır (Mahmood ve ark. 2014)

Kardiyovasküler biyobelirteçler yaygın olarak patofizyolojik süreçlere göre sınıflandırılır. Buna göre kardiyovasküler patoloji grupları; miyokard hasarı, miyokardiyal stres, inflamasyon, trombosit aktivasyonu, plak instabilitesi, sistemik stres ve kalsiyum homeostazisi olarak sıralanabilir. Bu gruplara göre kullanılan biyobelirteçler ise; miyokard hasarı için Kardiyak Troponinler, Kalp-tipi yağ asidi bağlayıcı protein ve Kardiyak miyosin bağlayıcı protein-C, miyokard stresi için A ve B tip Natriüretik peptidler, Orta bölgesel pro-adrenomedullin ve Kopeptin, inflamasyon için C-reaktif protein, İnterlökin-6, Büyüme farklılaşma faktörü 15, Tümörjenisitenin çözünebilir baskılanması 2 ve Galektin-3, platelet aktivasyonu için çözünebilir CD40 ligandı ve P-selektin, plak değişkenliği için Lipoprotein ilişkili fosfolipaz A2 ve Matris Metalloproteinaz-9, sistemik stres için Katekolaminler ve Granin proteinleri kalsiyum homeostazisi için Sekretoneurin şeklindedir (Lyngbakken ve ark. 2019).

Bunların dışında son yıllarda yapılan çalışmalarda kardiyovasküler hastalıklar için teşhis ve tedavide kullanılmak üzere potansiyel biyobelirteç olarak mikro RNA'ların da kullanılabileceği ortaya konmuştur (Ultimo ve ark. 2018; Zhou ve ark. 2018).

Aterosklerotik kardiyovasküler hastalık gelişiminin başlangıç basmağı olan endotel disfonksiyonu için de bazı biyobelirteçler bulunmaktadır (Zhang 2022). Bu biyobelirteçler özellikle kardiyovasküler hastalık gelişim riski ve yeni tedavi hedefleri açısından önem arz etmektedir (Szmitko ve ark. 2003). Kronik inflamatuvar bir süreç olan aterosklerozun başlangıç basmağı ile ilişkili olan bu biyobelirteçler Tablo 1 de sunulmuştur.

**Tablo 1. Endotel disfonksiyonu için biyobelirteçler (Szmitko ve ark. 2003).**

Biyobelirteç	Alternatif isim	Aile-Süper aile	Major Hüresel Kaynak	Potansiyel Kullanım Alımı
<b>E-Selektin</b>	Endotelyal lökosit adezyon molekülü-1, CD62E	Selektin	Aktive endotel	Endotel aktivasyonu için spesifik ve sentitif belirteç
<b>P-Selektin</b>	CD62P, GMP140, PADKEM	Selektin	Aktive endotel	Endotel aktivasyonu için sensitif belirteç
<b>ICAM-1</b>	Hücre-içi adezyon molekülü-1, CD54	Ig G gen super ailesi	Aktive endotel	Endotel aktivasyonu için sensitif ve güvenilir belirteç
<b>VCAM-1</b>	Vasküler hücre adezyon molekülü-1, CD106	Ig G gen super ailesi	Aktive endotel	Endotel aktivasyonu için sensitif ve güvenilir belirteç
<b>IL-6</b>	İnterlökin-6	Sitokin ailesi	Aktive endotel	Spesifik olmayan, Endotel aktivasyonu için sensitif ve güvenilir belirteç
<b>CRP</b>	C reaktif protein	Akut faz proteini	Aktive endotel	Spesifik olmayan, Endotel aktivasyonu için sensitif ve güvenilir belirteç
<b>LOX-1</b>	Lektin benzeri okside LDL reseptörü-1	Okside LDL için A reseptörü	Aktive endotel	Spesifik olmayan, endotel aktivasyonu için gelecek vaad eden yeni belirteç
<b>CD40L</b>	CD Ligand, CD154, TNF ilişkili aktivasyon proteini	TNF süperaillesi	Aktive endotel	Spesifik olmayan, endotel aktivasyonu için gelecek vaad eden yeni belirteç
<b>ADMA</b>	Asimetrik dimetil arjinin	Endojen NOS ailesi	Aktive endotel	Spesifik olmayan, endotel aktivasyonu için gelecek vaad eden yeni belirteç
<b>Endocan</b>	Endotelyal hücre spesifik molekül-1	Proteoglikan	Aktive endotel	Endotel aktivasyonu için gelecek vaad eden yeni belirteç

### Kardiyak Troponinler

Troponin bir kas protein kompleksi olup çizgili kaslarda bulunur. Troponin T, Troponin I ve Troponin C olmak üzere üç alt tipi vardır (Lyngbakken ve ark. 2019). Troponinlerin tüm izoformları hem kalp kası hem de iskelet kasında bulunmakla beraber kardiyak Troponin (cTnt) ve kardiyak Troponin I (cTnt I) miyokarda spesifiktir (Mohammed ve Januzzi 2010).

## Kalp Tipi Yağ Asiti Bağlayıcı Protein

Yağ asiti bağlayıcı proteinler yağ asitlerinin membrane boyunca taşınmasından sorumlu olan protein ailesidir. Karaciğer, ince bağırsak, adipositler, çevresel sinirler, beyin ve kalp olmak üzere pek çok doku izoformu bulunmaktadır (Lyngbakken ve ark. 2019). Kalp tipi yağ asiti bağlayıcı protein aynı zamanda FABP 3 olarak da bilinmekte olup iskelet kası ile kalbin baskın izoformudur (Otaki, Watanabe, ve Kubota 2017). Kalp tipi yağ asiti bağlayıcı protein miyokard hasarı göstergesi olarak akut miyokard iskemisi sonrası dolaşımda görülmektedir (Lyngbakken ve ark. 2019; Otaki ve ark. 2017).

## A ve B Tip Natriüretik Peptidler

Natriüretik Peptidler; Atriyal ya da A tip, Beyin ya da B tip ve C tip olmak üzere üç çeşittir. Natriüretik peptidler ağırlıklı olarak atriyum ve ventriküllerde yapılırlar ve böbrekten sodyum atılımından sorumludurlar. Natriüretik peptidlerin konsantrasyonları yaşla, böbrek fonksiyonlarının azalmasıyla ve atriyal fibrilasyonun varlığıyla birlikte artar. A tip natriüretik peptid konsantrasyonları ile akut kalp yetmezliği arasında güçlü bir ilişkili bulunmuştur (Lyngbakken ve ark. 2019).

## Mikro RNA ve Kardiyovasküler Hastalıklar

MikroRNA' lar, (miRNA) kısa (yaklaşık 22 nükleotid), kodlanmayan tek sarmallı RNA molekülleridir (Zhou ve ark. 2018). MiRNA' lar çeşitli fizyolojik süreçlerin düzenleyicileri olup aynı zamanda da Kardiyovasküler Hastalıklar, Obezite, Tip 2 Diyabet ve Kanser gibi patolojik durumlar ile de ilişkilidirler.

Yapılan çalışmalarda miRNA' lar ile hipertansiyon, kalp yetmezliği, aortik anevrizma, aritmiler, akut miyokard infarktı, konjenital kalp hastalıkları, vasküler hastalıklar ve aterosklerozun ilişkili olduğu gösterilmiştir (Çakmak ve Demir 2020). MiRNA' lar farklı sinyal yollarını kullanarak birçok geni etkileyen yeni terapötik ajanlar ve biyobelirteçler olarak sınıflandırılmaktadır.

## Sonuç

Dünya genelinde ölüm nedenlerinin başında gelen kardiyovasküler hastalıklar için yeni teşhis ve tedavi yöntemlerinin bulunması son derece önemlidir. Klasik risklerden bağımsız olarak kardiyovasküler olaylarla ilişkilendirilebilen yeni biyobelirteçler kardiyovasküler risk belirleme ve tedavi geliştirme açısından yararlı olabilecektir.

\*Sorumlu yazar e-mail: ezgi.yilmaz3@std.yildiz.edu.tr

#### Özet

Konvansiyonel atıksu arıtma tekniklerine kıyasla proses maliyetlerinin daha yüksek olması sebebiyle elektrokimyasal prosesler özellikle biyolojik olarak ayrışamayan, toksik içeriği yüksek, dirençli ve kalıcı kirleticilerin su ve atıksu ortamından uzaklaştırılmasında kullanılmaktadır. Bu prosesler uygulama kolaylığı, alan ihtiyacının düşüklüğü, ikincil kirlilik oluşumunu engellemesi, yüksek giderim verimi potansiyeli ve dirençli ve kalıcı kirleticilere cevap verebilmesi gibi avantajları ile pek çok araştırmada tercih edilmektedir. Son yıllarda kullanılan iki boyutlu elektrokimyasal sistemlere anot-katot çiftinin yanı sıra parçacık/partiküler elektrot gibi üçüncü bir elektrotun eklenmesi ile sistem üç boyutlu (3D) elektrokimyasal sisteme modifiye edilmekte ve böylece su ortamında daha yüksek iletkenlik, daha fazla reaktif alan ve düşük voltajlarda bile daha yüksek akım yoğunluğu gibi sistem performansını iyileştiren kolaylıklar sağlanabilmektedir. 3D elektrokimyasal proses performansının artması kullanılan parçacık/partiküler elektrotun tipi, cinsi, boyutu ve kimyasına göre değişim göstermektedir. 3D elektrokimyasal proseslerde kullanılan parçacıkların yüksek spesifik yüzey alanı içermesi kirleticilerin giderim mekanizması olarak adsorpsiyon prosesinin de etkin olduğunu göstermektedir. Geniş yüzey alanı ve gözenekli yapıları sayesinde adsorpsiyon kapasitesi yüksek olan granüler aktif karbon yaygın olarak kullanılan parçacık elektrotların başında gelmektedir. Buna ilaveten, yapılan çalışmalar metal oksitler, kaplanmış karbon malzemeler, arıtma çamuru ve çüruf gibi parçacıkların da bu sistemlerde kullanımının mümkün olduğunu göstermektedir. Üç boyutlu elektrokimyasal sistemler, iki boyutlu sistemlere kıyasla daha yüksek kirletici giderimi sağlarken daha düşük enerji ve proses maliyetleri gerektirmektedir. Bu çalışma ile su ve atıksu ortamından üç boyutlu elektrokimyasal sistemler kullanılarak farklı kirletici türlerin gideriminde etkin rol alan parçacık/partiküler elektrot türleri incelenmiştir. Ayrıca, bu farklı türdeki parçacık elektrotların hem fiziksel ve kimyasal özellikleri hem de kullanıldığı işlemlerin maliyetleri de belirlenmiştir.

**Anahtar Kelimeler:** Üç boyutlu elektrokimyasal proses, su ve atıksu arıtımı, parçacık elektrodu

#### Examination of Particulate Electrode Types Used in Three-Dimensional Electrochemical Processes Applied in Pollutant Removal from Water and Wastewater

#### Abstract

Electrochemical processes are especially used to remove non-biodegradable, high toxic, resistant and persistent pollutants from water and wastewater environment due to the higher process costs compared to conventional water and wastewater treatment techniques. These processes are preferred in many studies with their advantages such as ease of application, low space requirement, prevention of secondary pollution, high removal efficiency potential and ability to respond to resistant and persistent pollutants.

By adding a third electrode, such as a particle electrode, to the two-dimensional electrochemical systems used in recent years, the system is modified into a three-dimensional electrochemical system, and thus, facilities that improve system performance such as higher conductivity in the aquatic environment, more reactive area and higher current density even at low voltages can be provided. The increase in 3D electrochemical process performance depends on the type, size and chemistry of the particle electrode. The high specific surface area of the particles used in 3D electrochemical processes shows that the adsorption process is also effective as a mechanism for removing pollutants. Granular activated carbon, which has a high adsorption capacity thanks to its large surface area and porous structure, is one of the most commonly used particle electrodes. In addition, studies show that it is possible to use particles such as metal oxides, coated carbon materials, sewage sludge and slag in these systems. 3D electrochemical systems provide higher pollutant removal compared to two-dimensional systems and require lower energy and process costs. In this study, particle electrode types that play an active role in the removal of different types of pollutants from the water and wastewater environment

were investigated using three-dimensional electrochemical systems. In addition, both the physical and chemical properties of these different types of particle electrodes and the costs of the processes in which they are used have been determined.

**Keywords:** Three-dimensional electrochemical process, water and wastewater treatment, particle electrode

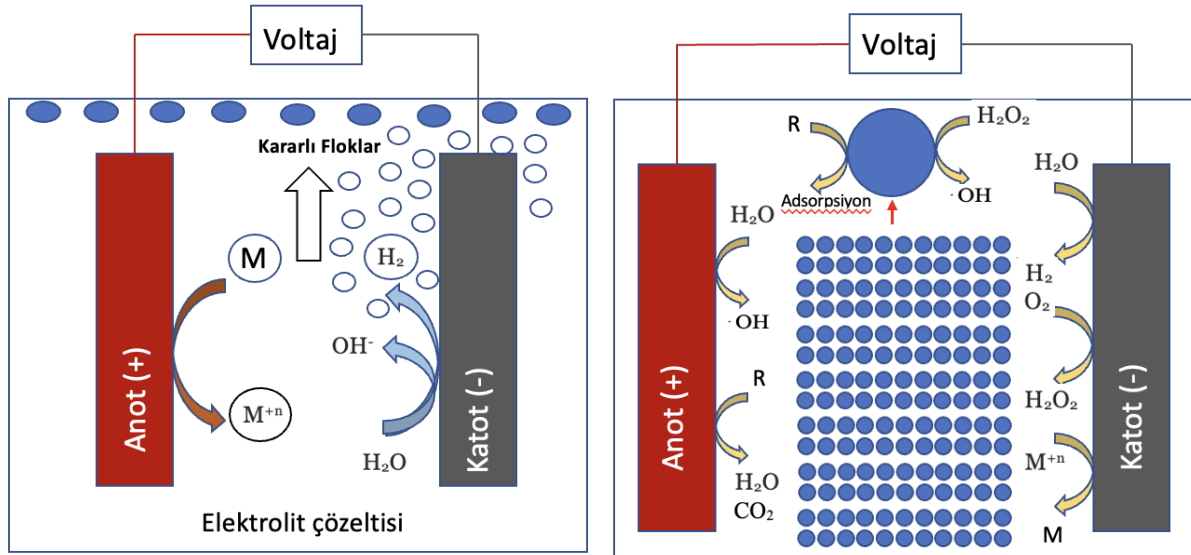

## GİRİŞ

Elektrokimyasal arıtım elektrokimyasal hücre olarak adlandırılan bir yapı içerisinde gerçekleştirilir. Elektrokimyasal hücre ise iki farklı elektrotun iletken bir ortamda oluşturduğu sistemler olarak tanımlanabilir. Bu hücrelerde elektrik akımı sayesinde kimyasal reaksiyonların gerçekleşmesi sağlanır (Kaygusuz, 2013). Hücre içerisinde indirgenme ve yükseltgenme reaksiyonları gerçekleşirken, indirgenme gerçekleşen elektrota katot, yükseltgenme gerçekleşen elektrota anot denir. Anot ve katot çiftinin tek başına kullanıldığı bu sistemler iki boyutlu (2D) sistemler olarak adlandırılırlar. 2D sistemler elektrotlar ile elektrolitik çözelti arasında meydana gelen elektron transferi esasına dayanmaktadır. Elektron transferi elektrokimyasal teknoloji için uygun spesifik materyallerden yapılan anot ve katot arasında elektriksel alan uygulanarak elde edilmektedir. Uygulanan akım/potansiyel farkı, elektrokimyasal hücre içinde yer alan çözeltide, oksidasyon-redüksiyon reaksiyonlarını başlatmak için gerekli itici gücü sağlamaktadır (Fernandes ve ark., 2015). Anot ve katot olarak genellikle metal, karbon veya yarı iletken özellikte elektrotlar kullanılır. Anot ve katotta meydana gelen redoks reaksiyonları Tablo 1’de verilmiştir. Evsel atıksuların arıtımının yanı sıra tekstil atıksuları, mezbaha atıksuları, sızıntı suları, deterjan atıksuları ve kağıt sanayi atıksuları gibi sanayi atıksularının arıtımında da elektrokimyasal prosesler kullanılmaktadır. Organik madde, ağır metal, askıda katı madde (AKM), renk, nitrat ve fenol gibi kirleticilerin gideriminde oldukça etkili yöntemlerdir (İlhan ve ark., 2007). Arıtımın genel mekanizması ise adsorpsiyon, koagülasyon, absorpsiyon, çöktürme ve flotasyondur.

**Tablo 1.** Elektrokimyasal proseslerde gerçekleşen anot ve katot reaksiyonları (Sivri, 2020)

Anot Reaksiyonları	Katot Reaksiyonları
$e^-$ vererek yükseltgenir	$e^-$ alarak indirgenir
Anotta çözünme $(Al \rightarrow Al^{+3} + 3e^-)$	Katotta birikme $(Cu^{+2} + 2e^- \rightarrow Cu)$
Anotta oksijen çıkışı $2H_2O - 4e^- \rightarrow O_2(g)\uparrow + 4H^+$	Katotta hidrojen çıkışı $2H_2O + 2e^- \rightarrow H_2(g)\uparrow + 2OH^-$
Anotta klor olması durumu $2Cl^- + 2e^- \rightarrow Cl_2\uparrow$	Gaz indirgeme durumu $O_2 + 4H^+ + 4e^- \rightarrow 2H_2O$

2D sistemine eklenen parçacık/partiküllerin elektrik alanı içerisinde elektrot görevi görmesiyle beraber üç boyutlu (3D) sistem oluşturulmaktadır. Şekil 1’de 2D ve 3D sistemlerin genel mekanizması gösterilmiştir.

Şekil 1. 2D ve 3D sistem genel mekanizması

Reaktöre eklenen parçacıklar elektrik alanı içerisinde bulunduğu için elektrostatik indüksiyon yoluyla yüklü hale gelir. Bu yüklü parçacıklar sistemde bağımsız 3 boyutlu elektrotlar haline gelir ve bir tarafı pozitif yüklü iken diğer tarafı negatif yüklü olacaktır (Foroughi ve ark., 2018; Zhang ve ark., 2013; Zhu ve ark., 2011). Her bir yüklü parçacık “mikro elektroliz hücresi” oluşturacağından elektrokimyasal reaksiyonun gerçekleştiği alan yüksek miktarda artacaktır (Li ve ark., 2021a). 2D elektrokimyasal sistemlerde anotta gerçekleşen oksidasyona ek olarak parçacık üzerinde de doğrudan ve dolaylı oksidasyon mekanizması gerçekleşir. Sistemde hidroksi radikali gibi aktif ürünlerin oluştuğu da gözlenmiştir. Ayrıca bu parçacıkların yüksek adsorpsiyon kapasitesi sayesinde kirleticilerin gideriminde adsorpsiyon mekanizmasının da etkili olduğu söylenebilir. Oluşan elektriksel alanın artması ve adsorpsiyon kapasitesi sayesinde, 2D sisteme kıyasla daha düşük voltajlarda daha yüksek giderim veriminin elde edilir ve neticesinde daha düşük işletim maliyeti sağlanmış olur.

Yapılan literatür çalışmalarında görülmüştür ki toksik içeriği yüksek, biyolojik olarak arıtılması zor ve dirençli kirleticilerin yoğun olduğu tekstil endüstrisi (Ren ve ark., 2023), kömür atıksuyu (Sun ve ark., 2021), ilaç endüstrisi (Zhan ve ark., 2019), petrol rafinerisi atıksuyu (Yan ve ark., 2016), çelik üretimi (Hu ve ark., 2022), kağıt endüstrisi (Chi ve ark., 2018), kimya ve gıda endüstrisi (Can ve ark., 2014) gibi kirletici özelliği yüksek atıksuların arıtılması için 3D sistemler çoğunlukla tercih edilmektedirler. Bu çalışmada, 3D elektrokimyasal sistemlerde kullanılan farklı parçacık/partikül elektrot türleri ve kullanılan elektrotların fiziksel ve kimyasal özellikleri ve 3D elektrokimyasal proseslerin elektrot, enerji ve işletme maliyetleri araştırılmış ve parçacık/partikül elektrot kullanımının proses maliyeti üzerindeki etkileri belirlenmiştir.

## 2D Sistemlerde Kullanılan Elektrot Türleri

Elektrokimyasal proseslerde arıtma verimini etkileyen parametrelerin en önemlisi seçilen elektrot tipidir. Farklı elektrot tiplerinin kullanımında farklı reaksiyonlar gerçekleşmekte dolayısıyla giderim verimleri de farklı olmaktadır. Elektrokimyasal sistemlerde anot ve katot malzemesi olarak çoğunlukla çözünen suya geçen ve koagülant özellikleri yüksek olan alüminyum ve demir elektrotlar kullanılmaktadır. Kolay ulaşılabilir olmaları, ucuz olmaları ve etkili olmalarından kaynaklı olarak elektrokimyasal proseslerde sıklıkla kullanıldıkları bilinmektedir (Zazou ve ark., 2019).

2D sistemlerde demir ve alüminyum gibi çözünen elektrotların yanında Ti, Ru, bor katkılı elmas gibi tükenmeyen elektrotlarda kullanılmaktadır. Genellikle kullanılan elektrotlar ise bor katkılı elmas, PbO<sub>2</sub>/Ti, PbO<sub>2</sub>/SnO<sub>2</sub>, PbO<sub>2</sub>, TiO<sub>2</sub>/TiRuO<sub>2</sub>, SnO<sub>2</sub>, Ti/Pt-Ir, Ti/PdO-CO<sub>3</sub>O<sub>4</sub>, Ti/RhO<sub>x</sub>-TiO<sub>2</sub>, Ti-SnO<sub>2</sub>/Pt elektrotlardır (Andrade ve ark., 2007; Cabeza ve ark., 2007). Özellikle bor katkılı elmas yüksek gerilim potansiyeline sahiptir ve geniş aralıklı voltajlarda çalışabilirler. Bu sayede yüzeylerinde daha fazla OH radikali adsorplayabilirler. Böylelikle de kirlilik daha çabuk okside olduğundan genellikle tercih edilen elektrot tipidir. Literatürde 2D sistemlerde kullanılan elektrot türlerinin özetleri Tablo 2’de verilmiştir.

**Tablo 2.** 2D Elektrokimyasal proseslerde elektrot tipleri ve verimleri

### 3D SİSTEMLERDE KULLANILAN PARÇACIK/PARTİKÜL ELEKTROT TÜRLERİ

Parçacık/Partikül elektrotların seçimi 3D sistemlerin verimi etkileyen en önemli parametrelerden biridir. Parçacık/partikül elektrotların yeterli adsorpsiyon kapasitesi için spesifik yüzey alanının yüksek olması ve gözenekli yapıda olması istenir. Ayrıca, elektrot iletkenliğinin yüksek olması da sistem verimi etkilediğinden aranan bir diğer özelliktir. Literatürdeki yapılan 3D elektrokimyasal çalışmalarında kullanılan parçacık/partikül elektrot türleri satın alınanlar, sentezlenenler ve atıktan üretilenler üç farklı kategoride sınıflandırılmıştır. Yapılan çalışmalarda çoğunlukla ekonomik uygunluğu, kolaylıkla temini sebebiyle aktif karbonun sıklıkla parçacık/partikül elektrot olarak kullanıldığı görülmüştür. Buna ek olarak metal parçacıklar, metal oksit kaplanmış aktif karbon, doğal madeni taşlar, atıktan üretilmiş biochar, atık çamur, cüruf gibi malzemeler de parçacık/partikül elektrot olarak kullanılmaktadır.

#### Satın Alınanlar

Şekil 2’de satın alınan parçacık elektrotların türleri verilmiştir. Aktif karbon ulaşılabilirliği ve adsorpsiyon kapasitesinin yüksek olması nedeniyle en çok tercih edilen elektrot olmuştur. Foughi ve ark. (2020), tetrakisiklin giderimi için granül aktif karbonun (GAC) kullanıldığı 3D sistem kullanılmıştır. 3D sistemde tetrakisiklin giderimi 20 dk sonunda %90 iken 2D sistemde verim %65.16 olmuştur. Yapılan bir diğer çalışmada (Ulucan-Altuntas ve ark., 2022) ise Oksitetrasiklin (OTC) gideriminde kullanılan GAC sonucunda 3D sistem 2D sisteme göre %21 daha iyi performans göstermiştir. Doğal madenler ve volkanik kayalarda geniş yüzey alanları, yüksek iletkenlik ve düşük maliyet gibi özellikleri nedeniyle tercih edilen diğer elektrotlardır. Volkanik kaya Norfloksasin gideriminde oldukça etkili sonuçlar vermiştir (Song ve ark., 2021). Doğal bir maden olan zeolit ise hem tek başına (Li ve ark., 2021b) hem de GAC ile birlikte (Feng ve ark., 2018) kullanılmaktadır. Li vd., (2021b)’nin yaptıkları çalışmada zeolitin GAC ile benzer performans gösterdiği görülmüştür. Piroluzit doğal kaynağı yüksek adsorpsiyon kapasitesi yanında içerdiği geçiş metalleriyle katalitik özelliği yüksektir. İletkenliğinin düşük olmasına çözüm olarak grafit toz ile beraber kullanılan çalışmada (Hong ve ark., 2018) %49,56 KOİ giderimi elde edilmiştir. Aynı çalışmada partikül elektrot olarak GAC kullanılması da araştırılmış ve verim %35 civarında kalmıştır.

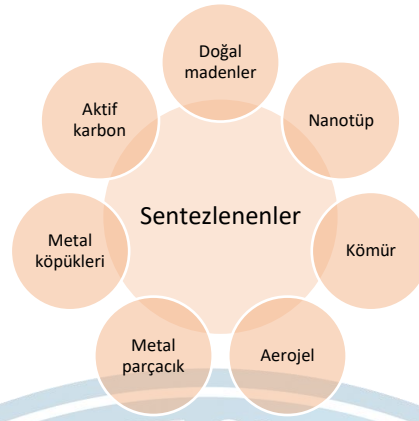

Şekil 2. Doğrudan satın alınarak kullanılan parçacık/partikül elektrot türleri

Yüksek iletkenlik ve mükemmel kimyasal stabiliteye sahip aerojel elektrotlar 3D sistemlerde kullanılan diğer elektrotlardır. Grafen aerojellerin kullanıldığı sistemde Bisfenol A (BAS) kirleticisinin gideriminde %98 giderim verimi elde edilirken (Zhang ve ark., 2018), karbon aerojellerin kullanıldığı sistemde %90 üzerinde fenol giderimi gözlenmiştir. 3D elektro fenton (3D-EF) prosesinde kullanılan demir köpüğü hem sistemde parçacık elektrot olarak görev görür hem de sistemin ihtiyacı olan demiri karşılar (Zheng ve ark., 2019). Folik asit gideriminde kullanılan 3D-EF ile %70.4 ile yüksek giderim verimi elde edilmiştir (Zheng ve ark., 2019). Titanyum köpük ve nikel köpüğün kullanıldığı bir diğer 3D-EF sisteminde ise 30 dakika gibi kısa bir sürede Rhodamine B (RhB) kirleticisinin %99 giderimi nikel köpük kullanımı sonucunda elde edilmiştir. Titanyum köpük ise 90 dakika sonunda %53 seviyesinde kalmıştır. Nikel köpüğün iletkenliğinin daha yüksek olması verimin bu derece yüksek olmasına etki ettiği yazarlar tarafından bildirilmiştir (Liu ve ark., 2012). Sıfır değerlikli demir düşük maliyetli olması, indirgeme potansiyelinin yüksek olması ve toksik olmaması gibi avantajlarıyla 3D sistemlerde kullanılan bir diğer parçacık türüdür. Ozon ile desteklenmiş 3D sistemde kullanılan sıfır değerlikli demir parçacıklar ile 120 dk sonunda %85.2 TOK giderimi elde edilirken 20 dk sonunda %90.5 nitrobenzen giderimi elde edilmiştir (Wang ve ark., 2021).

### Sentezlenenler

Sentezlenerek elde edilen parçacık elektrotların özeti Şekil 3’de verilmiştir. Elektrokatalitik etkinin elde edilmesi veya artırılması, yüzey alanının genişletilmesi ve kütle transferinin teşvik edilmesi amacıyla parçacık elektrotlarının üzerine metal veya metal oksitler kaplanmaktadır (Li ve ark., 2021a; Zhang ve ark., 2013). Yaygın olarak GAC, alüminyum oksit ( $Al_2O_3$ ), doğal taşlar taşıyıcı olarak kullanılırlar. Katalizör olarak ise Zn, Mn, Sn, Ti, Cu, Ni, Ce, Zr ve Co kullanılmaktadır. Katalizörlerin düşük maliyetli olması ve uzun ömürlü olması tercih edilmelerinin sebeplerindendir. 3D sistemlerde en çok tercih edilen GAC tek başına kullanıldığı için birtakım katalizörlerin üzerine sentezlenmesi sonucunda da 3D sistemlerde sıklıkla kullanılmaktadır. Tekstil atıksularından sıklıkla görülen RhB kirleticisinin giderimi için Mn-Sn kaplanmış GAC parçacık elektrot olarak kullanılmıştır (Yang ve ark., 2023). %94.3 giderim verimi elde edilen sistemde katalizörlerin kullanılmadığı GAC tek başına olduğunda verim %80.7’ye düşmüştür. Pu ve ark., (2023)’nin yaptıkları diğer bir çalışmada  $SnO_2-Sb_2O_3$  kaplanmış GAC parçacık elektrodunun GAC’den daha yüksek katalitik aktiviteye sahip olduğunu (GAC için 1.0 V iken  $SnO_2-Sb_2O_3/GAC$  için 1.6 V) ve bunun sonucu olarak GAC kullanılan sisteme kıyasla Fenol gideriminin %31.68 ve KOİ gideriminin %42.26 daha fazla olduğunu görülmüştür (Pu ve ark., 2023). Al, Si ve diğer elementlerce zengin olan kaolin mükemmel elektriksel iletkenliğe ve stabiliteye sahiptir. Cu ve Fe elementlerinin kaolin üzerine sentezlenerek elde edildiği CuFeO/Kaolin parçacığı Orange G kirleticisinin giderilmesi için 3D-EF sisteminde kullanılmıştır (Zhou ve ark., 2023). CuFeO/Kaolin parçacığının kullanıldığı durumda giderim verimi %99.48 iken tek başına kaolin kullanılan sistemde verim %52.63 olmuştur. Kaolin parçacığına sentezlenen elementler ile katalitik aktif bölge artırılmış ve daha fazla  $H_2O_2$  ile OH radikali üretimi sağlanmıştır.

**Şekil 3.** Farklı malzemelerden sentezlenerek elde edilen parçacık/partikül elektrot türleri

Son yıllarda elektrokimyasal proseslerde enerji ihtiyacını azaltmak, kütle transferi teşvik etmek ve reaktif türlerin üretimini arttırmak için karbon nanotüplerin uygulaması giderek artmaktadır (Mengelizadeh ve ark., 2019). Diğer parçacık elektrotlarda da olduğu gibi nanotüpler yüksek iletkenlik, yüksek mekanik ve kimyasal dayanım ve geniş yüzey alanına sahiptirler. Fe<sub>3</sub>O<sub>4</sub> kaplanmış bir karbon nanotüp'ün kullanıldığı 3D-EF prosesinde diklofenak giderimi 60 dk sonunda %95.6 olmuştur (Iranpour ve ark., 2018). Al<sub>2</sub>O<sub>3</sub> ise geniş kanalları ve yüzey alanı sayesinde geçiş metallere için etkili bir taşıyıcıdır (Zhang ve ark., 2013). Co, Ce ve Zr elementlerinin Al<sub>2</sub>O<sub>3</sub> üzerine sentezlenmesi sonucu elde edilen Co-Ce-Zr/ $\gamma$ -Al<sub>2</sub>O<sub>3</sub> parçacığı bir çeşit antibiyotik olan Siprofloksasin giderimi için kullanılmıştır (Liu ve ark., 2021). Hazırlanan parçacıkla hedef kirleticinin giderimi boş Al<sub>2</sub>O<sub>3</sub> parçacığa göre 2 kat daha yüksek olmuştur. TOK gideriminde ise %17.3 daha yüksek verim elde edilmiştir.

#### Atıktan Üretilenler

Atıktan üretilen parçacık elektrotların özet şeması Şekil 4'te verilmiştir. Son yıllarda döngüsel ekonomi kavramıyla birlikte ortaya çıkan bütünsel yaklaşım neticesinde çürüf, arıtma çamuru, biochar ve endüstriyel yan ürünlerin hammadde olarak kullanılması giderek ilgi odağı haline gelmiştir (Petala ve ark., 2022). Biochar, biyokütle kalıntılarının (arıtma çamuru, gıda atıkları, organik çöpler vb.) oksijensiz ortamda ya da sınırlı oksijen altında düşük sıcaklıklarla yakılması sonucu elde edilir. Karbon açısından oldukça zengin bir malzeme olmasının yanında geniş yüzey alanına da sahiptir. Pirinç kabuğundan elde edilen biocharın kullanıldığı 3D sistemde Norfloksasin giderim verimi incelenmiştir. 120 dakika sonunda hedef kirleticide %87 giderim verimi elde edilirken TOK giderim verimi %90 olmuştur (Wang ve ark., 2023). Yapılan bir diğer çalışmada ise (Xie ve ark., 2021), şeker kamışından üretilen biochar üzerine Mn, Sn ve Sb katalizörleri ayrı ayrı kaplanmış ve 4-klorofenol giderim verimleri karşılaştırılmıştır. En iyi verim Mn kaplı parçacık ile %99,93 olurken verimlerin sıralaması Mn/AC > Sn/AC > Sb/AC şeklinde görülmüştür. Çelik, nikel, lityum ve mangan gibi metallerin çürüfleri de parçacık elektrot olarak kullanılan diğer türlerdir. Mangan çürüfünün üzerine Cu-Fe katalizörlerinin kaplanarak kullanıldığı 3D-EF sisteminde Diklofenak giderimi araştırılmıştır (Long ve ark., 2019). İlave oksidan olarak Persülfatın da kullanıldığı sistemde %96.3 gibi yüksek bir verim elde edilebilmiştir. Boksit mineralinden alüminyum oksit üretimi için kullanılan bayer prosesinden kırmızı çamur olarak adlandırılan bir atık oluşmaktadır. Kırmızı çamur yüksek miktarda demir içeriğinin yanında silisyum ve titanyum gibi bileşikler de içerisinde barındırır. Yüksek kimyasal stabiliteye ve yüksek yüzey morfolojisine sahip olmasının yanında elektron transferinin çok iyi sağlanmadığı düşük iletkenliğe ve yüksek elektrik direncine sahiptir. Bu nedenle katalizörler yardımıyla iletkenliği geliştirilerek kullanılması tercih edilmektedir (Lu ve ark., 2022). Lu ve ark., (2022) yaptıkları çalışmada kırmızı çamurun üzerine CuO katalizörünü kaplamış ve 3D-EF prosesinde Siprofloksasin giderimini incelemiştirler. 80 dk sonunda 3D-EF sisteminde giderim %78.43 iken 2D sistemde verim %54.6'da kalmıştır. Evsel atıksu arıtma tesisinden elde edilen arıtma çamuru ve demir çamurunun sentezlenerek parçacık elektrot olarak kullanıldığı bir diğer çalışmada (Hou ve ark., 2017), N-heterosiklik bileşiklerden olan indol, kinolin ve piridin giderimi üzerine çalışmalar yürütülmüştür. 120 dk sonunda giderim verimleri sırasıyla %99.1, %96.7 ve %64.2 olmuştur. Arıtma çamurlarından elde edilen parçacık elektrotlarının 3D sistemler için iyi bir parçacık elektrot olduğu böylece görülmüştür.

Şekil 4. Çeşitli atıklardan üretilen parçacık/partikül elektrot türleri

### Elektrokimyasal Proseslerde Elektrot Tipinin Enerji Verimliliği Üzerine Etkisi

3D sistemlerde anot ve katot olarak genellikle Ti, Ti/RuO<sub>2</sub>, Ti/IrO<sub>2</sub>, çelik gibi çözünmeyen elektrotlar tercih edilir. Bu nedenle arıtma işlemi sırasında sürekli bir maliyet oluşturmazlar. Parçacık elektrotlar ise yapılan çalışmalarda göstermiştir ki tekrar tekrar kullanıldıklarında bile yüksek verim elde edilmesine olanak sağlamaktadırlar (Gu ve ark., 2023; Miao ve ark., 2022; Ta ve ark., 2023). Bu özellikleri sayesinde sistemde maliyet oluşturan esas kalemlerden biri olmanın dışındadır. 3D sistemlerin asıl maliyeti ise sistemin işletme gücü olan elektrik maliyetidir. 2D sisteme kıyasla 3D sistemlerde katalitik kapasitenin ve enerji aktif bölgenin yüksek olması sonucu daha fazla serbest radikal oluşumu gözlenir. Yani daha düşük enerji ihtiyacıyla daha yüksek giderim verimi elde edilebilir. Miao ve ark., (2022) yaptıkları çalışmada 2D sistemde enerji verimliliğinin 2.02 kWh/m<sup>3</sup> atıksu iken nikel cürufunun kullanıldığı 3D sistemde 0.69 kWh/m<sup>3</sup> olduğunu bildirmişlerdir. Yapılan diğer bir çalışmada (Zhao ve ark., 2023), 3D sistemde enerji verimliliği 0.0077 kWh/gr KOİ iken 2D sistemde 0.0673 kWh/gr KOİ olduğu görülmüştür. Ulucan-Altuntaş ve ark., (2022) OTC gideriminde kullandıkları GAC sayesinde enerji verimliliğini 2.33 kWh/kg OTC'den 0.99 kWh/kg OTC'ye düşürmüşlerdir. Maliyette bu sayede 5.38 Euro/m<sup>3</sup> iken 2.81 Euro/m<sup>3</sup> olmuştur. Yapılan çalışmalar 2D sisteme kıyasla parçacık elektrotlarının kullanıldığı 3D sistemlerin enerji verimliliğinin daha yüksek olduğunu göstermiştir.

### SONUÇ

Biyolojik olarak ayrışması zor, toksik içeriği yüksek ve dirençli kirleticilerin arıtılması için kullanılan elektrokimyasal proseslere olan ilginin artmasıyla sistemin dezavantajlarının azaltılması ile ilgili çalışmalar giderek artmıştır. 3D elektrokimyasal sistemlerde iyileştirme çalışmaları gün geçtikçe artmakta ve sistemin verimini pozitif yönde etkileyen yeni birçok parçacık/partikül elektrot literatüre kazandırılmaktadır. Bu çalışmaların bir sonucu olarak ortaya çıkan 3D elektrokimyasal prosesler ise 2D proseslere kıyasla daha az enerji ihtiyacı ile daha yüksek giderim verimi elde edilmesine olanak sağlamaktadır. 3D proseslerde kullanılan parçacık/partikül elektrotlarının türü ve yapısı 3D sistemleri etkileyen en önemli parametredir. Yapılan çalışmalar göstermiştir ki kullanılan partiküllerin geniş yüzey alanına sahip olması, yüksek iletkenlikte olması ve kimyasal ve fiziksel dayanımının yüksek olması 2D elektrokimyasal sistemlere kıyasla proses performansını iyileştirici etkiler ortaya koymaktadır. Yüzey alanı oldukça geniş olan aktif karbon en çok kullanılan parçacık olmakla birlikte iletkenliğinin artırılması için üzerine bazı geçiş metallerinin sentezlenmesi sonucu daha iyi kirletici giderim verimlerinin elde edildiği görülmüştür. Elektrokimyasal sistemlerde en büyük maliyeti elektrik ihtiyacı oluşturmakla beraber, 3D sistemlerin düşük elektrik akımında bile yüksek kirletici giderim potansiyeli de bu maliyetin de giderek azaldığını göstermektedir. 2D elektrokimyasal sistemlerin bir ileri verisyonu olan 3D elektrokimyasal sistemlerin sağlamış olduğu bu avantajlar ile farklı karakterizasyonlara sahip endüstriyel atıksulardan spesifik ve dirençli kirleticilerin gideriminde uygulanabilir olduğu anlaşılmaktadır. Ayrıca, 3D elektrokimyasal sistemlerin çeşitli spesifik kirleticilerin su ve atıksulardan gideriminde etkin olduğu ve kompleks kirletici türleri içeren sızıntı suları gibi arıtımı birden fazla basamaktan oluşan ve yüksek maliyetli arıtma sistemlerinin kullanıldığı atıksu tiplerinde alternatif bir sistem olabileceği öngörülmektedir.

#### Özet

Hidrojenin depolanması, dağıtımı ve kontrollü salınımı, hidrojene dayalı ekonomi için önemli bir endişe kaynağıdır. Sodyum borohidrit (NaBH<sub>4</sub>), hidrojen depolama ve üretimi için kullanılan en çok çalışılan kimyasal hidritlerden biridir. Bununla birlikte, kontrol edilebilir hidrojen üretimi için dehidrojenasyonunu hızlandırmak üzere verimli katalizörler gerektirir. Bu çalışmada, ticari olarak satın alınan Co<sub>3</sub>O<sub>4</sub> ve sentezlenen Fe<sub>3</sub>O<sub>4</sub> nanokatalizörlerinin NaBH<sub>4</sub> hidroliziyle hidrojen üretimleri incelenmiştir. Ayrıca, bu iki nanokatalizörün hidrojen üretim hacimleri ve hidrojen üretim hızları (HGR) karşılaştırılmıştır. Fe<sub>3</sub>O<sub>4</sub> nanokatalizörünün NaBH<sub>4</sub> hidroliziyle üretilen hidrojen hacmi 112 mL ve HGR değeri ise 306.67 mL H<sub>2</sub>/gkat·dk. olarak ölçüldü. Co<sub>3</sub>O<sub>4</sub> nanokatalizörü kullanıldığında üretilen hidrojen hacmi 235 mL ve HGR değeri ise 713.33 mL H<sub>2</sub>/gkat·dk. olarak ölçüldü. Sonuç olarak, Co<sub>3</sub>O<sub>4</sub> nanokatalizörü Fe<sub>3</sub>O<sub>4</sub>'ten NaBH<sub>4</sub> hidrolizi için daha yüksek bir katalitik aktivite sergilediğini göstermektedir. Ayrıca, bu çalışma Co<sub>3</sub>O<sub>4</sub> bazlı sentezlenecek katalizörlerin NaBH<sub>4</sub> hidroliziyle daha yüksek hidrojen üretimi sağlayacaktır.

**Anahtar Kelimeler:** Hidrojen üretimi, NaBH<sub>4</sub>, Co<sub>3</sub>O<sub>4</sub>, Fe<sub>3</sub>O<sub>4</sub>

#### Comparison of hydrogen production of Co<sub>3</sub>O<sub>4</sub> and Fe<sub>3</sub>O<sub>4</sub> nanocatalysts by NaBH<sub>4</sub> hydrolysis

#### Abstract

The storage, distribution and controlled release of hydrogen is a major concern for the hydrogen-based economy. Sodium borohydride (NaBH<sub>4</sub>) is one of the most studied chemical hydrides used for hydrogen storage and production. However, controllable hydrogen production requires efficient catalysts to accelerate its dehydrogenation. In this study, hydrogen production of commercially purchased Co<sub>3</sub>O<sub>4</sub> and synthesized Fe<sub>3</sub>O<sub>4</sub> nanocatalysts by NaBH<sub>4</sub> hydrolysis was investigated. In addition, the hydrogen production volumes and hydrogen production rates (HGR) of these two nanocatalysts were compared. The hydrogen volume produced by the NaBH<sub>4</sub> hydrolysis of the Fe<sub>3</sub>O<sub>4</sub> nanocatalyst is 112 mL and the HGR value is 306.67 mL H<sub>2</sub>/gkat·min was measured. When the Co<sub>3</sub>O<sub>4</sub> nanocatalyst is used, the volume of hydrogen produced is 235 mL and the HGR value is 713.33 mL H<sub>2</sub>/gkat·min was measured. In conclusion, the Co<sub>3</sub>O<sub>4</sub> nanocatalyst shows a higher catalytic activity for NaBH<sub>4</sub> hydrolysis from Fe<sub>3</sub>O<sub>4</sub>. In addition, this study will provide higher hydrogen production by NaBH<sub>4</sub> hydrolysis of catalysts to be synthesized based on Co<sub>3</sub>O<sub>4</sub>.

**Keywords:** Hydrogen production, NaBH<sub>4</sub>, Co<sub>3</sub>O<sub>4</sub>, Fe<sub>3</sub>O<sub>4</sub>

#### GİRİŞ

Enerji ve enerji kaynakları ülkelerin ekonomik ve sosyal gelişimi açısından oldukça önemlidir. Bu enerji ihtiyacını karşılamak için birincil enerji kaynağı olarak çoğunlukla fosil yakıtlar kullanılmaktadır (Özkan ve ark., 2019). Ancak bu kaynakların yakın gelecekte tükenmesi ve sera gazlarının salınımından dolayı çevre kirliliğine sebep olması, temiz, güvenli, ekonomik ve verimliliği yüksek enerji kaynakları arayışını tetiklemiştir (Vernekar ve ark., 2012; Özkan ve ark., 2019).

Bu enerji kaynakları arasında Hidrojen (H<sub>2</sub>), çevre dostu doğası ve yüksek enerji yoğunluğu nedeniyle gelecek için alternatif bir enerji taşıyıcısı olarak kabul edilmektedir (Öztürk ve ark., 2018; Yang ve ark., 2021). Tüm avantajlarına rağmen hidrojene dayalı enerji teknolojisinin gelişmesi için üretim, depolama ve nakliye gibi sorunların çözülmesi gerekmektedir. Basınçlı hidrojen, katı hal hidrojen, kriyojenik sıvı, karbon malzemelerde adsorpsiyon, metal hidritler gibi çeşitli hidrojen depolama teknolojileri mevcuttur. Bu teknolojiler arasında

metal hidritler yüksek gravimetrik hidrojen depolama yoğunluklarına sahiptir (Dönmez ve Ayas, 2021). Bu metal hidritler; sodyum hidrit (NaH), sodyum alüminyum hidrit (NaAlH<sub>4</sub>), sodyum borohidrit (NaBH<sub>4</sub>), lityum hidrit (LiH), lityum alüminyum hidrit (LiAlH<sub>4</sub>), lityum borohidrit (LiBH<sub>4</sub>), kalsiyum hidrit (CaH<sub>2</sub>), kalsiyum borohidrit (Ca(BH<sub>4</sub>)<sub>2</sub>), magnezyum hidrit (MgH<sub>2</sub>), magnezyum borohidrit (Mg(BH<sub>4</sub>)<sub>2</sub>), potasyum hidrit (KH), potasyum borohidrit (KBH<sub>4</sub>)'tir (Izgi ve ark., 2019). Bu hidritlerin çoğu su ile çok hızlı reaksiyona girer. Diğer hidritlerle karşılaştırıldığında NaBH<sub>4</sub>, yüksek hidrojen kapasitesine (ağırlıkça %10,8) sahip olması, ekonomik olması, yanıcı olmaması, alkali çözeltilerde çok kararlı olması ve çevre dostu olması gibi avantajlara sahiptir. Ayrıca, NaBH<sub>4</sub> hidroliz işleminin yan ürünü (NaBO<sub>2</sub>) toksik değildir ve geri dönüştürülebilir (Yolcular ve Karaoglu, 2020). NaBH<sub>4</sub>'ün hidroliz reaksiyonu (Reaksiyon 1) aşağıdaki gibidir.

Bu çalışmada, sentezlenen Fe<sub>3</sub>O<sub>4</sub> ve ticari olarak satın alınan Co<sub>3</sub>O<sub>4</sub> nanokatalizörlerin NaBH<sub>4</sub> hidroliziyle hidrojen üretimleri incelenmiştir. Co<sub>3</sub>O<sub>4</sub> nanokatalizörün hidrojen üretimi için NaBH<sub>4</sub>, NaOH ve katalizör miktarları gibi parametreler optimize edilmiş ve en yüksek hidrojen miktarı veren parametreler belirlenmiştir. Ayrıca, optimum şartlarda bu iki nanokatalizörlerin hidrojen üretim miktarları karşılaştırılmıştır.

## MATERYAL VE METOT

### Kimyasallar

Reaksiyonlarda kullanılan tüm kimyasallar ve çözücüler analitik saflıktadır. Demir (III) klorür heksahidrat (FeCl<sub>3</sub>·6H<sub>2</sub>O, % 99.9, Merck), demir (II) klorür tetrahidrat (FeCl<sub>2</sub>·4H<sub>2</sub>O, % 98, Alfa Aesar), amonyak (NH<sub>3</sub>, % 28.0, İsolab), etanol (CH<sub>3</sub>CH<sub>2</sub>OH, % 99.9, İsolab), kobalt oksit (Co<sub>3</sub>O<sub>4</sub>, % 99.55, 48 nm) Nanografi şirketinden temin edildi.

### Fe<sub>3</sub>O<sub>4</sub> Manyetik Nanokatalizörün Sentezi

12 mmol FeCl<sub>3</sub>·6H<sub>2</sub>O ve 6 mmol FeCl<sub>2</sub>·4H<sub>2</sub>O bileşikleri iki boyunlu balona konularak 200 ml saf su eklendi ve karışım oda sıcaklığında 30 dakika boyunca karıştırıldı. Reaksiyon sıcaklığı 70 °C ye çıkartıldı. Karışım üzerine 50 mL 8 M NH<sub>3</sub> eklendi (Çözelti ilk başta turuncu renkte iken NH<sub>3</sub> eklenmesiyle siyah renge dönüştü). Oluşan siyah karışım 30 dakika daha karıştırıldı. Ardından karışım soğutuldu ve miktarın yardımıyla Fe<sub>3</sub>O<sub>4</sub> manyetik nanokatalizör ortamdan izole edildi. Manyetik nanokatalizör 4 defa saf suyla ve 2 defa etanolle yıkandı ve 70 °C'de 24 saat etüvde kurutma işlemi yapıldı (Kutluay ve ark., 2021).

### Karakterizasyon

Fe<sub>3</sub>O<sub>4</sub> manyetik nanokatalizör Fourier dönüşümü kızılötesi spektroskopisi (FTIR) spektrumu, Bruker Vertex 70 spektrometresi kullanılarak kaydedildi.

### Hidrojen Üretimi

Fe<sub>3</sub>O<sub>4</sub> ve Co<sub>3</sub>O<sub>4</sub> nanokatalizörlerin NaBH<sub>4</sub> hidroliziyle hidrojen üretim için 100 mL'lik yuvarlak tabanlı reaksiyon şişesine 75 mg NaBH<sub>4</sub> ve 25 mg nanokatalizörler ilave edildi. Hidroliz reaksiyonunu başlatmak için 25 °C'de bu reaksiyon şişesine 10 mL su ilave edildi ve 500 rpm'de çözelti karıştırıldı. Açığa çıkan hidrojen miktarı, tasarladığımız su dolu ters çevrilmiş bir gaz silindiri aracılığıyla Su-gaz yer değiştirme yöntemi kullanılarak zamana bağlı olarak kaydedildi. HGR, aşağıdaki formül kullanılarak belirlendi (Wei ve ark., 2020).

$$HGR = \frac{\text{mL H}_2}{\text{gkat} \times \text{zaman}} \quad (2)$$

Bu formülde, mL H<sub>2</sub>; üretilen hidrojen hacmi, gkat; kullanılan katalizör miktarı ve zaman ise reaksiyon süresiydi. Bu çalışmada, NaBH<sub>4</sub> (25, 50 ve 75 mg), NaOH (0 ve 20 mg), katalizör (10, 25 ve 50 mg) miktarları ve katalizör çeşidinin hidrojen üretimi üzerinde etkileri incelendi.

## BULGULAR ve TARTIŞMA

### Co<sub>3</sub>O<sub>4</sub> ve Fe<sub>3</sub>O<sub>4</sub> Nanokatalizörlerin Karakterizasyonu

Co<sub>3</sub>O<sub>4</sub> ve Fe<sub>3</sub>O<sub>4</sub> nanokatalizörlerde bağ oluşumunu analiz etmek için FTIR spektrumu kullanıldı ve bu nanokatalizöre ait sonuçlar Şekil 1 ve 2'de verildi. Bu nanokatalizörlerin FTIR spektrumu, 4000 ila 500 cm<sup>-1</sup> aralığında izlendi.

Co<sub>3</sub>O<sub>4</sub> nanokatalizörüne ait FTIR spektrumu incelendiğinde, 730 ve 830 cm<sup>-1</sup>'de ortaya çıkan iki güçlü ve keskin pik, bu nanokatalizörün doğrulanması olan metal oksit sallanma titreşimine karşılık gelen Co-O'nun

karakteristik bantlarına atfedilir. 3440 ve 1630  $\text{cm}^{-1}$ 'deki iki farklı titreşim bandı, adsorbe edilmiş su moleküllerinden kaynaklanan O-H gerilme ve bükülme titreşimlerine atfedilir (Şekil 1) (Packiaraj ve ark., 2019).

Şekil 1.  $\text{Co}_3\text{O}_4$  nanokatalizörüne ait FTIR spektrumu (Packiaraj ve ark., 2019).

$\text{Fe}_3\text{O}_4$  nanokatalizörüne ait FTIR spektrumu incelendiğinde, 560  $\text{cm}^{-1}$  civarındaki keskin pik, Fe-O bağıyla (gerilim titreşimi) ilişkilidir. 3400  $\text{cm}^{-1}$  civarındaki çok geniş pik, -OH (gerilim titreşimi) gruplarının varlığının bir göstergesidir (Şekil 2) (Kutluay ve ark., 2021).

Şekil 2.  $\text{Fe}_3\text{O}_4$  nanokatalizörüne ait FTIR spektrumu (Packiaraj et al., 2019; Kutluay et al., 2021)

### NaBH<sub>4</sub>'den Hidrojen Üretimi

NaBH<sub>4</sub> hidrolizi yoluyla hidrojen üretimi, NaBH<sub>4</sub> miktarı, alkalinite için kullanılan NaOH miktarı, reaksiyon sıcaklığı ve kullanılan katalizör miktarı gibi birçok faktörden etkilenir. Bu çalışmada, bu faktörlerin detaylı incelemesi yapılmıştır. Ayrıca, katalizör olarak kullanılan  $\text{Co}_3\text{O}_4$  ve  $\text{Fe}_3\text{O}_4$  nanokatalizörlerin hidrojen üretim miktarları kıyaslanmıştır.

### NaOH Miktarının Hidrojen Üretimine Etkisi

NaBH<sub>4</sub>'ün kendi kendine hidrolizini engellemek için NaBH<sub>4</sub> çözeltisine genellikle bir dengeleyici görevi görmesi için NaOH eklenir (Li ve ark., 2021). Bu nedenle, NaOH miktarındaki bir artışın hidroliz oranını düşürmesi beklenir (Huang ve ark., 2016).

Şekil 3, 25 °C'de 25 mg nanokatalizör, 50 mg NaBH<sub>4</sub> ve farklı miktarlarda NaOH kullanılarak hidrojen üretimlerini verir. NaOH miktarı 0'dan 20 mg kadar yükseltildiğinde, üretilen hidrojen hacmi dramatik bir şekilde 175'ten 20 mL'ye kadar düştüğü belirlendi (Şekil 3). NaOH miktarındaki bir artış hidrojen hacminin azalmasına neden olmuştur. Farklı miktarlardaki NaOH'in (0 ve 20 mg) HGR değerleri sırasıyla 612 ve 64 mL H<sub>2</sub>/gkat-dk. olarak belirlendi. HGR değerleri kıyaslandığında,  $\text{Co}_3\text{O}_4$  nanokatalizörünün NaBH<sub>4</sub> hidroliz reaksiyonunda NaOH'in kullanılmaması en yüksek HGR değeriyle sonuçlandı.

Şekil 3. Farklı miktarlardaki NaOH'in, NaBH<sub>4</sub> hidroliziyle hidrojen hacmi üzerindeki etkisi (Reaksiyon koşulları: 25 mg nanokatalizör, 50 mg NaBH<sub>4</sub>, 0 ve 20 mg NaOH ve 25 °C)

### NaBH<sub>4</sub> Miktarının Hidrojen Üretimine Etkisi

NaBH<sub>4</sub> miktarının Co<sub>3</sub>O<sub>4</sub> nanokatalizörü kullanılarak hidrojen üretimi üzerindeki etkisi, Şekil 4'te gösterilmektedir. Hidroliz reaksiyonu için başlangıç koşulları şunlardır: 25 mg Co<sub>3</sub>O<sub>4</sub> nanokatalizörü, 10 ml su ve 500 rpm karıştırma hızı ile 25°C'de 25-75 mg arasında değişen NaBH<sub>4</sub> miktarları kullanıldı.

NaBH<sub>4</sub> miktarı 25'ten 75 mg kadar yükseltildiğinde, üretilen hidrojen hacmi dramatik bir şekilde 99'dan 235 mL'ye kadar yükseldi. Şekil 4 incelendiğinde, 10 dk. kadar 50 mg NaBH<sub>4</sub> daha fazla hidrojen ürettiği belirlendi. Bunun nedeni, reaksiyon ortamında daha yüksek miktarda NaBH<sub>4</sub> kullanılması sonucu bir yan ürün olan NaBO<sub>2</sub> üretebilir, bu da katalizörün aktif bölgelerini bloke edebilir ve böylece daha düşük hidrojen hacmine neden olduğu söylenebilir. Ancak 10 dk. sonra NaBO<sub>2</sub> katalizör üzerindeki etkisi azaldığı için 75 mg NaBH<sub>4</sub> daha fazla hidrojen hacmi ürettiği belirlendi. NaBH<sub>4</sub> miktarındaki artış üretilen hidrojen hacminin artırılmasına faydalı olduğu görülmektedir.

Şekil 4. Farklı miktarlardaki NaBH<sub>4</sub>'ün, Co<sub>3</sub>O<sub>4</sub> katalizörü kullanılarak NaBH<sub>4</sub> hidrolizi yoluyla hidrojen hacmi üzerindeki etkisi (Reaksiyon koşulları: 25 mg nanokatalizör, 25, 50 ve 75 mg NaBH<sub>4</sub> ve 25 °C)

### Katalizör Miktarının Hidrojen Üretimine Etkisi

Şekil 5, aynı koşullar altında farklı Co<sub>3</sub>O<sub>4</sub> nanokatalizör miktarları (10 mg'dan 50 mg'a) için hidrojen üretimini göstermektedir. Nanokatalizör miktarı 10 mg'dan 50 mg kadar yükseltildiğinde, üretilen hidrojen hacmi dramatik bir şekilde 85'ten 235 mL'ye kadar yükseldi. Şekil 5 incelendiğinde, 5 dk. kadar farklı miktarlardaki nanokatalizörlerin üretilen hidrojen hacimleri birbirine yakın olduğu belirlendi. 5-14 dk. arasına kadar artan

katalizör miktarına bağlı olarak üretilen hidrojen hacimlerinde artış gözlemlendi. Bunun nedeni muhtemelen çözeltiye eklenen nanokatalizörün tamamen  $\text{NaBH}_4$ 'e maruz kalmış olmasıdır. 14 dk. sonra artan katalizör miktarına bağlı olarak üretilen hidrojen hacimlerinde azalış gözlemlendi. Bunun nedeni, nanokatalizör yapısının bozulmaya başladığı söylenebilir.

**Şekil 5.** Farklı miktarlardaki  $\text{Co}_3\text{O}_4$  katalizörü kullanılarak  $\text{NaBH}_4$  hidrolizi yoluyla hidrojen hacmi üzerindeki etkisi (Reaksiyon koşulları: 10, 25 ve 50 mg nanokatalizör, 75 mg  $\text{NaBH}_4$  ve 25 °C)

Farklı miktarlardaki nanokatalizörün (10, 25 ve 50 mg) HGR değerleri karşılaştırıldığında, 10 mg nanokatalizöre karşılık gelen HGR, 25 °C'de 425 mL  $\text{H}_2$ /gkat·dk. olarak belirlendi. Bununla birlikte, nanokatalizör miktarı 25 mg'a çıkartıldığında, hidrojen üretimi hızlandı ve 12 dakikada HGR değeri 713.33 mL  $\text{H}_2$ /gkat·dk. ulaştı. Nanokatalizör miktarı 50 mg'a çıkarıldığında, hidrojen üretimi 12 dakikada arttı, yine de 380 mL  $\text{H}_2$ /gkat·dk. gibi nispeten küçük bir HGR'ye neden olduğu belirlendi. Bu sonuçlar, daha yüksek bir nanokatalizör miktarının daha fazla  $\text{H}_2$  üretmek üzere  $\text{NaBH}_4$ 'ün hidrolizini kolaylaştırıyor gibi görünse de, fazla nanokatalizörün kullanımı nispeten düşük HGR'ye yol açabileceğini göstermektedir. Bunun nedeni muhtemelen eklenen nanokatalizörün tamamen  $\text{NaBH}_4$ 'e maruz kalmamış olması ve dolayısıyla nanokatalizörün sadece bir kısmının  $\text{NaBH}_4$  hidrolizinin katalizine katkıda bulunmasıdır. Bu sonuçlar ayrıca, 25 mg'lık nanokatalizör miktarının optimal miktar olduğu belirlendi.

### Katalizör Çeşidinin Hidrojen Üretimine Etkisi

$\text{Co}_3\text{O}_4$  nanokatalizörünün hidrojen üretimi için belirlenen optimum koşullarında bir başka nanokatalizör olan  $\text{Fe}_3\text{O}_4$ 'in hidrojen üretimi ve HGR değerleri belirlendi. Ayrıca, bu iki nanokatalizörün hidrojen üretimi ve HGR değerleri karşılaştırıldı.  $\text{Fe}_3\text{O}_4$  nanokatalizörünün hidrojen üretimi,  $\text{NaBH}_4$ 'ten çok yavaş salındığını ve hidrojen hacmi 14 dakikada 112 mL olarak belirlendi. Hidrojen üretim hızı ise 306.67 mL  $\text{H}_2$ /gkat·dk. olarak belirlendi.

$\text{Co}_3\text{O}_4$  nanokatalizörü kullanıldığında, hidrojen üretimi 14 dakika içinde 235 mL'ye ulaştığı ve hidrojen üretim hızı ise 713.33 mL  $\text{H}_2$ /gkat·dk. olarak belirlendi.  $\text{Co}_3\text{O}_4$  nanokatalizörü,  $\text{Fe}_3\text{O}_4$ 'in  $\text{NaBH}_4$ 'ün hidrolizinden daha hızlı olduğu belirlendi. Böylece,  $\text{Co}_3\text{O}_4$  nanokatalizörü,  $\text{NaBH}_4$ 'ün hidrolizini katalize edebildiğini ortaya çıkardı. Bu sonuçlara göre  $\text{Co}_3\text{O}_4$  nanokatalizörü,  $\text{Fe}_3\text{O}_4$ 'ten daha yüksek bir katalitik aktivite sergilediğini gösterir. Ayrıca, bu karşılaştırma aynı zamanda  $\text{Co}_3\text{O}_4$  bazlı malzemelerin üretilmesi ve bunların kullanımı hidrojen üretimi için  $\text{NaBH}_4$  hidrolizini katalize etmek için gelecek vaat eden avantajlı bir malzeme olarak görüldüğünü doğrular.

**Şekil 6.** Farklı nanokatalizörler kullanılarak NaBH<sub>4</sub> hidroliziyle hidrojen hacmi üzerindeki etkisi (Reaksiyon koşulları: 25 mg nanokatalizör, 75 mg NaBH<sub>4</sub>, ve 25 °C)

Tablo 1 ile karşılaştırıldığında, Co<sub>3</sub>O<sub>4</sub> nanokatalizörü tarafından katalize edilen NaBH<sub>4</sub>'ün hidrolizi, literatürdeki ticari Co<sub>3</sub>O<sub>4</sub> katalizörüne yakın bir HGR değeri gösterdiği belirlendi. Ayrıca, Co<sub>3</sub>O<sub>4</sub> nanokatalizörü, diğer Co<sub>3</sub>O<sub>4</sub> katalizörler ve bu katalizörlere bağlı yapılardan daha düşük bir HGR gösterdiği belirlendi. Bunun nedeni literatürdeki Co<sub>3</sub>O<sub>4</sub> katalizörlerinin yapı şekli ve katalizöre bağlı olan yapılardan dolayı olduğu söylenebilir. Bu da Co<sub>3</sub>O<sub>4</sub> katalizörüne bağlanacak grubun HGR artışına sebep olacağını gösterir (Tablo 1). Fe<sub>3</sub>O<sub>4</sub> nanokatalizörü Tablo 1 ile karşılaştırıldığında, Fe<sub>3</sub>O<sub>4</sub> bazlı katalizörlerden daha düşük bir HGR sahip olduğu belirlendi. Fe<sub>3</sub>O<sub>4</sub> nanokatalizörü de Co<sub>3</sub>O<sub>4</sub> katalizörü gibi bir yapı bağlandığında HGR değerinde bir artış olduğu belirlendi (Tablo 1). Böylece, Her iki Fe<sub>3</sub>O<sub>4</sub> ve Co<sub>3</sub>O<sub>4</sub> nanokatalizörlerine farklı yapılar bağlanarak daha yüksek HGR değerleri elde edilebilir.

**Tablo 1.** NaBH<sub>4</sub> hidrolizi ile hidrojen üretimi için kullanılan çeşitli katalizörlerin karşılaştırılması

Katalizör	Sıcaklık (°C)	HGR (ml H <sub>2</sub> / gkat·dk.)	Kaynaklar
Ticari Co <sub>3</sub> O <sub>4</sub>	25	860	(Krishnan ve ark., 2008)

Fe <sub>3</sub> O <sub>4</sub>	25	306.67	Bu çalışmada

## SONUÇ

Bu çalışmada, ticari olarak satın alınan Co<sub>3</sub>O<sub>4</sub> ve Fe<sub>3</sub>O<sub>4</sub> nanokatalizörü basit, güvenilir ve ucuz bir proses ile başarılı bir şekilde hazırlanmıştır. Co<sub>3</sub>O<sub>4</sub> ve Fe<sub>3</sub>O<sub>4</sub> nanokatalizörleri alkali çözeltilerde NaBH<sub>4</sub> hidrolizinden hidrojen üretimi için kullanılır. Co<sub>3</sub>O<sub>4</sub> nanokatalizörünün HGR üzerindeki etkisini belirlemek için NaBH<sub>4</sub>, NaOH ve katalizör miktarları incelenmiştir. Ayrıca, Co<sub>3</sub>O<sub>4</sub> ve Fe<sub>3</sub>O<sub>4</sub> nanokatalizörlerinin HGR değerleri karşılaştırılmıştır. Co<sub>3</sub>O<sub>4</sub> nanokatalizörü için 75 mg NaBH<sub>4</sub>, 25 mg katalizör, 10 ml saf su kullanılması ve reaksiyonda NaOH kullanılmamasıyla en yüksek HGR değeri elde edilmiştir. Elde edilen maksimum HGR

değeri 713.33 mL H<sub>2</sub>/gkat-dk. olarak bulunmuştur. Fe<sub>3</sub>O<sub>4</sub> nanokatalizörünün HGR değeri ise 306.67 mL H<sub>2</sub>/gkat-dk. olarak bulunmuştur. HGR değerleri literatürde bildirilen değerlerle karşılaştırılabilir. NaBH<sub>4</sub> hidrolizi yoluyla hidrojen üretimi için ekonomik ve büyük ölçekli Co<sub>3</sub>O<sub>4</sub> ve Fe<sub>3</sub>O<sub>4</sub> bazlı nanokatalizörlerinin üretimi, hidrojeni ana yakıt kaynağı yapmak için çok daha basit ve daha ticari bir süreç sunar.

#### Abstract

Climate change profoundly affects aquatic ecosystems, with consequential impacts on hydrobiology and global biodiversity. This review elucidates the multifaceted relationships between climate change, aquatic ecosystem health, and human society. By synthesizing current research and case studies, it extensively examines the physical impacts of climate change, including sea level rise, temperature fluctuations, and extreme weather events on aquatic environments. The review includes the ecological responses, identifying key areas such as the effects on aquatic organisms, habitat alteration, spread of invasive species, and water quality changes. Economic and social implications are also critically evaluated, focusing on fisheries, aquaculture, water provision, and recreational and cultural values. An in-depth analysis of adaptation and mitigation strategies, technological solutions, and policy recommendations is also presented to address these challenges. Hydrobiology, as the nexus of the study, offers critical insights into the interactions and complexities within aquatic ecosystems, underscoring the vital role of water organisms in maintaining ecosystem functions. Through the lens of hydrobiology, the review emphasizes the necessity for a comprehensive approach to understanding, predicting, and managing the changes occurring in aquatic environments. This review is a foundational resource for researchers, policymakers, environmental managers, and other stakeholders, aiming to foster informed decisions and effective strategies for conserving and sustainably managing aquatic ecosystems in the face of climate change. By highlighting the interconnectedness of climate, water, biology, and human society, it underscores the urgent need for integrative and collaborative efforts to protect the vitality and resilience of our planet's aquatic life.

**Keywords:** Aquatic ecosystems, Climate change, Hydrobiology, Mitigation.

#### INTRODUCTION

Climate change, stemming from increased greenhouse gas emissions, severely impacts aquatic environments, including oceans, lakes, rivers, and wetlands (Harley et al., 2006). These systems are susceptible to temperature shifts, altered precipitation patterns, and sea-level changes. The field of hydrobiology, which examines biological phenomena within aquatic settings, is vital in understanding these effects. It aids in exploring the complex relationships shaping aquatic ecosystems and their responses to climate change. This review analyzes the multifaceted consequences of climate change on aquatic ecosystems by focusing on the interplay between hydrobiology and ecology. By synthesizing current research and case studies, the review aims to contribute to developing strategies for adapting and conserving these crucial systems and informing policy and management. It underscores the urgency in understanding and safeguarding aquatic ecosystems in a rapidly changing climate, recognizing their vital role in human sustenance and livelihood, including migration (Çelekli et al., 2023).

#### MATERIALS AND METHODS

This review's methodological approach offers a comprehensive view of the relationship between climate change and aquatic ecosystems. Using multiple databases like PubMed, Web of Science, and Google Scholar, and government reports and conference proceedings, a meticulous search was conducted with keywords related to hydrobiology, ecology, and aquatic ecosystems. Studies were chosen based on relevance, publication date within the last twenty-five years, and English availability. Exclusions were made for non-aligned materials, and quality assessment ensured methodological rigor. The data extraction involved gathering critical information, leading to thematic synthesis across physical impacts, biodiversity, water quality, socio-economic impacts, and adaptation strategies. Comparative analysis was used to cross-validate findings across studies and

regions, guided by systematic review protocols, providing an integrative view of current knowledge. The review synthesizes existing research and sets the stage for future inquiries, policy-making, and practical interventions, forming a solid base to understand and tackle aquatic ecosystems' challenges.

## **PHYSICAL IMPACTS OF CLIMATE CHANGE**

### **Sea Level Changes**

One of the most observable physical impacts of climate change on aquatic ecosystems is the alteration in sea levels. Rising sea levels, attributed to the melting of polar ice caps and the thermal expansion of seawater, have profound implications for coastal ecosystems; these changes threaten to inundate coastal habitats, erode shorelines, increase salinity in estuaries, and create more frequent and severe coastal flooding (Hallegatte et al., 2011).

### **Water Temperature Fluctuations**

Water temperature is a critical factor in determining the health and function of aquatic ecosystems. Climate change has led to noticeable water temperature fluctuations in marine and freshwater environments. Warming waters can affect metabolic rates, breeding cycles, and migration patterns of aquatic organisms; for example, increased temperatures can cause corals to bleach, disrupt fish migration routes, and alter the distribution of phytoplankton, which is the basis of many aquatic food webs and is of economic and biotechnological importance, such as the removal of harmful dyes (Çelekli et al., 2011; Doney et al., 2012; Frederick & Major, 1997; Zariç et al., 2022).

## **BIODIVERSITY AND ECOSYSTEM RESPONSES**

### **Effects on Aquatic Organisms**

Climate change's physical impacts trigger biological responses in aquatic ecosystems. Warming waters and other altered environmental conditions directly affect species by challenging their physiological limits, leading to differences in reproduction, survival, and behavior (Reid et al., 2019). Fish and invertebrate species migrate to calmer waters, forming new community structures. Some species suffer from increased mortality rates due to thermal stress (Sebens, 1994). Warmer water temperatures can cause coral reef bleaching, a stress response that can lead to coral mortality and the subsequent decline of species dependent on coral habitats (Lough, 2000). Changes in water temperature and pH levels influence phytoplankton and zooplankton dynamics, affecting food availability for higher trophic levels (Strecker et al., 2004).

### **Habitat Loss and Alteration**

The physical changes brought about by climate change often lead to significant alterations or even complete loss of critical habitats. Rising sea levels and increased storm surges can erode or inundate coastal wetlands, vital for many fish and bird species (Fujii, 2012). Melting ice in polar regions jeopardizes species relying on ice-covered areas, including specific seals, penguins, and polar bears (Ainley et al., 2003).

### **Spread of Invasive Species**

Altered conditions favor non-native species, enabling them to outcompete natives. In freshwater ecosystems, invasive species may thrive in warmer temperatures; in marine systems, changes in currents and temperatures can spread invasives, disrupting local ecology (Dukes & Mooney, 1999). These profound and complex impacts lead to intricate biological responses that vary across ecosystems (Kernan, 2015). Preserving aquatic life's diversity and ecological functions requires collaboration across various scientific fields. Research sheds light on strategies to protect and manage these creatures. Dealing with the effects of climate change on water health requires cooperation among different disciplines, governments, industries, and communities. This collaboration aims to develop adaptive strategies to sustain water resources.

### **Changes in Water Quality**

Extreme weather events, such as intense rainfall, can cause increased runoff from agricultural and urban areas, carrying pollutants like nutrients, pesticides, and heavy metals into water bodies (Agrawal, 1999). Floods can also increase sedimentation, which may smother sensitive habitats like coral reefs and seagrass beds; increased nutrient loads can lead to eutrophication, where excessive algae growth depletes oxygen levels in the water, leading to "dead zones" where aquatic life cannot survive (van Beusekom, 2018).

## **Chemical Alterations**

Ocean Acidification: Increased atmospheric CO<sub>2</sub> leads to higher concentrations of carbonic acid in oceans, lowering pH levels. This ocean acidification affects organisms that rely on calcium carbonate for their shells and skeletons, such as mollusks and corals (Guinotte & Fabry, 2008). Changes in temperature and flow regimes can also affect the chemical composition of rivers and lakes, potentially influencing the availability of essential nutrients and the concentration of harmful substances.

## **ECONOMIC AND SOCIAL IMPACTS**

The impact of climate change on aquatic ecosystems goes far beyond just the environment; it also profoundly affects human communities and economies. The way climate, water, living organisms, and human actions are interconnected creates complicated problems but also opportunities. This means that changes in the climate can have widespread effects on everything from the water we drink to the economy we rely on, and it requires careful consideration and planning to manage these interconnected challenges.

### **Fisheries and Aquaculture**

Changes in water temperature and currents can cause fish populations to shift, affecting local fisheries and potentially leading to conflicts over fishing rights and territories (Munday et al., 2008). Coastal communities dependent on fishing may face significant economic challenges if fish stocks decline or move to different areas. Climate-related water quality and temperature changes may affect aquaculture operations, influencing growth rates and increasing disease susceptibility.

### **Effects on Tourism and Recreation**

Rising sea levels and increased storm activities may threaten coastal tourist destinations, impacting local economies heavily dependent on tourism (Scott et al., 2012). Using the climate change process in biological urbanization engages nature-environment communication (Çelekli et al., 2023). Changes in water quality and biodiversity loss may diminish the appeal of lakes, rivers, and coastal areas for recreational activities such as fishing, boating, and diving.

### **Water Security and Public Health**

Water quality and availability changes affect drinking water supplies, necessitating costly treatment or transportation and impacting human health (Mishra, 2023). Altered ecosystems can influence the spread of waterborne diseases, potentially creating new public health challenges.

## **ADAPTATION AND MITIGATION STRATEGIES**

Adaptation strategies are plans that help us get used to the new conditions created by climate change. They aim to reduce any adverse effects and take advantage of possible benefits. In other words, these strategies help us prepare for and respond to changes in the climate so that we can lessen the damage and find new ways to thrive.

### **Ecosystem-Based Approaches**

Restoring and preserving natural barriers such as mangroves and wetlands to enhance coastal resilience.

### **Flexible Water Management**

Adaptive water management plans for ensuring sufficient water quality and quantity under changing climatic conditions.

### **Community Engagement**

Involving local communities in decision-making for culturally appropriate and effective local adaptation.

### **Mitigation Strategies**

Mitigation strategies tackle the root causes of climate change, aiming to reduce emissions or enhance the sinks of greenhouse gases.

### **Sustainable Fisheries Management**

Implementing energy-efficient fishing methods and sustainable aquaculture practices.

## **Renewable Energy Transition**

Transitioning from fossil fuels to renewable energy sources in water management and related sectors.

## **Carbon Sequestration in Aquatic Ecosystems**

Protecting and restoring blue carbon ecosystems for significant CO<sub>2</sub> sequestration.

## **Integrating Adaptation and Mitigation**

A holistic approach integrating adaptation and mitigation can create more resilient and sustainable pathways.

## **Policy Integration**

Incorporating climate considerations at all levels of policy-making for coordinated strategies.

## **Cross-Sector Collaboration**

Engaging various sectors for cohesive, comprehensive solutions.

## **Investment in Research and Technology**

Supporting research and innovation in climate science, ecology, and technology. The challenges of climate change in aquatic ecosystems require thoughtful, targeted adaptation and mitigation strategies. From ecosystem-based approaches to policy integration, these strategies offer pathways to resilience, vulnerability reduction, and sustainability. The collaborative, integrative, and forward-thinking approaches outlined here can create a future where human societies and aquatic ecosystems flourish in a changing climate.

## **CASE STUDIES**

### **Mangrove Restoration in Vietnam**

Coastal erosion and increased storm surges due to climate change threatened local communities.

Strategy: Restoration and protection of mangrove forests to act as natural barriers.

Outcome: Enhanced coastal resilience, protection of livelihoods, and additional benefits in biodiversity conservation (Tri et al., 1998).

### **Sustainable Fisheries Management in Iceland**

Challenge: Overfishing and changing fish migration patterns influenced by climate change.

Strategy: Implementing quota systems and leveraging technology for real-time data collection and adaptive management.

Outcome: Sustainable fish stocks, economic stability for fishing communities, and a model for other nations (Chambers & Kokorsch, 2017).

### **Adaptive Water Management in Australia's Murray-Darling Basin**

Challenge: Severe drought and altered precipitation patterns affecting water availability.

Strategy: Flexible water allocation policies, stakeholder engagement, and climate-informed planning.

Outcome: Improved water efficiency, support for agricultural sectors, and enhanced ecosystem health (Connell & Grafton, 2011).

### **Carbon Sequestration in the Blue Carbon Project, Indonesia**

Challenge: Loss of carbon-sequestering ecosystems like mangroves and seagrass beds.

Strategy: Community-led conservation and restoration projects to enhance carbon sinks.

Outcome: Significant carbon sequestration, improved local livelihoods, and increased biodiversity (Sejati et al., 2020).

### **Climate-Resilient Tourism in the Maldives**

Challenge: Rising sea levels and coral bleaching threaten tourism.

Strategy: Investments in coral reef restoration, sustainable tourism practices, and infrastructure adaptation.

Outcome: Preservation of the tourism industry, enhanced environmental stewardship, and global recognition as a leader in climate adaptation (Kagawa, 2022).

These case studies illuminate the real-world applications and successes of adaptation and mitigation strategies in addressing the challenges of climate change in aquatic ecosystems. They highlight the importance of context-specific solutions, interdisciplinary collaboration, community engagement, and innovative thinking. Moreover, they demonstrate that addressing climate change's impacts is about averting crises and seizing opportunities for sustainability, resilience, and social equity. By learning from these examples and scaling up similar efforts, we can foster a future where human communities and aquatic ecosystems thrive harmoniously with our changing climate.

## **PREDICTIONS AND RECOMMENDATIONS FOR THE FUTURE**

As we move into the 21st century, climate change's effects on aquatic ecosystems will unfold in complex and interconnected ways. While there are uncertainties, several predictions can be made, and corresponding recommendations can guide our approach:

### **Increased Climate Variability**

More frequent and severe weather events are likely, affecting water quality, availability, and ecosystem stability.

### **Continued Shifts in Biodiversity**

Changes in temperature and chemistry will continue to alter species distributions and interactions within aquatic ecosystems.

### **Growing Socio-Economic Pressures**

Coastal communities and those dependent on fisheries and aquaculture will likely face increasing economic challenges.

### **Technological and Policy Innovations**

As awareness and understanding grow, expect increased innovation in technology and policy aimed at mitigation and adaptation.

### **Invest in Research and Monitoring**

Continuous research and monitoring of aquatic ecosystems are crucial for understanding ongoing changes and implementing timely responses.

### **Promote Cross-Sector Collaboration**

Encourage collaboration between governments, industries, researchers, and communities for comprehensive and integrative solutions.

### **Strengthen Local Community Engagement**

Empower local communities through education, resources, and active participation in decision-making processes.

### **Implement Adaptive Management Strategies**

Develop flexible, adaptive management plans that can be adjusted as new information and conditions emerge.

### **Prioritize Sustainable Development**

Balance ecological conservation with economic development, focusing on long-term sustainability rather than short-term gains. The future of our aquatic ecosystems in the face of climate change is fraught with challenges, but it is also ripe with opportunities for innovation, collaboration, and transformation. The predictions and recommendations provided here offer a roadmap for navigating these complexities. Investing in research, fostering collaboration, engaging communities, adopting adaptive management, and prioritizing sustainability can construct a resilient and flourishing future for aquatic ecosystems and human societies. The task is substantial but within our reach with concerted effort, thoughtful planning, and a commitment to shared values and goals. The future of our aquatic ecosystems depends on our collective willingness to understand, adapt, innovate, and act with foresight, compassion, and wisdom.

## RESULTS and DISCUSSION

In our exploration of climate change's multifaceted impacts on aquatic ecosystems, we synthesized a wide array of information from diverse disciplines such as hydrobiology, ecology, and economics. Our study's key findings include the physical alterations in aquatic environments, such as changes in temperature, salinity, and circulation patterns, which have significant and cascading consequences for both ecosystem health and human welfare. Climate change is leading to alterations in species distribution, abundance, and behavior, resulting in shifts in ecosystem structure and function. Our analysis identified significant alterations in water quality parameters such as nutrient loading, oxygen levels, and contaminant concentrations, potentially affecting human health and ecosystem sustainability. The economic ramifications of climate-induced changes in aquatic ecosystems have far-reaching impacts, affecting fisheries, tourism, and water supply, and disproportionately impacting marginalized communities. A range of successful case studies demonstrated effective, regionally-tailored adaptation and mitigation strategies that are not mutually exclusive but work most effectively when integrated. The complexity of climate change effects on aquatic ecosystems makes the development of a holistic and flexible strategy essential. Our findings underscore the urgency and shared responsibility to act. The success of adaptation and mitigation strategies depends on a nuanced understanding and tailored approaches to specific regional and community contexts. Solutions must align with both ecological imperatives and the social and economic realities of affected communities, recognizing the deeply interconnected nature of these systems. The case studies examined provide tangible blueprints for action, highlighting the need for innovation, investment, and cross-sector collaboration. Our research is more than an academic exercise; it represents a profound call to responsible stewardship and sustainable development. In conclusion, the complex interconnections within our planet's aquatic ecosystems necessitate a unified and mindful approach. The findings of this study function both as a comprehensive guide and a call to action for aligning future development with the fragile beauty of these ecosystems. The decisions made today will determine the legacy left to future generations, posing both significant challenges and unique opportunities to create a sustainable and harmonious relationship with our aquatic environment.

## CONCLUSION

Our study of aquatic ecosystems highlights the urgent need for a multifaceted approach, blending empathy, innovation, and stewardship. Reflecting fragility and resilience, these systems symbolize our interconnected fate with nature. Beyond scientific and economic considerations, we underscore a moral imperative to protect and sustain these vital resources. The human potential for positive change is evident in our capacity to adapt and innovate. Recommendations include the continued interdisciplinary research, community involvement, and aligned policies aimed at preserving the aquatic resources that sustain our planet. In embracing these principles, we commit to a future that honors the intricate balance of life, recognizing our shared responsibility to foster a sustainable world where human civilization and aquatic ecosystems can flourish.

#### Özet

FIBAN AK-22-1 anyon değiştirici fiberler kullanılarak sulu çözeltilerden Cr(VI)'nin değişen pH, temas süresi, başlangıç Cr(VI) konsantrasyonu, adsorban dozajı ve sıcaklıkta gibi parametreler ile kesikli adsorpsiyonu incelenmiştir. Anyon değiştirici fiber tarafından Cr(VI) adsorpsiyonu için optimum pH aralıkları 1.0-2.0 olarak bulunmuştur. Anyon değiştirici fiber için maksimum Cr(VI) adsorpsiyonu 30 dakikada meydana gelmiştir. Fiber tarafından Cr(VI) tutumu kinetiği, ikinci dereceden kinetik modeli ile gerçekleşmiştir. Adsorpsiyon izotermi, Langmuir, Freundlich ve üç parametrelili Redlich-Peterson modelleri kullanılarak analiz edilmiştir. Adsorpsiyon için termodinamik parametreler (serbest enerji değişimi  $\Delta G^\circ$ , entropi değişimi  $\Delta S^\circ$  ve entalpi değişimi  $\Delta H^\circ$ ) da değerlendirilmiştir. Sıcaklıktaki artış, Cr(VI)'nin anyon değiştirici fiber tarafından adsorplanması için denge sabitinin (Kc) değerinde bir artışa neden olmuştur.

**Anahtar Kelimeler:** Anyon değiştirici fiber; Adsorpsiyon; Krom

#### Removal of Cr(VI) from aqueous solution by FIBAN AK-22-1 anion exchange fiber

#### Abstract

By using FIBAN AK-22-1 anion exchange fibers, batch adsorption of Cr(VI) from aqueous solutions with parameters such as changing pH, contact time, initial Cr(VI) concentration, adsorbent dosage and temperature was investigated. The optimum pH ranges for Cr(VI) adsorption by the anion exchange fiber were found to be 1.0-2.0. Maximum Cr(VI) adsorption for the anion exchange fiber occurred at 30 minutes. The kinetics of Cr(VI) uptake by the fiber was realized with the second order kinetic model. Adsorption isotherms were analyzed using Langmuir, Freundlich and three parameter Redlich-Peterson models. Thermodynamic parameters (free energy change  $\Delta G^\circ$ , entropy change  $\Delta S^\circ$  and enthalpy change  $\Delta H^\circ$ ) for adsorption were also evaluated. The increase in temperature caused an increase in the value of the equilibrium constant (Kc) for Cr(VI) to be adsorbed by the anion exchange fiber.

**Keywords:** Anion exchange fiber; Adsorption; Chromium

#### GİRİŞ

Deri tabaklama, metalürji, galvanik kaplama vb. gibi çeşitli endüstrilerde kromun yaygın kullanımı, kromun çevreye salınmasına neden olmuştur. Bu endüstrilerden üretilen atık sularındaki Cr(VI) varlığı, sağlık ve çevre üzerindeki zararlı etkilerinden dolayı günümüzde önemli bir endişe haline gelmiştir.  $\text{HCrO}_4^-$ ,  $\text{Cr}_2\text{O}_7^{2-}$  ve  $\text{CrO}_4^{2-}$  gibi Cr(VI) türlerinin oksitleme potansiyeli onları bakteri, bitki ve hayvanlar için oldukça toksik hale getirir [ATSDR, 2000; Edebali ve Pehlivan, 2010]. Cr(VI)'nin iç yüzey sularına deşarj limiti 0,1 mg/L'dir. İçme suyu için maksimum Cr(VI) kirletici seviyesi 0,05 mg/L'dir [US EPA, 1990]. Bu nedenle sulardan Cr(VI) giderimi çevre sağlığı açısından önemlidir. Geri kazanım için farklı metodolojiler (yani, iyon değişimi [Göde ve Pehlivan, 2005], solvent ekstraksiyonu [Venkateswaran ve Palanivelu, 2004], dağılmayan solvent ekstraksiyonu [Alonso ve ark. 1999], membran bazlı yöntemler [Hafiane ve ark., 2000; Cengeloglu ve ark., 2003; Tor ve ark., 2004; Yılmaz ve ark., 2008; Arslan ve ark., 2009; Venkateswaran ve Palanivelu, 2005] ve adsorpsiyon [Kobya, 2004; Khezami ve Capart, 2005; Arslan ve ark., 2010] kullanılmıştır. veya Cr(VI)'nin sulu çözeltilerden çıkarılması. Bununla birlikte, iyon değişimi dışındaki bu tekniklerin, eksik metal giderimi, pahalı ekipman ve izleme sistemi gereksinimleri, yüksek reaktif veya enerji gereksinimleri veya bertaraf edilmesi

gereken toksik çamur veya diğer atık ürünler gibi önemli dezavantajları vardır [Dragan ve ark., 2003]. Son yıllarda, bir tip adsorban olarak cleating ve iyon değiştirici fiberler, geniş özgül yüzey, yüksek şişme kapasitesi, mükemmel mekanik dayanım gibi avantajları nedeniyle su ve atık sudan anyonların uzaklaştırılması için yaygın olarak kullanılmaktadır. Örneğin, Liu ve ark. (1999) atık sudan Cu(II), Zn(II), Cd(II) ve Hg(II)'nin poli(akrilaminofosfonik)-tipi şelatlama fiber ile uzaklaştırılmasını incelediler. Park ve Na (2006), akrilik asitle aşılansız polipropilen dokunmamış fiber ve iyon değiştirme özelliğinin aminasyonu ile bir anyon değiştirici fiberin hazırlanmasını bildirmiştir. Huang ve ark. (2009), kimyasal olarak modifiye edilmiş kavak ağacı fiberleri tarafından bakırın emilmesini tanımlamıştır. Başka bir çalışmada Zhang ve ark., (2008) tarafından güçlü bir bazik anyon değiştirici hazırlanmış, stirenin poli(tetrafloroetilen) fiber üzerine radyasyona bağlı aşılansızına göre  $Cr_2O_7^{2-}$  ve  $MnO_4^{2-}$  için adsorplama özelliği incelenmiştir. Bu çalışmanın temel amacı, aminokarboksil grubu içeren FIBAN AK-22-1 iyon değiştirici fiberle sulu çözeltiden Cr(VI) giderimi için denge ve kinetik parametrelerinin araştırılmasıdır. Başlangıç Cr(VI) konsantrasyonu, temas süresi, pH, fiber miktarı ve sıcaklık gibi adsorpsiyonu etkileyen parametreler araştırılmış ve sonuçlar tartışılmıştır.

## MATERYAL VE METOT

Bu çalışmada kullanılan FIBAN AK-22-1 anyon değiştirici fiber Eichrom Technologies Inc.'den (Ecofil, Minsk, Beyaz Rusya) satın alınmıştır. Fiberin temel fiziko-kimyasal özellikleri Tablo 1'de verilmiştir. Cr(VI) stok solüsyonu,  $K_2CrO_4$ 'ün çift damıtılmış suda çözülmesiyle hazırlandı. Kullanılan tüm kimyasallar analitik derecedeydi ve Merck Co.'dan (Darmstadt, Almanya) temin edildi. Deneyler boyunca tüm çözeltileri hazırlamak için çift damıtılmış su kullanıldı.

**Tablo 1.** FIBAN AK-22-1 anyon değiştirici fiberin özellikleri ve türleri

FIBAN AK-22-1 anyon değiştirici fiber	
Tip	Zayıf baz anyon değiştirici
Matrix	Poliakrilonitrilik fiber
Fonksiyonel grup	-NH <sub>2</sub> , -COOH
Sevk edilen iyonik form	H <sup>+</sup> , Cl <sup>-</sup>
Amino üzerinde toplam değişim kapasitesi	-3.8 meq/g
-COOH	-1.0 meq/g üzerinde
Stabilite (pH aralığında)	1-8
Nem tutma kapasitesi	%80

### Kesikli adsorpsiyon deneyleri

Cr(VI) çözeltileri, stok çözelti ( $K_2CrO_4$ 'ten hazırlanan 1000 mg/L Cr(VI)) istenen konsantrasyonlara seyreltilerek hazırlandı. İyonmetre (Orion EA940, ABD) kullanılarak belirlenen çözeltilerin pH'ları 0,1 M NaOH veya 0,1 M HCl çözeltileri ile istenilen düzeye getirildi. Deneyler, bilinen miktarda fiberle 20 mL Cr(VI) solüsyonunda sıcaklık kontrollü orbital çalkalayıcıda (Gallenkamp, UK) 220 rpm'de ve  $25 \pm 1$  °C'de denge süresi boyunca çalkalanmasıyla kesikli sorpsiyon tekniğine göre gerçekleştirilmiştir. Daha sonra solüsyon Whatman No.42 filtre kağıdından süzüldü. Temas süresinin (5-240 dakika), başlangıç Cr(VI) konsantrasyonunun (5-1000 mg/L) ve adsorbent miktarının (1.5-10 g/L) ve sıcaklığın (25-65 °C) etkileri de incelenmiştir. FIBAN AK-22-1 anyon değiştirici fiber. Adsorplanan Cr(VI) miktarı Denk. (1).

$$q = (C_o - C_e) \cdot V/m \quad (1)$$

Burada q, Cr(VI) emilir (mg/g);  $C_o$ , Cr(VI)'nin başlangıç konsantrasyonu (mg/L);  $C_e$ , dengede çözeltideki Cr(VI) konsantrasyonu (mg/L); V, çözelti hacmi (L); m, fiber dozajı (g). Cr(VI) konsantrasyonu, hava-asetilen alevinde Atomik Adsorpsiyon Spektrometresi (ContrAA 300, Analytik jena) kullanılarak belirlendi. Tüm deneyler, iki kopya veya üç kopya halinde gerçekleştirildi ve bir deney aralığı içindeki tekrar numuneler arasındaki varyasyonlar %3'ten azdı.

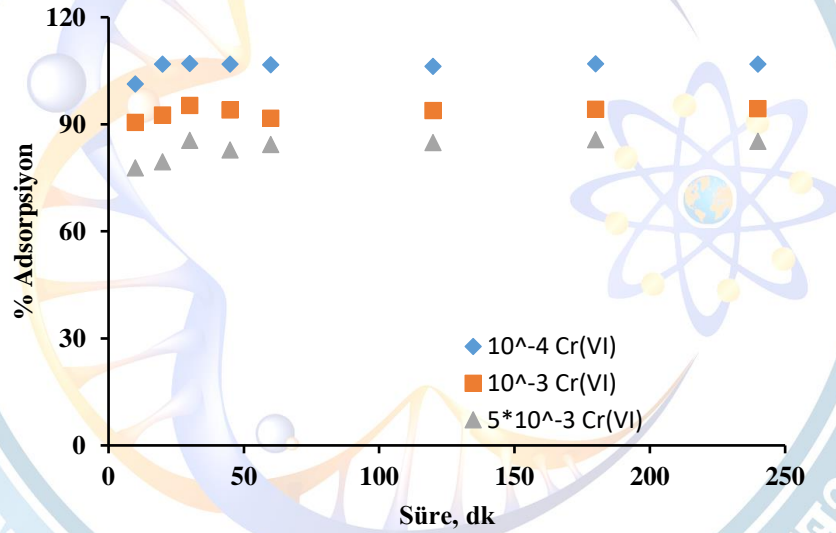

## BULGULAR ve TARTIŞMA

### Temas süresinin ve kinetik değerlendirmenin etkisi

Temas süresinin bir fonksiyonu olarak Cr(VI)'nın anyon deęiřimli fiber tarafından uzaklařtırılması Őekil 1'de gsterilmektedir. Anyon deęiřtirici fiber iin sorpsiyon dengesine 30 dakikada ulařılmıřtır. Ayrıca denge sresinin ilk Cr(VI) konsantrasyonuna baęlı olmadığı da bulundu. Barassi ve ark., (2009) gre adsorban yzeyindeki fonksiyonel grubun konsantrasyonu, yalancı ikinci dereceden kinetik model aracılıęıyla kimyasal adsorplama hızının deęerlendirilmesine izin verir. Bu nedenle, deneysel veriler Denklem. (2) [Ho ve McKay, 1999] gre deęerlendirilmiřtir.

$$t/qt = 1/(k_2 \cdot q_e^2) + t/q_e \quad (2)$$

$q_e$  ve  $qt$  sırasıyla dengede ve  $t$  zamanında (dk) emilen Cr(VI) miktarları (mg/g) olduęunda,  $k_2$  yalancı ikinci dereceden kemisorpsiyonun hız sabitidir (g/(mg.dk)). İncelenen konsantrasyonlar iin, hız sabiti ( $k_2$ ) ve teorik denge sorpsiyon kapasiteleri,  $q_e$  (hesaplanan), szde ikinci dereceden kinetik modelin lineer izimlerinin eęiminden ve kesiřme noktasından hesaplandı ve Tablo 2'de verildi. belirleme ( $R^2$ ) ve teorik ve deneysel  $q_e$  deęerleri, Cr(VI)'nın anyon deęitirici fiber tarafından adsorplamasının ikinci dereceden tip reaksiyon kinetięini takip ettięini gsterdi (Tablo 2).

**Őekil 1.** Temas sresinin FIBAN AK-22-1 anyon deęiřtirici fiber tarafından Cr(VI) adsorpsiyonuna etkisi (bařlangı Cr(VI) konsantrasyonu): 5, 50 ve 250 mg/L; fiber miktarı: 2,5 g /L, zelti pH'ı: 1,0, sıcaklık: 25±1 C; alkalama hızı: 220 rpm).

**Tablo 2.** Yalancı ikinci dereceden kinetik model iin adsorpsiyon hızı sabiti deęerleri.

FIBAN AK-22-1 anyon deęiřtirici fiber			
	5 mg/L	50 mg/L	250 mg/L
$q_e$ (hesaplanan) (mg/g)	2.085	19.646	89.285
$q_e$ (deneysel) (mg/g)	2.512	20.105	90.251
$k_2$ [g/(mg. min)]	1.44	0.116	0.010
$R^2$	0.999	1.000	1.000

### pH'in etkisi

Cr(VI) iyonlarının sulu çözeltilerde pH ve konsantrasyona bağlı olarak çeşitli anyonik formlarda ( $\text{Cr}_2\text{O}_7^{2-}$ ,  $\text{HCrO}_4^-$ ,  $\text{CrO}_4^{2-}$  ve  $\text{HCr}_2\text{O}_7^-$ ) bulunduğu bilinmektedir.  $\text{CrO}_4^{2-}$  anyonu bazik veya hafif asidik çözeltilerde hakimdir. Ayrıca, Cr(VI) konsantrasyonu yaklaşık 1000 mg/L'yi aştığında,  $\text{Cr}_2\text{O}_7^{2-}$  asidik sulu çözeltide  $\text{HCrO}_4^-$  anyonuna dönüşür [Pehlivan ve Çetin, 2009]. Bu nedenle, bu çalışmada, Cr(VI)'nın çalışılan başlangıç konsantrasyonları  $\leq 1000$  mg/L olduğundan, Cr(VI) iyonları sulu çözeltide  $\text{HCrO}_4^-$  olarak bulunacaktır. Sulu çözeltilerde anyon değiştirici ve iyonların birbirleriyle etkileşime girebilmesinin iki ana yolu vardır. En yaygın yol, iyon değişimini veya metal iyonlarının şelatlanmasını içerir. Bu etkileşimler, mevcut fonksiyonel gruplar açısından reçine yapısı ile karakterize edilir [Pehlivan ve Çetin, 2009]. Ek olarak, düşük pH değerlerinde, eşanjörün yüzeyi hidronyum iyonları ile çevrili olacaktır, bu da Cr(VI)'nın sorbentin bağlanma bölgeleri ile etkileşimini daha büyük çekici kuvvetlerle arttıracaktır. Bununla birlikte, pH arttıkça, sorbentler üzerindeki genel yüzey yükü negatif hale geldi ve iyon değişimi azaldı. Şekil 2 ayrıca, çözelti pH'ının, Cr(VI)'nın anyon değiştirici fiber tarafından adsorplanması üzerindeki etkisini göstermektedir. Anyon değiştirici reçinenin aksine, Cr(VI) için daha yüksek adsorpsiyon etkinliğinin pH 1.0-2.0 aralığında elde edildiği bulunmuştur. Ayrıca, çözelti pH'ındaki bir artış, anyon değiştirici fiberin adsorpsiyon kabiliyetini azaltmıştır. pH bağımlılığından, çözelti ile fiberin amino ve karboksil grupları arasındaki etkileşimler, Denklemler izlenerek ifade edilebilir. (3) ve (4), solüsyondaki fiberin amino ve karboksil gruplarının protonasyon ve deprotonasyon reaksiyonlarını gösterir.

Düşen çözelti pH'ı ile, özellikle  $\text{pH} \leq 2.0$ 'da, Denk. (3) karboksil grubunun pKa değeri 1.8 olduğu için sola doğru ilerlemiştir [Troy, 2006]. Bu nedenle  $\text{pH} \leq 2.0$ 'da fiberin  $\text{HCrO}_4^-$  iyonu ile  $-\text{NH}_3^+/\text{Cl}^-$  grubu arasında iyon değişimi gerçekleşmiştir. Çözelti pH'ı 1,8 ve 8,0 arasında, fiber matrisinde protonlanmış amino ( $-\text{NH}_3^+$ ) ve deprotonlanmış karboksil ( $-\text{COO}^-$ ) grupları bulunur. Bu nedenle, 2.0-8.0 pH aralığında, protonu giderilmiş karboksil grubu ile  $\text{HCrO}_4^-$  arasındaki olası bir itme kuvveti adsorpsiyonu azaltmıştır. Böylece FIBAN AK-22-1 anyon değiştirici fiber ile Cr(VI)'nın etkin adsorpsiyonu için optimal pH aralıkları 1.0-2.0 olmuştur.

**Şekil 2.** FIBAN AK-22-1 anyon deęiřtirici fiber tarafından Cr(VI) adsorpsiyonuna pH'ın etkisi (bařlangıç Cr(VI) konsantrasyonu): 25 mg/L; fiber miktarı: 2,5 g/ L; temas süresi: 1 saat; sıcaklık: 25±1 °C; çalkalama hızı: 220 rpm).

### Adsorpsiyon izoterm modelleri

Adsorpsiyon izotermelerinin analizi tasarım amaçları için önemlidir. Bu nedenle deneysel veriler, Langmuir, Freundlich ve Redlich-Peterson izotermelerini içeren iyi bilinen adsorpsiyon izoterm modelleri ile analiz edilmiştir. Langmuir izotermi, adsorpsiyon yüzeylerinin tek tabakalı kaplamasını modeller ve adsorpsiyonun adsorbanın yapısal olarak homojen bir yüzeyinde gerçekleştiğini varsayar. Bu izoterm Denklem olarak verilir. (5) [Langmuir,1916].

$$q_e = \frac{Q_o \cdot b \cdot C_e}{1 + b \cdot C_e} \quad (5)$$

Langmuir izoterm modelinin lineer formu Denklem. (6);

$$C_e/q_e = (1/Q_o \cdot b) + (C_e/q_e) \quad (6)$$

$C_e$ , dengede Cr(VI) iyonunun konsantrasyonu (mg/L) olduğunda,  $Q_o$  adsorbanın tek tabaka kapasitesi (mg/g) ve  $b$ , Langmuir sorpsiyon sabitidir (L/mg).  $C_e/q_e$ 'ye karşı  $C_e$  grafięi düz bir çizgi verir (Şekil 3 (a)) ve  $Q_o$  ve  $b$  deęerleri sırasıyla grafięin eğiminden ve kesiřme noktasından hesaplanabilir.

Freundlich denklemi, çok katmanlı sorpsiyonu modellemek ve heterojen yüzeyler üzerindeki sorpsiyon için türetilmiştir. Freundlich modeli Denklem olarak formüle edilir. (7) [Freundlich,1906].

$$q_e = k \cdot C_e^{1/n} \quad (7)$$

Freundlich denkleminin lineerleştirilmiş formu ařaęıdaki denklemle verilir:

$$\log q_e = \log k + (1/n) \log C_e \quad (8)$$

$C_e$  denge konsantrasyonu (mg/L) olduğunda,  $k$  kabaca adsorpsiyon kapasitesinin [(mg/g).(mg/L)<sup>-1/n</sup>] bir göstergesidir ve  $n$  ampirik bir parametredir. Denklem(9)'a göre  $\log q_e$ 'nin  $\log C_e$ 'ye karşı grafięi bir doğru verir (Şekil 3 (b)) ve  $k$  ve  $n$  deęerleri bu düz çizginin kesiřme noktası ve eğiminden hesaplanır, sırasıyla.

Redlich-Peterson izotermi [Redlich ve Peterson, 1959], payda konsantrasyona doęrusal bir baęımlılıęa ve paydada üstel bir fonksiyona sahiptir. Freundlich modeline yüksek konsantrasyonlarda yaklařır ve Langmuir

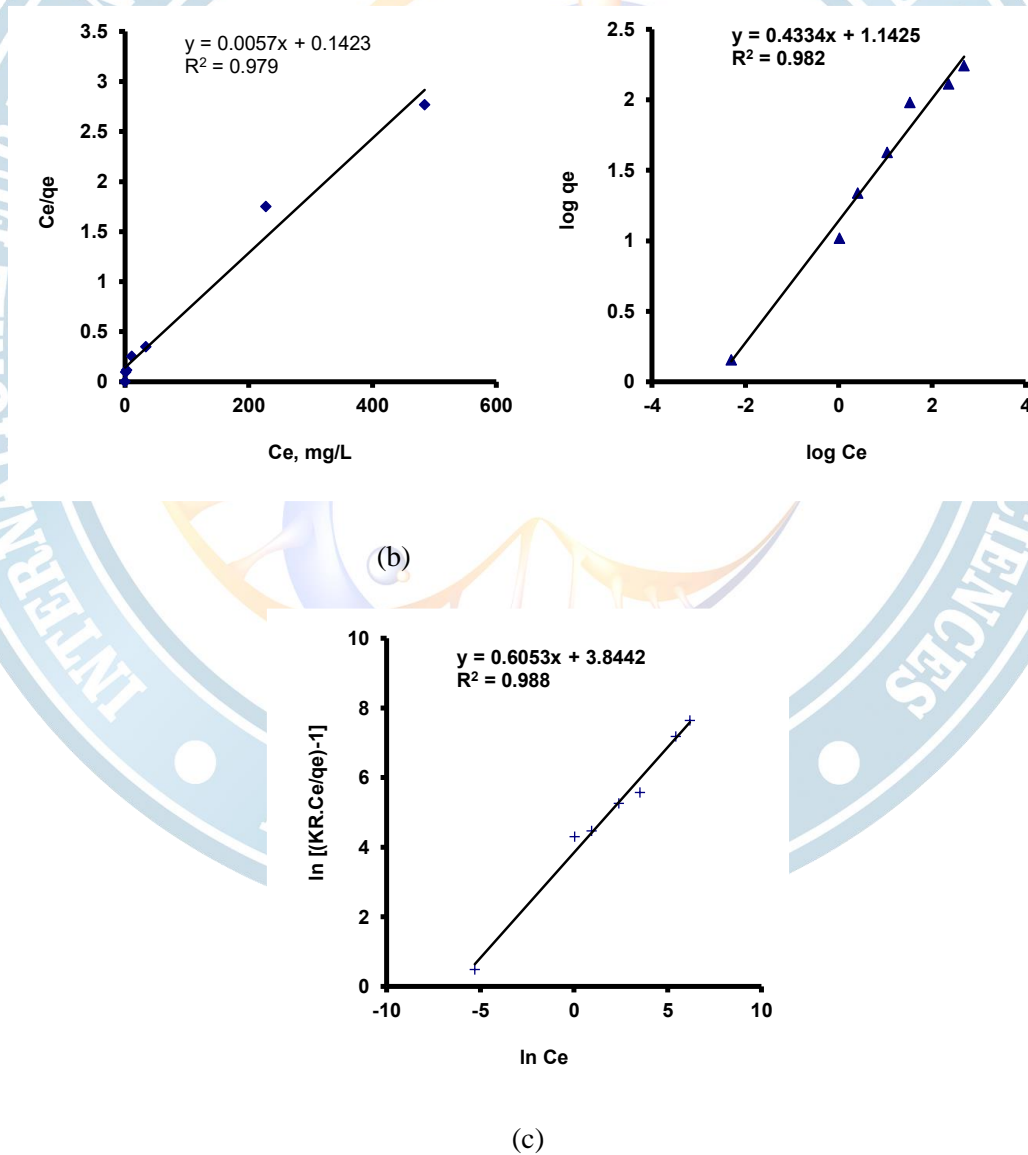

denkleminin düşük konsantrasyon limiti ile uyumludur. Ayrıca, Redlich-Peterson denklemi ampirik bir izotermde üç parametre içerir ve bu nedenle çok yönlülüğü nedeniyle homojen veya heterojen sistemlere uygulanabilir. Redlich-Peterson denklemi:

$$q_e = K_R \cdot C_e / (1 + a_R \cdot C_e^\beta) \quad (9)$$

Burada  $K_R$  Redlich-Peterson izoterm sabitidir (L/mg),  $a_R$  aynı zamanda bir sabittir (L/mg) $^\beta$  ve  $\beta$  sıfır ile bir arasında yer alan üsdür.  $\beta = 1$  için Denk. (10) Langmuir denklemine ve  $\beta = 0$  için Henry denklemine indirgenir. Denk. (10) logaritma alınarak doğrusal forma dönüştürülebilir:

$$\ln[(K_R \cdot C_e / q_e) - 1] = \ln a_R + \beta \cdot \ln C_e \quad (10)$$

Redlich-Peterson izotermi için sabitlerin değerleri de izotermi lineer formunun (Eq. 10) çizimlerinin (Şekil 3 (c)) eğiminden ve kesişme noktalarından elde edildi. Cr(VI)'nın anyon değiştirici fiber tarafından adsorplanması, Freundlich izoterm modeli ile daha iyi tarif edilebilir. Tablo 3'teki birden ( $<1$ ) küçük olan  $\beta$  (0.605) değeri de bu sonucu desteklemektedir [Tor, 2006].

Şekil 3. Anyon değiştirici fiber için; Langmuir izoterm grafiği (a), Freundlich izoterm grafiği (b), Redlich-Peterson izoterm grafiği (c) (fiber miktarı: sırasıyla 2.5 g/L, çözelti pH: 1.0, temas süresi: 1 saat, çalkalama hızı: 220 rpm, sıcaklık: 25±1 °C).

**Tablo 3.** Cr(VI)'nin FIBAN AK-22-1 anyon deęiřtirici fiber tarafından sulu çözeltiliden adsorplanması için Langmuir, Freundlich ve Redlich-Peterson izoterm parametreleri.

Izoterm modeli	FIBAN AK-22-1 anyon deęiřtirici fiber

$R^2$	0.988

#### **Adsorban dozajının etkisi**

Deęişken miktarlarda anyon deęiřtirici fiber ile Cr(VI) sorpsiyonunun yüzdesi, Şekil 4'te gösterilmiştir. Genel olarak, adsorban dozundaki bir artış, adsorbatın giderilme yüzdesini artırdı. Bu, daha yüksek adsorban dozajlarının daha düşük q deęerleri ile sonuçlanacağı beklentisiyle tutarlıdır. Fiber üzerindeki fonksiyonel grupların konsantrasyonu, yüzey bölgesi yoğunluğu aracılığıyla bu adsorbanların miktarı ile ilişkilidir [Sujana ve ark., 1998]. Fiber miktarının artmasıyla Cr(VI) adsorpsiyonu artmıştır, Cr(VI) adsorpsiyonu üzerinde kayda deęer bir etkisi yoktur.

Şekil 4. Cr(VI) adsorpsiyonunun anyon deęiřtirici fiber miktarı ile deęiřimi (Cr(VI) konsantrasyonu): 100 mg/L, çözelti pH'ı: 1.0, temas süresi: 1 saat, çalkalama hızı: 220 rpm, sıcaklık: 25±1 °C).

#### Sıcaklığın etkisi

Serbest enerji deęiřimi ( $\Delta G^\circ$ ), entalpi deęiřimi ( $\Delta H^\circ$ ) ve entropi deęiřimi ( $\Delta S^\circ$ ) gibi termodinamik parametreler Denklemler kullanılarak hesaplanabilir. (11-13) burada  $K_c$ , metal iyonunun sırasıyla iyon deęiřtirici ve çözelti içindeki denge konsantrasyonlarının oranından kaynaklanan denge sabitidir [Gode ve Pehlivan, 2005]. Karışımın sıcaklığı 25 ila 65 °C arasında deęiřmiştir.

$$K_c = C_{Ae} / C_e \quad (11)$$

$$\Delta G^\circ = -RT \cdot \ln K_c \quad (12)$$

$$\log K_c = \left[ \Delta S^\circ / 2.303 \cdot R \right] - \left[ \Delta H^\circ / (2.303 \cdot RT) \right] \quad (13)$$

Burada  $C_e$  çözültideki denge konsantrasyonu (mg/L) ve  $C_{Ae}$  dengedeki katı faz konsantrasyonudur (mg/L).  $\Delta G^\circ$ ,  $\Delta H^\circ$  ve  $\Delta S^\circ$  sırasıyla serbest enerji, entalpi ve entropi deęiřimleridir.  $\Delta G^\circ$  Denklem ile hesaplanabilir (12).  $\Delta H^\circ$  ve  $\Delta S^\circ$ ,  $\log K_c$ 'ye karşı  $1/T$  grafięinden hesaplanabilir (Şekil 5 ve Denk.(13)) ve Tablo 4'te verilir. Tablo 4'te görüldüğü gibi, anyon deęiřtirici fiber için pozitif  $\Delta H^\circ$  deęerleri, endotermik reaksiyon meydana geldi. Pozitif  $\Delta S^\circ$  deęerleri, Cr(VI)'nın fiber üzerine adsorplaması sırasında iyon deęiřtirici-çözelti arayüzünde rastgelelięi önerdi.  $\Delta G^\circ$ 'nun negatif deęerleri, anyon deęiřtirici fiber ile adsorpsiyon işlemlerinin kendilięinden gerçekleştiğini gösterdi. Ayrıca, sıcaklığın artmasıyla birlikte  $\Delta G^\circ$  deęerlerinde meydana gelen bir düşüş, fiber tarafından adsorplanması daha yüksek sıcaklıklarda daha kendilięinden olduğunu göstermiştir (Tablo 4).

Şekil 5. Cr(VI)'nin sıcaklığın bir fonksiyonu olarak anyon deęiřimli fiber üzerindeki denge sabitleri.

Tablo 4 . Cr(VI)'nin FIBAN AK-22-1 iyon deęiřtirici fiber üzerine adsorpsiyonu için termodinamik parametreler.

FIBAN AK-22-1 anyon deęiřtirici fiber			
	$\Delta G^\circ$ (J/mol)	$\Delta H^\circ$ (J/mol)	$\Delta S^\circ$ (J/K.mol)
T=298 K	-6467.72	16106.78	75.96
T=303 K	-6896.21		
T=308 K	-7395.29		
T=318 K	-8015.24		
T=328 K	-8856.34		
T=338 K	-9515.24		

## SONUÇ

Mevcut çalışma, FIBAN AK-22-1 anyon deęiřtirici fiberin Cr(VI) iyonu için kayda deęer bir adsorplama kabiliyetine sahip olduęunu göstermiřtir. İyon deęiřimi için optimum pH aralıkları, anyon deęiřtirici fiber için 1.0-2.0 idi. Cr(VI) adsorpsiyonu, anyon deęiřtirici fiber için 30 dakikada bir dengeye ulařmıřtır. Hem reęine hem de fiber tarafından Cr(VI) adsorpsiyonunun kinetięi, ikinci dereceden kinetik modeli takip etti. Fiber üzerindeki adsorplama verileri Freundlich modeliydi, Cr(VI)'nin anyon deęiřtirici fiber tarafından adsorplanmasına iliřkin verileri daha iyi temsil ediyordu. Sonuç olarak, FIBAN AK-22-1 anyon deęiřtirici fiber, su numunelerinden Cr(VI)'nin bařarıyla uzaklařtırılması için kullanılabilir bir materyal olduęu deneysel veriler ile ortaya konmuřtur. Anyon deęiřtirici fiber için denge adsorpsiyon seviyesi, artan sıcaklıkla arttıęı grlmřtr.

#### Özet

Günümüzde ve yakın gelecekte en çok konuşulacak konuların su sorunu ve enerji olacağı bilinmektedir. Hem tüketimin hem de kirliliğin artması sebebiyle, bu kaynakların geri kazanımı ve çevresel kirliliklerin tespit edilip temizlenmesi gelecek yılların en önemli sorunu olarak görülmekte ve bu sorunun daha ciddi boyutlara ulaşmadan çözümünün araştırılması gerekmektedir. Membran teknolojileri günümüzde; yüksek seçicilik, verimlilik, az sarf kimyasal kullanımı, diğer ayırma ve saflaştırma yöntemleriyle birlikte kullanılabilmesi, yerinde temizlik göstermesi, düşük enerji tüketimi ve modüler esnek tasarımı kolaylığı gibi avantajları sayesinde birçok ayırma ve saflaştırma proseslerin de sürekli gelişime açık olarak tercih edilmektedir. Membran uygulamalarında en önemli problem membranın mekanik kararlılığı, akış, seçicilik ve kirlenmenin neden olduğu membran gözenek tıkanmasıdır. Membranların bu dezavantajlarını ortadan kaldırmak için, membranlara farklı özellikte kompozit, inorganik ve/veya organik malzemeler katılmak son yıllarda yaygın bir yöntem olmuştur. Özellikle inorganik katkı maddelerinin; killer, zeolitler, nanopartiküller vb. kompozit hibrit malzemelerin membran yapısında kullanımı membran teknolojisine yeni bir boyut kazandırmıştır. Su arıtım teknolojilerine yeni bir boyut kazandıracak, performans çalışmalarında pilot sistem kullanılarak su arıtımında birden fazla uygulama alanına hitap eden, yüksek akı, seçicilik ve kirlenmenin neden olduğu membran gözenek tıkanmasını minimize eden ve atık bir malzemenin değerlendirilmesi açısından ayrı bir önem taşıyan kırmızı çamur katkılı polimerik kompozit membranlar elde edilmiştir. Farklı oranlarda aktif kırmızı çamur katkılı polisüfon(PSf) kompozit membran hazırlanması ve bunların gözenekli destek tabaka malzeme üzerine kaplanması ile yüksek geçirgenlik gösteren, aktif kırmızı çamur içeriğindeki metal oksitler sayesinde seçimli ve kirlenmeye karşı minimize edilen kompozit malzeme destekli membranların geliştirilmesi sağlanmış ve membranların hidrofilitesi, membranın morfolojik özellikleri SEM ve yüzey temas ölçüm teknikleri kullanarak karakterize edilip, su geçirgenliği, akı geri kazanım oranı, bovin serum albümin kullanarak kirlilik testleri ve Kütahya Emet bölgesinden temin edilen gerçek su numunesinde arsenik giderimi her bir kompozit membran için karşılaştırılarak araştırılmıştır. Elde edilen sonuçlar doğrultusunda % 90 civarı bir arsenik giderimi sağlanmıştır.

**Anahtar Kelimeler:** Arsenik, Kırmızı çamur, Membran

#### Preparation of Waste Red Mud Added Nanoporous Polymeric Composite Membranes and Investigation of Membrane Performances

#### Abstract

It is known that the most discussed topics today and in the near future will be the water problem and energy. Due to the increase in both consumption and pollution, the recovery of these resources and the detection and cleaning of environmental pollution are seen as the most important problem of the coming years, and the solution of this problem should be investigated before it reaches more serious dimensions. Membrane technologies today; Thanks to its advantages such as high selectivity, efficiency, low consumption of chemicals, use with other separation and purification methods, cleaning in place, low energy consumption and ease of modular flexible design, it is preferred for many separation and purification processes, open to continuous improvement. The most important problem in membrane applications is the mechanical stability of the membrane, flow, selectivity, and membrane pore clogging caused by contamination. In order to eliminate these disadvantages of membranes, it has been a common method in recent years to add composite, inorganic and/or organic materials with different properties to membranes. Especially inorganic additives; clays, zeolites, nanoparticles etc. The use of composite hybrid materials in the membrane structure has brought

a new dimension to membrane technology. Red mud added polymeric composite, which will add a new dimension to water treatment technologies, address more than one application area in water treatment by using a pilot system in performance studies, minimize membrane pore clogging caused by high flux, selectivity and pollution, and is of particular importance in terms of evaluation of a waste material. membranes were obtained. With the preparation of polysulfone (PSf) composite membrane with activated red mud in different proportions and their coating on the porous support layer material, the development of composite material supported membranes with high permeability, selective and minimized against pollution thanks to the metal oxides in the active red mud content, and the hydrophilicity of the membranes, the membrane's hydrophilicity The morphological features were characterized using SEM and surface contact measurement techniques, water permeability, flux recovery rate, pollution tests using bovine serum albumin and arsenic removal in real water sample obtained from Kütahya Emet region were compared for each composite membrane. In line with the results obtained, an arsenic removal of around 90% was achieved.

**Keywords:** Arsenic, Red mud, Membrane

## GİRİŞ

Günümüzde ve yakın gelecekte en çok konuşulacak konuların su sorunu ve enerji olacağı bilinmektedir. Dünya nüfusunun hızlı bir şekilde artması, ülkelerin gelişim çabaları, enerji tüketimini ve doğal kaynaklarının tüketimini çok hızlı bir şekilde artırmaktadır. Enerji kaynaklarına alternatif çözümler üretilebilmektedir ancak artan nüfus ile birlikte dünyadaki temiz su kaynakları azalmakta, endüstriyellemenin artmasıyla da sınırlı sayıdaki kaynaklar kirlenmektedir ve suya olan talep de günden güne artmaktadır. Hem tüketimin hem de kirliliğin artması sebebiyle, bu kaynakların geri kazanımı ve çevresel kirliliklerin tespit edilip temizlenmesi gelecek yılların en önemli sorunu olarak görülmekte ve bu sorunun daha ciddi boyutlara ulaşmadan çözümünün araştırılması gerekmektedir. Bu amaçla yapılan çalışmalar; (i) temiz su kaynaklarının kullanılabilirliğinin artırılması ve (ii) atık suların tekrar kullanıma sunulması üzerinde yoğunlaşmıştır. Bu sorunların çözümü için yapılan çalışmalarda membran teknolojisi yaygın olarak kullanılmaktadır. Membran teknolojileri günümüzde; yüksek seçicilik, verimlilik, az sarf kimyasal kullanımı, diğer ayırma ve saflaştırma yöntemleriyle birlikte kullanılabilmesi, yerinde temizlik göstermesi, düşük enerji tüketimi ve modüler esnek tasarımı kolaylığı gibi avantajları sayesinde birçok ayırma ve saflaştırma proseslerin de sürekli gelişen bir teknoloji olarak tercih edilmektedir. Membran uygulamalarında en önemli problem membranın mekanik kararlılığı, akış, seçicilik ve kirlenmenin neden olduğu membran gözenek tıkanmasıdır. Membranların bu dezavantajlarını ortadan kaldırmak için, membran performansını ve verimliliğini artırmak amacı ile membranların geliştirilmesi gerekmektedir. Bu nedenle membranlara farklı özellikte kompozit, inorganik ve/veya organik malzemeler katılmak son yıllarda yaygın bir yöntem olmuştur. Özellikle inorganik katkı maddelerinin; killer, zeolitler, nanopartiküller vb. kompozit hibrit malzemelerin membran yapısında kullanımı membran teknolojisine yeni bir boyut kazandırmıştır. Nanopartiküller ve kompozit yapılar; yüksek kararlılık, kimyasal ve biyolojik dayanımları, eşsiz fizikokimyasal özellikleri, geniş pH aralığında çalışma imkanı, kolay fonksiyonelleştirilebilme özelliği, bazı malzemeler için fotokatalitik, antibakteriyel, kirlilik önleme vb. özelliklerinden faydalanmak ve özellikle membranın hidrofobik polimer yapısından dolayı ortaya çıkan dezavantajı ortadan kaldırmak için membran yapısına nanopartikül ve kompozit bazı malzemeler eklenmektedir. Kırmızı çamur ise alüminyum üretim tesislerinde boksitten saf alüminyum elde edilmesi sonucunda atık olarak açığa çıkan bir kompozit malzemedir. Kırmızı çamur kolloidal yapısı nedeni ile bol miktarda su içermekte ve barajlarda depolanarak rüzgarın ve çeşitli doğa olaylarının etkisiyle, çevre kirliliği ve insan sağlığı konusunda risk arz etmektedir. Ayrıca içerdiği alkali ve mikron boyutlu partiküller, kurduğunda toz halinde havaya karışarak çevre kirliliği ve insan sağlığı konusunda tehdit oluşturmaktadır. Endüstriyel faaliyetler sonucu oluşan katı atıklar, üretimin en büyük problemlerinden biridir. Bunların bertarafı için, bu katı atıkların su arıtmada düşük maliyetli adsorban olarak kullanmaları iyi bir yöntem olabilmektedir. Böylelikle hem atık hacmi azaltılmış olacak hem de su arıtma işleminin maliyeti düşürülebilecektir. Kırmızı çamur, adsorban özelliği sayesinde sulardan metal iyonlarının, boyaların, fenollerin ve inorganik anyonların giderilmesinde kullanılmaktadır. Kırmızı çamurun Zn (Sahu ve diğ., 2010), Cr (Danış, 2005), Cd (Ma ve diğ., 2009), Pb (Gupta ve diğ., 2001; Luo ve diğ., 2011), Cu (Nadaroğlu ve diğ., 2017) ve As (Altundoğan ve diğ., 2002) gibi iyonları adsorplaması konusunda literatürde birçok çalışma ile karşılaşmak mümkündür. Bu çalışmaların çoğunda, yüksek yüzey alanına sahip olduğu belirtilen toz şeklindeki kırmızı çamur kullanılmıştır. Ancak membran yapısında aktif kırmızı çamur kullanılarak membran çalışması literatürde bulunmamaktadır. Su arıtım teknolojilerine yeni bir boyut kazandıracak, performans çalışmalarında pilot sistem kullanılarak su arıtmada birden fazla uygulama alanına hitap eden, yüksek akı, seçicilik ve kirlenmenin neden olduğu

membran gözenek tıkanmasını minimize eden ve atık bir malzemenin değerlendirilmesi açısından ayrı bir önem taşıyan kırmızı çamur katkılı polimerik kompozit membranlar elde edilmiştir.

## MATERYAL VE METOT

### *Kırmızı çamurun nötralleştirilmesi ve aktive edilmesi*

Seydişehir Eti Alüminyum A.Ş. Tesislerinden (Konya) temin edilecek olan ham kırmızı çamur, saf su ile sıvı/katı oranı 2/1 (w/w) olacak şekilde sıvı kısmın pH değeri 8,0-8,5 olana kadar yıkanmış ve daha sonra 105°C'de kurutulacaktır. Kırmızı çamur nötralizasyon işlemlerinden sonra kırmızı çamurun kompozisyonu, tane boyutu dağılımı tespit edilecektir. Literatürde belirtilen kırmızı çamurun ortalama kimyasal analizi şu şekildedir: %18.71±0.59 Al<sub>2</sub>O<sub>3</sub>, %39.70±0.67 Fe<sub>2</sub>O<sub>3</sub>, %14.52±0.37 SiO<sub>2</sub>, %8.82±0.96 Na<sub>2</sub>O, %4.47±0.56 CaO, %4.90±0.54 TiO<sub>2</sub>, ve diğerleri. Mineralojik açıdan bakıldığında, sodyum alüminyum silikat ve hematit bileşiklerinden oluşmaktadır. Kırmızı çamurun tane boyutu 10 µm'nin altındadır. Üretim sürecine giren boksitin yaklaşık %35-40'ı kırmızı çamur halinde atılmaktadır. Kırmızı çamur, alüminyum üreten tesislerin en önemli atık problemidir. Kırmızı çamur gerek kostik soda içermesi gerekse depolama nedeniyle önemli bir çevre sorunu oluşturmaktadır. Ayrıca, yazın kuruyan kırmızı çamurun havayı kirletmesi de ayrı bir çevresel problemidir. Aktif kırmızı çamur; ham kırmızı çamurun hem yüzey alanını genişletmek hem de yüzeyde kirlilik oluşturan metal oksitlerin uzaklaşması sağlamak koşuluyla asit ile muamelesi sonucu ortaya çıkar. Bu prosedür şu şekilde uygulanmıştır; Ham kırmızı çamur saf suyla yıkamak suretiyle nötr (pH≈7) hale getirilmiş ve 105°C de kurutulmuştur. Aktive işlemi için nötr haldeki kırmızı çamurdan 10 gr alınarak üzerine 200 ml % 20 lik HCl çözeltisi eklenerek 3 saat boyunca karıştırılmıştır. Aktivasyon işlemi için diğer asit çözeltileride duruma göre ilave edilerek (H<sub>2</sub>SO<sub>4</sub> ve/veya HNO<sub>3</sub>) karıştırma işlemi devam edilmiştir. Daha sonra aktive edilmiş kırmızı çamur daha sonra filtre kağıtından daha sonra nuçe erleninden vakum altında süzülerek nötr (pH≈7) oluncaya kadar saf suyla yıkanarak tekrar 105°C de kurutulmuştur. Böylece aktive edilmiş kırmızı çamur kullanıma hazır hale getirilmiştir.

### *Aktif kırmızı çamur katkılı kompozit membranların hazırlanması ve karakterizasyonu*

Projenin bu basamağında yine grubumuz tarafından daha önceki membran hazırlama çalışmalarında (Arslan vd., 2009; Akın vd., 2014) başarılı bir şekilde uygulanan, su ile çöktürme tekniği kullanılarak kompozit membranlar hazırlanmıştır. Kompozit membranların hazırlanışında; ham ve aktive edilmiş atık kırmızı çamur farklı oranlarda (%w/w) polisülfon çözeltisine katılanmasıyla, destek maddesi (hollytex 3329) üzerine döner kaplama cihazı (spin coater) yardımıyla kaplama yapılıp, su ile çöktürme (polimerleşme) tekniği kullanılarak kompozit membranlar elde edilmiştir. Kompozit membran hazırlanmasını aşamalandırırsak;

Homojen bir polisülfon çözeltisi hazırlamak için ağırlıkça %15 olacak şekilde DMF içerisinde 12 saat boyunca manyetik karıştırıcıda karıştırılmıştır. Bu polimer çözeltisine farklı oranlarda (w/w)% kırmızı çamur içericek şekilde 5 mL DMF içerisinde karıştırıp homojen bir şekilde dağıtılarak polimer çözeltisine ilave edilmiştir.

Karışım çözeltisi dokuma olmayan kumaş destek maddesi (Hollytex 3329) üzerine döner kaplama cihazı (spin coater) yardımı ile kaplama işlemi gerçekleştirilmiştir. Spin coater ile kaplama yapılırken; karışım çözeltisinin miktarı, kaplama hızı ve süresi için optimum parametreler belirlenip kaplama işlemi gerçekleştirilmiştir.

Son olarak polimerizasyonunun başlatılarak polimerin çökmesini sağlamak için oda sıcaklığında su banyosuna daldırılarak 5 dakika bekletilerek membranlar hazırlanmıştır. (Paez-Hernandez vd., 2009).

### *Membran Performans Çalışmaları*

Hazırlanan membranların geçirgenlik çalışmalarında Şekil 1.'deki Prosesstechnik GmbH pres masaüstü membran pilot sistemi kullanılacaktır. Geçirgenlik çalışmalarında saf su akısı, tuz reddetme oranı (Mg(NO<sub>3</sub>)<sub>2</sub>, MgSO<sub>4</sub> ve MgCl<sub>2</sub>) ve kirlilik testleri (BSA) araştırılmıştır. Membran performans denemeleri oda sıcaklığında, besleme çözeltisinin konsantrasyonunu sabit tutmak için hem konsantre (retenteate) hem de süzüntü (permeate) besleme tankına geri döndürülmüş şekilde, işlem her membran için 1-6 saat arasında sürdürülerek, farklı konsantrasyon, farklı basınç aralıklarında (4-40 bar) gerçekleştirilmiştir. Şekil 1.'deki M2 modülü için 2,5 L uygulama hacmine sahip olan besleme tankına 2 L besleme çözeltisi kullanılacaktır. 19 Membranlar 7,5 cm çapında dairesel olarak hazırlanarak M2 modülüne yerleştirilip ve birer saat arayla hem süzüntüden hem de beslemeden numune alınarak pilot sistem çalışmaları sürdürülmüştür. Tuz reddetme oranının belirlenmesinde farklı konsantrasyonlar ve basınç parametreleri ayrı ayrı her bir membran için araştırılıp, Mg konsantrasyonu ContrAA 300 cihazı ile, kirlilik (BSA) denemeleri ise UV spektrofotometre ile tespiti yapılmıştır. Gerçek su numunesi denemeleri; Kütahya Emet bölgesinden temin edilen gerçek su numunelerinin öncelikle kompozisyonu belirlenmiş ve sorunlu olan arseik konsantrasyonu için en iyi performans gösteren membrada orijinal numunede optimum şartlarda çalışma gerçekleştirilmiştir.

Şekil 1. Prozesstechnik GmbH pres masaüstü membran pilot sistemi

## BULGULAR ve TARTIŞMA

### *Aktif kırmızı çamur katkılı kompozit membranların karakterizasyonu*

Aktive edilmiş kırmızı çamur ile hazırlanan kompozit membranların optik ve yapısal karakterizasyonları için SEM ve yüzey temas ölçüm analizleri gerçekleştirilmiştir. Katı yüzeylerde, damla şekli ve temas açısı katının serbest yüzey enerjisine bağlıdır. Hazırlanmış olduğumuz membranların yüzey temas açısı ölçümlerinde KSV CAM 200 cihazı kullanılmıştır. Temas açısı ölçümleri, her bir kompozit membranın üç farklı noktasından ölçüm alınarak ölçüm değerlerinin ortalaması alınmıştır. Hazırlanan kompozit membranların temas açısını ölçmek için sabit damlası yöntemi kullanılmıştır. Temas açısı, yüzey üzerine yerleştirilen 0.10 mL'lik bir şırınga vasıtasıyla yüzeye 5 µL su damlatılarak yatay bir ışın karşılaştırıcı ile ölçülmüştür. Şekil 2'de görüldüğü üzere görüntüler dijital fotoğraf makinesi tarafından kaydedilmiştir. Bu görüntülerin temas açıları statik temas açıları hesaplama yazılımı ile hesaplanmış (Akın vd., 2014) ve sonuçlar Tablo 1'de verilmiştir.

**Tablo 1.** Farklı oranlardaki PSf-RM kompozit membranların yüzey temas açısı ölçüm değerleri( $\Theta$ )

PSf-RM	$\Theta$ değeri
%0.1	85,23 $\pm$ 0.1
%0.3	82,47 $\pm$ 0,07
%0.5	73,21 $\pm$ 0,12
%1	67,50 $\pm$ 0,8

Elde edilen kompozit membranların yüzey temas açısı değerleri incelendiğinde PSf-RM kompozit membranların hidrofilitik karakterinin artan madde miktarı ile değiştiği görülmüştür. Yapılarındaki hidroksil sayısının ve miktarının artması, aktive edilmiş kırmızı çamurun polimerizasyon işlemi sırasında su ve organik çözücünün hızlı yer değiştirmesi sonucunda membran içerisine çekilerek yüzeyde gözeneklilik azalması yanında ağ örgü yapıyı değiştirerek plakalar halinde boşluklar oluşturduğu (Çelik vd. 2011) yüzeydeki değişime bağlı olarak yüzey temas açısında azalma meydana gelmesine neden olduğu düşünülmektedir.

Şekil 2. PSf-RM kompozit membranların yüzey temas açısı ölçüm görüntüleri(sırasıyla; (% w/w 0.1; 0.3;0.5;1 RM)

Farklı oranlarda katkılanmış aktive edilmiş kırmızı çamurların membran içerisindeki etkinliğini ve yapısal ve fiziksel hallerini görebilmek için farklı büyütme oranlarında SEM yüzey ve kesit görüntüleri alınarak Şekil 3.'de aşağıda verilmiştir. Elde edilen kompozit membranların SEM görüntüleri incelendiğinde katkılanan malzemeye ve orana göre yüzeyde ve kesitte farklılıklar göstermektedir. Yapısındaki metal oksitler sayesinde polimer tabaka arasında kesit görüntülerinden de görüleceği üzere ağ örgü yapı oran arttıkça daha belirgin hale gelmiştir. Membranların yüzey deformasyonu katkılanan aktive edilmiş kırmızı çamur miktarı arttıkça artmakta olduğu tespit edilmiştir. Polymerizasyon sırasında su ve organik çözücünün hızlı yer değiştirmesi esnasında oluşan boşluklara aktive edilmiş kırmızı çamur parçacıkları sürekli yer değiştirmesinden dolayı kanallar oluşturarak ağ örgü yapının oluşumunu sağlamaktadır (Vatanpour vd., 2012).

**Şekil 3.** Farklı oranlarda (sırasıyla; (% w/w 0.1; 0.3; 0.5; 1) aktive kırmızı çamur içerikli PSf kompozit membranların SEM yüzey ve kesit görüntüleri

### Membran Performans Çalışmaları Sonuçları

Su tutma kapasitesi kompozit malzemelerin destek tabakasının etkinliğini tayin etmede önemli bir faktördür. Çok katmanlı aktive edilmiş kırmızı çamur katkılı kompozit membranların su tutması kapasitesi gravimetrik metot ile ölçülmüştür. 7 cm x 7 cm ebatlarında farklı oranlarda PSf-RM katkılanmış membranlar saf suda 3 saat bekletilerek, ıslak ve kuru değerleri farkından [denk. 1] kullanılarak hesaplanmıştır. Burada; membranın, sırasıyla  $W_w$  ve  $W_d$  ıslak ve kuru olarak ağılıklarını,  $U$  ise su tutma oranını göstermektedir. Elde edilen sonuçlar Tablo 2’de verilmiştir.

$$U = \left( \frac{W_w - W_d}{W_d} \right) \times 100$$

(1)

**Tablo 2** Farklı oranlardaki PSf-RM kompozit membranların su tutma kapasite değerleri

PSf-RM	U değerleri
%0.1	25,22
%0.3	32,48
%0.5	38,12
%1	49,14

Edilen sonuçlar gösteriyor ki PSf-RM kompozit membranların içeriğindeki aktive edilmiş kırmızı çamur miktarı arttıkça su tutma kapasitesi artmaktadır. Yapısındaki metal oksitler hidroksil suyu seven gruplar olduğundan dolayı bu artışın gözlemlendiği düşünülmektedir. Metal nanopartiküllerin etrafında hidroksil gruplarının bulunması ve hidrfilik özellik sağlamasından dolayı su moleküllerin tutunma olasılığını arttırmaktadır. SEM kesit görüntülerinden de anlaşılacağı gibi ağ örgü yapının madde miktarı ile doğru orantılı olarak artması sonucu su tutma kapasitesi değerlerinde fazla çıkmamasına sebep olmaktadır. Şekil 4.’de de görüldüğü gibi farklı oranlardaki saf su akı değerlerindeki değişim bu durumu doğrulamaktadır.

Şekil 4. Farklı oranlarda (%w/w 0.1; 0.3;0.5;1) aktive kırmızı çamur içerikli PSf-RM kompozit membranların saf su akı değişimi

### Kirlilik Direnci Testleri

Membran performans denemeleri için tuz reddetme oranı (NaCl, Na<sub>2</sub>SO<sub>4</sub>, MgSO<sub>4</sub> ve MgCl<sub>2</sub>) ve kirlilik testleri (BSA) gerçekleştirilmiştir. Membran performans denemeleri oda sıcaklığında, besleme çözeltisinin konsantrasyonunu sabit tutmak için hem konsantre (retentate) hem de süzüntü (permeate) besleme tankına geri döndürülmüş şekilde, işlem her membran için 1-6 saat arasında sürdürülerek gerçekleştirilmiştir. Tuz reddetme oranının belirlenmesinde farklı konsantrasyonlar ve basınç parametreleri ayrı ayrı her bir membran için araştırılıp, Na ve Mg konsantrasyonu ContrAA 300 cihazıyla, kirlilik (Bovine Serum Albumin-BSA) denemeleri ise UV spektrofotometre ile 280 nm'de tespiti yapılmıştır. Hazırlanan kompozit membranların ayırma performansı, 25 ° C ve 1 MPa altında bir çapraz akış test sisteminde saf su akışı, BSA (moleküler ağırlık: 66 kD) reddinin ölçülmesi ile karakterize edildi. Her membran, zarın etkili alanının 44 cm<sup>2</sup> olduğu gözenekli bir paslanmaz çelik disk üzerindeki hücrede desteklenmiştir. Saf su, sulu bir BSA çözeltisi (100 mg/L, pH = 7) besleme çözeltisi ile test edilmiştir. Su akışı (L/m<sup>2</sup>h<sup>1</sup>) aşağıdaki denklemle hesaplanmıştır:

$$J_{w,1} = [M / (A \times \Delta t)] \quad (2)$$

Burada M, nüfuz eden suyun ağırlığı (L), A membran alanı (m<sup>2</sup>) ve süresi (h) 'dir. Permeatlar belirli bir süre boyunca toplandı ve tartıldı. Deneyler 25 °C'de gerçekleştirildi. BSA reddi, görünür ışık-ultraviyole spektrofotometre kullanılarak 280 nm'de belirlendi. Proteinin reddi (R,%) şu yollarla elde edildi;

$$R(\%) = [1 - (C_p / C_f)] 100 \quad (3)$$

Buradaki C<sub>p</sub> ve C<sub>f</sub>, sırasıyla permeat ve beslemedeki konsantrasyonlardır.

Protein çözeltisi J<sub>p</sub> (Lm<sup>-2</sup>h<sup>-1</sup>) için akı, membranlara 6 saat boyunca 1 MPa'da nüfuz eden su miktarına göre ölçüldü. Kirlenmiş membranlar, protein çözeltisinin süzülmesinden sonra 30 dakika boyunca damıtılmış su ile yıkandı ve bundan sonra temizlenmiş membranlar J<sub>w2</sub>'nin (L/m<sup>2</sup>h) su akışı tekrar ölçüldü, ayrıca J<sub>w1</sub>'nin (L/m<sup>2</sup>h) saf su akı değerini göstermektedir. Filtrasyon işlemi sırasında oluşan direnç, membranın kirlenmesini gösterebilir. Kirlenme, membran yüzeyinde bir kek/jel tabakasının oluşması ve membran yüzeyine veya membran gözenekleri içine adsorpsiyon nedeniyle gerçekleşir.

Şekil 5. Farklı miktarlarda sırasıyla % 0.1, 0.3, 0.5 ve 1 oranlarında aktive edilmiş kırmızı çamur katkılı kompozit membranların süre ile BSA reddetme akı değerleri değişim

Tablo 3. Farklı miktarlarda sırasıyla % 0.1, 0.3, 0.5 ve 1 oranlarında aktive edilmiş kırmızı çamur katkılı kompozit membranların süre ile BSA reddetme değerleri(%)

Süre(saat)	PSf-RM			
	%0.1	%0.3	%0.5	%1
1	35,3	51,0	58,8	64,8
2	43,7	55,4	59,8	67,1
3	47,5	58,6	61,8	68,2
4	52,2	61,7	65,3	73,8
5	58,7	65,3	71,9	79,4
6	61,2	67,3	75,4	81,6

BSA kirlilik direnç değerleri incelendiğinde toplam kirlilik direnci değeri %0.1'lik RM içeren PSf-RM kompozit membranlarda yaklaşık %35-61 arasında sırasıyla artarak değişmektedir. %0.3'lük RM içeren PSf-RM kompozit membranlarda yaklaşık ise yaklaşık %51-67 arasında sırasıyla artarak değişmektedir. %0.5'lük RM içeren PSf-RM kompozit membranlarda yaklaşık ise yaklaşık %58-75 arasında sırasıyla artarak değişmektedir. %1'lük RM içeren PSf-RM kompozit membranlarda yaklaşık ise yaklaşık % 64-81 arasında sırasıyla artarak değişmektedir. Verilen bu sonuçlar 1 saatlik verilerin oranlarıdır. Süre ilerledikçe toplam kirlilik direncindeki değişim yapıdaki aktive edilmiş kırmızı çamur miktarı arttıkça azaldığı görülmüştür. Elde edilen BSA toplam kirlilik direnci değerleri Tablo 3.'de verilmiştir.

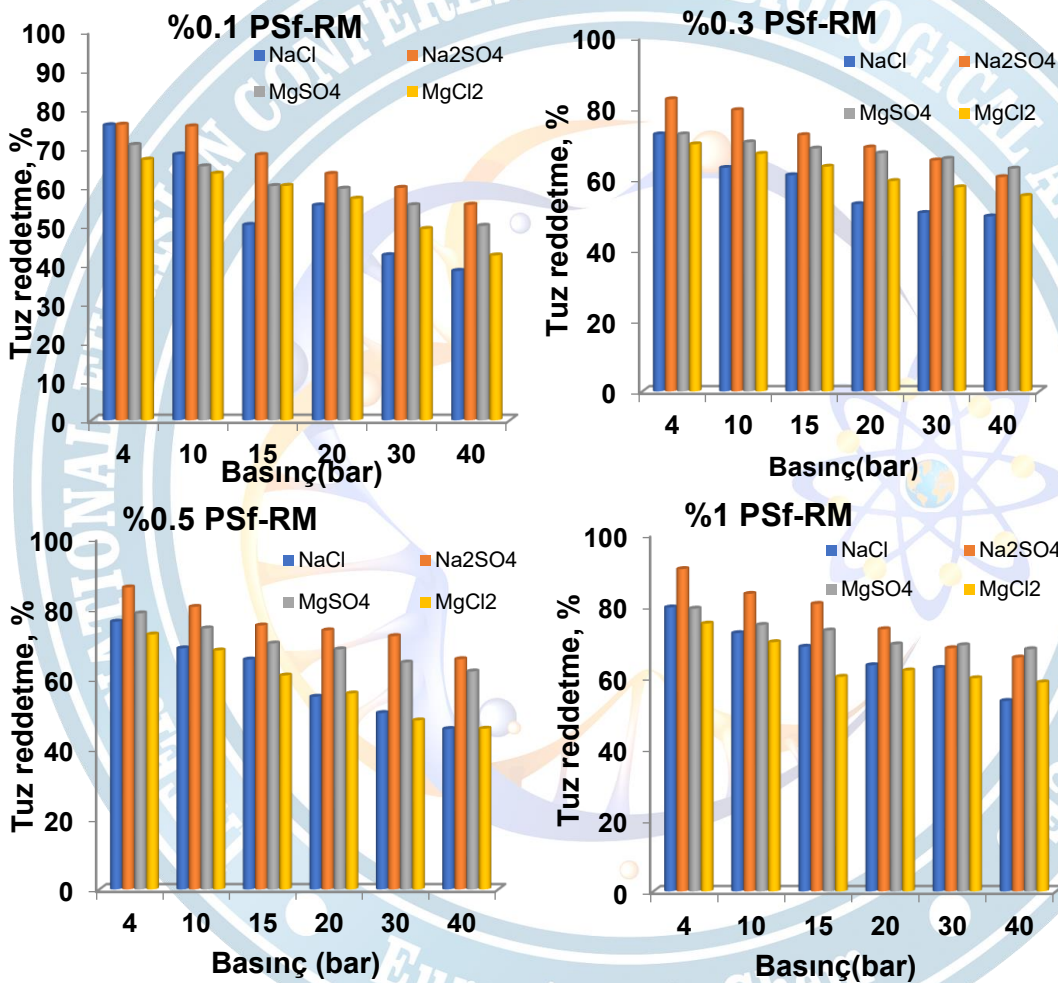

### Tuz Reddetme Çalışması

Farklı oranlarda hazırlanan PSf-RM kompozit membranların performansları incelemek amacıyla, tuz reddetme (rejection) çalışmaları yapılmıştır. Tuz reddetme oranının belirlenmesinde NaCl, Na<sub>2</sub>SO<sub>4</sub>, MgSO<sub>4</sub> ve MgCl<sub>2</sub> tuzlarının 1000 mg/L lik çözeltileri hazırlanarak farklı basınç parametreleri ayrı ayrı her bir membran için araştırılmış ve Na, Mg konsantrasyonu ContraAA 300 cihazıyla tespit edilmiştir. Elde edilen sonuçlar Şekil 6'da verilmiştir. Elde edilen sonuçlar doğrultusunda basınç faktörünün etkili olduğu açıkça belli olmaktadır. Basıncın artmasıyla (4-40 bar) tuz reddetme oranının her bir membran için kendi içerisinde azaldığını gözlemlenmiştir. Tuz reddindeki düşüşün sebebi ise itici kuvvetin (basınç) artması membranın gözenek boyutunun değişmesine ve membranın mekanik dayanımının azalmasına sebep olduğu düşünülmektedir. Bunun sonucunda su akışını artırırken tuz reddetme oranında düşüşler gözlenmektedir. Ganesh ve ark. (2013) yapmış oldukları PSf/GO kompozit membran ile Na<sub>2</sub>SO<sub>4</sub> reddetme çalışmasında da benzer sonuçlar elde etmişlerdir. Elde edilen kompozit membranlarda en iyi tuz reddetme oranları 4 bar basınç altında elde edilmiştir. Tablo 4.'de elde edilen değerler verilmiştir. Wu ve ark. (2014) PSf çözeltisi içersine SiO<sub>2</sub>-GO eklenmesi ile membranın hidrofilitliğini geliştirdiğini, membran ve su molekülleri arasındaki etkileşimi geliştirmek ve buna bağlı olarak sutaşıma oranını arttırdığını belirtmişlerdir. Bu durum, aynı zamanda aktive edilmiş kırmızı çamur eklenmesi ile de literatürle uyumlu olduğu görülmüştür. Sonuç olarak hazırladığımız farklı oranlarda

aktive edilmiş kırmızı çamur içeren kompozit membranların tuz reddetme performansları incelendiğinde tuz reddetme değerleri(%)  $\text{Na}_2\text{SO}_4 > \text{NaCl} > \text{MgSO}_4 > \text{MgCl}_2$  şeklinde sıralandığı ve madde miktarına bağlı olarak artış gösterdiği bulunmuştur.

**Tablo 4.** Farklı miktarlarda sırasıyla % 0.1, 0.3, 0.5 ve 1 oranlarında aktive edilmiş kırmızı çamur içeren PSf-RM kompozit membranların 4 bar basınçta ki tuz reddetme oranı değerleri(%)

PSf-RM				
Tuz	%0.1	%0.3	%0.5	%1
NaCl	75,86	72,56	76,24	79,50
$\text{Na}_2\text{SO}_4$	76,01	82,48	85,98	90,24
$\text{MgSO}_4$	70,80	72,56	78,60	79,16
$\text{MgCl}_2$	67,00	69,76	72,60	74,98

**Şekil 6.** Farklı oranlarda (%w/w 0.1; 0.3; 0.5; 1) kırmızı çamur içerikli PSf kompozit membranların tuz reddetme oranının basınç ile değişimi

### Gerçek Su Numunesi Çalışması

Prozesstechnik GmbH pres masaüstü membran pilot sistemiyle gerçek su numunesi denemeleri için Kütahya Emet ilçesinden temin edilen yeraltı suyu kullanılmıştır. Laboratuvar ortamında sentetik arsenik çözeltisi ile yapılan optimum koşullarla gerçek su numunesindeki şartlar birbirine uymayacağı düşünülerek elde ettiğimiz farklı oranlarda aktive edilmiş kırmızı çamur katkılanan PSf-RM kompozit membran ile gerçek su numunesin şartlarında (pH: 7,8; As konsantrasyonu: 21,2 ppm) pilot sistemde gerçekleştirileceği için çalışmalar basınç faktörü göz önünde bulundurularak çalışmalar gerçekleştirilmiştir. Ayrıca gerçek su numunesi için elde

ettiğimiz akı değerlerinde ki değişim sentetik numunelerdeki akı değerleriyle farklılık gösterdiği farklı orandaki PSf-RM kompozit membran denemelerinde görülmüştür.

Basınç çalışmalarında ise; 4-40 bar arasında yapılan denemeler sonucu arsenik gideriminde ve akı değerlerinde artış gözlenmiştir. Ancak basınç yükseldikçe membran yüzeyinde deformasyon ve gözenek boyutunda değişiklikler meydana gelmiştir. Basıncın artması membran ömrünü kısaltacağından optimum parametrelerin belirlenmesinde 4 bar basınç altında en yüksek verim elde edilmiştir.

Şekil 7. % 0.1-0.3-0.5 ve 1 RM içeren PSf-RM kompozit membranların gerçek su numunesindeki akı değişiminin incelenmesi

Şekil 8. % 0.1-0.3-0.5 ve 1 RM içeren PSf-RM kompozit membranlarında basınç etkisinin arsenik giderimine etkisinin incelenmesi

## SONUÇ

Çalışmada su arıtım teknolojilerine yeni bir boyut kazandıracak, yüksek performanslı membran malzemeleri geliştirerek, arıtılacak su karakterine göre membran sürecinin optimizasyonunun kolaylıkla sağlanabileceği, su arıtmada birden fazla uygulama alanına hitap eden, nano gözenekli, yüksek akı, seçicilik ve kirlenmenin neden olduğu membran gözenek tıkanmasını minimize edebilecek aktive edilmiş kırmızı çamur katkı polimerik kompozit membranlar üretilmesi amaçlanmıştır. Bu amaç doğrultusunda yapılan çalışmalarda aşağıdaki sonuçlar elde edilmiştir.

Ham atık kırmızı çamur alınarak uzun yıkama işlemleri sonucu pH 7 civarına getirilmiştir. Daha sonra aktive etme işlemi asit karışımları ile sağlanmıştır.

Elde edilen aktive edilmiş kırmızı çamur polimer matriksi (PSf) içerisinde homojen bir şekilde dağıtılıp, destek malzemesi üzerine (Hollytex) kaplanmasıyla yeni bir kompozit membran oluşturularak literatüre

kazandırılmıştır. Elde edilen polimerik kompozit membranların hidrofilitesi, membranların yüzey ve iç yapısının morfolojik özellikleri SEM ve yüzey temas ölçüm teknikleri kullanarak başarılı bir şekilde karakterize edilmiştir.

Laboratuvar ortamında hazırlanan numuneler ile hazırlanan tüm kompozit membranların performans test çalışmaları: su tutma kapasiteleri, su geçirgenliği, tuz reddetme ve bovin serum albümin kullanarak kirlilik testleri Prozesstechnik GmbH pres masaüstü membran pilot sisteminde her bir kompozit membran için karşılaştırılarak araştırılmıştır. Membran performans denemeleri için tuz reddetme oranı (NaCl, Na<sub>2</sub>SO<sub>4</sub>, MgSO<sub>4</sub> ve MgCl<sub>2</sub>) ve kirlilik testleri (BSA) gerçekleştirilmiştir.

Elde edilen sonuçlar doğrultusunda basınç faktörünün etkili olduğu açıkça belli olmaktadır. Basıncın artmasıyla (4-40 bar) tuz reddetme oranının her bir membran için kendi içerisinde azaldığını gözlemlenmiştir. Tuz reddinde ki düşüşün sebebi ise itici kuvvetin (basınç) artması membranın gözenek boyutunun değişmesine ve membranın mekanik dayanımının azalmasına sebep olduğu düşünülmektedir. Bunun sonucunda su akışını artırırken tuz reddetme oranında düşüşler gözlenmektedir. Elde edilen kompozit membranlarda en iyi tuz reddetme oranları 4 bar basınç altında elde edilmiştir. Sonuç olarak hazırladığımız farklı oranlarda PSf-RM kompozit membranların tuz reddetme performansları incelendiğinde tuz türüne göre reddetme değerleri (%) Na<sub>2</sub>SO<sub>4</sub> > NaCl > MgSO<sub>4</sub> > MgCl<sub>2</sub> şeklinde sıralandığı ve madde miktarına bağlı olarak artış gösterdiği bulunmuştur.

Prozesstechnik GmbH pres masaüstü membran pilot sistemiyle gerçek su numunesi denemeleri için Kütahya Emet ilçesinden temin edilen yeraltı suyu kullanılmıştır. Laboratuvar ortamında sentetik Arsenik çözeltisi ile yapılan optimum koşullarla gerçek su numunesindeki şartlar birbirine uymayacağı düşünülerek elde ettiğimiz farklı oranlarda aktive edilmiş kırmızı çamur katkılanan PSf-RM kompozit membran ile gerçek su numunesin şartlarında pilot sistemde gerçekleştirileceği için çalışmalar basınç faktörü göz önünde bulundurularak çalışmalar gerçekleştirilmiştir.

Basınç çalışmalarında ise; 4-40 bar arasında yapılan denemeler sonucu arsenik gideriminde ve akı değerlerinde artış gözlenmiştir. Ancak basınç yükseldikçe membran yüzeyinde deformasyon ve gözenek boyutunda değişiklikler meydana gelmiştir. Basıncın artması membran ömrünü kısaltacağından optimum parametrelerin belirlenmesinde 4 bar basınç altında denemeler gerçekleştirilmiştir. Buradan da basınç artışıyla arsenik gideriminin arttığı sonucunu çıkarabilir. Elde edilen sonuçlar doğrultusunda maksimum % 90 civarı bir As giderimi tespit edilmiştir.

Sonuç olarak; elde ettiğimiz kompozit membranlar ile yapılan denemeler her ne kadar olumlu sonuç verse de her zaman yeterli gelmemektedir. Burada da gördüğümüz gibi bazı doğal su numunelerinde tek seferde arsenik için WHO'nun belirlediği 10 µg/L limitinin altına inilememiştir. Bu sorunu ortadan kaldırmak içinde çift kademeli membran uygulaması veya diğer ayırma teknikleri ile hibrid şekli düşünülebilir veya membran sistemi ile adsorpsiyon hibridi uygulanması gerekmektedir.

#### Özet

Karkamış Baraj Gölü'nün (Gaziantep) mavi-yeşil alglerini belirlemek amacıyla gölden Mayıs-Ağustos 2021 tarihleri arasında örnekler alınmıştır. Çalışma süresince mavi-yeşil alglere ait toplam 23 takson tespit edilmiştir. Mavi-yeşil algler içerisinde en fazla taksonla temsil edilen cinsler *Chroococcus* sp. ve *Anabaena* sp. olmuştur. İstasyonlarda tüm aylarda kaydedilen mavi yeşil algler arasındaki Sorenson benzerlik indeksi ise en fazla ikinci ve üçüncü istasyonlar arasında çıkmıştır.

**Anahtar Kelimeler:** Mavi-yeşil alg, Karkamış Baraj Gölü, Gaziantep.

#### Blue-Green Algae of Karkamış Dam Lake (Gaziantep)

#### Abstract

In order to determine the blue-green algae of Karkamış Dam Lake (Gaziantep), samples were taken from the lake between May and August 2021. During the study, a total of 23 taxa of blue-green algae were identified. Among the blue-green algae, the genera represented by the most taxa are *Chroococcus* sp. and *Anabaena* sp. has been. The Sorenson similarity index among the blue-green algae recorded at the stations in all months was the highest between the second and third stations.

**Keywords:** Blue-green algae, Karkamış Dam Lake, Gaziantep.

#### GİRİŞ

Baraj gölleri; akarsuların üzerine inşa edilen, içme suyu temini, sulama, elektrik üretimi, balıkçılık, sel kontrolü ve rekreasyon amaçlı kullanılan yapay göllerdir. Akış hızları yüksek olan bu göller, askıda katı madde varlığı ve kısa su değişim süresi gibi özelliklerinden ötürü doğal göllerden ayrılırlar. Baraj gölleri su toplama havzalarının daha geniş olması dolayısıyla doğal göllere oranla havzadaki kirlenmeden daha fazla etkilenirler (Demir ve Atay, 1999).

Akçaalan vd., 2008; Albay vd., 2005'a göre: "Yurdumuzdaki baraj göllerinde yapılan araştırmalarda göllerin daha çok fitoplankton kompozisyonu incelenmiştir. Bu çalışmalarda, Chlorophyta ve Bacillariophyta bölümlerine ait türlerin oransal olarak fazla bulunduğu, Cyanophyta'nın ise nadiren bulunduğu, ancak zaman zaman sayısal artışlar olduğu kaydedilmiştir." (Fakioğlu ve ark. 2011).

Cyanophyta (mavi-yeşil algler),sucul ortamda yaşam süren prokaryotik organizmalardır (Saad ve Atia, 2014). Bu algler, riketsiya, aktinomiset ve miyoplazma gruplarının dahil olduğu; gerçek çekirdek zarları ve membrana bağlı organelleri olmayan, fosfolipid tabakalı hücre çeperi bulunan mikroorganizmalardır. Hemen hemen tamamında kromozomları proteinle çevrilmiş halkasal şekilde bir DNA zinciri içerirken, mitoz bölünmezler. Her hücrede monoploid olarak bulunan tek kromozom, açılıp bir hücrenin bir ucundan, diğer bir ucuna hareket ederek kendini replike ettiğinde, hücre bölünür. Evrimsel süreçte ise, 2,5-3 milyar sene önce, kese şeklindeki ilk hücreden evrimleştiği düşünülmektedir (Paerl ve ark., 2001; URL, 1). Mavi-yeşil algler, farklı morfolojik görünümlere sahiptirler. Ototrof organizmalardır(Ris H., 1961). Alglerin en çok bilinenleri mavi-yeşil olanlarıdır. Sitoplazmalarında klorofilin yanısıra fikosiyanın (mavi renk) denilen renk pigmentleri de mevcuttur (Gantt E., 1980). Genellikle koloni halinde derelerde, göllerde, denizlerde, nemli topraklarda, havuz kenarlarında, nemli kayaların üzerlerinde ve kaplıca sularında yaşarlar. Bitkilerin yeryüzünde yaptığı

görevi algler sulara yaparlar. Bu algler; akuatik ortamda yaşayan canlılar için besin ve oksijen kaynağıdır (Saad A. ve Atia A., 2014; URL, 1).

Mavi yeşil algler, diğer algler gibi sucül ekosistemdeki besin zincirlerinde temel basamakta ilk sırada yerini alırlar. Yapısında bulunan pigmentler sayesinde, suyu ve bazı besin tuzlarını (azot, fosfor), ışık etkisiyle karbonhidratlara çevirirler. Böylece hem besin üretir, hem de suyun çözünmüş oksijen miktarını artırmış olurlar. Çoğalmaları ışık, sıcaklık ve besine bağlı olarak belirlenir. Ya tek tek hücresel yapıda ya da koloniler halinde yaşarlar (URL, 2). Visser, (2015)'deki derleme makalesinde özetle: "Bu algler aşırı çoğaldığında da sudaki oksijeni azaltarak, suda bulanıklığa sebep olurlar ve bu durum ışığın suyun derinlerine inmesine engel olur. Bu durum ise; derinlerde yaşayan canlılarının ölümüne yol açar. Yine, bu algler; tatlı suların yüzeylelerinde diğer planktonlarla birlikte "su çiçeği" denilen bir yapıyı oluştururlar. Bunlar arasında yer alan bazı türler, salgıladıkları toksinler nedeniyle zooplanktonların ve balıkların ölümüne de yol açabilmektedirler." olarak bildirmiştir (Visser, 2015). Göllerde genişleyen insan faaliyetleri nedeniyle siyanobakteri patlamaları çok yaygın olarak görülmektedir (Christoffersen ve Kaas, 2000). Bu çalışmanın amacı, baraj göllerimizde fitoplankton üzerine yapılan araştırmaların incelenmesi ile mavi-yeşil alg artışları potansiyelini ve izlenmesinin önemini ortaya koymaktır.

## MATERYAL VE METOT

Çalışma alanı olarak seçilen bölge; Güneydoğu Anadolu Projesi'nin bir kısmını oluşturan, sınır Fırat Projesi'nin ikinci ünitesi olarak bulunan, Karkamış Barajı ve HES Tesisi, Fırat Nehrinin üzerinde, Suriye Sınırı'na 4,5 km'lik uzaklıkta, beton ağırlık ve toprak dolgu tipinde ve yine Türkiye'de nehir santrali tanımlamasıyla gerçekleşen ilk uygulama alanıdır. 180 MW gücünde olan bu santralin, senede 652 GWh'lik elektrik enerjisi üretmesi amaçlanmıştır. Enerji üretmekte olan bu barajın, baraj rezervuar bölgesinde sağ-sol sahil koruma seddeleri de yapılarak, 336 m kotunda olan baraj gölünün işletme kotu 340 m'ye çıkarılarak, baraj gölü altında kalan yer ve 433 hektarlık tarım arazisinin korunması hedeflenmiştir (URL, 3). Karkamış Barajı'nın gövdesel hacmi; 2.100.000 m<sup>3</sup>, akarsu yatağından yüksekliği ise 29,00 m normal su kotunda, gölün hacmi 157,00 hm<sup>3</sup>, normal su kotundaki göl alanıysa 28,40 km<sup>2</sup>'dir. Karkamış Baraj Gölü'nün mavi-yeşil alglerini belirlemek için 500 m aralıklarla üç istasyon belirlenmiştir. Üç istasyonda da kalitatif fitoplankton örnekleri plankton ağı ile toplanmıştır. Toplanan örnekler plankton ağının ucundaki kapak açılarak önceden göl suyuyla steril edilmiş cam kavanozlara alınmıştır. Fitoplankterlerin sayımları için 'Leitz' marka inverted mikroskop kullanılmıştır. Sayımlar için alınan örneklerden 1 ml alınarak sayma lamına konulmuş ve sayılmıştır. Sayımlar sırasında tek hücreli alglerde hücre sayıları baz alınırken, kolonial veya filamentli formlarda her bir koloni veya filament bir organizma olarak kabul edilmiştir. Mavi-yeşil alglerin tür bazında teşhislerinin yapılabilmesi için gliserinle geçici preparatları oluşturulmuştur. Teşhisler için ilgili kaynaklardan (Geitler, 1925; Bourelly, 1968; Bourelly,1972) yararlanılmıştır. İstasyonlardaki mavi-yeşil algler arasındaki benzerliği ortaya çıkarmak için Sorenson benzerlik indeksi uygulanmıştır.

Sorenson Benzerlik İndeksi:  $Q/S = 2J/A+B$

A= Birinci örnekteki toplam tür sayısı

B= İkinci örnekteki toplam tür sayısı

J= Her iki örnekte ortak olan tür sayısı (Sørensen, 1948).

## BULGULAR

Araştırma süresince Karkamış Baraj Gölü'nde mavi-yeşil alglere (Cyanophyta) ait toplam 23 takson kaydedilmiştir Mavi- yeşil alglerin istasyonlara göre bulunma özellikleri Tablo 1'de gösterilmiştir (Tablo 1).

**Tablo 1.** Karkamış Baraj Gölü'nde Kaydedilen Mavi-Yeşil Alglerin İstasyonlara Göre Bulunma Özellikleri

## Birinci İstasyonda Kaydedilen Mavi- Yeşil Algler (Cyanophyta)

Karkamış Baraj Gölü'nden seçilen birinci istasyonda mavi- yeşil alglere ait *Chroococcus* (3 takson), *Dactylococcopsis* (1 takson), *Gleocapsa* (1 takson), *Calothrix* (1 takson), *Anabaena* (3 takson), *Nostoc* (1 takson), *Geitlerinema* (1 takson), *Oscillatoria* (1 takson), *Porphyrosiphon* (1 takson) ve *Schizothrix* (1 takson) olmak üzere toplam 14 takson kaydedilmiştir. Ortaya çıkış sıklığı ve birey sayıları bakımından en önemli cinsler, *Anabaena*, *Nostoc* ve *Oscillatoria* olmuştur. Bu alglerin birinci istasyondaki birey sayıları çalışma süresince hava sıcaklığına paralel bir şekilde düzenli olarak artmıştır. *Oscillatoria limosa* 'nın Ağustos ayında kaydedilen ml'deki filament sayısı (82 fil./ml) bu istasyonun diğer mavi-yeşil algleri arasındaki en yüksek birey sayıları olmuştur (Şekil 1). Birinci istasyonda *Anabaena* cinsi, *Anabaena augstumalis*, *Anabaena levanderi* ve *Anabaena verrucosa* türleri ile; *Nostoc* cinsi yalnızca *Nostoc communium* türü ve *Oscillatoria* cinsi ise yalnızca *Oscillatoria limosa* türü ile temsil edilmiştir. Bu istasyonda birey sayıları bakımından önemli olan diğer türler Mayıs ayında *Geitlerinema earlei* (77 fil./ml), Haziran ayında *Porphyrosiphon versicolor* (66fil./ml), Temmuz ayında *Schizothrix tinctoria* (68 fil./ml), Ağustos ayında ise *Geitlerinema earlei* (50 fil./ml) olmuştur.

Şekil 1. Birinci istasyonda tüm aylarda kaydedilen *Anabaena sp.*, *Nostoc communium* ve *Oscillatoria limosa* 'nın ml'deki filament sayılarındaki aylık değişimler

## İkinci İstasyonda Kaydedilen Mavi-Yeşil Algler (Cyanophyta)

Karkamış Baraj Gölü'nden seçilen ikinci istasyonda mavi-yeşil alglere ait *Chroococcus* (2 takson), *Synechocystis* (1 takson), *Dactylococcopsis* (1 takson), *Gleocapsa* (2 takson), *Calothrix* (1 takson), *Anabaena* (2 takson), *Dolichospermum* (1 takson), *Nostoc* (1 takson), *Trichormus* (1 takson), *Geitlerinema* (1 takson), *Oscillatoria* (1 takson), *Phormidium* (3 takson), *Planktothrix* (1 takson), *Porphyrosiphon* (1 takson) ve *Schizothrix* (1 takson) olmak üzere toplam 20 takson kaydedilmiştir.

İkinci istasyonda birey sayıları ve ortaya çıkış sıklığı bakımından en önemli cinsler ise *Phormidium*, *Planktothrix* ve *Schizothrix* olmuştur. *Phormidium* cinsi bu istasyonda *P. ambiguum*, *P. diguetii* ve *P. hamelii* türleri ile temsil edilirken *Porphyrosiphon* cinsi, *P. versicolor*, *Schizothrix* cinsi ise *S. tinctoria* türü ile temsil edilmiştir. Bu istasyonda dört ayda da ortaya çıkan bu cinslerin aylara göre birey sayılarında artma ve azalmalar dikkat çekici olmuştur.

Şekil 2. İkinci istasyonda tüm aylarda kaydedilen *Phormidium sp*, *Porphyrosiphon versicolor* ve *Schzothrix tinctoria*'nın ml'deki filament sayılarındaki aylık değişimler

Karkamış Baraj Gölü'nün ikinci istasyonunda tüm aylarda kaydedilen diğer bir türler ise *Anabaena verrucosa*, *Nostoc communitum* ve *Oscillatoria limosa* olmuştur. Fakat bu türlerin ml deki filament sayıları Şekil 2'de gösterilen türlere nazaran daha düşük olmuştur. Diğer türler ise ya bir ya da iki ayın örneklerinde kaydedilmişlerdir.

### Üçüncü İstasyonda Kaydedilen Mavi-Yeşil Algler (Cyanophyta)

Karkamış Baraj Gölü'nün üçüncü istasyonunda mavi-yeşil alglere ait *Chroococcus* (1 takson), *Synechocystis* (1 takson), *Dactylococcopsis* (1 takson), *Gleocapsa* (1 takson), *Anabaena* (1 takson), *Dolichospermum* (1 takson), *Trichormus* (1 takson), *Geitlerinema* (1 takson), *Lyngbya* (1 takson), *Phormidium* (1 takson), *Planktothrix* (1 takson), *Porphyrosiphon* (1 takson) ve *Schizothrix* (1 takson) olmak üzere toplam 13 takson kaydedilmiştir.

Bu istasyonda örneklemenin yapıldığı tüm aylarda ortaya çıkan taksonlar *Lyngbya martensiana*, *Planktothrix prolifica*, *Phormidium diguetti* ve *Schzothrix tinctoria* olmuştur. *Porphyrosiphon versicolor* türü ise Mayıs ayı hariç haziran, temmuz ve ağustos'ta kaydedilen mavi- yeşil alg olmuştur. Diğer türlere ise bir veya iki örnekte ancak rastlanılabilmektedir. Karkamış Baraj Gölü'nün üçüncü istasyonunda tüm aylarda kaydedilen *Lyngbya matrensiana*'nın Mayıs ayında kaydedilen filament sayıları (142 fil./ml) her üç istasyonda da kaydedilmiş en yüksek birey sayıları olmuştur. Bu istasyonda ortaya çıkış sıklığı fazla olan diğer bir tür *Gleocapsa aeruginosa* olmuştur. Fakat bu türün ml'deki hücre sayıları önemsiz olmuştur.

Şekil 3. Üçüncü istasyonda tüm aylarda kaydedilen *Lyngbya martensiana*, *Phormidium diguetti* ve *Schzothrix tinctoria*'nın ml'deki filament sayılarındaki aylık değişimler

Üçüncü istasyonda birey sayıları bakımından önemli olan diğer bir tür *Phormidium digueti* ile *Schizothrix tinctoria* olmuştur. *P. digueti*'ye ait en yüksek filament sayıları (81 fil./ml) Mayıs, *S. tinctoria*'ya ait en yüksek filament sayıları (61 fil./ml) ise Haziran ayında kaydedilmiştir. Sorenson Benzerlik İndeksi birinci ve ikinci istasyon arasında %70,58; ikinci ve üçüncü istasyon arasında %72,72 çıkarken, birinci ve üçüncü istasyon arasında ise %44,44 gibi bir sonuçla çok düşük çıkmıştır.

## TARTIŞMA VE SONUÇ

Karkamış Baraj Gölü'nde yapılan bu çalışmada, mavi-yeşil algelere ait toplam 23 takson kaydedilmiştir. Chroococcales ordosuna ait 7 takson, Hormogonales ordosuna ait 1 takson, Nostocales ordosuna ait 6 takson ve Oscillatoriales ordosuna ait 9 takson tespit edilmiştir. Baraj Gölü'nden tespit edilen istasyonlar arasındaki Sorenson Benzerlik İndeksi en yüksek (%72,72) ikinci ve üçüncü istasyon arasında, en düşük ise (%44,44) birinci ve üçüncü istasyonlar arasında çıkmıştır (Sorenson, 1948). Birinci ve üçüncü istasyonlar arasında bu kadar düşük bir benzerlik çıkmasının nedeni ise habitat farklılığından kaynaklı olabileceği sonucunu ortaya koymaktadır. Örnek alma yeri olarak seçilen birinci istasyonda çok az makrofit bulunurken ikinci ve üçüncü istasyonlar bol makrofitli alanlardan seçilmiştir.

Sönmez ve ark. (2017)'nin Karkamış Baraj Gölü (Şanlıurfa/Türkiye)'nde "Fitoplanktonun Mekansal Temporal Dağılımı" adlı çalışmalarında mavi-yeşil (Cyanophyta) algelere ait (*Geitlerinema amphibium*, *Gleocapsa alpina*, *Lyngbya major*, *Microcystis aeruginosa*, *Oscillatoria limosa*, *Oscillatoria tenuis*, *Phormidium breve*, *Phormidium lucidum*, *Phormidium subfuscum* ve *Spirulina major*) toplamda 10 adet takson kaydedilmiştir. Aynı baraj gölü'nde yapmış olduğumuz bu çalışmanın bulguları ile Sönmez ve ark. (2017)'nin bulguları *Oscillatoria limosa* hariç yalnızca cins seviyesinde benzerlik göstermiştir. Bu durum örnek alma istasyonlarının ve aylarının farklılıklarından kaynaklanmış olabileceğini ortaya koymaktadır. Fakıoğlu ve ark. (2011)'nin "Baraj Göllerinde Toksik Mavi-Yeşil Algler" adlı çalışmalarında toksik Cyanobacteria artışlarının izlenmesi ve alınması gereken önlemler araştırılmıştır. Bu çalışmada mavi-yeşil alglerden 98 adet tür teşhis edilmiş ve bu türlerden 57 tanesinin toksik olabileceği vurgulanmıştır. Bu toksik türler arasında yer alan iki tür (*Chroococcus turgidus* ve *Lyngbya martensiana*) çalışmamız bulgularında da tespit edilmiştir. Toksik mavi-yeşil alglerin içme sularında gelişiminin engellenmesi halk sağlığının korunması açısından önemlidir. Bu alglerin aşırı artması, su kirlenmesi ile orantılıdır. Ortamdaki azot ile fosfor derişiminin standart seviyelerde olmasıyla bu alglerin artışları önlenabilir. Bu bağlamda havza yönetimi önem kazanmaktadır. Çünkü dış ve iç azot ve fosfor yükünün kontrolü stratejik bir havza yönetimi ile mümkündür (Anonymous, 2010).

Açıkgöz ve Baykal (2005)'in "Karagöl (Çubuk-Ankara) Alg Florası" isimli araştırmalarında Karagöl'ün planktonik, epipelik, epifitik ve epilitik alg florası Kasım 1999-Ekim 2000 tarihleri arasında kalitatif olarak incelenmiş ve Bacillariophyta (120), Chlorophyta (41), Cyanophytaya (24), Euglenophyta (9) ve Dinophyta (2) olmak üzere toplam 196 adet takson tespiti yapılmıştır. Cyanophyta'ya ait 24 takson içerisinde bulunan *Lyngbya*, *Oscillatoria*, *Phormidium*, *Anabaena* ve *Nostoc* cins bazında *Lyngbya martensiana* ise tür bazında çalışmamızın bulguları ile benzerlik göstermiştir.

Öztürk (2014)'ün "Apa Baraj Gölü Algleri Üzerine Araştırmalar" isimli doktora tezinde; gölün bentik algleri (epipelik, epifitik ve epilitik), kıyı bölgesi fitoplanktonu, mevsimsel değişimi ve bu değişime etki eden fiziksel ve kimyasal faktörler Mart 2010-Mart 2012 tarihleri arasında incelenmiştir. Fitoplanktonda *Heterokontophyta*, *Chlorophyta*, *Charophyta*, *Cyanobacteria*, *Euglenophyta* ve *Dinophyta*'ya ait toplam 116 adet takson saptanmıştır. Cyanobacteria'dan *Nostoc commune*'nin Mayıs ayında bölgesel koloni oluşturduğu bunun yanısıra Ağustos-Eylül aylarında algal artış gözlemlendiği ve en baskın türün *Microcystis aeruginosa* olduğu tespit edilmiştir. Bu türlere ise çalışmamız bulgularında rastlanılmamıştır.

Türkiye baraj göllerinin fiziksel, kimyasal ve biyolojik parametreleri hakkında yeterli bilgi olduğunu söylemek zordur. Ülkemizdeki bazı baraj göllerinde yürütülen çalışmaların ise sınırlı olduğu ve belirli bir amaç için yapıldığı görülmektedir. Bunun sonucu olarak, yapılan çalışmalar ancak birkaç yıllık gözlemleri içermekte, bir baraj gölü hakkında geleceğe ve çok amaçlı kullanımlarına yönelik planlama yapılması mümkün olmamaktadır. Karkamış Baraj Gölü'nde yapılan bu çalışma ile hem Türkiye alg veri tabanının oluşturulmasına hem de baraj göllerinde yapılacak çok amaçlı çalışmalara katkı sağlanması düşünülmüştür.

#### Özet

Bu araştırma, COVID-19 pandemi sürecindeki duygu durumlarının bireylerde yeme davranış bozuklukları ile Akdeniz diyeti bağıllıkları üzerine etkisini ve bu etmenler arasındaki ilişkiyi belirlemek amacıyla tanımlayıcı araştırma çalışması olarak planlanıp yürütülmüştür. Araştırmanın örneklemini Türkiye’de yaşayan 18-65 yaş aralığında bulunan bireyler oluşturmuştur. Bu çalışma toplam 491(190’ı erkek, 301’i kadın) birey üzerinde yürütülmüştür. Çalışma verileri bireylerin sosyodemografik bilgilerine yönelik sorular, Akdeniz Diyeti Bağıllık Ölçeği (MEDAS), COVID-19 Korku Ölçeği (FCV-19S), Üç Faktörlü Yeme Ölçeği (TFEQ-R21), beslenme alışkanlıkları ile ilgili soruların yer aldığı bir form aracılığıyla online olarak elde edilmiştir. Çalışma sonucunda elde edilen veriler Windows ortamında Statistical Package for the Social Sciences (SPSS) 25.0 paket programı ile değerlendirilmiş ve tüm hesaplamalarda  $p<0.05$  anlamlı kabul edilmiştir. Katılımcıların FCV-19S ile MEDAS ve TFEQ-R21 arasında aynı yönlü anlamlı bir ilişki bulunmuştur( $p<0.05$ ). Katılımcıların TFEQ-R21 alt boyutu bilişsel kısıtlama ile MEDAS ve FCV-19S arasında aynı yönlü anlamlı bir ilişki bulunmuştur( $p<0.05$ ). Katılımcıların TFEQ-R21 alt boyutu duygusal yeme ile FCV-19S arasında aynı yönlü anlamlı bir ilişki bulunmuştur ( $p<0.05$ ). Katılımcıların TFEQ-R21 alt boyutu kontrolsüz yeme ile MEDAS arasında ters yönlü anlamlı bir ilişki bulunmuştur( $p<0.05$ ). Katılımcıların TFEQ-R21 alt boyutu kontrolsüz yeme ile FCV-19S arasında aynı yönlü anlamlı bir ilişki bulunmuştur( $p<0.05$ ). Sonuçta yetişkin bireylerde artan COVID-19 korkusunun TFEQ-R21 toplam puanını, duygusal yeme, bilişsel kısıtlama ve kontrolsüz yeme davranış düzeylerini arttırdığı, artan kontrolsüz yeme MEDAS uyumunu düşürdüğü ve artan bilişsel kısıtlama MEDAS uyumunu artırma eğiliminde olduğu bulunmuştur. Artan FCV-19S artan MEDAS ile ilişkili olduğu bulunmuştur. Pandemi süresince yetişkin bireylerin hissettikleri korku seviyelerinin azaltılması, yeme davranışlarına pozitif anlamda etki edilerek MEDAS düzeylerinin artırılması için disiplinler arası çalışmaların faydalı olacağı düşünülmektedir.

**Anahtar Kelimeler:** Covid-19, Akdeniz diyeti, Yeme davranışı

**Evaluation of mediterranean diet addiction level with eating behavior disorders during the covid-19 pandemic period**

#### Abstract

This research was planned and conducted as a descriptive research study in order to determine the effect of mood states during the COVID-19 pandemic process on eating behavior disorders and Mediterranean diet adherence in individuals and the relationship between these factors. The sample of the study consisted of individuals between the ages of 18-65 living in Turkey. This study was conducted on a total of 491(190 male, 301 female) individuals. The study data were obtained online through a form including questions about the sociodemographic information of individuals, Mediterranean Diet Adherence Scale (MEDAS), COVID-19 Fear Scale (FCV-19S), Three-Factor Eating Scale (TFEQ-R21), and nutritional habits. The data obtained as a result of the study were evaluated with the Statistical Package for the Social Sciences (SPSS) 25.0 package program in the Windows environment and  $p<0.05$  was considered significant in all calculations. A statistically significant correlation was found between the participants' FCV-19S and MEDAS and TFEQ-R21( $p<0.05$ ). A significant correlation was found between the participants' TFEQ-R21 sub-dimension cognitive restriction and

MEDAS and FCV-19S( $p<0.05$ ). A significant correlation was found between the participants' TFEQ-R21 sub-dimension emotional eating and FCV-19S( $p<0.05$ ). A significant inverse relationship was found between the participants' TFEQ-R21 sub-dimension, uncontrolled eating, and MEDAS( $p<0.05$ ). A significant correlation was found between the participants' TFEQ-R21 sub-dimension, uncontrolled eating, and FCV-19S( $p<0.05$ ). As a result, it was found that increased fear of COVID-19 in adults increased TFEQ-R21 total score, emotional eating, cognitive restriction and uncontrolled eating behavior levels, increased uncontrolled eating decreased MEDAS compliance, and increased cognitive restriction tended to increase MEDAS compliance. Increased FCV-19S was found to be associated with increased MEDAS. It is thought that interdisciplinary studies will be beneficial to reduce the level of fear felt by adults during the pandemic and to increase MEDAS levels by positively affecting their eating behaviors.

**Keywords:** Covid-19, Mediterranean diet, Eating behavior

## GİRİŞ

Covid-19, tüm dünyayı etkisi altına alan, ivedilikle el atılması gerekli olan bir sağlık krizidir (Bavel vd., 2020). Türkiye’de mart ayında, ilk vakanın görülmesi ile birlikte Covid-19 virüsünün yayılmasını kontrol altına almak için diğer ülkelerde olduğu gibi sıkı tedbirler uygulanmaya başlanmıştır (T.C. Sağlık Bakanlığı, 2021). Bu tedbirler enfeksiyon oranını azaltmaya yardımcı olurken nüfusun alışkanlıklarında ani ve radikal bir değişime neden olmuştur (Hossain vd., 2020). Sosyal etkileşim kurmaya alışkın olan insanların arkadaş ve aileleri ile mesafelerini korumak zorunda kalmaları, aniden daha fazla veya tamamen yalnız kalmaları, kısıtlamalar nedeniyle günlük rutinlerinin kesintiye uğraması, medyadan sürekli olarak Covid-19 ile ilgili haberlerin duyulması veya okunması anksiyete ve stresi artırmıştır (Todisco & Donini, 2021). İnsanlar, olumsuz hislerin üstesinden gelebilmek amacıyla çeşitli yeme davranışlarına yönelebilirler (Kaner vd., 2023). Duygusal durumlar, besin alımını arttırabildiği gibi bazı bireylerde ise azaltmaktadır (Konttinen, 2020). Sağlığın en önemli yapı taşlarından biri beslenmedir. Beslenme tedavisi, birçok akut, kronik ve bulaşıcı hastalıklar olmak üzere çeşitli hastalıkların tedavisinde büyük önem taşımaktadır. Destekleyici beslenme tedavisinin Ebola virüs salgınında vaka ölüm oranını azalttığı gözlenmiştir. SARS-CoV-2 için de aynı durumun geçerli olduğu düşünülmektedir (Kartal vd., 2020). Literatürde Covid-19’dan korunmada adından en sık bahsettiren diyet çeşidi, Akdeniz diyetidir. Birçok otorite bu dönemde meyve ve sebze alımının artmasını, işlenmiş gıda alımının azaltılmasını önermektedir (Yasar & Aytakin, 2021). Yaşanılan pandemi süreci gibi toplumun yaşamını etkileyen süreçlerde, toplumun sağlıklı bir şekilde baş etmesini sağlayabilmek, sekonder hastalık riskini azaltabilmek ve uygun tedbirler alabilmek için bu süreçlerde meydana gelen duygu durum değişikliğinin yeme davranış ve diyet kaliteleri üzerine etkilerini araştırmak önemlidir. Bu çalışmada, pandemi süresince yetişkin bireylerin duygu durumlarının belirlenip yeme davranışı ve Akdeniz diyeti bağlılık düzeyi ile aralarındaki ilişkilerin araştırılması amaçlanmıştır.

## MATERYAL VE METOT

### Araştırmanın Türü

Bu çalışma, Covid-19 pandemi süresince yetişkinlerin duygu durumları ile yeme davranışları ve Akdeniz diyeti bağlılıklarının belirlenerek aralarındaki ilişkinin değerlendirilmesi amacıyla kesitsel ve betimleyici tipte tasarlanmıştır. Veriler 1 Ekim 2021-31 Aralık 2021 tarihleri arasında toplanmıştır.

### Araştırma Evreni ve Örneklemi

Araştırmanın evrenini Türkiye’deki 18-65 yaş aralığında olan, araştırmaya katılmaya gönüllü olan, okuma yazması olan, sosyal ağ siteleri ve uygulamalarından (Instagram, Facebook ve WhatsApp) en az birini kullanan bireyler oluşturmaktadır. G\*Power 3.1.9.4 programı ile yapılan analizde 0.05 hata payı, 0.95 güç ve 0.5 etki büyüklüğü ile örneklem büyüklüğü hesaplandığında çalışmaya alınması gereken kişi sayısı minimum 210 bulunmuştur.

### Veri Toplama Araçları

Genel tanıtıcı bilgiler, beslenme durumu ile ilgili sorular, Akdeniz Diyeti Bağlılık Ölçeği, Üç Faktörlü Yeme Ölçeği ve COVID-19 Korku Ölçeği’nin bulunduğu anket formu “Google forms” ile oluşturulduktan sonra bireylere araştırmacı tarafından sosyal ağ siteleri ve uygulamaları (Instagram, Facebook ve WhatsApp) ya da

e-posta yoluyla ulaştırılmıştır. Genel tanıtıcı bilgiler formu, araştırmacılar tarafından oluşturulan on bir soruluk bir bölümdür. Beslenme alışkanlıkları formu, araştırmacılar tarafından geliştirilen bu form pandemi süresince ara ve ana öğün sayıları, öğün atlama durumları ile besin takviyesi kullanımının sorgulandığı dört soruluk bir bölümdür. Akdeniz Diyeti Bağlılık Ölçeği 2012 yılında Martinez-Gonzalez ve arkadaşları tarafından geliştirilmiştir (Martínez-González vd., 2012). Akdeniz Diyeti Bağlılık Ölçeği 14 sorudan oluşan bir ankettir. Tüketim miktarına göre sorulan her soru için 1 ya da 0 puan alınmakta olup, toplam puanın hesaplaması yapılmaktadır. Toplam puanın 7 ve üzerinde olması bireyin Akdeniz diyetine kabul edilebilir derece uyumunun olduğunu, 9 ve üzerinde olması ise bireyin Akdeniz diyetine sıkı uyumunun olduğunu göstermektedir. Akdeniz Diyeti Uyum Skorlaması (ADS) Akdeniz Diyeti Bağlılık Ölçeği'nin Türkçe 'ye Uyarlanması Geçerlilik ve Güvenilirliği çalışmasından alınmıştır (Özkan Pehlivanoglu vd., 2020). Bu çalışmada, katılımcıların Covid-19 pandemi döneminde duydukları korku düzeyinin tespit edilmesi için COVID-19 Korku Ölçeği kullanılmıştır. FCV-19S, Ahorsu ve arkadaşları tarafından geliştirilen tek boyutlu yedi maddeli, beş puanlı Likert ölçeğidir (Ahorsu vd., 2020). Bu çalışmada, katılımcıların yeme davranışlarını değerlendirmek için üç faktörlü yeme ölçeği formu kullanılmıştır. Bu ölçeğin orijinali 51 madde içermekte ve iki bölümden oluşmaktadır. Baş, Bozan & Cığırım (2008) tarafından Türkiye'de yapılan çalışmada 51 maddeden oluşan Üç Faktörlü Yeme Ölçeği kullanılmıştır (Baş vd., 2008). Buna ek olarak Karakuş, Yıldırım & Büyüköztürk (2016) tarafından bu ölçeğin 21 maddelik formu Türk kültürüne uyarlanmıştır. Bu ölçek yeme davranışını bilişsel kısıtlama, kontrolsüz yeme ve duygusal yeme adı altındaki üç alt faktör ile ölçmektedir (Karakuş vd., 2016).

## BULGULAR

Araştırmaya Türkiye'de yaşayan 18-65 yaş aralığındaki 301'i kadın, 190'ı erkek olmak üzere toplam 491 yetişkin birey katılmıştır. Sosyo-demografik özelliklere ilişkin frekans dağılımı Tablo 1 'de sunulmuştur.

**Tablo 1.** Sosyo-demografik özelliklere ilişkin frekans dağılımı tablosu

Değişkenler		N	%
Cinsiyet	Kadın	301	61.30
	Erkek	190	38.70

	Azalma oldu	77	15.68
	Değişmedi	170	34.62
	Bilmiyorum	24	4.89
Covid-19 pandemi öncesi haftada en az 150 dk egzersiz yapma durumu	Evet	182	37.07
	Hayır	309	62.93
Covid-19 pandemi sürecinde haftada en az 150 dk egzersiz yapma durumu	Evet	140	28.51
	Hayır	351	71.49

N: Sayı, %: Yüzde.

Tablo 1'de yer alan verilere göre çalışmaya katılan bireylerin %61.30'unun kadın, %38.70'inin erkek olduğu belirtilmiştir. Araştırmaya katılan yetişkinlerin %21.59'unun evli, %78.41'inin bekar medeni durumuna sahip olarak bildirilmiştir. Katılımcıların %3.26'sının eğitim düzeyinin ortaokul ve altı, %14.26'sının lise, %63.14'ünün lisans ve %19.35'inin eğitim düzeyinin lisansüstü olduğu saptanmıştır. Katılımcıların %41.96'sı çalıştığını, %58.04'ü ise çalışmadığını belirtmiştir. Çalışmaya katılanlardan %14.66'sının doktor tarafından

tanısı konulmuş kronik rahatsızlığının olduğunu, geriye kalan %85.34'ünün herhangi bir kronik hastalığının olmadığı bildirilmiştir. BKİ sınıflandırılmasına göre; çalışmaya katılan bireylerin %6.11'inin zayıf, %61.51'inin normal, %24.44'ünün hafif şişman ve %7.94'ünün obez olduğu saptanmıştır. Katılımcıların %44.81'inin pandemi sürecinde vücut ağırlığında artış olduğu, %15.68'inde vücut ağırlığında azalma olduğu, %34.62'sinin vücut ağırlığında değişiklik olmadığını bildirmiştir. Çalışmaya katılanların %37.07'sinin pandemi öncesi egzersiz yaptığı, %28.51'inin pandemi sürecinde egzersiz yaptığı görülmektedir. Pandemi öncesi dönemde egzersiz yapmadığını belirtenler katılımcıların %62,93'ü iken pandemi sırasında egzersiz yapmadığını bildirenler katılımcıların %71,49'u olarak saptanmıştır.

$\bar{X}$ : Aritmetik ortalama, Ss: Standart sapma, \*p<0.05

Tablo 2'de bulunan verilere göre; Akdeniz diyeti bağlılık düzeyleri açısından BKİ durumları arasında istatistiksel olarak anlamlı bir farklılık bulunmamaktadır (p>0.05). Covid-19 korku düzeyleri açısından BKİ durumları arasında istatistiksel olarak anlamlı bir farklılık bulunmamaktadır (p>0.05). Üç faktörlü yeme düzeyleri açısından BKİ durumları arasında istatistiksel olarak anlamlı bir farklılık bulunmaktadır (p<0.05). Zayıf BKİ sınıflamasına sahip olan katılımcıların üç faktörlü yeme düzeyleri normal, hafif şişman ve obez olanlara göre anlamlı derecede düşük, normal kilolu olanların üç faktörlü yeme düzeyleri hafif şişman ve obez olanların düzeylerine göre anlamlı derecede düşüktür. Bilişsel kısıtlama düzeyleri açısından BKİ durumları arasında istatistiksel olarak anlamlı bir farklılık bulunmaktadır (p<0.05). Zayıf BKİ sınıflamasına sahip olan katılımcı bireylerin bilişsel kısıtlama düzeyleri normal, hafif şişman ve obez olanlara göre anlamlı derecede düşük, normal kilolu olanların bilişsel kısıtlama hafif şişman ve obez olanların düzeylerine göre anlamlı derecede düşüktür. Duygusal yeme düzeyleri açısından BKİ durumları arasında istatistiksel olarak anlamlı bir farklılık bulunmaktadır (p<0.05). Zayıf BKİ sınıflamasına sahip olanların duygusal yeme düzeyleri normal, hafif şişman ve obez olanlara göre anlamlı derecede düşük, normal kilolu olanların duygusal yeme hafif şişman ve obez olanların düzeylerine göre anlamlı derecede düşüktür. Kontrolsüz yeme düzeyleri açısından BKİ durumları arasında istatistiksel olarak anlamlı bir farklılık bulunmaktadır (p<0.05). BKİ kategorisi zayıf

olanların kontrolsüz yeme düzeyleri normal, hafif şişman ve obez olanlara göre anlamlı derecede düşük, normal kilolu olanların kontrolsüz yeme hafif şişman ve obez olanların düzeylerine göre anlamlı derecede düşüktür.

Tablo 3'te bulunan verilere göre; Covid-19 korku düzeyi ile Akdeniz diyeti bağlılık düzeyleri arasında aynı yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=0.116$ ;  $p<0.05$ ). Covid-19 korku düzeyleri arttıkça Akdeniz diyet bağlılık düzeyleri de artmaktadır. Covid-19 korku düzeyi ile üç faktörlü yeme ölçek düzeyleri arasında aynı yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=0.336$ ;  $p<0.05$ ). Covid-19 korku düzeyleri arttıkça üç faktörlü yeme ölçek düzeyleri de artmaktadır. Bilişsel kısıtlama düzeyleri ile Akdeniz diyeti bağlılık düzeyleri arasında aynı yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=0.125$ ;  $p<0.05$ ). Bilişsel kısıtlama düzeyleri arttıkça Akdeniz diyeti bağlılık ölçek düzeyleri de artmaktadır. Bilişsel kısıtlama düzeyleri ile Covid-19 korku düzeyleri arasında aynı yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=0.208$ ;  $p<0.05$ ). Bilişsel kısıtlama düzeyleri arttıkça Covid-19 korku düzeyleri de artmaktadır. Duygusal yeme düzeyleri ile Covid-19 korku düzeyleri arasında aynı yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=0.250$ ;  $p<0.05$ ). Duygusal yeme düzeyleri arttıkça Covid-19 korku düzeyleri de artmaktadır. Kontrolsüz yeme düzeyleri ile Akdeniz diyeti bağlılık düzeyleri arasında ters yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=-0.139$ ;  $p<0.05$ ). Kontrolsüz yeme düzeyleri arttıkça Akdeniz diyeti bağlılık ölçek düzeyleri de azalmaktadır. Kontrolsüz yeme düzeyleri ile Covid-19 korku düzeyleri arasında aynı yönlü gücü zayıf dereceli istatistiksel olarak anlamlı bir ilişki bulunmaktadır ( $r=0.317$ ;  $p<0.05$ ). Kontrolsüz yeme düzeyleri arttıkça Covid-19 korku düzeyleri de artmaktadır. Diğer düzeyleri arasında istatistiksel olarak anlamlı bir ilişki bulunmamaktadır ( $p>0.05$ ).

## TARTIŞMA

Literatürde bulunan bir araştırmada, duygusal yeme BKİ artışına sebep olduğu ve bununla birlikte duygusal yeme davranışının bireylerin ideal BKİ ulaşmalarına engel olduğu belirtilmiştir (Sainsbury vd., 2019). Başka bir çalışmada ise normal vücut ağırlığında olan katılımcıların bilişsel kısıtlama seviyeleri fazla kilolu olan katılımcılara göre anlamlı ölçüde yüksek olduğu belirtilmiştir (Şen & Kabaran, 2021). Fazla kilolu ve obez sınıflamasındaki grubun TFEQ-R21 toplam puanı anlamlı derecede daha yüksek olduğu bildirilmiştir. BKİ seviyesi arttıkça duygusal yeme ve kontrolsüz yeme alt boyut yeme davranışları artış gösterdiği rapor edilmiştir (Valencio vd., 2022). İtalya'da genç yetişkin bireyler üzerinde yapılan bir araştırmada, katılımcıların duygusal yeme düzeyleri arttıkça BKİ seviyelerinin artış gösterdiği saptanmıştır (Guerrini-Usubini vd., 2023). Negatif hislerle baş etme durumlarında hafif şişman ve obez BKİ gruplamasına sahip olan bireyler; zayıf ve normal kiloya sahip olanlara kıyasla daha çok yeme davranışına yönelmeye yatkın oldukları bildirilmektedir (Geliebter & Aversa, 2003). Bu çalışma, BKİ sınıflamasına göre zayıf olan katılımcıların üç faktörlü yeme, bilişsel kısıtlama, kontrolsüz yeme ve duygusal yeme düzeyleri; normal, hafif şişman ve obez olan katılımcılara kıyasla anlamlı derecede düşük iken normal olanların üç faktörlü yeme düzeyleri; hafif şişman ve obez olanların düzeylerine göre anlamlı derecede düşük bulunmuştur (Tablo 2). Elde edilen bulgulara göre,

literatür ile paralel olarak BKİ sınıflama derecesi arttıkça duygusal yeme, kontrolsüz yeme ve bilişsel kısıtlama seviyelerinin artış gösterdiği görülmektedir. Dolayısıyla yeme davranışlarındaki düzensizliğin vücut ağırlıklarının kontrolü üzerinde önemli bir etkisi olduğu gibi bireylerin mevcut BKİ değerlerinin yeme davranışlarını da etkilediği düşünülebilir.

Ülkemizde pandemi zamanı yapılmış olan diyet kalitesi ile Covid-19 kaynaklı kaygı durumunun aralarındaki ilişkinin araştırıldığı bir çalışmada, korku ölçek puanlaması ile Akdeniz diyeti uyumu arasında bir fark gözlemlenmediği rapor edilmiştir (Sevim vd., 2021). Yetişkinler üzerinde yapılan pandemi korku düzeyi ile Akdeniz diyeti uyum durumunun değerlendirildiği bir çalışmada, bireylerin korku düzeyine göre besin seçiminin farklılık gösterdiği belirtilmiş olup düşük korku seviyesine sahip katılımcı bireylerin Akdeniz diyetine uyum düzeyi, korku seviyesinin yüksek ve orta düzeyde olan katılımcıların Akdeniz diyeti uyum puanlarına göre daha düşük seviyede olduğunu bildirmiştir. Fakat; bireyler Covid-19 korku seviyesi ile Akdeniz diyeti bağlılıkları arasında anlamlı bir ilişki bulunmadığı belirtilmiştir (Gumus vd., 2023). Bu çalışmada, katılımcıların Covid-19 korku düzeylerinin artması ile Akdeniz diyeti bağlılık seviyelerinin de arttığı tespit edilmiştir (Tablo 3). Bireylerde pandemi döneminde duyulan virüse yakalanma korku durumunun bağışıklık sistemini güçlendirmek amacıyla daha sağlıklı ve dengeli beslenmeye yönelim konusunda etkili olduğu düşünülebilir.

Sağlık çalışanları üzerinde yapılan bir çalışmaya göre TFEQ-R18 puanlamasındaki artış stres ile korku seviyelerini azalttığı tespit edilerek; hissedilen korku seviyelerinin yeme davranışlarını olumsuz olarak etki ettiğini belirtmiştir (Üstün & Yılmaz, 2023). Covid-19 korkusunun aracılığı ile yetişkin bireyler üzerinde olumsuz hislerin duygusal yeme davranış düzeyine anlamlı derecede etki ettiği bulunmuştur (Dominte vd., 2022). Bu çalışmada, katılımcıların Covid-19 korku düzeyi artış gösterdikçe üç faktörlü yeme ölçeği toplam puanı, ölçek alt boyutu olan bilişsel kısıtlama, duygusal yeme ve kontrolsüz yeme düzeyleri de artış gösterdiği saptanmıştır (Tablo 3). Literatür araştırmasına göre, korku gibi kaygılı ve stresli dönemlerde, bireylerin duygularını beslenmeye yönelerek kontrol etmeye çalıştıklarını göstermektedir. Bu sebeple, Covid-19 korkusu yeme davranışlarında bozuklukları tetikleyeceği düşünülmektedir.

Yapılan bir çalışmada; ruh hali, beslenme davranışları ve diyet kalitesi ile ilgi çalışmada fazla kilolu ve obez metabolik sendromlu erkek bireylere Akdeniz diyeti uyumu yüksek beslenme planları 12 ay boyunca uygulanmış ve hiçbir müdahale yapılmayan grup ile çalışma sonuna değerlendirilme yapılmıştır. Müdahale edilen grubun duygusal ve kontrolsüz yeme davranışında azalma görülürken bilişsel kısıtlayıcı yeme davranışına artış olduğu bildirilmiştir. Katılımcıların müdahale sonucunda vücut ağırlıklarında herhangi bir değişim olmadığı bildirilse de Akdeniz diyeti uyumları artış gösterdiği bildirilmiştir (Paans vd., 2020). Bu çalışmada, yeme davranışları alt boyutlarından bilişsel kısıtlama arttığında Akdeniz diyeti uyum düzeyinin de yükseldiği tespit edilmiştir (Tablo 3). Ayrıca kontrolsüz yeme davranış seviyesinin artması ile Akdeniz diyeti bağlılık düzeyinin azaldığı saptanmıştır (Tablo 3). Bu bağlamda, toplumda Akdeniz diyeti bağlılığının artırılması ile ilgili teşvik ve çalışmalarının yeme davranışlarını olumlu yönde etkileyeceğini düşündürmektedir.

## SONUÇ

Covid-19 korku düzeyleri arttıkça Akdeniz diyet bağlılık ve üç faktörlü yeme davranış düzeyleri de artış göstermektedir. Bilişsel kısıtlama yeme davranış düzeyleri arttıkça Akdeniz diyeti bağlılık ve Covid-19 korku düzeyleri de artış gösterdiği bulunmuştur. Duygusal yeme düzeyleri arttıkça Covid-19 korku düzeyleri artmaktadır. Kontrolsüz yeme düzeyleri arttıkça Akdeniz diyeti bağlılık ölçek düzeyleri azalırken Covid-19 korku düzeyleri artış gösterdiği bulunmuştur. Zayıf BKİ derecesine sahip olanların üç faktörlü yeme, bilişsel kısıtlama, kontrolsüz yeme ve duygusal yeme düzeyleri; normal, hafif şişman ve obez olanlara göre anlamlı derecede düşük, normal kilolu olanların üç faktörlü yeme düzeyleri; hafif şişman ve obez olanların düzeylerine göre anlamlı derecede düşük düzeyde bulunmuştur.

## TEŞEKKÜR

Çalışmaya katılan tüm gönüllülere teşekkür ederiz.

## Özet

Bireylerin beden algıları duygu durumlarını ve duygu durumları da beslenme davranışlarını değiştirebilmektedir. Bu çalışmanın amacı öğrencilerin yeme davranışlarının duygusal durum ve beden memnuniyetsizliği doğrultusunda farklılaşıp farklılaşmadığını belirlemektir. Kesitsel olarak planlanan araştırmanın evreni Burdur Mehmet Akif Ersoy Üniversitesi öğrencileridir. Online anket olarak planlanan çalışmaya Şubat- Mayıs 2023 tarihleri arasında toplam 141 kadın, 35 erkek olmak üzere 176 kişi katılmıştır. Katılımcılara uygulanan ankette sosyo-demografik ve antropometrik bilgiler, öğrencilerin beden memnuniyetleri, Hollanda Yeme Davranışı Ölçeği (DEBQ) ve Yeme Farkındalığı Ölçeği (YFÖ) yer almıştır. Yaş, cinsiyet ve BKİ bağımlı değişken, DEBQ ve YFÖ ise bağımsız değişken olarak değerlendirilmiştir. Çalışmaya katılan kadın öğrencilerin yaş ortalaması 22,1±2,5 yıl, erkeklerin ise 25,1±7,3 yıldır. Kadın öğrencilerin %51,8'i, erkek öğrencilerin %22,9'u daha ince bir vücuda sahip olmak istediğini belirtmiştir. Kadın öğrencilerin erkeklere kıyasla şimdiki vücut ağırlığından daha az memnun olduğu tespit edilmiştir. Kadın öğrencilerin yalnızca %12,8'i, erkek öğrencilerin yalnızca %22,9'u öğün atlamadığını belirtmiştir. Çalışmaya katılan kadın öğrencilerin DEBQ puanları erkek öğrencilere kıyasla daha yüksektir. Fakat sadece duygusal yeme puanları istatistiksel olarak anlamlı farklılık göstermektedir. Mevcut ağırlıklarından memnun olmayanların duygusal yeme ve kısıtlayıcı yeme davranış düzeyleri yüksek, dışsal yeme davranış düzeyleri ise düşüktür. Kadın öğrencilerin yeme farkındalığı ölçeği alt boyutlarından yeme kontrolü davranışı erkek öğrencilere kıyasla istatistiksel olarak anlamlı düzeyde daha yüksektir (p<0,05). Üniversite eğitim dönemi öğrencilerin hayatında yeni bir hayata geçiş dönemidir ve bu dönemde özellikler kadın öğrencilerde duygusal davranışlar dış faktörler ile beraber beslenme davranışlarını oldukça etkilemektedir. Bu nedenle üniversite öğrencilerine sağlıklı beslenme davranışları kazandırılmalı kadın öğrencilerde sağlıklı beden farkındalığı oluşturulmalıdır.

**Anahtar kelimeler:** Beslenme, duygusal yeme davranışı, beden memnuniyeti

## Abstract

Individuals' perceptions of their bodies may affect their emotional states, and emotions can affect their eating habits. The aim of this study is to determine whether emotional states and body dissatisfaction have an impact on students' eating patterns. Students at Burdur Mehmet Akif Ersoy University constitute the study's population. Between February and May 2023, 176 individuals (141 women and 35 men) participated in the study, which was designed as an online survey. Students' body satisfaction, the Dutch Eating Behavior Scale (DEBQ), and the Mindful Eating Questionnaire (MEQ) were among the items on the questionnaire given to the participants. Age, gender and BMI were considered as dependent variables, while DEBQ and MEQ were considered as independent variables. The mean age of the female students participating in the study was 22.1±2.5 years, and 25.1±7.3 years for males. 51.8% of female students and 22.9% of male students stated that they wanted to have a slimmer body. It has been determined that female students are less satisfied with their current body weight compared to males. Only 12.8% of students in the female and 22.9% of students in the male reported not to skip meals. Female study participants scored higher on the DEBQ than male participants. However, the only scores that differ statistically are those related to emotional eating. High levels of emotional

eating and restrictive eating behavior are present in people who are unhappy with their weight, while low levels of external eating behavior are present. Female students scored statistically substantially higher than male students on the eating control behavior sub-dimension of the eating awareness measure ( $p<0.05$ ). University education period is the transition period to a new life in the lives of students, and in this period, emotional behaviors in female students, together with external factors, affect nutritional behaviors. For this reason, healthy eating behaviors should be taught to university students and healthy body awareness should be created in female students.

**Keywords:** Nutrition, emotion, emotional eating behavior, body satisfaction

## Giriş

Dünya Sağlık Örgütü sağlığı “insanın fiziksel, zihinsel ve sosyal yönden tam bir iyilik halinde olması” biçiminde tanımlamaktadır (WHO, 1948). Sağlıklı beslenme; yeterli ve dengeli miktarda besin öğelerini, her bir bireye özgü gereksinim miktarınca tüketmesidir. Bunun yanı sıra besinlerden haz alarak, yeterli miktarlarda alarak yaşamın devamını sağlamak amacıyla yapılan bilinçli bir eylemdir. Sadece tüketilmek istenen besinin vücuda alınması ya da sadece açlık duygusunu bastırmak amacıyla yapılmamaktadır (Baysal ve ark., 2013). Bireylerin besin tercihi; sosyo-demografik faktörler, şişmanlık, beden algısı, iştah, içinde bulunulan duygusal durum, dini ve kültürel inanışlar, geçmiş deneyimler, hormonlar, çevre ve genetik gibi birçok etmen tarafından belirlenmektedir (Deveci ve ark., 2017). Duyguların bireylerin besin tercihlerinde ve beslenme alışkanlıklarının oluşumunda çok güçlü bir etkisi olduğu bilinmektedir (Framson ve ark., 2009). Yeme davranışı üstünde pozitif (mutluluk, sevinç vb.) ve negatif (üzüntü, korku ve öfke vb.) duyguların etkileri vardır. Örneğin öfke duygusu ile bireyler, düzensiz ve hızlı bir şekilde ne yediğini umursamaksızın dürtüsel yeme davranışı gösterebilmekte ya da mutluluk duygusunda hedonik davranışı ile yemeklerden zevk almak için yemeye yönelebilmektedir. Ayrıca öfke gibi yoğun yaşanan olumsuz duygular varlığında yemenin duygusal durumu düzenlemek ve dikkati başka yöne çekmek için yapıldığı düşünülmektedir. Bu gibi duygular bireyi yeme davranışına yönlendirmekte ve bu davranışı etkileyen birçok etmen bulunmaktadır. Bunlar arasında şişmanlık, zayıflık, beden algısı, medya, dini ve kültürel inanışlar, geçmiş deneyimler, sosyodemografik özellikler, bireyin o an ki duygusal durumu, hormonlar, çevre, genetik ve iştah sayılabilmektedir (Karakuş ve ark., 2016).

Beslenme davranışı yaşam boyunca hızla gelişmektedir (Bilici ve Özkan, 2018). Bu gelişim sürecinde yeme davranışı ve duygu durumu arasındaki ilişki bilim insanları tarafından uzun zamandan beri araştırılmaktadır. Yaşamın devamlılığı için gerekli olan beslenme davranışı kişiye verdiği hazzın yanında yetersiz veya aşırı beslenme ya da yeme bozuklukları gibi bazı sağlık sorunlarına da neden olabilmektedir (Özgen ve ark., 2012). Ergenlerde genel olarak arkadaş, aile ve sosyal medyanın “ince ya da zayıf olma” konusundaki tutumlarının özellikle kızlarda beden algısını olumsuz etkilediği bilinmektedir (French ve ark., 2012). Son zamanlarda duygulardan etkilenen yeme davranışı ön plana çıkmakta olup; duygusal yeme, kontrolsüz yeme ve bilişsel kısıtlama davranışı gibi davranışlar olumsuz duygulara verilen bir tepki olarak kullanılan baş etme stratejisi olarak ele alınmaktadır (Sevinçer ve Konuk, 2013). Farkındalık temelli müdahalelerin etkinliği ve yargısal olmayan deneyim kabulü artan bir deneysel destek kazanmıştır. Yapılan bir çalışmada; farkındalık, depresyon, anksiyete, ağrı gibi birçok kronik sağlık probleminin tedavisinde manyetik rezonans görüntüleme beyin aktivasyon yönelimlerinde gözle görülür değişikliklerle etkili sonuçlar göstermiştir (Lutz ve diğerleri, 2013).

Duygusal yeme, son zamanlarda gündeme gelen ve üzerinde yoğun araştırmalar yapılan bir yeme davranışıdır. Duygusal yeme davranışı ilk olarak Kaplan ve Kaplan (1957) ve Bruch (1964) tarafından, bireylerin kaygı, depresif ruh hali, öfke ve stres gibi olumsuz duygularla baş etme yöntemi olarak yeme eğilimi olarak tanımlanmıştır. Duygusal yeme, olumsuz deneyimler sonucunda yaşanan duygulara tepki olarak aşırı yeme eğilimidir (Pinaguy ve ark., 2003). Duygusal yeme davranışı, olumsuz veya olumlu duygusal durumlara eğilim gösterir. Macht (2008), duygusal uyarıcıların iştah üzerinde %30'luk bir etkiye sahip olduğunu ve iştahı azaltmadaki etkisinin ise %48'e ulaşabildiğini rapor etmiştir.

Bireylerin duygu durumlarının farkına varması ve bu duygu durumları ile başa çıkabilmesi için yeme farkındalıklarının artırılması gerekmektedir (Köse, 2017). Yeme farkındalığı kavramı; Türkçe olarak ilk defa ‘Ne yenildiğinden çok, nasıl ve neden yeme davranışının oluştuğunu fark ederek, fiziksel açlık-tokluk

kavramını içselleştirip duygu ve düşüncelerin etkisinin farkında olarak, çevresel etmenlerden etkilenmeden, besin seçimlerini yargılamadan o anda tüketilecek olan besine odaklanarak yeme' olarak ifade edilmiştir (Köse ve ark., 2016). Yeme davranışları üzerine yoğunlaşarak, farkındalık kavramının yeme farkındalığına uyarlanması sonucu oluşmuştur (Framson ve ark., 2009; Hulbert-Williams ve ark., 2014). Bu çalışmanın amacı Burdur Mehmet Akif Ersoy Üniversitesi'nde öğrenim gören kadın ve erkek öğrencilerin şu an ki beden memnuniyetsizliği doğrultusunda yeme davranışlarının duygusal durum ile farklılaşıp farklılaşmadığını incelemektir.

## **Materyal ve Metot**

### **Araştırmanın Örnekleme ve Yapıldığı Yer ve zaman**

Çalışma kesitsel bir araştırmadır ve Burdur Mehmet Akif Ersoy Üniversitesi'nde eğitim gören öğrenciler üzerinde gerçekleştirilmiştir. Araştırma verileri, Mayıs 2023-Temmuz 2023 tarihleri arasında Google formlar aracılığıyla online olarak toplanmıştır. Burdur Mehmet Akif Ersoy Üniversitesi öğrencisi olan, 18 yaş ve üzeri olan, araştırmaya gönüllü olarak katılmak isteyenler ve bilinen psikiyatrik bozukluğu olmayan bireyler çalışmaya dahil edilmiştir. Burdur Mehmet Akif Ersoy Üniversitesi öğrencisi olmayan bireyler, Araştırmaya katılmak istemeyenler, bilinen psikiyatrik bozukluğu olanlar, veri toplama araçlarını eksik dolduran bireyler çalışmadan dışlanmıştır. Buna göre çalışmaya 141 kadın, 35 erkek olmak üzere toplam 176 kişi katılmıştır.

### **Anket Formu**

Öğrencilerin sosyodemografik özellikleri, besin tüketim alışkanlıkları ve beden memnuniyetsizliğine ilişkin veriler ile Yeme Farkındalığı Ölçeği (YFÖ-30) ve Hollanda Yeme Davranışı Ölçeğini (DEBQ) içeren anket formu oluşturulmuştur. Anket formunda bireylerin vücut ağırlığı ve boy uzunluğu bilgileri katılımcının beyanı ile alınmıştır.

### **Yeme Farkındalığı Ölçeği**

Yeme Farkındalığı Ölçeği (YFÖ), Framson ve ark. (2009) tarafından geliştirilen ve özgün adı 'Mindful Eating Questionnaire' olan ölçek ile yeme davranışı, farkındalığı ve duygusal durum arası ilişkiler incelenmektedir. Ölçeğin Türkçe geçerlilik ve güvenilirlik çalışması Köse ve ark. (2016) tarafından yapılmış ve yeni ölçekte 5'li likert skalası (1:hiç, 2:nadiren, 3:bazen, 4:sık sık, 5:her zaman) olarak belirlenmiştir. Ölçeğin alt faktörleri; disinhibisyon, duygusal yeme, yeme kontrolü, odaklanma, yeme disiplini, farkındalık ve enterferans olmak üzere 7 başlıkta incelenmiştir. Ölçeğin her bir alt boyutu için alınan yüksek puan katılımcının ilgili alt boyutun değerlendirildiği özelliği taşıdığını gösterirken, ölçek toplam yeme farkındalığı puanını da ölçmektedir, fakat kesme noktası belirtilmemiştir.

### **Hollanda Yeme Davranışı Ölçeği**

Hollanda Yeme Davranışı Ölçeği (The Dutch Eating Behaviour Questionnaire-DEBQ) Van Strien ve ark. (1986) tarafından geliştirilmiş ve Türkçe'ye adaptasyonu Bozan ve ark. (2011) tarafından yapılmıştır. Duygusal yeme davranışlarını, dışsal yeme davranışlarını ve kısıtlı yeme davranışlarını değerlendiren 3 alt ölçekten oluşmaktadır. Ankette yer alan maddeler 5'li Likert skalası ile değerlendirilmektedir (1: hiçbir zaman, 2: nadiren, 3: bazen, 4: sık, 5: çok sık). Ölçeğin toplam skoru değerlendirilmemekte, 3 alt ölçek kendi içinde değerlendirilmektedir. Ölçeğin skorlanması herhangi bir kesim noktası olmazken 3 alt ölçeğin kendi içinde değerlendirilen toplam puanının yüksek olması yeme davranışı ile ilgili olumsuzluğu göstermektedir. Hollanda Yeme Davranışı anketinin Türkçe versiyonunda ilk 10 soru kısıtlı yeme, 11-23 arası duygusal yeme, 24-33 arası ise dışsal yeme tutumunu değerlendiren sorulardır.

### **İstatistiksel Analiz**

Araştırmanın verileri IBM SPSS 22 (Statistical Package for the Social Sciences) programı kullanılarak analiz edilmiştir. Tanımlayıcı değer olarak nicel veriler için aritmetik ortalama ( $x$ )  $\pm$  standart sapma (SS), nitel veriler için yüzde (%) ve frekans (n) değerleri verilmiştir. Öğrencilerin tanımlayıcı özellikleri ile YFÖ puan ortalaması ve DEBQ puan ortalaması arasında normal dağılım gösteren değişkenlerde; bağımsız örneklem t

testi ve One-Way ANOVA testleri, normal dağılmayan değişkenlerde ise Mann Whitney-U ve Kruskal Wallis testleri kullanılmıştır.  $p < 0,05$  istatistiksel anlamlılık düzeyi olarak kabul edilmiştir.

### **Araştırmanın Etik Yönü**

Araştırmanın yürütülmesi için Burdur Mehmet Akif Ersoy Üniversitesi Girişimsel Olmayan Klinik Araştırmalar Etik Kurulu Başkanlığından GO 2023/208 karar numaralı 05/04/2023 tarihli “Etik Kurul Onayı” alınmıştır. Öğrencilere araştırma hakkında açıklama yapılmış ve araştırmaya katılmayı kabul eden gönüllü öğrenciler ile yürütülmüştür.

### **Bulgular**

Çalışmaya katılan 176 kişiden elde edilen veriler analiz edilmiş, çalışmaya katılan öğrencilerin sosyodemografik özellikleri Tablo 1.’de gösterilmiştir. Buna göre kadınların yaş ortalaması  $22,1 \pm 2,5$  yıl, erkeklerin yaş ortalaması ise  $25,1 \pm 7,3$  yıldır. 1. sınıfta eğitim gören kadın katılımcıların oranı %21,3 iken, erkek katılımcıların oranı %17,1’dir. 4. sınıfta eğitim gören kadın katılımcıların oranı %35,5, erkek katılımcıların ise %28,6’dır. Geliri giderinden az olan kadın öğrencilerin oranı %27,7, erkek öğrencilerin oranı ise %25,7’dir. Geliri giderine eşit olan kadın öğrencilerin oranı %61,7, erkek öğrencilerin oranı ise %48,6 olduğu saptanmıştır. Katılımcıların şimdiki vücut ağırlıklarını nasıl değerlendirdikleri incelendiğinde; daha ince olmayı isteyen kadın katılımcıların oranı %51,8 iken, erkek katılımcıların oranı %22,9’dur. Buna göre kadın öğrencilerin şimdiki vücut ağırlıklarından daha az memnun olduğu söylenebilir. Kadın katılımcıların %17,7’sinin hekim tarafından tanısı konmuş bir hastalığı varken erkek katılımcıların %14,3’ünün hekim tarafından tanısı konmuş bir hastalığı vardır. Kadın katılımcılarda en çok %16,7 oranla demir eksikliği anemisi, psikiyatrik hastalıklar ve diğer hastalıklar görülürken, erkeklerde %8,6 oranla diğer hastalıklar görülmektedir. Kadın katılımcıları %28,4 ‘ü sigara kullanırken erkek katılımcıları %57,1 ‘i sigara kullanmaktadır. Alkol kullanan kadın katılımcıların oranı %28,4 iken erkek katılımcıların oranı %51,4’tür.

### **Genel beslenme alışkanlıkları**

Öğrencilerin bazı beslenme alışkanlıkları incelenmiş ve elde edilen sonuçlar Tablo 2.’de gösterilmiştir. Buna göre kadın öğrencilerin %42,6’sının (60 kişi) erkek öğrencilerin ise %40’ının (14 kişi) öğün atladığı saptanmıştır. Öğrencilerin tamamında en çok atlanan öğünün %43,2 ile öğle öğünü olduğu görülmüştür. Neden öğün atlıyorsunuz sorusuna kadın öğrenciler en çok uykuda olduğum için (%19,9) seçeneğini işaretlerken, erkek öğrencilerde zamanım yok (%19,3) seçeneği tercih edilmiştir. Duygusal durumunuz yeme davranışınızı etkiler mi sorusuna kadın öğrencilerin %74,5’i, erkek öğrencilerin ise %54,3’ü evet demiştir. Çay ve kahve tüketim alışkanlıkları incelendiğinde erkek öğrencilerin kadın öğrencilere kıyasla daha fazla şeker attığı (sırasıyla  $10,0 \pm 7,8$  ve  $11,0 \pm 7,4$  g), fakat farkın önemli olmadığı saptanmıştır.

### Öğrencilere ait Hollanda Yeme Davranışı Ölçeği (DEBQ) ve Yeme Farkındalığı Ölçeği (YFÖ-30) puanlarının değerlendirilmesi

Öğrencilerin yeme davranışlarını gösteren DEBQ ve YFÖ-30 ölçek skorları incelenmiş, buna göre elde edilen sonuçlar Tablo 3.'te gösterilmiştir. DEBQ ölçeğine ait kısıtlayıcı yeme, duygusal yeme ve dışsal yeme skorlarının hepsinin kadın öğrencilerde daha yüksek olduğu saptanmıştır. Duygusal yeme puanlarındaki fark istatistiksel olarak anlamlıdır ( $p<0,05$ ). YFÖ-30'un alt grupları incelendiğinde ise sadece duygusal yeme ve yeme kontrolü davranışı skorlarında cinsiyete göre anlamlı farklılık saptanmıştır ( $p<0,05$ ). Erkeklerde duygusal yeme skorları  $18,5\pm4,5$  iken, kadınlarda bu skor  $16,0\pm4,7$ 'dir. Yeme kontrolü puanları incelendiğinde ise kadın ve erkek öğrencilerde sırasıyla  $15,5\pm3,6$  ve  $13,5\pm3,1$ 'dir.

**Tablo 3.** Cinsiyete göre DEBQ ve YFÖ-30 ölçek puanları

	<b>Kadın</b>	<b>Erkek</b>	<b>Toplam</b>	<b>p<sup>a</sup></b>
	<b>x±SS</b>	<b>x±SS</b>	<b>x±SS</b>	
<b>DEBQ Puanı</b>				
Kısıtlayıcı yeme	24,2±8,0	22,1±1,9	23,8±8,0	0,180
Duygusal yeme	30,9±13,8	25,4±10,6	29,8±13,4	0,012
Dışsal yeme	31,0±7,1	30,5±7,0	30,9±7,0	0,708
<b>Yeme Farkındalığı</b>				
Disinhibisyon	17,0±4,5	17,1±3,4	17,0±4,3	0,964
Duygusal yeme	16,0±4,7	18,5±4,5	16,5±4,8	0,009
Yeme kontrolü	15,5±3,6	13,5±3,1	15,1±3,6	0,001
Odaklanma	16,1±2,6	15,6±2,9	16,0±2,7	0,131

Toplam	99,4±13,7	99,1±13,0	-	0,899

a: Mann Whitney U testi kullanılmıştır. \*: p <0,001

Öğrencilerin şimdiki vücut ağırlığından memnun olma durumuna göre ölçek puanları Tablo 4.'te gösterilmiştir. Daha ince olmayı isteyen öğrencilerin kısıtlayıcı yeme (28,2±7,1) ve duygusal yeme skorları (34,9±14,0) istatistiksel olarak anlamlı düzeyde yüksektir (p<0,001). DEBQ ölçeği alt boyutlarından dışsal yeme skorlarında ise istatistiksel olarak anlamlı farklılık saptanmamıştır (p>0,05). Yeme farkındalığı alt boyutlarından ise sadece duygusal yeme skorlarında istatistiksel olarak anlamlı farklılık saptanmıştır (p<0,05). Bu farklılığın daha ince olmayı isterdim (15,3±4,8) seçeneğini işaretleyen öğrencilerin skorlarından kaynaklandığı görülmektedir. Öğrencilerin şimdiki vücut ağırlığından memnun olma durumları DEBQ ölçeği toplam puanında istatistiksel olarak anlamlı farklılık gösterirken (p<0,05), YFÖ-30 toplam puanları arasında istatistiksel olarak anlamlı farklılık bulunmamaktadır (p>0,05).

## Tartışma

Bu çalışmaya katılan öğrencilerin büyük bir çoğunluğu kadındır. Büyük ölçüde sağlık alanına ilişkin bölümlerde eğitim almakta olan öğrencilerle gerçekleştirilmiş olması bunun temel nedenidir. Benzer şekilde yürütülen bir çalışmada da kadın katılımcı sayısının daha yüksek olduğu görülmüştür (Köse ve ark., 2016). Öğrencilerin yaş ortalaması 22,7± 4,1 yıldır. Öğrencilerin BKİ değerleri incelendiğinde ise büyük çoğunluğunun normal aralıkta olduğu saptanmıştır. Çalışmaya dahil olan öğrenci grubunun özellikleri

nedeniyle bu durumun beklenen bir sonuç olduğu söylenebilir. Yapılan diğer bir çalışmada da öğrencilerin BKİ değerleri benzer şekilde dağılım göstermiştir (Köse, 2017).

Çalışmamıza katılan öğrencilerin büyük çoğunluğu öğün atladığını (%85,2) bildirmiştir. Yapılan bir diğer çalışmada ise benzer şekilde katılımcıların %82,8'inin öğün atladığı tespit edilmiştir. %42' si kesin olarak öğün atladığını belirtirken, %43,2'si ara sıra öğün atladığını belirtmiştir. Cinsiyetler arası öğün atlama incelendiğinde kadınların erkeklere göre daha çok öğün atladığı istatistiksel olarak anlamlı bulunmuştur (İbrahimova, 2020). Şimdiki vücut ağırlığından memnun olma durumunda da kadın öğrencilerin daha ince olmayı istediği görülmektedir. Kadın öğrencilerin daha zayıf olma istekleri nedeniyle daha fazla öğün atladıkları söylenebilir.

Hollanda yeme davranışı ölçeği incelendiğinde; kısıtlayıcı yeme, duygusal yeme ve dışsal yeme davranışı düzeylerine göre daha ince olmayı isteyen bireylerin sayısı kadınlarda daha fazladır. Anschutz, ve ark. (2008) tarafından üniversite öğrencileri üzerinde yapılan bir çalışmada, 163 kız öğrencide görülen beden memnuniyetsizliği ile kısıtlayıcı yeme ve duygusal yeme davranışları arasında pozitif bir ilişki olduğu, beden memnuniyetsizliği ile dışsal yeme davranışı arasında ise bir ilişki olmadığı saptanmıştır. Snoek ve ark.'nın (2007) adölesanlar üzerinde yaptığı bir çalışmada kız öğrencilerde erkek öğrencilere göre kısıtlayıcı yeme ve duygusal yeme skorlarının daha yüksek olduğu görülmüştür. Erkeklerde ise kızlara göre daha yüksek dışsal yeme skorları olduğu saptanmıştır.

Çalışmamızda YFÖ alt boyutlarından duygusal yeme ve yeme kontrolü ile cinsiyet arasında anlamlı fark saptanmıştır ( $p < 0,05$ ). Duygusal yemenin alt boyut kapsamaları duygusal açlık, iyi hissetme ve tatmin için yeme; yeme kontrolünün alt kapsamaları yeme hızını ayarlama, yeme işlevinin kontrolünü elinde tutmaktan oluşmaktadır. Erkek öğrencilerin puan ortalaması, kadın öğrencilerin puan ortalamasından daha yüksektir. Erkek öğrencilerin bu konulardaki farkındalık bilgisinin kadın öğrencilerden daha fazla olduğu söylenebilir. Fakat çalışmaya katılan erkek öğrenci sayısının az olması da bu duruma neden olmuş olabilir. Erkek öğrenci sayısının az olması çalışmanın sınırlı yönü olarak düşünülmektedir. Spor salonunda spor yapan katılımcılar ile gerçekleştirilen diğer bir çalışmada ise YFÖ-30 alt boyutlarından duygusal yeme, yeme kontrolü ve bilinçli beslenme alt boyut puanlarının cinsiyete göre istatistiksel olarak anlamlı fark gösterdiği belirlenmiştir. Spor yapan katılımcıların duygusal yeme, yeme kontrolü ve bilinçli beslenme puanları, kadınlarda erkeklere göre daha yüksektir. Spor yapan katılımcıların YFÖ-30 alt boyutlarından disinhibisyon, farkındalık, yeme disiplini, bilinçli beslenme, enterferans alt boyutları ve YFÖ-30 ölçek puanlarının cinsiyete göre anlamlı farklılık göstermediği ( $p > 0,05$ ) saptanmıştır (Üstündağ, 2020).

## Sonuç

Sonuç olarak öğrenciler üzerinde gerçekleştirilen bu çalışmada özellikle kadın öğrencilerin BKİ değerleri normal aralıkta olmasına rağmen, daha ince görünmeyi istedikleri, daha fazla öğün atladıkları ve yeme davranışlarının da buna göre etkilendiği görülmektedir. Beslenme üzerine çevrenin etkileri de olduğu bilinmekte ve bu çalışmadan elde edilen sonuçların öğrencilerin beslenme alışkanlıklarının değerlendirilmesinde çevresel faktörlerden kolaylıkla etkilenebildiğini göstermektedir. Öğrencilere sağlıklı vücut ağırlığı kavramının önemini içeren eğitimler, afişler, kongre ve sempozyumların düzenlenmesi bu konuda bilinçlendirme sağlaması açısından önemlidir.

#### Abstract

Adjuvant genes used in DNA vaccines designed to prevent and treat cancer stimulate elements of both the innate and adaptive immune systems. Normally, GM-CSF is produced in response to cytokines, which primarily mediate immune activation and inflammation and respond to various cell types including macrophages and T cells. Because of its critical role in the development and maturation of antigen presenting cells (APCs), GM-CSF indirectly affects T cells. In addition, GM-CSF has been shown to induce the proliferation, differentiation, and activation of both APCs and T cells. These properties make GM-CSF a potent adjuvant that is often used in vaccine trials. In this study, the GM-CSF gene was cloned into the pVAX1 vector, a common DNA vaccine vector. The GM-CSF gene was synthetically obtained and amplified by PCR. After the reaction, the resulting products were analysed by agarose gel electrophoresis, and the bands were extracted from the gel. PCR products cut with *Xba*I and *Xho*I enzymes were extracted with a phenol-chloroform-isoamyl alcohol mixture. Similarly, pVAX1 was cut with the same enzymes and extracted from the gel. The resulting fragments were exposed to an appropriate ligation reaction mixture at 16°C for 16 hours. The ligation products were introduced into competent *E. coli* JM109 cells by heat shock. Transformants were plated on LB-agar medium containing 50 µg/mL kanamycin and incubated. Randomly selected colonies observed on the petri dishes were used for colony PCR. Bands specific for the GM-CSF gene were observed from the colony PCR results. Plasmid isolation was performed from one of these colonies, followed by Sanger sequencing analysis. This confirmed that the gene was correctly positioned on the pVAX1 vector. The resulting recombinant expression plasmid was named as pVAX1-GM-CSF. The DNA vaccine plasmid carrying the adjuvant gene successfully obtained in this study can be used for the expression of any preventive or therapeutic gene against cancer.

**Keywords:** GM-CSF, adjuvant, DNA vaccine, cloning, recombinant DNA

#### INTRODUCTION

Despite coming more than a century after infectious disease vaccines, cancer vaccines are even more promising. While infectious disease vaccines focus primarily on disease prevention, cancer vaccines aim to treat as well as prevent cancer. Most current cancer vaccine efforts target tumour-associated antigens, whether known or unknown. In addition to these antigens, adjuvants are often used in cancer vaccine research. Often used in combination with tumour-associated antigens, adjuvants enhance the specific immune response generated against the antigen, thereby increasing the efficacy of the vaccine (Madan et al., 2012; Schlom, 2012; Thomas & Prendergast, 2016).

A DNA vaccine is a recombinant DNA produced by combining a DNA sequence to be used as a vaccine with a plasmid DNA capable of expressing that sequence using recombinant DNA technology. Host cells are transfected with the plasmid DNA containing the relevant DNA sequence and carrying fragments or genes encoding immunogenic antigens. This approach effectively induces an immune response in both humoral and cellular immunity, generating an effective immune response in both aspects (Silveira et al., 2017; Yang Lee et al., 2018). Granulocyte-macrophage colony-stimulating factor (GM-CSF) is encoded by a 2.5 kb mRNA with 4 exons. It is secreted as a small glycosylated monomeric protein with a molecular weight of 23 kDa. Human GM-CSF is derived from a precursor containing a signal peptide. GM-CSF is produced in response to various

cytokines that mediate immune activation and inflammation, primarily by various cell types including macrophages, mast cells, T cells, fibroblasts and endothelial cells. Circulating GM-CSF levels are typically low or undetectable under normal conditions, but can rise to high levels in response to immune stimuli. GM-CSF is produced by activated T cells following engagement of the T cell receptor with the antigen, together with appropriate co-stimulatory signals. Many of the effects of GM-CSF on T cells are thought to be mediated indirectly through antigen presenting cells (APCs) (Farrar et al, 1988). In addition, GM-CSF has been shown to be critical for the development and maturation of antigen-presenting cells, particularly dendritic cells (DCs), within APCs. One of the most studied in vivo effects of GM-CSF in the immune system is the critical interaction between T cells and APCs in anti-tumour immunity. The outcome of this interaction determines the fate of cancer cells based on signals received by dendritic cells, referred to as either "danger" or "tolerogenic" signals (Wada et al., 1997). On the other hand, GM-CSF has been shown to induce the proliferation, differentiation and activation of macrophages, neutrophils, various antigen-presenting cells and T cells. These properties make GM-CSF a potent adjuvant and a commonly used component in vaccine trials (Mach & Dranoff, 2000). With this in mind, the GM-CSF gene was incorporated into the DNA vaccine in this study to allow expression of the GM-CSF gene as an adjuvant.

## MATERIALS AND METHODS

*E. coli* JM109 strain, DNA ladder and restriction enzymes were purchased from Invitrogen Company (USA). The pVAX1 expression vector was purchased from ThermoFisher Scientific. The GM-CSF gene was synthesised by Invitrogen. Chemicals used in the study, including bacterial growth media, plasmid isolation kit, enzymes, DNA markers, and all other chemicals, were purchased from Invitrogen, Sigma, ThermoFisher Scientific, Intron Biotechnology, Fluka, and Merck. Initially, the following primers were used for GM-CSF gene amplification *Xho*I-GMCSF-F; 5'-ATTTCTCGAGATGTGGCTGCAGA-3' and *Xba*I-GMCSF-R; 5'-ATTCTAGATCACTCCTGGACTGG-3'. The gene was amplified using Phusion High-Fidelity DNA Polymerase (Thermo Scientific, USA) by PCR with gene-specific primers. PCR amplification included denaturation at 98 °C for 30 seconds, followed by 35 amplification cycles at 98 °C for 10 seconds, 55 °C for 30 seconds and 72 °C for 35 seconds. The final extension step was performed at 72 °C for 5 minutes. The PCR product was then digested with *Xho*I and *Xba*I enzymes. Similarly, the pVAX1 plasmid was digested with the same enzymes. The two digested products (gene and plasmid) were ligated using T4 DNA ligase to produce the recombinant plasmid. The putative recombinant plasmid was introduced into competent *E. coli* JM109 cells by heat shock transformation. LB agar containing 0.5% yeast extract, 1% tryptone, 0.5% NaCl, 2% agar and 50 µg/mL kanamycin was prepared to select for kanamycin-resistant transformants. To confirm positive transformants, colony PCR was performed using gene and vector specific primers. Based on the results of agarose gel electrophoresis, putative recombinant plasmids were purified from positive transformants and sequenced using the Sanger sequencing method.

## RESULTS and DISCUSSION

### Amplification of GM-CSF gene and obtaining recombinant vector

The GM-CSF gene was amplified by PCR using gene-specific primers (**Figure 1A**). The PCR product was then digested with specific enzymes (*Xho*I and *Xba*I). In parallel, the pVAX1 plasmid was digested with the same enzymes and analysed by agarose gel electrophoresis. The two digested products, the gene and the plasmid, were then ligated together using T4 DNA ligase to produce the recombinant plasmid. The putative recombinant vector was introduced into competent *E. coli* JM109 cells by heat shock transformation. The transformed cells were cultured on LB agar supplemented with kanamycin. After incubation, the colonies were used for colony PCR to validate the presence of positive transformants (**Figure 2**). For this purpose, colony PCR was performed using gene/vector specific primers (**Figure 1B** and **C**). The result showed successful gene amplification in almost all selected clones. Plasmid sequencing was then performed. The results of both colony PCR and nucleotide blast analysis confirmed successful insertion of the GM-CSF gene into the appropriate site of pVAX1 (**Figure 3**). The recombinant plasmid was named pVAX1-GM-CSF. The recombinant plasmid was named pVAX1-GMCSF and its map was visualized by SnapGene (SnapGene® software, www.snapgene.com) (**Figure 4**).

## CONCLUSION

In this study, we aimed to clone GM-CSF gene into pVAX1 to obtain recombinant expression vector. Colony PCR and Sanger sequencing analysis showed that the gene was inserted into the plasmid at the correct position after transformation of bacteria with the resulting putative recombinant plasmid. The DNA vaccine plasmid carrying the adjuvant gene successfully obtained in this study can be used for the expression of any preventive or therapeutic gene against cancer

#### Özet

Prostat kanseri, prostat bezindeki anormal hücreler kontrolsüz bir şekilde büyüdüğünde ve kötü huylu tümörler oluşturduğunda gelişir. Prostat kanseri ile CYP450 sisteminin polimorfizmleri arasındaki ilişkiyi inceleyen çalışmalar gün geçtikçe ilgi görmektedir. Bugüne kadar yapılan çalışmalarda CYP016 enzim ailesi ve alt gruplarındaki polimorfizmlerin meme kanseri, akciğer kanseri, ağız kanseri ve kolorektal kanser gibi kanser türleri ile anlamlı şekilde ilişkili olduğu bulunmuştur. Bu bilgiler ışığında CYP-450 enzimlerinden biri olan CYP1A1 geni ile ilişkili m1(T>C; rs4646903) ve m2 (A>G; rs1048943) polimorfizmlerinin prostat kanseri ve BPH ile olası ilişkisi araştırılmıştır. (Benign Prostatik Hiperplazi) hastaları kontrol grubu olarak kullanılmış ve sağlıklı kontrol grubunun verileri ile bölgemizde CYP1A1 polimorfizmlerinin alel sıklığının belirlenmesi amaçlandı.

Çalışmaya, dahil edilme kriterlerine uyan, MEÜ Hastanesi Üroloji polikliniğine başvuran prostat kanseri tanısı almış 60 hasta, Benign prostat Hiperplazisi tanısı almış 40 hasta ve 30 sağlıklı birey dahil edildi. Hasta ve kontrol gruplarından EDTA'lı hemogram tüplerine 2 ml kan örnekleri alındı ve DNA izolasyonu, DNA izolasyon kiti kullanılarak ( Roche Diagnostics, GmbH Mannheim Almanya) yapıldı. Elde edilen DNA örneklerinde CYP1A1 rs4646903 ve rs1048943 polimorfizm analizi, RT-PCR cihazı kullanılarak (Roche Diagnostics LightCycler 480, GmbH Mannheim, Almanya) gerçekleştirildi. İstatistiksel analizler Statistica v.13.3.0 ve MedCalc v.11.5.0. paket programı ile yapıldı ve  $p < 0.05$  ise sonuçlar anlamlı kabul edildi.

Çalışma verileri incelendiğinde; Hasta grubu ve kontrol grubu arasında ve kontrol grubunu alt grupları olan gruplar ile karşılaştırıldığında CYP1A1 (rs1048943) polimorfizmi AA, GG ve AG genotipleri ( $p=0,81$ ) ve CYP1A1 (rs4646903) polimorfizmi TT ve TC genotipleri ( $p=0,007$ ) bakımından anlamlı bir ilişki saptanmadı. Bu konuda yeterli çalışma bulunmadığından, elde ettiğimiz verilerin literatüre katkısı olacağını düşünmekteyiz.

**Anahtar Kelimeler:** Prostat kanseri, ksenobiyotik, Sitokrom P450

#### CYP1A1 Gene in Prostate Cancer OF m1(T>C) and m2 (A>G) Polymorphism Investigation of the Possible role

#### Abstract

Prostate cancer develops when abnormal cells in the prostate gland grow uncontrollably and form malignant tumors. Studies examining the relationship between prostate cancer and polymorphisms of the CYP450 system are getting more and more attention. Studies conducted to date have found that polymorphisms in the CYP016 enzyme family and subgroups are significantly associated with cancer types such as breast cancer, lung cancer, oral cancer and colorectal cancer. In the light of this information, the possible relationship of m1(T>C; rs4646903) and m2 (A>G; rs1048943) polymorphisms associated with the CYP1A1 gene, one of the CYP-450 enzymes, with prostate cancer and BPH was investigated. (Benign Prostatic Hyperplasia) patients were used as the control group and it was aimed to determine the allele frequency of CYP1A1 polymorphisms in our region with the data of the healthy control group.

The study included 60 patients diagnosed with prostate cancer, 40 patients diagnosed with Benign Prostatic Hyperplasia, and 30 healthy individuals who applied to the Urology outpatient clinic of MEU Hospital, who

met the inclusion criteria. 2 ml blood samples were taken from the patient and control groups into hemogram tubes with EDTA and DNA isolation was performed using a DNA isolation kit (Roche Diagnostics, GmbH Mannheim Germany). LightCycler 480, GmbH Mannheim, Germany) was performed. Statistical analyzes Statistica v.13.3.0 and MedCalc v.11.5.0. It was done with a package program and the results were considered significant if  $p < 0.05$ .

When the study data are examined; CYP1A1 (rs1048943) polymorphism AA, GG and AG genotypes ( $p=0.81$ ) and CYP1A1 (rs4646903) polymorphism TT and TC genotypes ( $p=0.007$ ) were significant between the patient group and the control group and compared with the control group subgroups. no relationship was detected. Since there are not enough studies on this subject, we think that the data we obtained will contribute to the literature.

**Keywords:** Prostate cancer, Xenobiotic, Cytochrome P450

## GİRİŞ

Dünyada erkeklerde en çok görülen kanserlerden biri prostat kanseri olup ve yılda tahmini 1.600.000 vaka ve 366.000 ölümle sonuçlanan nonkutanöz kanserdir. Bu konudaki tıbbi ilerlemelere rağmen prostat kanseri, benign tümörlerin aşırı tedavisi ve/veya metastatik prostat kanserlerindeki yetersiz tedavilerden dolayı erkekler için önemli bir tıbbi sorun olmaya devam etmektedir. Prostat kanseri, prostat bezindeki anormal hücrelerin kontrolsüz bir şekilde büyüyerek malign tümör oluşturmasıyla gelişmektedir. Prostat kanserinde, normal prostat epitelinde sekretuar farklılaşmada artış, bazal hücre tabaka yapısında bozulma meydana gelmektedir. Aynı zamanda, nükleer ve nükleolar anormalliklerde ve mikrodamar yoğunluğunda artış olmasıyla birlikte ilerleyen preneoplazi veya displazi sonucu kanser oluşmaktadır [1]. 2022'de 24.200'den fazla erkeğe prostat kanseri teşhisi konduğu tahmin edilmektedir. Dünya genelinde tüm kanser türleri içerisinde PCa %7,3 görülme sıklığı ile en çok görülen üçüncü kanser türüdür. Ülkemizde ise yapılan araştırmalarda, PCa kanseri erkeklerde en çok görülen 3. kanser türü olup kanser kaynaklı ölümlerde 4. sırada bulunmaktadır [2,3].

Prostat kanserinde, tanı anında ortalama yaş 69'dur. İleri yaşın dışında etnik köken, genetik faktörler ve aile öyküsü değiştirilemez risk faktörlerini arasındadır [4]. Hastalığın etiyojisi tam olarak bilinmemekle birlikte, çevresel faktörler arasında bulunan beslenmenin kanser gelişiminde önemli bir rol oynadığı, sağlıklı beslenme modellerinin kanser riskini artırdığı belirtilmiştir. Ayrıca bireylere ait yaşam stilleri ve metabolik durumlarda hastalığın risk düzeyine etki ederken, sağ kalım düzeyini de etkilemektedir[5]. Obezite, hiperglisemi, vardiyalı çalışma, inaktivite ve kimyasal veya çevresel zararlara maruziyet, inflamasyon ve enfeksiyonlar da hastalığın değiştirilebilir risk faktörleri arasında bulunmaktadır [6]. Yaşanan coğrafya ve ırk gibi değişkenlerinde PCa insidansına etkisi olduğu gösterilmiştir. PCa görülme sıklığı ile ilgili yapılan çalışmalar sonucunda Afrikalı-Amerikalı erkeklerde en yüksek, Asyalılarda ise en düşük oranda gözlemlendiği raporlanmıştır [6-7]. Shimizu ve arkadaşlarının yapmış olduğu bir çalışmada, Japonya'dan Amerika Birleşik Devletleri'ne yerleşen erkeklerin, yaşam stilleri ve çevresel değişiklikler sebebiyle ülkelerindeki erkeklere kıyasla prostat kanseri görülme riski daha yüksek düzeyde görülmüştür [8].

Prostat kanseri gün geçtikçe tanı bakımından sıklığı yükselen, tanı ve tedavisindeki gelişmelerle beraber lokalize olarak yakalandığında kesin olarak kür olabilecek bir hastalık türüdür. Yakın geçmişe kadar prostat kanseri yaşlı erkeklerin kaçınılmaz bir sorunu olarak görülmüş ve üzerinde çok az çalışma yapılmıştır. Son 15 yılda prostat kanseri biyolojisi ve tedavisi üzerindeki çalışmalar artmıştır. Bunun nedeni daha iyi yaşamak isteyen yaşlı popülasyonun artmasıdır. Temel araştırmalar ileri moleküler biyoloji tekniklerinin gelişimi ve erken tanı ve tedaviye verilen yanıtın değerlendirilebildiği serum prostat spesifik antijen (PSA) testinin gelişimi ile daha da bir destek bulmuştur [9]. Kansere yatkınlık ile gen polimorfizmleri arasında bir ilişki olduğuna ilişkin kanıtlar mevcuttur. Onkogen ve tümör baskılayıcı genler, DNA onarımında bozulma, genetik instabilite, anjiyogenez, adhezyon, ilaç direnci ve ksenobiyotik metabolizmasından sorumlu genlerin tek ve ya kombine etkisiyle, normal prostat hücrelerinin regülasyonu bozulabilmekte ve daha agresif, metastatik ve hormona refraktör prostat hücrelerine dönüşebilmektedirler [10]. Bunlar arasında özellikle ksenobiyotik metabolizmasından sorumlu olan sitokrom P450 monooksijenaz enzim sistemlerine (CYP450) ait polimorfizmler ile prostat kanser gelişimi arasındaki bağlantı her geçen gün giderek daha da artan bir şekilde ilgi odağı olmaktadır. CYP450 monooksijenaz enzim sistemleri, iskelet kası hücreleri ve matür eritrosit haricinde prokaryotlarda ve tüm memeli hücre türlerinde yer alan hem-protein ailesidir.

CYP450 enzimleri, pek çok çevresel karsinojen, endojen bileşiklerin, ve toksik kimyasalın ksenobiyotiklerin metabolizmasından sorumludur. CYP450 enzim sistemi üç ayrı grupta (I. Grup/ II. Grup/III. grup) incelenir.

2. grupta bulunan enzimler daha çok biyomonitorizasyonda polimorfizmleri değerlendiren enzimlerdir. Bu grupta bulunan enzimler %70-80 oranında faz I metabolizmasında rol oynar [11]. İlaç biyotransformasyonu ve metabolizmasında rol alan en önemli sistem olan CYP450 enzim sistemi inhibisyon veya indüksiyon gibi birçok mekanizma ile değişime uğrayabilmektedir. Bunun neticesinde, bireyler arasında oldukça değişik formları ortaya çıkabilmektedir. CYP450 sistemi baz dizilimi benzerliklerine göre P450 40 farklı tip aile içerisinde gruplandırılır [12].

CYP450 enzim ailesinden CYP1A1, karaciğer dışı dokularda başlıca epitelyal dokularda ifade bulan ve II grupta yer alan bir enzimdir. Pek çok ksenobiyotik kimyasalın; 7-etoksikumarin, 7-etoksiresorufin, teofilin, klorzoksazon, kafein ve poliaromatik hidrokarbonların (PAH) ve Benzo(a) piren gibi polisiklik aromatik hidrokarbonların (PAH) oksidasyonunu katalizler. Karsinojen biyoaktivasyonu sonucu, akciğer kanserine yatkınlık ile CYP1A1 arasındaki ilişki olduğunu raporlayan araştırmalar bulunmaktadır. Ayrıca CYP1A1 genotiplerinin akciğer kanseri ile ilişkili olduğu ortaya çıkmış olup bunun haricinde, çok sayıda farklı tip östrojen metabolizması ilişkili kanserle bağlantılı olduğu ortaya çıkmıştır. CYP1A1 ve kanser bağlantısını araştıran araştırmalarda iki polimorfizm üzerinde daha fazla durulmuştur. Bunlar CYP1A1 m1(T>C) ve m2 (A>G) polimorfizmleridir [13]. Her ikisi de tek nükleotid polimorfizmi (Single nucleotide polymorphism, SNP) olup SNP numaraları sırasıyla rs4646903, rs1048943 olarak belirtilmektedir [14].

Kanserin multifaktöriyel bir hastalık olduğu bilinmekle birlikte, genetik faktörlerin etkisini tam olarak ortaya koymak adına moleküler çalışmalara ihtiyaç duyulmaktadır. Günümüze kadar yapılan araştırmalarda akciğer, meme ve kolorektal kanseri gibi kanser vakalarında, CYP016 enzim ailesi ve alt gruplarında oluşan polimorfizmlerin bu hastalıklar ile ilişkili olduğu raporlanmıştır [14-19]. Prostat kanseri etiolojisinde de CYP016 enzim sisteminde CYP9A0, CYP8C5 gibi alt gruplarındaki meydana gelen polimorfizmlerin prostat kanseri oluşumundaki rolü incelenmiştir. Ancak CYP1A1 gen polimorfizmi ile prostat kanserinde arasındaki bağlantıyı araştıran çok az çalışma bulunmaktadır.

Bu çalışmada bu bilgilerin ışığı altında CYP-450 enzimlerinden olan CYP1A1 geni ile ilişkili m1(T>C; rs4646903) ve m2 (A>G; rs1048943) polimorfizmlerinin prostat kanseri ile olan olası ilişkisinin araştırılması amaçlandı. Ayrıca kontrol grubu olarak kullanılan BPH (Benign Prostat Hiperplazisi) hastaları ve sağlıklı kontrol grubu verileri ile de CYP1A1 polimorfizmlerinin bölgemizde allel sıklığının saptanması hedeflendi.

## MATERYAL VE METOT

### Çalışma Grubu

Çalışmaya Mersin Üniversitesi Hastanesi, Üroloji Anabilim Dalı polinikliğine başvuran prostat kanseri tanısı almış 18-80 yaş arasında 60 birey (Hasta grubu), benign prostat hiperplazisi tanısı almış 18-80 yaş arasında 40 birey ve Mersin Üniversitesi Hastanesi Üroloji Anabilim Dalı polinikliğine başvuran rutin muayene ve testler sonucu herhangi bir sistemik hastalığı bulunmayan sağlıklı 18-80 yaş arasında 30 birey (Kontrol grubu) olmak üzere toplam 130 birey dahil edildi.

Bu çalışma 23/03/2022 tarihli ve 2022/197 sayılı kurul kararı ile Mersin Üniversitesi Klinik Araştırmalar Etik Kurulu tarafından onaylanmış olup, çalışmaya katılan tüm bireylerden yazılı onam formu alınmıştır.

### Örneklerin Toplanması ve Saklanması

Çalışmaya Mersin Üniversitesi Hastanesi Üroloji Anabilim Dalı polinikliğine başvuran prostat kanseri tanısı almış 60 birey (Hasta grubu), benign prostat hiperplazisi tanısı almış 40 birey ve Mersin Üniversitesi Hastanesi Üroloji Anabilim Dalı polinikliğine başvuran rutin muayene ve testler sonucu herhangi bir sistemik hastalığı bulunmayan sağlıklı 30 birey (Kontrol grubu) olmak üzere toplam 130 birey dahil edildi. Hastalardan EDTA'lı hemogram tüplerine alınan kan DNA izolasyonu için, biyokimya tüplerine alınan kan örnekleri kreatinin, HDL, LDL, VLDL, AST, ALT, WBC, RBC, CRP ve Üre, PSA, Ferritin analizi için kullanıldı. Çalışmaya katılmayı kabul eden hastalardan EDTA'lı tüplere alınan ve +4°C'de saklanan kan örneklerinden DNA izolasyonu, DNA izolasyon kiti kullanılarak (Roche Diagnostics, GmbH Mannheim Almanya) yapıldı. Bu işlemden uygulanan presedür;

1- Steril bir tüpe (1,5 ml'lik kapaklı) 200 µL tam kan alındı ve üzerine sırası ile 200 µL bağlayıcı tampon ve 40 µL proteinaz K eklendi. Proteinaz eklenmesini takiben tüplerin kapakları hemen karıştırıldı.

- 2- Tüpler 10 dakika 70 °C' de inkübe edildi.
- 3- İnkübasyonun ardından 100 µL izopropanol eklenir, iyice karıştırılır ve karışım filtre tüpüne aktarılır.
- 4- Bir dakika 8000 g'de santrifüj edildi.
- 5- Toplama tüpü değiştirildi ve tüpe 500 µL Inhibitor Removal Buffer eklendi. 1 dakika 8000 g'de santrifüj edildi ve toplama tüpü tekrar değiştirildi.
- 6- 0Ardından tüpe 500 µL wash buffer eklendi ve 1 dakika 8000 g'de santrifüj edildi. Toplama tüpü değiştirildi.
- 7- Bu yıkama işlemi bir kez daha tekrar edilerek, toplama tüpü değiştirildi.
- 8- Tüpe herhangi bir çözelti eklenmeden 10 saniye 13.000 g'de tekrar santrifüj edildi.
- 9- Son olarak 1,5 ml'lik kapaklı DNA saklama tüplerine filtre tüpleri yerleştirilerek içerisine 70 °C'de bekletilen elüsyon tamponundan 200 µL eklenerek 1 dakika 8000 g'de santrifüj edildi. Bu defa DNA elüsyon tamponunun yardımı ile 1,5 ml'lik kapaklı DNA saklama tüplerine geçtiği için filtre tüpleri uzaklaştırılır ve DNA eldesi tamamlanmış olur.

#### CYP1A1 rs4646903 ve rs1048943 polimorfizmi analizi

Elde edilen DNA örneklerinde CYP1A1 rs4646903 ve rs1048943 polimorfizm analizi, RT-PCR cihazı kullanılarak (Roche Diagnostics LightCycler 480, GmbH Mannheim, Almanya) gerçekleştirildi. Analiz sırasında üretici firmanın talimatları doğrultusunda aşağıdaki reaksiyon karışımı hazırlandı. Reaksiyon karışımının hazırlanmasında kullanılan materyaller ve miktarları Tablo 1'de verilmiştir.

**Tablo 1.** Reaksiyon karışımının hazırlanmasında kullanılan materyaller ve miktarlar

İçerik	Miktar
H <sub>2</sub> O	4 µl
Master Mix	10 µl
Primer-probe Assay	1 µl
Toplam karışım hacmi	15 µl
DNA	5 µl

Multiwell plate içerisine her bir örnek için 15 µL karışım ve karışımın üzerine 5 µL DNA eklendi. CYP1A1 rs4646903 ve rs1048943 polimorfizmlerinin analizi için uygulanan PCR koşulları Tablo 2'de verilmiştir.

**Tablo 2.** CYP1A1 rs4646903 ve rs1048943 polimorfizmlerinin analizi için PCR koşulları

PCR aşamaları		Hedefisi (°C)	Bekleme süresi (sn)
Denatürasyon		95	600
Amplifikasyon (40 Döngü)	Denatürasyon	95	15
	Anneal/extend	60	60
Soğuma		40	30

### BULGULAR VE TARTIŞMA

Çalışmaya, Mersin Üniversitesi Hastanesi Üroloji polikliniğine başvurmuş 130 birey dahil edildi.

Çalışma grupları;

Hasta grubu; Prostat kanseri tanısı konulan 60 hasta (yaş: 69),

Kontrol grubu; Benign prostat hiperplazisi tanısı konulan 40 hasta (yaş: 65,5) ve 30 sağlıklı kişi (yaş: 58,50) olmak üzere toplam 70 birey.

Çalışma gruplarına ait yaş, kilo, boy, aile öyküsü, sigara kullanımı ve alkol kullanımı gibi demografik veriler Tablo 3'te verilmiştir.

**Tablo 3.** Hasta ve kontrol gruplarına ait demografik veriler

		Hasta n=60	Kontrol n=70	p değeri
<b>Yaş</b>	medyan[min-max]	69.0[51-82]	63.0[26-85]	0,001
<b>Kilo (kg)</b>	medyan[min-max]	79.5[60-125]	79.0[57-178]	0,799
<b>Boy (cm)</b>	medyan[min-max]	1.72[1,55-1,91]	1.77[1,55-1,80]	0,001
<b>Aile Öyküsü</b>	n %	Var	23.0(38,3%)	0,12
		Yok	37.0(61,7%)	
<b>Sigara</b>	n %	Var	14.0(20%)	1,000
		Yok	56.0(80%)	
<b>Alkol</b>	n %	Var	10.0(16,7%)	,161
		Yok	50.0(83,3%)	

**Tablo 4.** PCa, BPH ve sağlıklı bireylere ait demografik veriler

		<b>PCa n=60</b>	<b>BPH n=40</b>	<b>Sağlıklı n=30</b>	<b>P değeri</b>	
<b>Yaş</b>	medyan[min-max]	69.0[51-82]	65.5[41-85]	58.5[26-86]	<0,001	
<b>Kilo(kg)</b>	medyan[min-max]	79.5[60-125]	81.0[57-178]	77.0[60-90]	0,303	
<b>Boy (cm)</b>	medyan[min-max]	1.72[1,55- 1,91]	1.74[1,55- 1,85]	1.56[1,65- 1,80]	<0,001	
<b>Aile Öyküsü</b>	n %	Var	23.0(38,3%)	13.0(32,5%)	0(0%)	0,001
		Yok	37.0(61,7%)	27.0(67,5%)	30.0(100%)	
<b>Sigara</b>	n %	Var	12.0(20%)	10.0(25%)	4.0(13,3%)	0,482

<b>Alkol</b>	n %	Var	10.0(16,7%)	6.0(15%)	0(0%)	,063
		Yok	50.0(83,3%)	34.0(85%)	30.0(100%)	

Erkeklerde en çok görülen kanser türü prostat kanseri'dir [20,21]. Birçok gelişmiş ülkede en fazla görülen nonkutanöz malignitedir[22,23]. Dünya çapında gittikçe artan sayıda prostat kanseri tanısı konulduğundan bu hastalık ve hastalığın önlenmesiyle ilgili bilgiler daha önemli hale gelmiştir. Prostat kanserinde önemli bir risk faktör olan yaşla birlikte hastalık insidansı ve görülme sıklığı yükselmektedir. Prostat kanseri ileri yaşlarda görülen bir hastalıktır. Esas olarak hastalık 65 yaş üstü erkeklerde sık gözlenirken nadiren 40 yaş öncesi gelişir ve yaşla birlikte artmaktadır. 70 yaş üzeri erkeklerin neredeyse yarısında mikroskobik düzeyde prostat kanseri bulunmaktadır ve bu hasta grubunda prevelans %57,4 civarındadır[24,25]. Yaşın prostat kanseri gelişimini nasıl kolaylaştırdığını halen bilinmemekle birlikte bu yaş prostat kanseri ilişkisine androjenik etkinin aracılık ettiği ifade edilmektedir[24].

Çalışmamızda, hasta grubunun yaş ortalaması 69, kontrol grubunun yaş ortalaması 58,50 olarak bulundu. Hasta grubunun yaş ortalamalarının kontrol grubuna göre daha yüksek olduğu bulundu. Gruplar arası karşılaştırmada anlamlı farklılık bulundu( $p<0,001$ ). Kontrol grubunun alt grupları ile hasta grubu karşılaştırıldığında da yaş bakımından anlamlı farklılık tespit edildi( $p<0,001$ ).

Prostat kanserinde risk faktörlerinden biri de aile öyküsüdür. Birinci derece akrabaları arasında prostat kanserli bir yakını olan bireydeki risk kontrol grubuna göre iki kat, iki yakını prostat kanseri olan bir bireydeki risk beş kat artmaktadır[26,27]. Prostat kanserine kalıtsal yatkınlığı olan kişi yalnızca risk altında kalmayıp erken yaş prostat kanserine de adaydır. Kalıtsal yatkınlık sadece %5-10 olarak bildirilmiş ve erken yaş prostat kanserlerinin %40'ının ( 55 yaş öncesi tanı konulanlar) kalıtsal bir bozukluktan kaynaklandığı ileri sürülmüştür[26]. Segregasyon analizleri, erken yaş prostat kanserlerine otozomal dominant katılımlı bir genin neden olabileceğini göstermiştir[26,28]. Henüz tanımlanmayan bu allelin popülasyonlardaki tahmini frekansı yaklaşık %0,36'dır. Bu alele sahip olan bir kişinin, 85 yaşlarında prostat kanserine yakalanma riski %88'dir. Prostat kanserli erkek kardeşi olan kişilerin, prostat kanserli babalara olanlara göre daha yüksek riske sahip olmasına dayanarak X'e bağlı resesif kalıtım gösteren bir genin prostat kanserine neden olabileceği de ileri sürülmüştür[29].

T.C. Sağlık Bakanlığı, Türkiye Halk Sağlığı Kurumu, Aile Hekimliği Uygulamasında Önerilen PSM ve Tarama Testleri Kılavuzu, ailesinde prostat kanseri öyküsü olan 40 yaşından büyük erkekler ve aile öyküsü olmayan 50 yaşından büyük erkeklerde erken tanı ve önleme amaçlı hastanın bilgilendirilmesini ve bir üroloji uzmanına yönlendirilmesini önermektedir[30].

Çalışmamızda; Hasta ve Kontrol grubu karşılaştırıldığında bakımından anlamlı bir farklılık bulunmadı ( $p=0,12$ ). Kontrol grubunun alt grupları ile hasta grubu karşılaştırıldığında da sigara kullanımı bakımından anlamlı farklılık tespit edildi ( $p<0,001$ ).

Prostat kanserinde risk faktörlerinden biri de sigara kullanımıdır. Sigara kullanan hastalarda görülen prostat kanseri evresinin ve hastalığın ilerlemesinin kullanmayanlara oranla daha yüksek olduğunu ve bu hastalarda prostat kanserine bağlı ölüm oranlarının anlamlı olarak artış gösteren çalışmalar bulunmaktadır [31]. Health Professionals Follow-up Study (HPFS) kohort çalışmasında, prostat kanseri tanısı alan hastaların ortalama 22 yıllık takibinin değerlendirildiği sigara içenlerde prostat kanserine bağlı ölüm ve biyokimyasal rekürrens oranlarında %60 artış göstermiştir [32]. Yapılan çalışmalarda <20 paket yılı sigara kullanımı olan, 10 yıldan uzun süredir sigarayı bırakmış olan hastalarda prostat kanseri tanı anında riskin ortadan kalktığı gözlenmiş olup; >20 paket yılı sigara öyküsü olan, 10 yıldan daha az süredir sigarayı bırakmış hastalar ile halen sigara kullanımı olan hastaların ise tanı anında eşit oranda risk altında olduğu belirtilmiştir [33,34].

Çalışmamızda; Hasta ve kontrol grubu karşılaştırıldığında sigara kullanımı bakımından anlamlı bir farklılık bulunmadı ( $p=1,000$ ). Kontrol grubunun alt grupları ile hasta grubu karşılaştırıldığında da sigara kullanımı bakımından anlamlı farklılık tespit edilmedi( $p=0,482$ ).

**Tablo 5.** Hasta ve kontrol gruplarına ait PSA değerleri

	Hasta n=60	Kontrol n=70		p değeri
		BPH n=40	Sağlıklı n=30	
PSA (ng/ml)	11,65[4,20-582]	1,050[,09-9,82]		<0,001
		1,81[,09-9,82]	,6950[10-3,29]	

Prostat kanserinin erken tanısı, evreleme ve izleminde en önemli belirleyicilerinden biri de Prostat spesifik antijen (PSA)'dır [35]. Sadece prostatik duktal epitel ve prostatik asini hücrelerinde oluşturulmakta kalmayıp malin özellikle olan hücrelerde sentezlendiği gibi normal yapılı hücrelerde de oluşturulmaktadır[36]. Prostat kanserinde serum PSA düzeyi yükselir bunun haricinde BPH, prostatit, yaşlanma, prostatik infarkt gibi benin durumlarda da artış gösterdiği görülmüştür. Prostat kanseri tanısında daha kesin sonuçlar elde etmek için toplam PSA değeri kullanılmaktadır bunun yanında yaşa bağlı PSA, PSA dansitesi, transizyonel zon dansitesi, serbest PSA oranı gibi değerlerden de faydalanılır. Prostat spesifik antijen (PSA), prostat bezindeki hücreler (hem normal hücreler hem de kanser hücreleri) tarafından üretilen bir proteindir. PSA genel olarak semende bulunurken kanda az miktarda bulunur. Kandaki PSA seviyesi, mililitre başına nanogram (ng / mL) adı verilen birimlerle ölçülür. Prostat kanseri olma riski PSA seviyesi yükseldikçe yükselir fakat bir erkeğin prostat kanseri olup olmadığını belirleyecek kesin bir yüksek değer bulunmamaktadır. Klinik olarak kararda, bazen 4 ng/mL veya daha yüksek bir PSA değeri ölçüt olarak kullanırken, bazen de 2.5 veya 3 gibi daha düşük bir seviyede daha ileri testlerin yapılmasını istenmektedir. PSA değeri prostat kanseri olmayan erkeklerin çoğunda 4 ng/mL'nin altındadır. PSA seviyesi prostat kanseri geliştiğinde, genellikle 4'ün üzerine çıkar. 4'ün altındaki bir değerde olması, kanser olmadığını bir garantisini oluşturmaz. PSA düzeyi 4 ile 10 arasında olan erkeklerin prostat kanseri olma olasılığı yaklaşık 4'te 1'dir. PSA 10'dan fazla ise, prostat kanseri olma olasılığı % 50'nin üzerinde olmaktadır [37]. Kanser dışındaki bir dizi faktörün PSA seviyelerini de etkileyebiliyor olması prostat kanseri taramasında, PSA testi ile belirli bir kesme noktası kullanmanın zor olmasının bir nedenidir [37].

Prostat spesifik antijen (PSA), Androjen reseptörü (AR5 $\alpha$ -redüktaz tip II (SRD5A2) ve sitokrom P450'yi (CYP) kodlayanlar dahil olmak üzere bir dizi genin PCa duyarlılık genleri olduğu doğrulanmıştır [38].

Çalışmamızda; Hasta ve kontrol grubu karşılaştırıldığında PSA değeri bakımından anlamlı bir farklılık bulundu ( $p<0,001$ ). Kontrol grubunun alt grupları ile hasta grubu karşılaştırıldığında da PSA bakımından anlamlı farklılık tespit edildi( $p<0,001$ ).

#### **Hasta ve kontrol gruplarında rs1048943 polimorfizminde genotip ve allel dağılıma ait bulgular**

Hasta ve kontrol grubunun rs 1048943 polimorfizmindeki genotip ve allel dağılımları Tablo 6'da verilmiştir.

Kanserin multifaktöriyel bir hastalık olduğu bilinmekle birlikte, moleküler çalışmaların yapılmasına gereksinim duyulmaktadır. Bugüne kadar yapılan çalışmalarda akciğer kanseri, meme kanseri, kolorektal kanseri ve ağız kanseri gibi kanser vakalarında, CYP016 enzim ailesi ve alt gruplarında meydana gelen polimorfizmlerin önemli derecede ilişkili olduğu tespit edilmiştir [14-19]. Prostat kanseri etiyojisinde de CYP016 enzim sisteminde CYP9A0, CYP8C5 gibi alt gruplarındaki polimorfizmlerin prostat kanseri oluşumundaki rolü araştırılmıştır. Ancak CYP1A1 gen polimorfizmi ile prostat kanserinde arasındaki araştırma çok az çalışmada bulunmaktadır. Karsinojen biyoaktivasyonu, CYP1A1 polimorfizmi ve akciğer kanserine yatkınlık arasında bağlantı kuran birçok çalışmada bulunmaktadır. Ayrıca akciğer kanseri dışında, CYP1A1 genotiplerinin çok sayıda farklı tip östrojen metabolizması ilintili kanserle ilişkisi olduğu bulunmuştur. CYP1A1 ve kanser ilişkisini araştırma çalışmalarında iki polimorfizm ön plandadır. Bunlar CYP1A1 m1(T>C; rs4646903) ve m2 (A>G; rs1048943) polimorfizmleridir [13].

CYP'ler, hayvanlarda, bitkilerde ve mikroorganizmalarda bulunan büyük bir korunmuş protein süper ailesidir. Sitokrom P450 1A1 (CYP1A1) ve 1B1 (CYP1B1), CYP1 ailesinin önemli üyeleridir. Bir faz I enzimi olarak sınıflandırılan CYP1A1, aril hidrokarbon hidroksilaz aktivitesinde yer alırken, CYP1B1 östrojenlerin hidroksilasyonunda yer alır. CYP1A1 proteini, CYP süper ailesinin bir üyesidir ve akciğer, böbrek, bağırsak, cilt, gırtlak, plasenta, lenfosit, beyin dokularında yaygın olarak dağılır [39]. Bu enzimin ana rolü, PAH'lar, heterosiklik aminler, aflatoksin B1 ve östrojen [40] gibi çevresel kanserojenleri metabolize etmek olduğundan, CYP1A1 genindeki varyasyonlar CRC oluşumunu indükleyebilir. Şu anda, CYP1A1 enzim aracılı kanserojen aktivasyonu için yaygın olarak kabul edilen bir paradigma, CYP1A1'in polisiklik aromatik hidrokarbonları reaktif epoksit ara ürünlerine metabolize etmesidir, bu da DNA'ya kovalent olarak bağlanabilir ve daha sonra tümörleri indükleyebilir [41]. Yüksek minör alel sıklığı (MAF) ve akciğer kanseri, kolorektal kanser, meme kanseri, lösemi, özofagus karsinomu ve prostat kanseri [42] dahil olmak üzere çeşitli karsinomların [43] artmış riskine olası katılımları nedeniyle, CYP1A1 rs1048943 A > G ve rs4646903 T > C polimorfizmleri daha yaygın olarak incelenmiştir. Kanseri oluşumunu indüklemenin yanı sıra, CYP1A1'in polimorfizmleri ülseratif kolit, kolorektal adenom, ateroskleroz, miyokard enfarktüsü ve benzeri gibi diğer hastalıklara da yol açabileceği belirtilmiştir [44,46].

He ve Feng [47], CYP1A1'in östrojen metabolizmasında rol oynadığını ve aynı zamanda prokarsinojenleri aktive ettiğini bildirmiştir. Ayrıca, CYP1A1 polimorfizminin PCa gelişimi ile ilişkili olduğu gösterilmiştir. Tokizane ve ark. [48] promotör/arttırıcı bölgenin hipometilasyonunun PCa hücrelerinde aşırı CYP1B1 ekspresyonuna yol açtığını ve CYP1B1 katalizinden gelen metabolitlerin bir hayvan modelinde PCa'yı indüklediğinin gösterildiğini bulunmuştur [49]. Androjen bağımlı bir organ olarak prostat, steroid hormonlarının metabolizmasına katılan CYP1A1 ve CYP1B1 dahil olmak üzere birkaç enzim içerir. CYP1A1 ve CYP1B1 polimorfizmleri ile PCa riski arasındaki ilişkiyi araştırma önceki meta-analizler tutarsız sonuçlar bildirmiştir.

Son yıllarda, kansere genetik duyarlılık, bilimsel toplulukta bir araştırma noktası olmuştur. Ortaya çıkan kanıtlar, özellikle CYP1A1 ve CYP1B1 dahil olmak üzere CYP1 ailesinde, gen polimorfizmleri ile kanser riski arasındaki potansiyel ilişkiyi göstermiştir. Örneğin, CYP1A1 polimorfizmlerinin akciğer [50], mesane [51], pankreas [52] ve meme kanserleri [53] dahil olmak üzere çok çeşitli kanserlere duyarlılık ile ilişkili olduğu bilinmektedir. Benzer şekilde, CYP1B1 polimorfizmlerinin ilişkisi ve çeşitli kanser türlerinin riski

araştırılmıştır [54,56]. Günümüzde, CYP1 ailesi gen polimorfizmleri ile PCa duyarlılığı arasındaki bağlantı yaygın olarak dikkat çekmektedir. Çok sayıda çalışma, CYP proteinleri ve SNP'leri arasındaki ilişkiye ve bunların PCa gelişimi üzerindeki olası etkilerine odaklanmıştır. Hem CYP1A1 hem de CYP1B1, östrojenler de dahil olmak üzere çok sayıda kanserojen ve steroidal hormonun metabolizmasında rol oynar [57,58]. Ayrıca, Cavalieri ve ark. [59], CYP1B1 katalizi tarafından üretilen kimyasal kanserojenlerin metabolitlerinin hayvan modellerinde PCa'yı indükleyebileceğini bildirmiştir. CYP1A1 \* 2A (rs4646903) polimorfizmi, poliadenilasyon bölgesinin aşağı akımındaki 3801'-kodlamayan bölgenin 3 pozisyonunda bir timidin sitozin ikamesini içerir [60]. Bazı çalışmalar rs4646903 varyantının mutant enzimlerin aktivitesini önemli ölçüde arttırdığını göstermesine rağmen, sonuçlar çelişkilidir [61]. CYP1A1 \* 2B (rs1048943) polimorfizmi, ekzon 1'deki kodon 1'nin 2455 pozisyonunda bir adenin-guanin geçişini içeren ikinci en yaygın CYP462A7 polimorfizmidir [62].

Wei Zhu ve arkadaşlarının yapmış oldukları bir çalışmada rs1048943 ve rs4646903'nün prostat kanseri riski arasında anlamlı bir ilişki bulmadıklarını belirtmişlerdir. Bunu PCa'nın multigenik bir hastalık olduğu ve bu nedenle tek bir polimorfizmin etkisinin sınırlı olabileceğine bağlamışlardır. Ayrıca çalışmanın rs1048943 polimorfizminin genel popülasyonda PCa duyarlılığı ile ilişkili olduğunu AA ile karşılaştırıldığında AB genotipindeki rs4646903 polimorfizminin ve AA ile karşılaştırıldığında BB genotipinin sırasıyla Asya ve Beyaz ırk popülasyonlarında PCa için risk faktörleri olarak kabul edildiğine dair kanıtlarının sağlandığına bununla birlikte, CYP1A1 rs4646903 polimorfizmi, genel olarak artan PCa riski ile ilişkili olmadığı belirtilmiştir. Polimorfizmlerin PCa duyarlılığı üzerindeki etkisi etnik kökenden etkilendiği açıklanmıştır. Ve yaptıkları bu meta analiz bu meta-analiz, CYP1A1 rs1048943 ve rs4646903 polimorfizmlerinin, sırasıyla özellikle Asya ve Beyaz ırk popülasyonlarında PCa riski ile ilişkili olduğunu öne sürmüşlerdir [63].

Sergentanis TN ve arkadaşlarının yapmış oldukları bir çalışmada Beyaz ırk, Çin ve Afrika popülasyonları üzerinde yaptıkları bir meta analiz çalışmasında CYP1A1 rs1048943 polimorfizminin meme kanseri ile ilişkisini incelemek için menopoz öncesi ve menopoz sonrası kadınlarda araştırıldığında sonuçlar mutant genotipin (GG) meme kanseri riskini artırdığını gösterdi ve sonuçları, bu polimorfizmin bu popülasyonlarda meme kanseri tahmini için iyi bir belirteç olacağını belirtmişlerdir [64].

Çalışmamızda; Hasta ve Kontrol grupları arasında CYP1A1 (rs1048943) polimorfizmi AA, GG ve AG genotipleri bakımından anlamlı bir farklılık bulunmadı. Kontrol grubunu alt gruplara ayırıp hasta grubuyla karşılaştırıldığında da AA, GG ve AG genotipleri bakımından anlamlı bir farklılık bulunmadı. Hasta ve kontrol grupları arasında A ve G alelleri bakımından anlamlı bir farklılık bulunmadı. Kontrol grubunu alt gruplara ayırıp hasta grubuyla karşılaştırıldığında da A ve G alelleri bakımından anlamlı bir farklılık bulunmadı.

Çalışmamızda; Hasta ve kontrol grupları arasında CYP1A1 (rs4646903) polimorfizmi TT ve TC genotipleri bakımından anlamlı bir farklılık bulunmadı. Kontrol grubunu alt gruplara ayırıp hasta grubuyla karşılaştırıldığında da TT ve TC genotipleri bakımından anlamlı bir farklılık bulunmadı. Hasta ve kontrol grupları arasında T ve C alelleri bakımından anlamlı bir farklılık bulunmadı. Kontrol grubunu alt gruplara ayırıp hasta grubuyla karşılaştırıldığında da T ve C alelleri bakımından anlamlı bir farklılık bulunmadı.

Yapılan bu çalışmanın sonucunda rs1048943 ve rs4646903 polimorfizmlerinin prostat kanseri ile ilişkisi incelendiğinde gruplar arasında anlamlı bir farklılık bulunmamıştır. Bu durumun coğrafi dağılım ve irksal farklılıklardan kaynaklandığını düşünmektedir. Yapılan literatür taramasında bu polimorfizmlerin bazı kanser türleri ilişkili olduğu gösteren çalışmalar bulunmasına rağmen prostat kanseri ile ilişkisi hakkında yeteri sayıda çalışma bulunmamaktadır. Elde ettiğimiz verilerin literatüre katkısı olacağını düşünmekteyiz.

## SONUÇ

Çalışmamızın sonucunda;

Aile öyküsü açısından gruplar incelendiğinde, PCa grubundan aile öyküsü bulunanlar %38,3 iken, kontrol grubunda %18,6 olarak tespit edildi. Gruplar arası karşılaştırmada aile öyküsü açısından anlamlı bir farklılık bulunmadı (p=0,12).

Sigara kullanımı açısından gruplar incelendiğinde her iki grupta sigara kullananlar %20 olduğu bulundu. Hasta ve kontrol grubu sigara kullanımı bakımından karşılaştırıldığında anlamlı bir farklılık bulunmadı (p=1,000).

PCa grubunda alkol kullanımı %16,7 iken, kontrol grubunda %8,6 olarak tespit edildi. Gruplar arası karşılaştırmada alkol kullanımı açısından anlamlı bir farklılık bulunmadı (p=1,61).

Gruplar arası karşılaştırmada PSA değeri açısından anlamlı bir farklılık bulundu (p<0,001).

Kontrol grubunun alt grupları ile hasta grubu karşılaştırıldığında; BPH grubunda 40 birey bulunan PSA değeri 0,9-9,82 ng/ml arasında olup medyan değeri 1,81 ng/ml olarak bulundu. Sağlıklı bireylerin olduğu grupta 30

birey bulunup PSA değeri 3,29-10 ng/ml arasında olup medyan değeri 0,6950 ng/ml olarak bulundu. Gruplar arası karşılaştırmada PSA değeri açısından anlamlı farklılık bulundu ( $p < 0,001$ ).

Hasta ve kontrol grupları arasında CYP1A1 (rs1048943) polimorfizmi genotipleri bakımından anlamlı bir bulunmadı ( $p=0,007$ ). Hasta grubunda A aleli %91,7 G aleli %8,33 olarak, kontrol grubunda ise A aleli %93,57 G aleli %6,43 olarak bulundu. Hasta ve kontrol grubunda A ve G alelleri karşılaştırıldığında anlamlı bir farklılık bulunmadı ( $p=0,635$ ).

Sağlıklı birey grubunda ise AA genotipine 24(80%) birey, GG genotipine 0(0%) birey ve AG genotipine sahip 6(20%) birey bulundu. Kontrol grubu alt gruplara ayrıldığında ve hasta grubunda AA, AG ve GG genotipleri ile karşılaştırıldığında anlamlı bir farklılık bulunmadı ( $p=0,353$ ). Hasta grubunda A aleli %91,7 G aleli %8,33, BPH grubunda A aleli %96,25 G aleli %3,75 ve sağlıklı bireyler grubunda A aleli %90 G aleli %10 bulundu. Kontrol grubu alt gruplara ayrıldığında ve hasta grubunda A ve G aleli ile karşılaştırıldığında anlamlı bir farklılık bulunmadı ( $p=0,9087$ ).

Hasta ve kontrol grupları arasında CYP1A1 (rs1048943) polimorfizmi genotipleri bakımından anlamlı bir bulunmadı ( $p=0,81$ ). Hasta grubunda A aleli %85,83 G aleli %14,17 iken kontrol grubunda A aleli %92,14 G aleli %7,86 olarak bulundu. Hasta ve kontrol grubunda T ve C alelleri karşılaştırıldığında anlamlı bir farklılık bulunmadı ( $p=0,11$ ).

Hasta grubunda A aleli %85,47 G aleli %14,53 ,BPH grubunda A aleli %91,25 G aleli %8,75 ve sağlıklı bireyler grubunda A aleli %93,65 G aleli %6,75 olarak bulundu. Kontrol grubu alt gruplara ayrıldığında ve hasta grubunda T ve C aleli ile karşılaştırıldığında anlamlı bir farklılık bulunmadı ( $p=0,3147$ ).

Bu konuda yeterli çalışma bulunmadığından, elde ettiğimiz verilerin literatüre katkısı olacağını düşünmekteyiz.

<sup>2</sup>Ege Üniversitesi, Su Ürünleri Fakültesi, Avlama ve İşleme Teknolojisi Bölümü, İzmir, Türkiye

eetkesen@gmail.com

### Özet

Balıkçılık çok eski uğraşlardan biri olmakla birlikte zaman içerisinde avlanma biçimleri oldukça değişmiştir. Teknolojinin gelişimiyle kullanılan av araçları ve yardımcı ekipmanların da gelişimini arttırmıştır. Bu gelişme balıkçılığın daha büyük araç ve ekipmanlar ile ticari boyutta yapılmasının önünü açmıştır. Avlanan ürün miktarının artışı ve bu avcılığı gerçekleştirmek üzere teknelerle birlikte denizde kalınan sürenin artması sonucu, denizde karşılaşılan risklerin sayısı ve maruz kalma olasılığı da buna bağlı olarak yükselmiştir. Riskin varlığı, bu riskin oluşturabileceği kayıpların bir şekilde telafi edilmesi gereğini doğurmuştur. Buradaki en büyük telafi mekanizması ve risk ile mücadele edecek araç "sigorta"dır. Balıkçı teknelerinde temel olarak üç çeşit sigorta teminatı uygulanabilir. Direkt olarak tekne ve üzerinde bulunan ekipmanın karşılaşılabileceği riskleri kapsayan Tekne ve Makine Sigortası, Teknenin Üçüncü Şahıslara verebileceği zarardan dolayı Sorumluluk Sigortası (P&I : Protection and Indemnity : Koruma ve Tazmin) ve son olarak da tekne üzerinde görevli personel (kaptan, mürettebat), yolculara gelebilecek riskleri kapsam altına alan Ferdi Kaza Sigortası. Bu bildiride balıkçı teknelerine uygulanabilecek sigortalardan Tekne ve Makine sigortası hakkında pratik bilgiler verilmiştir.

**Anahtar Kelimeler:** Balıkçılık, Sigorta, Tekne, Makine.

### Hull and machinery insurance for fishing vessels

### Abstract

Fisheries are one of the oldest types of occupation, and the way of fishing has changed considerably over time. With the development of technology has increased the fishing equipment and auxiliary equipment used. This development has enriched the way for commercial fishing with larger tools and equipment. As a result of the increase in the number of products caught and the time spent at sea with the boats to carry out this fishing, the number of risks encountered on the sea has increased and the probability of exposure has also increased accordingly. The existence of the risk has necessitated the compensation of the losses that this risk may cause in some way, the prominent compensation mechanism here and the tool to handle the risk is "insurance". Basically, 3 types of insurance coverage can be applied to fishing boats. Hull and Machinery Insurance covers the risks that the boat and the equipment on it may face directly, Liability Insurance due to the damage that the boat may cause to third parties (P&I: Protection and Indemnity) and finally the personnel on the boat (captain, crew) Personal Accident Insurance, which covers risks. In this study, practical information about Hull and Machinery insurance, which can be applied to fishing boats, is given.

**Keywords:** Fishing, insurance, vessel, machine.

### GİRİŞ

Balıkçı tekneleri avladıkları tür ve kullandıkları av araçları ve avlanma miktarına göre farklılık gösterir. Balıkçı gemileri genel olarak denizlerde ve tatlı sularda su ürünlerinin avlanmasında, üretilmesinde, korunmasında, işlenmesinde, taşınmasında kullanılan gemilerdir (Abur, 2023). Tahmini olarak tüm dünya genelinde 2020 yılı itibari ile 4,1 milyon balıkçı gemisi mevcuttur (FAO,2022) .Türkiye’de Balıkçılık ve Su Ürünleri Genel Müdürlüğü 2022 verilerine göre kayıtlı gemi sayısı içsular ve denizlerde toplam 18.444’dür.

Balıkçı tekneleri, balıkçıların hem mesleki faaliyetlerine devam edebilmelerini sağlayan bir araç hem de şahsi ya da tüzel olarak bir mal varlığıdır. Bu minvalde, kendilerine ya da teknelerine gelebilecek bir zarar ya da kayıp, gelir kaynağının sektöre uğramasına, refah seviyesinin düşmesine dolayısıyla ülke ekonomisine de negatif etkide bulunabilir. Bu sebeple, riskin transferi ve yönetimi oldukça önemlidir. Günümüzde tüm dünyada risk yönetiminin en etkili aracı 'sigortadır'.

Dünya çapında faaliyet gösteren tahmini 67.800 büyük ölçekli balıkçı gemisinin en az %90'ı (>24 m uzunluğunda) tekne ve makine sigortası kapsamındadır. Tekne ve Makine Sigortası kapsamındaki balıkçı gemilerinin sayısının ise global olarak 450.000 civarında olduğu tahmin edilmektedir. Sigortalı balıkçı gemilerinin %61'i Asya'da, %18'i Amerika'da, %14'ü Avrupa'da ve %6'sı Afrika'dadır. Yarı endüstriyel balıkçı gemilerinin (12-24 m) %50 ve %60'ı tekne ve makine sigortası kapsamındadır. Dünya çapında faaliyet gösteren tahmini 430.000 yarı endüstriyel balıkçı teknesinin on binlercesi ise herhangi bir sigortaya sahip değildir. 2,3 milyon motorlu küçük ölçekli balıkçı gemilerinin (<12 m) %95'inden fazlası sigortasızdır. Çoğunlukla küçük ölçekli balıkçıların özel ihtiyaç ve şartları sağlayabilecek yeterli sigortaya erişimleri yoktur (FAO, 2022).

Literatür taraması sırasında eksikliği görülen özellikle balıkçılık faaliyetlerinde, ihtiyaca yönelik bir sigorta uygulamasının bulunmaması, sigorta sektörü içerisinde bu mesleki faaliyetin tam olarak bilinmemesi ve risk unsurlarının karmaşık yapısı sebebi ile uygun bir teminat türünün olmayışı, balıkçılık faaliyetinde bulunan işveren ve çalışanların sigorta konusundaki bilgi ve tecrübe eksikliği riske bu denli açık bir sektörün doğru risk yönetimi yapamamasına neden olmaktadır. Bu bildiride balıkçı teknelerine uygulanabilecek sigortalardan Tekne ve Makine sigortası hakkında pratik bilgiler verilmiştir.

## MATERYAL VE METOT

Türkiye'de uygulanan Tekne ve Makine sigortasının genel şartları itibari ile teminat altına aldığı riskler ve teminat harici olan riskler belirtilecektir. Üç yıldır düzenli olarak sigortalanan 19 adet teknenin bedel ve prim bilgileri grafik halinde gösterilerek yıllar içerisindeki değişimi karşılaştırılacaktır.

## BULGULAR VE TARTIŞMA

Tekne ve Makine Sigortası; tekne ve teknenin içerisinde bulunan makine, vinç, jeneratör, ırgat gibi donanımları ve teknenin tüm ekipman ve teçhizatlarını sigortacı ile karşılıklı mutabakat ile teminat altına alır. Balıkçı teknelerinde bulunan ağ makarası (power block), balık saklama makinesi, buzluk, dondurucu, balık pompası, balık ağıları gibi ekipmanlar da dâhil edilebilir. Bir Tekne ve Makine Poliçesinde aşağıdaki detaylar yer almaktadır;

Tekne Adı

Tekne Bayrağı

Teknenin Yapım Malzemesi

İnşa Yılı

Ana Makine

Sigorta Bedeli

Sefer Sahası

Tekne Tipi

Boy, Genişlik

Sigortacı yukarıdaki bilgiler ile birlikte sigortalıya teklif iletebilir. Teklif verilirken, sigorta şirketlerinin kullandığı, geçmiş yıllardaki bilgilerin istatistiksel verileri ile tasarlanmış özel modüller ve/veya aktüerler tarafından teknenin boyu, yaşı, sefer sahası göz önünde bulundurularak bir fiyatlandırma yapılır. Bu fiyat çarpanı sigorta bedeli olarak belirtilmiş olan tekne bedeline uygulanır. Tekne bedeli içerisinde teknenin kabuk hali birlikte, tekne üzerindeki seyir ve seyire yardımcı ekipmanlar, vinçler, ırgatlar, jeneratörler, makineler, shaft, pervane tümüyle sigorta bedeline dâhil edilir. Yukarıda belirtilen fiyat çarpanı sigorta bedeline uygulanarak net prim bilgisi elde edilir. Özellikle Tekne ve Makine sigortalarmı fiyatları ya da sigortacının riski kabul edebilirliği teknenin bedeli, teknenin yaşı ve kondisyon durumuna göre değişmektedir. Özellikle 30 yaşını geçmiş tekneler çoğu sigorta şirketinin kabul kriterlerine uymamaktadır. Bunun yanı sıra sigortacının tekneye ekspertiz talebi doğrultusunda da teknenin göz ile muayenesi ve buna uygun olarak risk kabulü veya reddi gerçekleştirilir.

#### Tekne ve Makine Sigortalarının Rizikoları:

- 1) Deniz, ırmak, göllerin veya diğer sefer yapılabilir suların tehlikeleri.
- 2) Yangın, patlama (infilak).
- 3) Geminin dışındaki kişiler tarafından zor kullanılarak yapılan hırsızlık.
- 4) Denize mal atılması.
- 5) Korsanlık.
- 6) Kara taşıtları, rıhtım veya liman düzen veya donanımı ile temas.
- 7) Deprem, yanardağ püskürmesi veya yıldırım.
- 8) Yük veya yakıtın yüklenmesi, boşaltılması ya da yer değiştirmesi sırasında olan kazalar.
- 9) Bu sigorta, sigortalı edilen şeyin, aşağıdaki rizikolar nedeniyle uğradığı zıya veya hasarı kapsar.
  - 9.1. Kazanların patlaması, şaftların kırılması veya makine ya da teknedeki herhangi bir gizli kusur.
    - 9.1.2 Kaptanın, gemi zabıtlarının, gemi adamlarının ya da kılavuzların ihmali.
  - Burada sigortalı olmamaları koşulu ile onarımcılar ya da gemi kiracılarının ihmali.
    - 9.1.3. Kaptan, gemi zabıtları veya gemi adamlarının barataryası.
    - 9.1.4. Hava taşıtları, helikopter veya benzer nesnelere ya da bunlardan düşen şeylerle temas.Ancak zıya veya hasarın, sigortalı, gemi sahibi, gemi işletmecileri ya da gemi sahibinin eksperleri yahut idare merkezindeki [karadaki] her hangi müdürün gerekli özeni göstermemesinden kaynaklanmaması şarttır.
  - 9.2. Kaptan, gemi zabıtları, gemi adamları veya kılavuzlar gemide pay sahibi olsalar bile bu rizikolar anlamı içinde gemi sahibi olarak düşünülemez. (Institute Time Clauses Hulls,1995)

Yukarıda belirtilen rizikolara ek olmak üzere belirli şartlar, sınırlamalar ve istisnalar dâhilinde (bu şartlar, sınırlamalar ve istisnalar sigorta sözleşmesi içerisinde açıkça beyan edilir); Kırletme Tehlikesi,  $\frac{3}{4}$  Çatışma Sorumluluğu, Kardeş Gemi ile Çatışma ve/veya Kurtarma Hizmeti Alma, Müşterek Avarya ve Kurtarmadan doğacak hasarlarda teminat dâhilindedir.

Muafiyet, sigortalı ve sigortacı arasında teklif aşamasında mutabık kalınan oran ve ya belirli bir miktar olarak sözleşmeye not edilir. Hasar oluştuğundan sonra, bu oran veya miktar sigortalının üzerinde kalan kısımdır.

Hasar gerçekleştikten sonra sigortalı sözleşmede yer alan aşağıdaki belgeleri güncel olarak bulundurmalı ve ihtiyaç duyulduğu durumda sigortacıya vermekle yükümlüdür.

- 1) Deniz Elverişlilik Belgesi: Gemiler, tahsis amacına, cinsine ve sefer bölgelerine göre; tekne, makine, genel donanım, can kurtarma, yangından korunma ve yangın söndürme durumu, seyir teçhizatı ve haberleşme sistemi, sağlık koşulları, yük ve yolcu taşıma kapasiteleri, deniz kirliliğini önleme donanımları ile diğer seyir emniyeti konuları bakımından İdare tarafından bu Yönetmelik hükümlerine göre belirli aralıklarla denetlenir (Ulaştırma ve Altyapı Bakanlığı, 2009). Bakanlık mevzuatında yer alan aynı maddenin(5) 2. Fıkrasında yer alan "Tam boyu 15 m ve üzerindeki su araçlarına formu Ek-2 de belirlenmiş olan "Su Aracı Uygunluk Belgesi" verilir. Tam boyu 15 m'nin altındaki su araçlarına ise donatanın talebi üzerine "Su Aracı Uygunluk Belgesi" verilir" ibaresi küçük ölçekli ve kabotaj sınırları dâhilinde balıkçılık yapan tekneler için alınması ve maliyet ve zaman yönetiminin balıkçı tarafından daha kolay yürütülmesini sağlayabilir.
- 2) Gemi Sicil Tasdiknamesi: Tonaj sınırı aranmaksızın yurt içinde inşa edilen gemiler, yatlar ve özel maksatlı, özel yapılı bütün gemiler Türk Uluslararası Gemi Siciline tescil edilir.
- 3) Liman Kayıt Belgesi: Bağlama kütüğü, gemi, deniz ve iç su aracının kaydedildiği, ana ve yardımcı kütüklerden oluşan elektronik kayıt sistemini ve bağlama kütüğü dosyasını ifade eder, en yakın Liman Başkanlığı'ndan çıkartılabilir.
- 4) Uluslararası Tonilato Belgesi: Ticari olarak faaliyette bulunan gemi, deniz ve iç su aracının belirleyici özelliklerini, teknik özelliklerini ve ölçüm sonuçlarını gösteren belgedir (Ulaştırma ve Altyapı Bakanlığı, 2014).
- 5) Yangın Söndürme Sistemleri veya Elemanları Muayene Test Sertifikası: Sertifikaya ihtiyacı olan geminin bulunduğu/bağlı olduğu Liman Başkanlıklarınca mevcut sistem ve ekipmanların, belli periyotlarda uygunluğunun ve çalışmasının kontrolü sonucu verilen belgedir.
- 6) Gemi Adamı Donatımında Asgari Emniyet Belgesi: Ulusal bir belge olmak ile birlikte, (SOLAS V uyarınca) gereken yeterlilikleri yerine getirilmesini denetleyen belgedir. Gemilerin Genel Denetimi ve Belgelendirilmesi Hakkında Yönetmelik tarafından detayları yazılmıştır.
- 7) ISM sertifikası: IMO'nun A.741 (18) sayılı kararıyla Kasım 1993 tarihinde kabul edilmiş ve Mayıs 1994 tarihinde Denizlerde Can Emniyeti Uluslararası Sözleşmesi SOLAS 1974'ün 9. Bölümüne eklenmiş 13 maddelik bir kuraldır (Taylan, 1999).

Ancak burada önemli bir not olarak, ISM kodu alması zorunlu olan gemiler “bayrakları her ne olursa olsun uluslararası sularda çalışan bütün gemiler için zorunludur” ibaresi ile belirtilmiş, rekreasyonel balıkçılık icra eden küçük ölçekli balıkçılar için gerekli olup olmadığı muallaktır.

8) Klas-PI : IACS (Uluslararası Klas Kuruluşları Birliği) üyesi bir klas kuruluşuna veya Türk Loydu klasına sahip olması ve bu klas şartlarını poliçe süresi boyunca koruması gerekmektedir. Tıpkı ISM sertifikasında olduğu gibi balıkçı tekneleri için Klas Belgesi alma zorunluluğu “Gemi ve Su Araçlarının İnşa, Tadilat ve Bakım-Onarım Yönetmeliği” gereğince bulunmamaktadır. Bir balıkçı teknesinde bu belgenin olmayışı sigortacının ilk değerlendirme aşamasından riski reddetmesi için bir sebep olabilir.

Bu bağlamda, üç yıldır düzenli olarak sigortası yapılan aynı firmaya ait 19 adet teknenin bedellere göre prim bilgileri Şekil 1, 2 ve 3’te verilmiştir.

Şekil 1. Tekne boyu ve bedeline göre net prim (2021)

Şekil 2. Tekne boyu ve bedeline göre net prim (2022)

Şekil 3. Tekne boyu ve bedeline göre net prim (2023)

Grafiklere baktığımızda, her yıl artan bir bedel ve prim oranı olduğu görülmektedir. Bunun en büyük sebebi denizcilik sektörünün dövizle bağlı oluşu ve ülkemizdeki döviz kurunun dalgalı seyridir. Her geçen yıl artan döviz kuru, tekne bedellerini ve buna bağlı olarak sigorta primlerini de arttırmıştır. Bir diğer sebep ise tekne yaşlarının her geçen yıl artması ve yaşı artan teknelerin sigortacı tarafından daha riskli görülmesi sebebi ile uygulanan fiyat çarpanının artırılması. Ek olarak, endüstriyel balıkçılık, Uluslararası Çalışma Örgütü (ILO) tarafından dünyadaki en tehlikeli sektörlerden biri olarak gösterilmektedir. Bunun nedeni dünya genelinde açık deniz balıkçılığının yapılmasıdır. Ülkemizde her ne kadar açık deniz balıkçılığı yapılmıyor olsa da balıkçılık, 26.12.2012 tarihli Resmi Gazetede yayımlanarak yürürlüğe giren İş Sağlığı ve Güvenliğine İlişkin Tehlike Sınıfları Tebliği'nde tehlikeli sınıfta yer almaktadır (Abur, 2023). Bu sebeple, çoğu sigorta şirketinin risk kabul kriterlerine uymadığından dolayı balıkçı tekneleri için teminat bulmak oldukça zorlaşmaktadır.

Sigortalıların, sigorta poliçesi satın alma kararını vermelerindeki süreçte bakıldığında, kredi ve fonlardan yararlanma durumunun oldukça etkili olduğunu söyleyebiliriz. Bankaların ya da fonları sağlayacak kuruluşların müşterilerinden poliçe talep etmeleri sigorta satın alınmasında ciddi bir etki yaratmaktadır.

Ming Shang (2020)'e göre, konuya özel sigorta şirketleri açısından bakıldığında, operasyonel süreçler karşılığında alınacak prim ile durum değerlendirildiğinde, maliyetin kazançtan fazla olması, risk yapısının karmaşık ve asimetrik bilgiler içermesi sebebi ile sigorta şirketlerinin bu riskleri göz ardı etmesine sebep olmaktadır. Küçük ölçekli, merkezi olmayan, yüksek riskli, düşük verimli üretim ile birlikte sınırlı ödeme kapasitesi ve karmaşık denetim ve kayıp tespit teknolojisi, sigorta şirketlerinin taahhüdünü sınırlamıştır. Kısıtlı arz ve yetersiz talep, balıkçılık sigortası piyasasında bir çelişki oluşturduğunu söylemişlerdir. Sigorta ve sigorta kapsamı hakkındaki eksik bilgiler, özellikle balıkçı ile sigortacı arasında herhangi bir köprü olmaması, sigortacılar tarafından balıkçılık faaliyetinin karmaşık ve riskli bulunması bu zamana kadar ülkemizde bu faaliyet alanına uygun bir ürün geliştirilememesine sebep olmuştur. Hali hazırda bazı sigorta şirketleri balıkçı teknelerine verdikleri teminatları “gezinti teknesi sigortası”, “yat sigortası” başlıkları altında, birkaç ilave şart ile sunmaktadır. Ayrıca, ülkemiz genelinde de özellikle artan yakıt maliyetleri, gıda enflasyonu sebebi ile artan giderler arasında sigorta giderinin de eklenmesi imkansız hale gelmiştir.

Karadeniz'de yer alan balıkçıların eğitim durumlarının diğer bölgelere göre oldukça yüksek olduğu dikkat çekmektedir. Bunun yanı sıra üniversite mezunlarının küçük balıkçılığa yönelmeleri ülkemizde yaşanan işsizlik problemine de işaret etmektedir (Erdoğan-Sağlam ve ark., 2016) Akdeniz'de yer alan balıkçıların eğitim durumlarının diğer bölgelere göre daha düşük oranlarda olduğu görülmüştür. Özellikle Akdeniz bölgesinin en sosyal ve gelişmiş illerinden olan Hatay, Mersin ve Antalya'da balıkçıların arasında nadir de olsa üniversite mezunlarının çalıştığı dikkati çekmektedir. Yükseköğretim mezunlarının bu illerde turizm sektörüne yönelmesi balıkçılığı iş alanı olarak görmelerini ikinci plana atmaktadır (Karadal, 2014). Gökçeada balıkçıların eğitim düzeyleri incelendiğinde ilköğretim mezunu ile üniversite mezunu arasında değiştiği tespit edilmiştir. En yüksek oranın %54,2 ile ilköğretim mezunu oldukları ortaya konmuştur. Bu oran yapılan benzer çalışmalarda Ege Bölgesi'ndeki balıkçıların %2,30'u okur-yazar, %62,82'si ilköğretim, %17,24'ü ortaokul, %10,73'ü lise ve %1,53'ü ise üniversite mezunu olduğu rapor edilmiştir (Çeliker ve ark., 2008). Türkiye genelinde yapılan bu çalışmalardan anlaşıldığı üzere balıkçılık faaliyeti ile uğraşan kişilerin sosyo-ekonomik seviyesindeki

yetersizlik sebebi ile balıkçılık idaresini oluşturan kurum ve kuruluşların balıkçılık faaliyeti ile ilgilenen tüm paydaşların hakkını gözeterek ve balıkçılık faaliyetinin devamlılığı ve sürdürülebilirliğini sağlamak üzere adımlar atması gerekmektedir. Sonuçta,

Balıkçılığa kayıtlı tüm teknelerin ve lisans sahibi tüm kişilerin balıkçılık faaliyeti yapılırken uygulanabilecek sigortalar hakkında bilgilendirilmesini sağlamak,  
Ülkemizde 2005 yılında kurulmuş TARSİM'in (Tarım Sigortaları Havuzu A.Ş.) sağlamış olduğu mevcut sigortalara ek olarak tarım ve gıda üretiminin bir parçası olan avcılık yolu ile gerçekleştirilen balık üretimine yönelik sigorta poliçesi dizaynı ve mevcut poliçelere uygulandığı üzere %50 devlet desteği sağlamak,  
2017 yılından itibaren kullanılmaya başlanan 12 m ve üzeri Balıkçı Gemileri İzleme Sistemi (BAGİS) yardımı ile sigortalı – sigortasız balıkçı teknelerinin takibini sağlamak, böylece balıkçı teknelerine özel bir prim havuz oluşumunu sağlamak,  
Üniversitelerin ilgili bölümlerinde (Su Ürünleri Mühendisliği, Balıkçılık Teknolojisi Mühendisliği), balıkçılık sektöründe uygulanabilecek sigortalar konusu ile ilgili ders konularının müfredata eklenmesi, eğitimin niteliğinin ve sektör ihtiyaçlarına yönelik uzman yetiştirilmesini sağlamak gerekli ve önemlidir.

## ORAL PRESENTATION

### Üzümü meyvelerin antioksidan kapasitesinin Diabetes Mellitus hastalığına etkisi

Gökçe Çakmak Kafadar<sup>1\*</sup> (ORCID: <https://orcid.org/0000-0002-0364-1546>)

\*Sorumlu yazar e-mail: gokcecmk@gmail.com

#### Özet

İnsan sağlığı üzerindeki olumlu etkilerinin ortaya çıkmasıyla birlikte üzümü meyvelerin önemi giderek artmaktadır. Meyve ve sebzeler içerisinde fenolik madde ve özellikle antosiyanince zengin olan üzümü meyveler yüksek antioksidan kapasiteye sahiptir. Birçok bitki türü (nar, böğürtlen, yaban mersini, çilek vb.) içerdikleri fenolik bileşikler ve bu bileşiklere bağlı olarak sahip oldukları antioksidatif özelliklerden dolayı fonksiyonel gıdalar olarak değerlendirilmektedir. Üzüümü meyvelerin ise yüksek antioksidan kapasiteleri, askorbik asitten çok fenolik maddelerden, antosiyaninlerden, fenolik asit ve flavonoidlerden kaynaklanmaktadır. Antosiyanin alımının, Tip 2 diyabet modelinde kan şekeri seviyelerinin yükselmesini engellediği ve insülin duyarlılığını artırdığı tespit edilmiştir. Meyveler içerisinde özellikle üzümü meyvelerin doğal antioksidanlar bakımından zengin olduğu ve yüksek antioksidan kapasitesi ile antosiyanin miktarına sahip oldukları bilinmektedir. Biyolojik olarak aktif fitokimyasallar, özellikle antosiyaninler ve proantosiyanidinler açısından zengin meyveler, kan şekeri seviyelerindeki artışı baskılayabilir, diyabet ve diğer metabolik bozuklukları iyileştirebilir. Meyvelerdeki antioksidanlar özellikle büyük ölçüde antosiyaninlerden kaynaklanmaktadır. Siyah, koyu kırmızı ve mavi renkler içeren meyvelerin antioksidan değerleri çok daha yüksektir. Ayrıca antosiyaninlerin adipozitler üzerinde etkili olabileceği ve adipozitokinler sergilediğini gösteren çeşitli çalışmalarda ise, antosiyanin alımının, tip 2 diyabet modelinde kan şekeri tüketiminin yükselmesini engellediği ve insülin salgısını artırdığı tespit edilmiştir. Meyve ve sebzelerde antioksidanlar, insülin duyarlılığını arttırmak ve diyabetlere karşı koruma sağlamak için bireylere takviye denemeleri hipotez edilmiş ve bu çalışmalarda antioksidanların diyabet mellitusu karşı koruyucu etkisi olabileceği ileri sürülmektedir. Üzüümü meyvelerin içindeki antosiyaninlerin, temel fonksiyonlarından olan insülin direncinin gelişiminde, adiposit fonksiyonunun etkilenecek postprandiyal glisemiye tetiklediği gözlemlenmiştir. Ayrıca, adipozitokinleri salgılanmasının artması hedef hücrelerin insülin duyarlılığını geliştirebileceği de tespit edilmiştir. Meyve ve sebzelerin sahip olduğu lif, magnezyum, folat, antioksidan içeriklerinin (C vitamini, E vitamini, karotenoidler) işlevsel yönlerinden dolayı diyabet gelişimi üzerinde belirli bir koruyucu etkileri olduğu ortaya konmuştur.

**Anahtar Kelimeler:** Üzüümü meyveler, Antioksidan, Antosiyanin, Diabetes Mellitus,

#### Effect of antioxidant capacity of some berry fruits on diabetes mellitus

#### Abstract

With the emergence of positive effects on human health, the importance of berry fruits is gradually increasing. Grape fruits, which are rich in phenolic substances and especially anthocyanins among fruits and vegetables, have high antioxidant capacity. Many plant species (pomegranate, blackberry, blueberry, strawberry, etc.) are considered as functional foods due to the phenolic compounds they contain and the antioxidant properties they have depending on these compounds. On the other hand, the high antioxidant capacity of berries is due to phenolic substances, anthocyanins, phenolic acids and flavonoids rather than ascorbic acid. Anthocyanin intake has been found to prevent the rise of blood sugar levels and improve insulin sensitivity in a Type 2 diabetes model. It is known that among fruits, especially berry fruits are rich in natural antioxidants and have high antioxidant capacity and anthocyanin content. Fruits rich in biologically active phytochemicals, especially anthocyanins and proanthocyanidins, can suppress the rise in blood sugar levels, improve diabetes and other metabolic disorders. The antioxidants in fruits are mainly due to anthocyanins. The antioxidant values of fruits containing black, dark red and blue colors are much higher. In addition, in various studies showing that anthocyanins can be effective on adipocytes and exhibit adipositokines, it has been determined that anthocyanin intake prevents the increase in blood sugar consumption and increases insulin secretion in a type

2 diabetes model. Antioxidants in fruits and vegetables have been hypothesized to be supplemented with individuals to increase insulin sensitivity and protect against diabetes, and these studies suggest that antioxidants may have a protective effect against diabetes mellitus. It has been observed that anthocyanins in berries trigger postprandial glycemia by affecting adipocyte function in the development of insulin resistance, which is one of its basic functions. It has also been found that increased secretion of adipocytokines can improve the insulin sensitivity of target cells. It has been revealed that fruits and vegetables have a certain protective effect on the development of diabetes due to their functional aspects of fiber, magnesium, folate, antioxidant contents (vitamin C, vitamin E, carotenoids).

**Keywords:** Berries, Antioxidant, Anthocyanin, Diabetes Mellitus.

## GİRİŞ

Meyveler, besin ve biyoaktif fitokimyasallar kaynağı olarak bilinen insan diyetinin önemli bileşenleridir. Antioksidan aktiviteleri ile bilinen C, A ve E vitaminlerini içerirler (Sławińska ve ark., 2023). birçok bitki türü (nar, böğürtlen, yaban mersini, çilek vb.) içerdikleri fenolik bileşikler ve bu bileşiklere bağlı olarak sahip oldukları antioksidatif özelliklerden dolayı fonksiyonel gıdalar olarak değerlendirilmektedir (İnan ve Kaya., 2015). Gıdalarda, özellikle sebzelerde bulunan antioksidanlar fenolik bileşikler (fenolik asitler ve flavonoidler), karotenoidler, tokoferol ve askorbik asittir. Bu bileşikler insan sağlığı için önemli koruyucu maddelerdir (Islam ve ak. 2017).Bütün bitki metabolizmalarında, sekonder metabolit olarak bulunan ve bitkilerin kendilerini bazı zararlılara karşı korumada rolleri olduğu bilinen çok sayıda farklı nitelik ve miktarlarda çeşitli fenolik bileşikler bulunmaktadır. Fenolik birleşikler, meyve ve sebzelerin tat, aroma, renk gibi meyve özellikleri üzerinde direkt etkileri olan ikincil metabolitlerdir. Antioksidanlar ise serbest radikallerin zararlı etkilerinden koruyan maddelerdir. Antioksidan maddeler bu serbest radikalleri tutarak ya da etkisiz hale getirerek oksidasyonu neden olduğu zararlanmaları hücresel bazda engellemekte ve hastalıkları oluşmasını önlemektedir (Şensoy., 2018).

Üzümsü meyveler grubunda yer alan çilek, ahududu, böğürtlen, frenküzümü, beктаşiüzümü, maviyemiş, turnayemişi gibi türler dünyada çok sevilen ve yaygın bir şekilde tüketilen meyve türleri arasında yer almaktadır. Özellikle bileşimlerinde yer alan vitamin, mineral madde ve fenolik maddelerin yüksek oranda bulunuşu bu türlerin önemini daha da artırmaktadır (Çelik., 2012). Üzümsü meyvelerin ise yüksek antioksidan kapasiteleri, askorbik asitten çok fenolik maddelerden, antosiyaninlerden, fenolik asit ve flavonoidlerden kaynaklanmaktadır (Eke., 2017). Meyveler içerisinde özellikle üzümü meyvelerin doğal antioksidanlar bakımından zengin olduğu ve yüksek antioksidan kapasitesi ile antosiyanin miktarına sahip oldukları bilinmektedir (Engin ve ark., 2018). Antioksidan kapasite üzerinde en etkili bileşenlerin ise askorbik asit, antosiyaninler ve ellagitanninler olduğu belirtilmektedir (Erten ve Yılmaz., 2019). Üzümsü meyvelerde çok yoğun bir şekilde bulunan fenollerden ellagic asit (antikanserojen), flavon ve flavonoidlerden (antioksidan) antosiyanin, quercetin, kaempheol, myricetin en önemli “nutraceutical” veya “functional foods” değerine sahip bitkisel kimyasallardır (Pehlivan ve Gülerüz., 2004).

## BULGULAR VE TARTIŞMA

### Üzümsü meyvelerin tanımlanması

Üzümsü meyveler genel anlamda, üzüme benzeyen meyve türleri için kullanılmaktadır. Bu meyvelerin etli, sulu, yumuşak ve hoş kokulu olmaları ve aynı zamanda antioksidan kapasitelerinin diğer meyvelere göre çok daha yüksek olması en önemli özellikleridir. Üzümsü meyveler denildiği zaman daha çok üzüm (Vitis), çilek (Fragaria), ahududu ve böğürtlen (Rubus,) frenk üzümü ve beктаşi üzümü (Ribes), yaban mersini, kırmızı noktalı yaban mersini, kültür yaban mersini, bataklık yaban mersini (Vaccinium), kuşburnu (Rosa), kadıntuzluğu (Berberis), çakal eriği (Prunus) gibi cinsler ve bunlara bağlı türler akla gelmektedir (Özarda., 2009).

Üzümsü meyveler olarak da bilinen berry sınıfı fenolik bileşikler, organik asitler, taninler, antosiyaninler ve flavonoidler gibi biyoaktif bileşiklerin geniş bir çeşitliliğini içermesi ile bilinir (Çağlar ve Demirci., 2017).

### Üzümsü sınıfının antioksidan içeriği

Berry sınıfı genel olarak dut, çilek, böğürtlen, ahududu, frenk üzümü, beктаşi üzümü, yaban mersini, mürver meyvesi gibi türleri içeren meyvelerin antioksidan kapasiteleri oldukça yüksektir. Böğürtlen (Rubus fruticosus), ahududu (Rubus ideaus L.), frenk Üzüümü (Ribes sativum), kızılçık (Cornus mas cv. Vermio), çilek, siyah üzüm yüksek miktarlarda fenolik bileşik ve antosiyanin içeren meyvelerdir (Nizamlioğlu ve Nas., 2010).

**Çilek:** Çilek meyvesi, doğal antioksidanların yanı sıra; vitamin, mineral, antosiyanin, flavonoidler ve fenolik asitler açısından da zengindir. Çileğe kırmızı rengini veren antosiyaninin, insan plazmasındaki antioksidan

kapasiteyi arttırarak, düşük yoğunluklu lipoproteinler üzerindeki etkisi oldukça yüksektir. Diğer yandan, çileklerde bulunan yüksek miktarda askorbik asit, reaktif oksijen radikalleri üzerinde koruyucu özellik sağlamaktadır. Askorbik asidin, antosiyaninlerin ve toplam fenolik madde içeriğinin, nörotoksositeye neden olan oksidatif stresi azalttığı bilinmektedir. Sağlam epidemiyolojik kanıtlar, çilek tüketiminin hiperlipidemi, insülin direnci, diyabet ve KVH riski/insidansı ile ters ilişkili olduğunu göstermiştir (Erdoğan ve ark., 2013).

**Ahududu ve Böğürtlen:** Ahududu, quercetin ve kaempfeol flavonoidlerinin iyi bir kaynağıdır. Quercetin hem antikanserijen hem de antioksidan etkiye sahiptir. Quercetin ve Kaempferol gibi antioksidanlar, insan vücudundaki hücrelerde yıkım meydana getiren lipid peroksidasyonunu önleyebilmektedirler (Pehlivan ve Güleryüz., 2004). Ahududu ve böğürtlenler besin değeri bakımından oldukça önemli, sağlık için vazgeçilmez değerde yüksek oranlarda mineral maddeler ve vitaminler içermektedir. Az miktarda A, B, C vitaminleri ve diyet için lifli (çözülen veya çözülmeyen) yapıları çok büyük değere sahiptir (Çelik., 2012). Rubus cinsine ait bir meyve türü olan böğürtlen, polifenoller, özellikle antosiyaninler ve daha yüksek antioksidan aktivitesine katkıda bulunan diğer antioksidanlar açısından zengindir (Gowd ve ark., 2018). Böğürtlen meyvesi, antosiyanin-3-O-glukozit ve klorojenik asit başta olmak üzere yaklaşık 15 fenolik madde içerir (Li ve ark., 2022).

**Yaban Mersini:** Yaban mersini yüksek antioksidan kapasiteye sahip olup, bol miktarda fenolik bileşen içermektedir. Kanser, kardio ve serebrovasküler hastalıklar ve diyabet gibi bazı kronik hastalıklara karşı koruyucu etkisi yüksek antioksidan kapasitesine bağlanmaktadır. Küçük taneli birçok meyve üzerinde yapılan analizlerin sonuçlarına göre; yabani yaban mersinlerinin belirlenen oksijen radikallerini absorbe etme kapasitesiyle en yüksek antioksidan etkiye sahip oldukları saptanmıştır (Ceylan ve ark., 2017). Yaban mersini içinde bulunan en önemli polifenoller antosiyaninlerdir. Araştırmalarda yaban mersininin yüksek ORAC (Oxygen radical absorbance capacity) değerine sahip olduğu bulunmuştur. (Ayvaz., 2021). Yaban mersini antosiyaninlerin yanısıra antioksidan aktiviteye katkı sağlayan klorojenik asit, kuersetin, kamferol, mirisetin, prosiyanidin, kateşin, epikateşin, resveratrol gibi fenolik bileşikler ile vitamin C açısından da iyi bir kaynaktır. Kılcal damarların tıkanmasına neden olan düşük yoğunluktaki lipidlerin vücuttan atılması, kan şekerinin düzenlenmesi, kalp krizi riskinin azaltılması, içerdiği lif ile bağırsak metabolizmasının düzenlenmesi üzerine etkilerinin yanı sıra kanı temizlemek, kan kolesterolünü düşürmek gibi faydaları da bulunmaktadır (Yıldız., 2012).

**Kızılcık:** Kızılcık meyvesinin, zengin bir C vitamini ve polifenol kaynağı olduğu bilinmektedir. Hem meyvelerinde hem de yapraklarında önemli miktarda flavanoid, antosiyanin ve iridoid olduğu bildirilmiştir (Çelik., 2022). Biyoaktif bileşenler sayesinde antibakteriyel, antidiyabetik, antiinflamatuvar etki göstererek bağırsak, mide kalp ve karaciğer sağlığının korunmasına yardımcı olmaktadır (Durgut ve ark., 2022). Başta meyveye rengini veren antosiyanin olmak üzere, fenolik bileşiklerden zengindir. Kızılcıkta baskın antosiyanin grupları siyanidin rutinosit ve pelargonidin galaktosittir. Bu bileşiklerin miktarı bitki genotipine, yetiştiriciliğine ve meyvenin olgunluğuna bağlıdır. Kızılcık meyvesi, çilek, limon gibi meyvelerden önemli ölçüde daha fazla C vitamini içermektedir. Kızılcık meyvesi, yüksek potasyum (K) ve magnezyum (Mg) içeriğine sahiptir (Çelik., 2022). Kızılcık içerisindeki antosiyanidin ve ursolik asitlerin aşırı kalorili beslenmenin devam ettiği yağlanma sürecinde yağ dokusunun oluşumunu %24 azalttığı, karaciğerde yağ birikiminin azaldığı ve trigliserol oranını düşürdüğü yönündedir (Bayoğlu., 2021). Kızılcık, Escherichia coli'nin idrar yoluna yapışmasını engelleyen proantosiyanidinler bakımından yüksek olan az sayıdaki meyveden biridir. Kızılcık kardiyovasküler hastalıkları tedavi etmeye, lipit profilini iyileştirmeye, düşük yoğunluklu lipoproteinleri azaltarak ateroskleroz olasılığını en aza indirmeye, kan basıncını düşürmeye ve metabolik sendromu önlemeye yardımcı olur. Kızılcık tüketimi, tip 2 diyabet riskini azaltır (Nemzer ve ark., 2022).

**Goji Berry:** Goji berry'de bulunan flavonoidler (rutin, myricetin, quercetin, kaempferol) ve fenolik asitler (kafeik asit, klorojenik asit ve kumarik asit), Goji berry'nin antioksidan ve antimikrobiyal aktivite sergilenmesine neden olan ana bileşenlerdir (Kalkan., 2019). Goji meyveleri karotenoidler (beta-karoten, lutein, likopen, zeaksantin, zeaksantin dipalmitat), polisakkaritler (posanın %30'unu oluşturur), vitaminler (askorbik asit glukopiranosil askorbik asit ve tokoferol), yağ asitleri, betain ve peptidoglikanlar içerir (Islam ve ak. 2017). Çalışmalar, L. barbarum'un yaşlanma, nöroproteksiyon, genel iyilik hali, yorgunluk/dayanıklılık, metabolizma/enerji harcaması, diyabetiklerde glukoz kontrolü, glokom, anti-tümör aktivite ve hücre koruma üzerindeki etkilerini göstermektedir (Amagase ve Farnsworth., 2011). Goji meyveleri, en güçlü antioksidanlardan biri olarak bilinen zeaksantin dipalmitatın bilinen en zengin doğal kaynağıdır ve anti-inflamatuvar etkileri iyi tanımlanmıştır (Ramon ve ark., 2019).

**Aronya:** Antioksidan özelliği en yüksek ve süper meyve olarak adlandırılan aronya meyvesinin ORAC değerinin 16.062 gibi yüksek bir düzeyde olduğu bildirilmiştir (Anonim, 2021). Antioksidan açısından oldukça zengindir. Ayrıca vitamin ve mineral kaynağıdır. B12 ve D vitamini hariç tüm vitaminleri içermektedir. Bu

yüzden aronya ya 'Süper Meyve' denilmektedir. Bilim adamları, aronya da kafeik asit, siyanidin-3 galaktozid, delfinidin, epikateşin, malvidin ve birçok özel maddeler saptamışlardır (Sosnowska, 2016, Bolling, 2017 ). Bu özel maddeler, anti-bakteriyel, anti-viral ve anti-diyabetiktir. Aronya kan şekerini düşürür ve vücudun kendi doğal üretimi olan insülinin artmasına sağlar. Aronya içinde bulunan bazı bileşikler doğal kanser savaşıdır (Özder., 2021).

### **Berry türü meyvelerin Diabetes Mellitus'a etkisi**

Biyolojik olarak aktif fitokimyasallar, özellikle antosiyaninler ve proantosiyanidinler açısından zengin meyveler, kan şekeri seviyelerindeki artışı baskılayabilir, diyabet ve diğer metabolik bozuklukları iyileştirebilir. Postprandial glikozu azaltmak için varsayılan mekanizma,  $\alpha$ -amilaz ve  $\alpha$ -glukosidaz aktivitesini inhibe ederek glikoz emilimini sınırlamaktır (Golovinskaia ve Wang., 2021).

Goji berry içerisindeki sahip olduğu polifenolik bileşikler antioksidatif özellikler sayesinde düşük yoğunluklu lipoprotein (LDL) kolesterol fraksiyonunun ve trigliseritlerin kan seviyelerini düşürür ve metabolik hastalık (örn. diyabet, obezite) riskini en aza indirir. Yüksek biyolojik değeri nedeniyle kan basıncını düşürmek ve kandaki glikoz seviyesini düşürmek için kardiyovasküler hastalıkların tedavisinde uygulanır (Oszm iański ve Lachowicz., 2016).

Böğürtlen özleri ile kırmızı ahududu özleri karşılaştırıldığında; ahududu  $\alpha$ -amilazın inhibe edilmesinde etkili olanlardır. Bazı çalışmalar, antosiyaninlerin adipositlerin işlevini iyileştirdiğini ve insülin duyarlılığını artırdığını göstermektedir (Golovinskaia ve Wang., 2021).

Çilek, glukozidaz ve anjiyotensin-1-dönüştürücü enzimleri inhibe eder ve  $\alpha$ -amilaz için daha az belirgin bir inhibe etme potansiyeline sahiptir (da Silva ve ark., 2010).

Frenk üzümü özleri, tip 2 diyabetik (T2D) farelerde ve insanlarda kan şekerini azaltabilir ve glikoz toleransını geliştirebilir.

Yaban mersini antosiyaninlerinin insülin duyarlılığını ve hiperglisemiyi azalttığı gösterilmiştir. Yaban mersini tozu ile takviye edilmiş diyet, farelerde glikoz toleransını artırır, obez farelerde glikoz metabolizması belirteçlerini normalleştirir ve insanlarda insülin duyarlılığını artırır (Elks ve ark., 2015). Ayrıca, antosiyaninlerin, insülin sekresyonunun indüklenmesinden sorumlu pankreatik hücrelerle birleşen peptid-1 gibi glukagon üretimini indüklediği doğrulanmıştır. (Golovinskaia ve Wang., 2021).

Kızılcık (Cornus mas L.; CM), başta meyveye rengini veren antosiyanin olmak üzere fenolik bileşiklerden zengindir. Antosiyaninlerin,  $\alpha$ -glukozidaz enzim aktivitesini azalttığı ve inhibe ettiği gösterilmiştir. Alfa-glukozidaz, karbonhidratların hidrolizinde yer alan bir sindirim enzimidir. Bu enzimin inhibisyonunun karbonhidratların hidrolizini önlediği ve kan glikozu düzeylerini düşürdüğü görülmektedir. Antosiyanin içeriği zengin CM, glikozun azalmasına yol açan reseptörler aracılığıyla insülin etkisini iyileştiren G-protein reseptörlerini de aktive edici etkiye sahiptir (Çelik., 2022). Kızılcık flavonoidleri, glikozun bağırsak emilimini geciktirir ve glisemik yanıtı iyileştirir. Bazı araştırmalar, kızılcık ürünlerinin açlık glisemisini azaltarak, homeostaz modeli değerlendirilmesi tahmini insülin direncini iyileştirerek, insülin duyarlılığını artırarak ve telafi edici insülin sekresyonunu önleyerek glikoz homeostazını destekleyebileceğini göstermektedir. Doğal bir polifenol ve lif kaynağı olan kızılcık tüketimi, T2D'li hastalarda daha olumlu bir glisemik tepki sağlayacaktır. Kızılcık, gastrik glikoz emilim oranındaki azalma ile ilgili olan çözünür lifler polidekstroz ve  $\beta$ -glukan içerir (Golovinskaia ve Wang., 2021).

Üzüm meyvelerinin içindeki antosiyaninlerin, temel fonksiyonlarından olan insülin direncinin gelişiminde, adiposit fonksiyonunun etkilenerek postprandiyal glisemiyi tetiklediği gözlemlenmiştir. Ayrıca, adipositokinleri salgılanmasının artması hedef hücrelerin insülin duyarlılığını geliştirebileceği de tespit edilmiştir. Serum adiponektin protein seviyeleri sistemik insülin duyarlılığı ile ilişkilidir ve insüline dirençli, diyabetik ve obez kişilerde azaldığı gözlemlenmiştir. Obezite veya diyabette, glikoz taşıyıcı 4'ün (GLUT4) ekspresyonu ile adipositler azalmaktadır; azalmaya RBP4 ekspresyonunda ve kan sekresyonunda bir artış eşlik eder. Artış, iskelet kasında insülin sinyalinin bozulmasına neden olur ve karaciğerde glikoz üretimini uyarır. Bu değişiklikler kanda yüksek glikoz konsantrasyonlarına yol açar. Bu nedenle, adiposit GLUT4-RBP4 sisteminin düzensizliği tip 2 diyabet ile güçlü bir şekilde ilişkilidir. RBP4'ün düşürülmesi tip 2 diyabetin önlenmesi ve tedavisi için potansiyel olarak yeni bir hedefdir (Afacan ve Sönmezdağ., 2020).

Li ve arkadaşlarının 2015 yılında antosiyaninlerin tip 2 diyabetli hastalarda dislipidemi, oksidatif durum ve insülin duyarlılığı üzerindeki etkilerini araştırdığı çalışmada antosiyanin takviyesinin, tip 2 diyabetli hastalarda dislipidemiyi iyileştirerek, antioksidan kapasiteyi artırarak ve insülin direncini önleyerek yararlı metabolik etkiler gösterdiğini göstermektedir (Li ve ark., 2015).

Kalt ve arkadaşlarının yürüttüğü; obez, insüline dirençli yetişkinler üzerinde yapılan plasebo kontrollü bir çalışmada, insülin duyarlılığı 6 haftalık yaban mersini alımından sonra daha yüksek olduğu saptanmıştır. Yabanmersini ve siyah frenk üzümünden elde edilen antosiyanin özünün (günde 80 mg), plaseboya kıyasla 58

T2DM hastasında insülin duyarlılığını (HOMA-IR), plazma lipid profillerini iyileştirdiği ve oksidatif stresin plazma belirteçlerini azalttığı gözlemlenmiştir (Kalt ve ark., 2020).

Paralel, çift kör, randomize, kontrollü bir çalışmada, Curtis ve meslektaşları 45 kişiden oluşan bir grupta, enerjisi yoğun bir gıdayla (900 kcal; 500 g milkshake) birlikte tüketilen dondurularak kurutulmuş bir yaban mersininin (26 g, 150 g taze uzun boylu yaban mersine eşdeğer) postprandiyal kardiyometabolik tepki üzerindeki etkisini araştırdı. Yaban mersini yoğun gıda alımı, yemek sonrası glikoz ve insülin tepkisini ve toplam kolesterolü azaltırken, HDL-C, Apolipoprotein AI (APO-A1), yüksek yoğunluklu lipoprotein parçacık sayısını artırdığı gözlemlenmiştir (Venturi ve ark., 2023).

Lycium barbarum meyvelerinden elde edilen polisakkaritlerin antidiyabetik etkisi araştırılmıştır. Diyabetik farelere Lycium barbarum polisakkaritleri 6 hafta 200 mg/kg/gün dozda oral olarak verilmiş ve çalışma sonunda farelerin açlık kan şekeri seviyelerinde (%13.51 azalma) ve glikozillenmiş hemoglobin fonksiyonunda iyileşme gözlenmiştir. Ayrıca bu çalışma, LBP'lerin bağırsak mikrobiyotasını ve bağırsak bariyerini değiştirerek anti-diyabetik etki sağlayabileceğini göstermiştir. Lycium barbarum L.'den elde edilen su ekstraktının hipoglisemik etkilerini ve etki mekanizmasının değerlendirildiği bir çalışmada, Lycium barbarum L. özütünün diyabetik sıçanlarda kan şekeri ve lipid seviyelerini belirgin şekilde modüle edebileceğinin yanı sıra karaciğer, böbrek ve pankreastaki hasarları onarabileceği gösterilmiştir (Alp., 2023).

Sağlıklı yetişkinlerde, üzümü meyve pürelere glikoz metabolizması, insülin direnci ve glisemik yanıtın diğer araçlar üzerindeki etkisini değerlendiren çalışmada; mor meyvelerin olduğu öğünün tüketilmesinden 15 ve 30 dakika sonra plazma glukoz konsantrasyonları, kontrol öğününün tüketildiği değerlere göre önemli ölçüde daha düşük tespit edilmiştir. Yapılan diğer çalışmada, mor meyveleri içeren öğünün, kontrol yemeğine kıyasla daha düşük ve uzun süreli insülin tepkisini uyardığı ve yüksek insülin tepkisi belirtisi görülmediği gözlemlenmiştir [36]. Bu iki çalışma, mor meyvelerin postprandiyal hiperglisemi üzerindeki etkisini göstermesine rağmen, sonuçların yorumlanması diğer faktörlerin de göz önünde tutulması gerekmektedir. Kontrol öğününün ve dut öğününün lif içeriği eşleşmemektedir. Başka bir çalışmada ise antosiyanin alımının, obez fare modellemesinde, yüksek yağlı bir diyetin neden olduğu kan şekeri seviyesinin yükselmesini engelleyebileceğini bildirmiştir. Sasaki ve ark. Yapmış olduğu tip 2 diyabet model çalışmasında, antosiyanin alımının kan şekeri seviyelerinin yükselmesini engellediği ve insülin duyarlılığını artırdığı tespit edilmiştir. Bu etki, yaban mersini özündeki çeşitli C3G bileşiği ile ilişkilendirilmiştir (Afacan ve Sönmezdağ, 2020).

Yapılan bir çalışmada erken hafıza değişikliği geçiren yaşları ortalama 76 olan 9 yaşlı bireye 12 hafta boyunca 6-9 ml/kg yaban mersini suyunun etkisi araştırılmıştır. Sonuç olarak azalmış depresyon belirtileri (p=0.08) ve düşük glikoz düzeylerini (p=0.10) düşürdüren eğilimler tespit edilmiştir (Özkan., 2020).

## SONUÇ

Meyve ve sebzelerde bulunan mineraller, fitokimyasallar ve diğer biyoaktif bileşenler kronik hastalıkların önlenmesinde önemli rol oynamaktadırlar (Bulantekin ve ark., 2020). Nizamlioğlu ve Nas (2010)' ın bildirdiğine göre, genel olarak frenküzümü, beктаşıüzümü, dut, çilek, böğürtlen, ahududu, maviyemiş, mürver yemişi gibi türleri içeren meyvelerin antioksidan kapasiteleri oldukça yüksektir (Çelik., 20212). Doğal halde yüksek oranlarda içerdiği; C vitamini, antioksidanlar, flavon ve flavonoidler (fenolik bileşenler) nedeniyle fonksiyonel özellik kazanan çilek ve diğer üzümü meyveler, insan sağlığı açısından başka meyve gruplarıyla karşılaştırılmayacak kadar faydalı bir meyve grubudur (Erdoğan ve ark., 2013) Üzümsü meyveler üzerinde yapılan çalışmalarda adı geçen bitkisel kimyasallar bakımından bu grupta bulunan böğürtlen, ahududu ve maviyemişin en zengin meyveler arasında yer aldığı belirlenmiştir (Eke., 2017).

Antosiyaninler flavonoid grubunun bir bölümünü oluşturmaktadırlar. Özellikle böğürtlenlere kendilerine has karakteristik mavi rengi vermekteler. Meyvelerdeki antioksidanlar özellikle büyük ölçüde antosiyaninlerden kaynaklanmaktadır. Siyah, koyu kırmızı ve mavi renkler içeren meyvelerin antioksidan değerleri çok daha yüksektir (Pehlivan ve Gülerüz., 2004). Ayrıca antosiyaninlerin adipozitler üzerinde etkili olabileceği ve adipozitokinler sergilediğini gösteren çeşitli çalışmalarda ise, antosiyanin alımının, tip 2 diyabet modelinde kan şekeri tüketiminin yükselmesini engellediği ve insülin salgısını artırdığı tespit edilmiştir (Afacan ve Sönmezdağ., 2020). Yaban mersini, üzüm ve elma gibi spesifik meyvelerin tüketimi ile prospektif kohort çalışmaların bulguları temel alınarak bu meyveleri tüketen bireylerde diyabet riskinin daha düşük olduğu belirtilmektedir. Yapılan bir çalışmada flavonoid alımının veya flavonoid içeren gıdaların alımının, tip 2 diyabet riskinin azalmasıyla ilişkili olmadığı buna karşın kırmızı ve beyaz şarap tüketimiyle tip 2 diyabet riskinin azaldığı ifade edilmiştir. Anavatani Amerika kıtası olan saskatoon üzümü, aroniya, gilaburu, güz zeytini gibi üzümü meyvelerin içerdikleri fitokimyasallar diyabet hastalığının ilerlemesini durdurduğu ifade edilmiştir (Bulantekin ve ark., 2020).

Birkaç çalışmada ortaya çıktığı gibi, meyveler ve meyve polifenoller glikoz metabolizmasını etkileyebilir. Anti-diyabetik etkiler, pankreatik  $\beta$ -hücrelerini koruma, glikoz sindirimini, emilimini ve alımını etkileme ve

glikoz/lipid metabolizma yollarını aktive etmedeki yararlı etkilerine bağlanıyor gibi görünmektedir. Ek olarak, berry-biyoaktif, glisemik kontrolün iyileştirilmesinden sorumlu inkretin sisteminin bir hormonu olan glukagon benzeri peptit-1'i (GLP-1) uyarabilir (Venturi ve ark., 2023).

Sonuç olarak, chokeberry meyve türevleri, metabolik sendromda meydana gelen bozuklukların ve bunların komplikasyonlarının önlenmesi ve tedavisinde umut verici bir tamamlayıcı tedavi seçeneği olabilir (Jurgoński ve ark., 2008). Berry sınıfının fonksiyonel bir besin olarak kan glikozunu düşürücü etkisi olduğu hücre ve hayvan çalışmalarıyla ispatlanmıştır. Ayrıca bu meyvelerin glikoz alımı üstünde konsantrasyona bağlı tesir ettiği kanıtlanmıştır (Alp., 2023).

\*Sorumlu yazar e-mail: gokcecmk@gmail.com

#### Özet

İrritabl bağırsak sendromu (IBS) dünya genelinde oldukça sık rastlanan bir gastrointestinal fonksiyonel bozukluğudur. IBS hastalarında genel olarak karın ağrısı, şişkinlik karında rahatsızlık, ishal ya da kabızlık gibi belirtiler göstermektedir. Bu durum IBS'li hastaların yaşam kalitesini olumsuz etkilemektedir. Bu çalışmanın amacı IBS hastalığı ve bu hastalıkta etkili olabilecek besin ve beslenme çözümlerini sunmaktır. IBS hastalığında uygulanan bazı diyet çeşitleri bulunmaktadır. Bu diyet çeşitlerinden FODMAP diyeti olmak üzere, probiyotikler, prebiyotikler, sinbiyotikler ile mikrobiyotanın sağlığı, hastalığın tedavisinde önemli gözükmektedir. Yapılan çalışmalar FODMAP (fermente edilebilir oligosakkaritler, disakkaritler, monosakkaritler ve polioller) diyetinin diğer diyet çeşitlerine göre daha etkili olduğunu göstermektedir. Bununla birlikte bazı çalışmalarda IBS hastalarında bağırsak mikrobiyotasının zenginliğinde azalma olduğu saptanmıştır. Beyin-bağırsak eksenini nedeniyle probiyotik kullanımı IBS semptomlarına ve yaşam kalitesi üzerinde olumlu etkiler yaptığına dair çalışmalar mevcuttur. Mevcut veriler incelendiğinde IBS'nin etkileşim içinde olduğu çeşitli hastalıklar (depresyon vb.) mevcut besin ve beslenme çözümlerinin tamamen etkisinin görülmesini güçleştirmektedir. Bu sebeple bu alanda daha fazla randomize kontrollü çalışmalara gerek duyulmaktadır.

**Anahtar Kelimeler:** İrritabl bağırsak sendromu, Diyet, Besin, Beslenme

#### Food and nutrition solution for irritable bowel syndrome (IBS)

#### Abstract

Irritable bowel syndrome (IBS) is a very common gastrointestinal functional disorder worldwide. IBS patients generally show symptoms such as abdominal pain, bloating, abdominal discomfort, diarrhea or constipation. This situation negatively affects the quality of life of patients with IBS. The aim of this study is to present IBS disease and nutritional and nutritional solutions that may be effective in this disease. There are some types of diets applied in IBS disease. The health of the microbiota with probiotics, prebiotics, synbiotics, and the FODMAP diet, seem to be important in the treatment of the disease. Studies show that the FODMAP (fermentable oligosaccharides, disaccharides, monosaccharides and polyols) diet is more effective than other diet types. However, in some studies, it has been found that there is a decrease in the richness of the intestinal microbiota in IBS patients. There are studies showing that the use of probiotics has positive effects on IBS symptoms and quality of life due to the brain-intestinal axis. When the available data are examined, various diseases (depression, etc.) with which IBS interacts make it difficult to see the full effect of the existing food and nutrition solutions. Therefore, more randomized controlled studies are needed in this area.

**Keywords:** Irritable bowel syndrome, Diet, Food, Nutrition

#### GİRİŞ

Dünya çapında yaygın olarak görülen ve gastrointestinal fonksiyonel bir bozukluk olan irritable bağırsak sendromu (IBS) hastaları, genellikle karın ağrısı, şişkinlik, karında rahatsızlık ve ishal/kabızlıktan şikâyetçi olmaktadır. Bu durumda hastanın yaşam kalitesini ciddi şekilde olumsuz etkilemektedir (Liu, Y. L., & Liu, J. S., 2021).

Tedavi edilen en yaygın hastalıklardan biri olmasına rağmen IBS'li hastaların yalnızca %10 kadarı tıbbi destek almak istemektedir (Alammar, N., & Stein, E., 2019). Batı popülasyonlarında yaklaşık %5 ile %15 arasında IBS'nin varlığı tahmin edilmektedir. Lovell ve Ford tarafından yapılan bir çalışmada IBS'nin çoğunlukla

kadınlarda görüldüğü ve 50 yaşından önce başlayarak genel toplumda %11.2 oranında görüldüğü bulunmuştur (Alammar, N., & Stein, E., 2019).

IBS'nin patofizyolojisi belirsizdir. Değişen gastrointestinal motilite, visseral aşırı duyarlılık, enfeksiyöz sonrası reaktivite, beyin-bağırsak etkileşimleri, fekal mikro florada değişiklik, bakteriyel aşırı büyüme, gıda duyarlılığı, karbonhidrat malabsorpsiyonu ve bağırsak iltihabının tümü, IBS'nin patogenezi etkilendirmektedir. Buna ek olarak, bu mekanizmalardan algılanan belirtiler karın ağrısı ya da rahatsızlığı, şişkinlik, diyare ve konstipasyon oluşur. Bütün belirtiler gastrointestinal olmamakla birlikte yorgunluk çok yaygın bir şekilde görülebilir (Saha L., 2014).

## **BULGULAR ve TARTIŞMA**

### **IBS tanı kriterleri**

Roma IV son yayınlanan Roma kriterlerindedir ve IBS ile ilişkili karın semptomları olan hasta bireylerin daha iyi yönetilmesine yardımcı olmak için fonksiyonel bağırsak hastalığı uzmanları tarafından oluşturulmuştur. Semptomların tanıdan en az 6 ay önce kendini göstermesi ve son 3 ay içinde tanı kriterlerini doldurmalıdır. Bu bilgilere göre, son 3 ayda, haftada en az 1 gün tekrar eden karın ağrısı olmalıdır. Bununla birlikte, IBS, aşağıdaki kriterlerden 2 ya da daha fazlasıyla ilişkilidir.

Dışkılama ile ilgili

Dışkı sıklığındaki değişikliklerle ilişkili

Dışkı formundaki değişikliklerle ilişkili

Bu sınıflandırma kullanılarak IBS, baskın dışkı modeline göre sınıflandırılır.

1. Kabızlığın baskın olduğu IBS (IBS-C): %25'ten fazla sert dışkı ve %25'ten azından dışkı sulu ya da gevşek
2. İshalin baskın olduğu IBS (IBS-D): %25'ten fazlasında dışkı gevşek ve %25'ten azı sert dışkı
3. Karışık barsak alışkanlıklarına sahip IBS (IBS-M): %25'ten fazla gevşek dışkı ve %25'ten fazla sert dışkı
4. Sınıflandırılmamış IBS (IBS-U): %25'ten azı gevşek dışkı ve %25'ten azı sert dışkı (Alammar, N., & Stein, E., 2019).

IBS belirtileri spesifik olmayabilir, fakat belirtilerin değerlendirilmesi anında “tehlike işareti” semptomlarının sorularak öğrenilmesi önem arz eder. Bunlar, IBS belirtileri olarak sayılmaz ve her zaman daha fazla değerlendirme gerektirir. Tehlike işareti belirtileri aşağıdakileri içerir (Alammar, N., & Stein, E., 2019).

Yaşın 50'den büyük olması

Gece belirtileri, özellikle ishal durumu

Kanlı dışkı olması

Ateş

Kiloda azalma

Laboratuvar testlerinde anormallik (anemi, yüksek inflamatuvar belirteçler dahil)

Ailede inflamatuvar bağırsak hastalığı ya da kolon kanseri hikayesi

### **İbs'de besin ve beslenme çözümü**

IBS'li bireyler, sağlıklı insanlar ile karşılaştırıldığında daha kötü hayat kalitesi bildirirler ve diyet, yaşam tarzlarını etkileyen önemli bir faktördür. Hastaların çoğu, IBS belirtilerini tükettikleri yiyeceklerle ilişkilendirdi. Bu durum, IBS'li bireylerde düşük hayat kalitesi ile ilişkili gıdadan kaçınma davranışı sergiler ve diyetin hastaların refahı üzerindeki olumsuz etkisini vurgular. Bazı yiyecekler IBS belirtilerini arttırabilse de, bazıları rahatlatma sağlayabilir. IBS için etkili diyet yönetimi yaklaşımları tasarlamak için yapılan araştırmalarda çeşitli diyet stratejilerine odaklanılmıştır (Dimidi, E., & Whelan, K., 2020).

IBS'li hasta bireylerden üçte ikisi kadarı belirtilerin yemeklerden sonra kötüleştiğini bildirmektedir. Hastalar, uzun süredir IBS semptomlarını belirli yiyeceklerin yenilmesi ya da bir öğünün kendisi ile ilişkilendirmiştir ve postprandiyal belirtiler artan hastalık düzeyi ve azalan hayat kalitesi ile ilişkili görmüşlerdir (Harer, K. N., & Eswaran, S. L., 2021).

**Eliminasyon diyetleri:** Bazı özel gıdaların IBS belirtilerinin düzeyini arttırdığı düşüncesi, 1990'larda Cambridge grubunun öncülüğünü yaptığı ve zayıf dışlamaya odaklanan eliminasyon diyetlerinin temelini oluşturur. Bu düşünce modeli, hastaların genel olarak belirtilere sebep olduğunu gözlemlediği gıdaları ortadan kaldırarak başladığı daha ampirik bir yaklaşım olarak daha da geliştirildi. Bu ürün grubuna süt ürünleri, tahıllar, turuncuğiller, patates, çay, kahve, alkol, katkı maddeleri ve koruyucular dahil edilmiştir. Diyet içeriği olarak çoğunlukla taze et, balık, pirinç, sebzeler ve keçi, koyun ya da soya sütüne dayanan bir çalışma yapılmıştır. Diyetle dışlamalar yapıp belirtiler düzeldikten sonra gıdalara tekrar başlandı. Her 2-3 günde bir yeni bir gıda grubu verildi ve bu şekilde gıdalar tolere edilen ya da semptomlarasebep olan gıdalar olarak sınıflandırıldı. Semptomlar, eliminasyon diyeti ile hastaların 91/189'unda (%48) iyileşti ve yeniden

tüketmeden sonra 73'ü bir ya da daha fazla gıda intoleransı tanımlayabildi ve 72'si 1 yıldan uzun takipte iyi durumda kaldığını ifade etti.

İsveç'te yapılan bir araştırma, IBS hastalarının %84'ünün belirtilerini tetikleyen en az bir gıdayı ifade ettiğini ortaya çıkardı. Bunlar arasında süt ürünleri (%49), fasulye/mercimek (%36), elma (%28), un (%24) ve erik (%23) ile biyojenik aminler, şarap/bira (%31), salam (%22) ve peynir (%20) yer aldı ve %52'si genel olarak kızarmış/yağlı yiyecekleri ifade etti.

Norveç'te nüfusa dayalı bir çalışmada, IBS hastalarının ortalama olarak 2,5 gıda maddesinden kaçındığı bildirildi. Buna süttten kaçınan %35, %14 peynir, %16 bakliyat, %24 soğan, %10 buğday unu, %26 kahve ve %12 bira dahil edildi. Tanımlanan gıdaların sayısı ile duygudurum bozuklukları ya da kas-iskelet ağrısı arasında bir ilişki olmadığı bulundu (Spiller R.,2021).

**Düşük FODMAP diyeti:** Saygılı bir hasta-hekim ilişkisi, başarılı IBS tedavisinin temel noktasıdır ve güvenli bir IBS tanısı koymak, hastanın tanımı kabul etmesi için çok önemlidir. Tedavinin hedefleri, IBS belirtilerini kontrol etmenin dışında hayat kalitesini iyileştirmeyi ve stresi azaltmayı içerir. Özel olarak, FODMAP bakımından zayıf bir diyetin IBS popülasyonunda etkili ve güvenli olduğu düşünülmüştür. FODMAP'ler, muhtemelen çoklu mekanizmalar yoluyla GI belirtilerine katkıda bulunduğu düşünülen, ozmotik olarak aktif karbonhidratların çeşitli bir ailesidir.(Liu, J., Chey, W. D., Haller, E., & Eswaran, S., 2020).

Düşük FODMAP diyeti, kısa zincirli karbonhidratların, yani oligosakkaritlerin, disakkaritlerin, monosakkaritlerin ve poliollerin hariç tutulmasına dayanan bir diyet yaklaşımıdır. FODMAP'ler ortak hususlara sahip heterojen bir gruptur.İnce bağırsakta yavaş ve tamamen emilmezler, mikrobiyota tarafından hızla fermente edilebilirler ve yüksek ozmotik kapasiteye sahiptirler. Mevcut bilimsel kanıtlar, özellikle ağrı, şişkinlik ve diyare olmak üzere belirtilerin genel kontrolünde düşük FODMAP diyetinin (LFD) önemli bir etkinliğini göstermektedir. Yulaf, keten tohumu, psyllium gibi düşük FODMAP lif kaynakları ve kivi ve papaya gibi bazı meyve türleri bu durumlarda tercih edilecek yiyecek seçenekleri olabilir. Literatüre göre LFD, bağırsak mikrobiyotasında, yani Bifidobakterilerin bolluğunda olumsuz bir etkiye sahip olabilir; fakat bu negatif etki, probiyotik takviyelerin kullanımıyla kolayca kontrol altına alınabileceğini düşündürmektedir. Her vakanın kişisel ve ayrıntılı değerlendirmesi ve kişilerin terapötik sürece dahil edilmesi, her vaka için en uygun stratejinin tanımlanması için çok önemlidir (Guerreiro, M., Sousa Guerreiro, C., & Cravo, M., 2019).

Tam tahıllı buğday ürünleri ya da yüksek FODMAP meyve ve sebzeleri uygun düşük FODMAP seçenekleri ile değiştirilmezse, FODMAP içeriğindeki azalma aynı zamanda lif alımında da eş zamanlı bir azalmaya sebebiyet verebilir. FODMAP'lerde bir azalma, kabızlık ihtimalini artırarak bağırsak lümenine ozmotik sıvı geçişini de azaltabilir. Bu etkiler, devam eden kabızlığı olan IBS hastaları için özellikle zararlı olabilir (Bellini, M.,ve diğerleri., 2020).

**Buğday ve glutensiz diyetler:** Buğdayın hasta anketlerinde ifade edildiği gibi, sürekli olarak IBS belirtilerini ağırlaştırdığı tespit edilmiştir. Mekanizması net değildir, fakat çölyak hastalarında görüldüğü gibi glutene karşı immün reaksiyon, IBS belirtileri ile bağlantılıdır. Artan bağırsak geçirgenliği ve artmış mukozal mast hücreleri ve azalmış serotonin taşıyıcı gibi IBS'de görülen önemli anormallikler de çölyak hastalarında glutensiz bir diyetle başlamadan önce görülür. Bu gözlemler, birçok IBS'li bireyde, satışları son zamanlarda önemli ölçüde artan, daha çok talep edilen ve pahalı glutensiz diyeti benimsemesine ortaya çıkarmıştır. IBS yönetimine ilişkin kılavuzların çoğu, Roma III kriterlerini karşılayan seçilmemiş IBS hastalarında, kontroller ile karşılaştırıldığında çölyak hastalığına yakalanma riskinin 7 kat arttığından, çölyak hastalığını dışlamanın önemli olduğu konusunda uyarıda bulunur (Spiller R., 2021).

**Laktoz ve fruktoz kısıtlaması:** Bu, fermente edilebilir karbonhidratın kolona verilme hızına ek olarak malabsorpsiyon düzeyinin belirtilerin belirlenmesinde önemli olduğunu düşündürmektedir. Yapılan çalışmalar, devam eden laktoz alımına bir miktar adaptasyonun, diyetle laktoza 3 hafta maruz kaldıktan sonra nefes hidrojen yanıtında azalma ve belirtilerde azalma ile gerçekleştiğini göstermektedir. Son dışkı inkübasyon çalışmaları ayrıca semptomatik olanların daha fazla laktat ve diğer kısa zincirli yağ asitleri ürettiklerini göstermektedir, bu da kolonik mikrobiyotanın belirtilerin gelişip gelişmemesi konusunda önemli belirleyiciler olduğunu düşündürmektedir. Diğer anahtar faktör, distansiyona ve bakteriyel metabolitlere karşı visseral aşırı duyarlılıktır.Çin'de yapılan ve çoğunun genetik olarak belirlenmiş laktoz malabsorpsiyonuna sahip olduğu bir çalışmada, laktoz intoleransı olanların, asemptomatik laktoz malabsorpsiyonu olanlarla benzer seviyelerde laktoza karşı nefeste hidrojen tepkisine sahip olduğunu, fakat daha düşük dozlarda belirtileri bildirmedi farklılık gösterdiğini göstermektedir. Laktoz intoleransı olan IBS hastaları da sıklıkla fruktozu zayıf bir şekilde emer ve bu, bazılarında sorbitol gibibelirtilere sebebiyet verebilir. Fruktoz ve sorbitol azaltılmış diyetler, kontrolsüz müdahalelerde yarar sağlamıştır (Spiller R., 2021).

TABLO 1: Bazı Gıdaların FODMAP İçeriği (Liu, J., Chey, W. D., Haller, E., & Eswaran, S., 2020)

FODMAP İÇERİĞİ	Tahıllar	Meyveler	Sebzeler	Süt Ürünleri Ve Bitki Bazlı Seçenekler	Proteinler	İçecekler
<b>YÜKSEK</b>	Buğday Çavdar Arpa	Elma Kayısı Böğürtlen Kiraz Hurma Greyfurt Mango Armut Karpuz	Enginar Kuşkonmaz Karnabahar Sarımsak Pırasa Mantarlar Arpacık soğan Şeker bezelye	Hindistan cevizi sütü (karton paket) Dondurma Süt Yumuşak peynir Soya sütü Yoğurt	Fasulye/ Baklagiller İşlenmiş Etler	Yüksek fruktoz içeren Gazlı içecekler ve Meyve suları İçki Çaylar: papatya, Rezene, Ve çay
<b>DÜŞÜK</b>	Mısır ekmeği/ Cipsi İrmik Glütensiz Makarnalar, Kraker ve Ekmekler Yulaf ezmesi Patates Patlamış mısır Pirinç Ekşi maya Ekmek Kinoa	Muz (olgunlaşmamış) Üzüm Kivi Limon Misket limonu Mandalina Portakal Papaya Ananas	Çin lahanası Brokoli Havuç Frenk soğanı Salatalık Patlıcan Lahana Marul İstiridye mantarı Zeytin Turp Ispanak Domates	Badem sütü Hindistan cevizi yoğurdu Laktosuz Süt kreması, Yoğurt Peynir	Olgunlaşmamış soya fasülyesi Mercimek Konserve/ durulanmış nohut Biftek Tavuk Yumurtalar Balık/deniz ürünleri Domuz eti Hindi Tofu (sert)	Alkol: şarap (çoğu), bira, Kahve Sükröz tatlandırılmış veya diyet yumuşak içecekler Çaylar (Yukarıda listelenen çaylar hariç) Su

**Aloe Vera takviyesi:** 360'tan fazla sulu bitki türü içeren aloe, sağlıkla ilgili özellikleri sebebiyle geniş çapta araştırılan türlerden biridir. Glukomannanlar, acemannan ve mannoz içermesi sebebiyle, aloe verain vitro mikrobiyota fermantasyonuanında gösterilmiş olan kısa zincirli yağ asitlerine ek olarak bifidobakterilerdeki artışlarla bir prebiyotik potansiyele de sahip olabileceği düşünülmektedir. Bu fizyolojik etkiler dikkate alındığında, çalışmalar aloe vera bitkisinin IBS semptomlarını iyileştirebileceği olası gözükmemektedir (Dimidi ve Whelan, 2020).

**Nane yağı takviyesi:** Mentha X piperita bitkisinden elde edilen nane yağının, bağırsaktaki histaminergik ve kolinerjik reseptörleri modüle ettiği ve k-opioid agonist aktivitesi, serotonergik antagonizm ve anti-inflamatuar etkiler sergilediği gösterilmiştir. Aktif içeriği L-mentol, bağırsak düz kaslarının gevşemesine sebep olduğu için potansiyel olarak karın rahatsızlığını azaltır. Ek olarak, alt özofagus sfinkterinin gevşemesinin de gastro-özofageal reflüye neden olabileceği gösterilmiştir. Bu sebeple, reflü belirtilerine engel olmak için üst gastrointestinal sistemdeki salınımı atlayan, fakat nane yağının düz kas gevşetici özelliklerini sergileyebileceği alt gastrointestinal kanalda serbest bırakan enterik kaplı nane formülasyonları bulunmaktadır. 835 IBS'li hastadan oluşan 12 RKC'nin sistematik bir incelemesi ve meta-analizi, nane yağının IBS belirtilerini iyileştirmede güvenli ve etkili olduğu sonucuna ulaşmıştır. Nane yağının genel semptom riski üzerinde plasebo ile karşılaştırıldığında bir faydası olduğu görülmüştür (iyileşme RR 2.4, %95 CI 1.9-3.0, P< .001) ve karın ağrısı (iyileşme RR 1.8, %95 GA 1.4-2.2, P< .001). Daha yakın tarihli, sistematik bir inceleme ve meta-analizi, IBS'de nane yağı, çözünür lif, antispazmodik ilaçlar ve bağırsak-beyin modülatörlerinin etkisini karşılaştırdı. Tüm araştırmalar içinde, nane yağı etkinlik bakımından ilk sırada yer aldı. Çalışmalar nane yağının güvenli olduğunu ve karın ağrısı da dahil olmak üzere IBS semptomlarını hafifletebileceğinin olası olduğunu ifade etmektedir (Dimidi ve Whelan, 2020).

**Lif takviyeleri:** Azalan lif alımı, genel toplumda kabızlığın artma riski ile ilişkilidir ve birkaç randomize çalışma, bazı IBS'li bireylere lif vermenin faydalı olduğunu düşündürmektedir. Buna ek olarak, iki meta-analiz, bu etkinin sadece psilyum denemelerinde görüldüğü ve buğday kepeği gibi parçacıklı lifin hiçbir yarar sağlamadığını ifade etmektedir. Son araştırmalar, psilyumun ince bağırsakta suyu hapsederek ve kolonik su içeriğini artırarak daha yumuşak ve daha sık dışkıya sebep olarak nasıl davrandığını göstermektedir.

Psilyumunnden kabızlıkta yararlı olduđu açıktır, fakat psilyum sindirimi yavaşlatmadığı ve hızlı fermantasyonu azaltmadığı sürece neden kabız olmayan hastalara da yarar sağladığı belirsizdir (Spiller, 2021).

## SONUÇ

Dünya çapında yaygın olarak görülen ancak saptanması güç olan iritabl bağırsak sendromunun tanımlanması için ROMA IV kriterleri kullanılmaktadır. Bu kriterlerle tanı alan hastaların beslenmelerini düzenlemeleri önerilmektedir. IBS’de etkili olan çeşitli diyet, besin ve besin takviyeleri bulunmaktadır. Diyet şekli olarak FODMAP diyeti ile ilgili son yıllarda olumlu sonuçlar öne çıkarken aloe vera, nane yağı ve lif takviyelerinin de etkili olabileceği sonucuna varılmıştır. Beyin-bağırsak aksı sebebiyle depresyon gibi bir çok hastalıkla birlikte görülen IBS’de kesin olarak etkili diyet, besin veya besin takviyesi henüz saptanmamıştır. Bu sebeple dünya çapında yaygın görülen ve birçok bireyin yaşam kalitesini düşüren bu hastalıkta etkili olan besin ve beslenme çözümleri ile ilgili daha fazla randomize kontrollü çalışmalara ihtiyaç duyulmaktadır.

#### Abstract

Sugar beet is one of the plant sugar sources, providing 30-35% of annual sugar production worldwide. The aim of this study was to identify and characterize members of the TALE gene family in silico at a genome-wide level in *Beta vulgaris*. TALE genes are distributed in chromosomes 1,2,3,4,5,6,7,8,9 and 10 in the sugar beet genome. TALE proteins were determined to have the amino acid sequence range of 171-1826. Among them, Bvul-TALE-23 with 1826 amino acids, has the longest amino acid sequence. In contrast, the shortest amino acid sequence was obtained in Bvul-TALE-9 with 171 amino acids. Their molecular weights are between 19583.09-203572.25 DA, 33 of these proteins have acidic character, and 19 of them have basic character. As a result of the phylogenetic analyses carried out to elucidate the evolutionary status of the conserved region structures of TALE genes, it was determined that they were clustered in 3 different groups. Accordingly, it can be said that those located in similar regions in the classification have amino acid structures close to each other and therefore are in the same group. The most motifs were obtained from Bvul-TALE-3, 14 (13 motifs), and the least motif was from Bvul-TALE-15 (1 motifs). Among the TALE proteins found in *B. vulgaris*, 5 TALE proteins with a reliability of 90% and above were determined. The highest exon and intron numbers were obtained in Bvul-TALE-39. We believe that the results obtained from this study may be useful for future functional studies on the TALE gene family in sugar beet.

**Keywords:** Bioinformatic, TALE, in silico analysis, *Beta vulgaris*

#### INTRODUCTION

Sugar beet (*Beta vulgaris* L.) belongs to Caryophyllales in basal taxa of seed dicots. The species is diploid with  $2n=18$  chromosomes and an estimated genome size of 714 758 megabases (Dohm et al., 2014). Today, sugar beet is one of two phyto sugar sources that provide 30-35% of the annual sugar production worldwide (Zhang et al., 2016). It is also used for cattle feed (Evans and Messerschmidt, 2017), bioethanol (Zabed et al., 2014), baker's yeast and industrial alcohol production. Green chemistry has promoted new uses of sugar beet, such as bioplastic and biojet production, which bring the same economic and environmental benefits as sugar and alcohol production, creating a promising future for the beet sector. However, the quality and yield performance of sugar beet is strongly affected by abiotic and biotic stress (Märländer et al., 2003; Tzilivakis et al., 2005). Sugar beet genomic research, including genome-wide computational characterization of gene families, will offer opportunities to create high-yielding sugar beet varieties independent of abiotic and biotic stresses. Homeobox genes encode a large family of transcription factors (TFs) essential for the growth and development of animals and plants common in eukaryotes. The first homeobox gene was found in fruit flies (McGinnis et al., 1984). A typical homeobox domain has a triple helix region of 60 amino acids. The first and second helix form a loop structure, and the second and third helix form a helical return structure (Billeter et al., 1993). Homeobox genes in plants have been classified in two different ways. Initially, homeobox genes were divided into seven classes: ZM-HOX, HAT1, HAT2, ATHB8, GL2, KNOTTED-like homeodomain (KNOX/KNAT) and BEL1-like homeodomain (BELL/BLH) (Mukherjee et al., 2009). In subsequent research, homeobox genes were divided into 11 classes, including HD-ZIP (I ~ IV), WOX, NDX, PHD, PLINC, LD, DDT, SAWADEE, PINTOX, KNOX/KNAT, and BLH/BELL (Burglin et al., 2016). The aim of this study is to identify TALE gene family members in the sugar beet genome for the first time, using in silico methods, at a genome-wide scale. In this study, the phylogenetic relationships of the TALE gene family, their distribution in the genome, gene structure arrangement, composition of motifs, and 3-dimensional protein structures were

characterized. Identification and functional analysis of the *Beta vulgaris* TALE gene family provide a basis for a better understanding of the genetic mechanism of tolerance to biotic and abiotic stresses in the sugar beet genome.

## MATERIALS AND METHODS

### Identification of TALE Genes in the *Beta vulgaris* Genome

The protein sequences of the TALE gene family in the *Beta vulgaris* genome were obtained from the Phytozome database v12.1 (Anonymous, 2018a) using the Pfam Access Number for TALE proteins (PF00046) obtained from the Pfam database. In order to identify all possible TALE proteins in the *Beta vulgaris* genome, both the Phptozone database's v12.1 blastp and latent Markov model (HMM) (Anonymous, 2018b) search were scanned in the *B.vulgaris* genome with assumed parameters. Unrelated arrays were obtained using the "decrease redundancy tool Anonymous (Anonymous, 2018c). Presence of TALE proteins in related sequences was investigated using HMMER (Anonymous, 2018d) database. The molecular weight and theoretical isoelectric point (pI) of the obtained TALE proteins were determined using the ProtParam tool Anonymous (Anonymous, 2018e).

### Sequence Alignment, Phylogenetic Analyzes and Determination of Conserved Motifs

Sequence alignment was done using ClustalW via MEGA program. Sequence alignment was used for phylogenetic tree plotting. The phylogenetic tree was created using the Maximum Neighbour-joining method in the MEGA7 program and visualized using the iTOL database. iTOL database is used to create a new phylogenetic tree and to visualize the phylogenetic tree to make the relationship between evolutionary processes more evident. Exon-intron analysis was performed with the GSDS2.0 (<http://gsds.cbi.pku.edu.cn/>) database so that the phylogenetic tree could give as accurate results as possible. Exon-intron regions were created using the genomic sequences of TALE sequences and CDS sequences. This program was used because the upgraded GSDS 2.0 has more annotation features and formats with a newly designed face. MEME Suite (MEME 4.11.1; <http://meme-suite.org/>) database was used to identify conserved motifs. While performing the analysis, care was taken to ensure that the motif widths were optimum  $\geq 2$  and  $\leq 300$  by taking the maximum number of 5 motifs to determine the motifs. The motifs determined in the MEME Suite program were taken and the Publisher program was used to combine the motifs, and thus the preserved motif regions were determined (Bailey et al., 2009).

### Determination of Chromosome Distribution

Using the obtained data, chromosome distribution was found via MapChart and the results were determined (Voorrips, 2002).

### Homology Modeling of TALE Proteins

Using previously identified protein sequences for homology modeling, the 3D structure of the proteins was predicted with Phyre2. The reliability of the model was verified with the specified numerical data (Kelley, 2009).

## RESULTS and DISCUSSION

### Bioinformatics Analysis of TALE Proteins

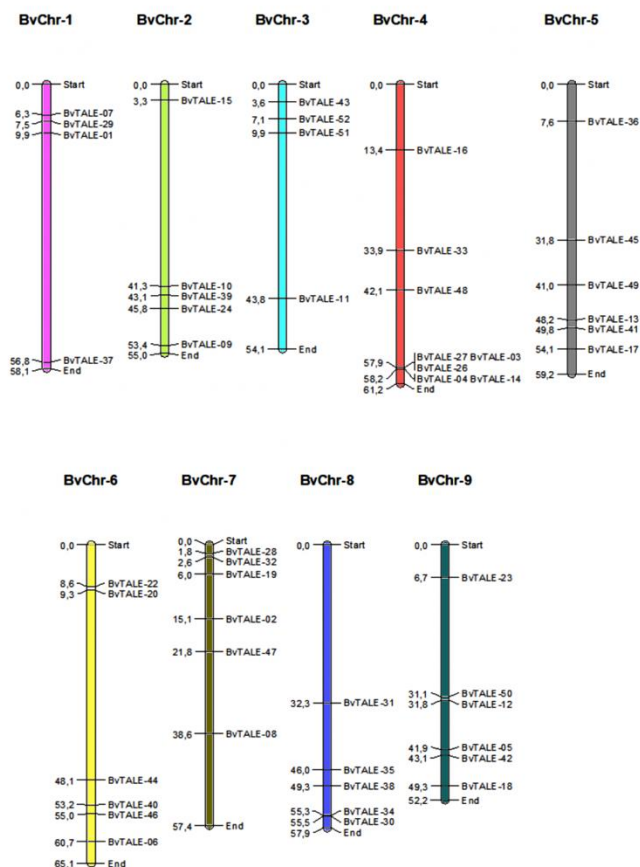

As a result of the analysis using the sequences of TALE proteins identified in sugar beet, 52 TALE genes were identified. These identified TALE genes were named Bvul-TALE using their Latin names. The TALE proteins identified in the sugar beet genome are 171-1826 amino acids long, their molecular weights are between 19583.09-203572.25 DA, and 33 of these proteins have acidic character, and 19 of them have basic character (Table 1).

**Table 1.** Information about the TALE genes found in the *B. vulgaris* genome

According to the results of the chromosomal distribution studies, it was determined that the chromosome with the highest number of TALE genes was the 4th chromosome with 8 genes, and the chromosomes with the least genes were the 1st and 3rd chromosomes with 4 genes.

**Figure 1.** Distribution of TALE genes in *B. vulgaris* chromosomes

### Phylogenetic Analyzes

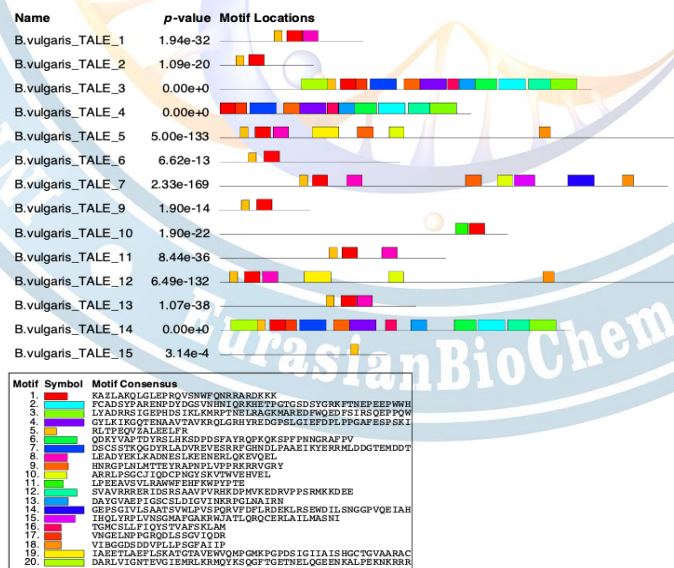

Phylogenetic tree analysis was performed using the MEGA7 [MolecularEvolutionaryGenetic Analysis] program to determine the evolutionary relationships between TALE genes. Maximum neighbor-joining approach was used in this analysis. According to phylogenetic tree analysis, TALE genes were divided into 4 main groups. Sequences were aligned with ClustalOmega[Clustal W] in MEGA7 and an unrooted phylogenetic tree was constructed. The created phylogenetic tree was colored in a different color for each families using the ITOL database.

**Figure 2.** Phylogenetic tree drawn with TALE proteins of *P.vulgaris*, *A. thaliana*, *C.sativus*, *G.max*, *M. truncatula*, *O.sativa*, *S. bicolor*, *T. aestivum*, *V.vinifera* and *Z.mays* plants

### Motif Regions of TALE Proteins

To test the reliability of the phylogenetic tree, motif compositions of TALE proteins were examined using the MEME database. Similar motif groups make it easy to determine a structural similarity between TALE proteins. According to this analysis, it was determined that proteins containing similar motif patterns in both species were in the same class in the phylogenetic tree.

**Figure 3.** Distribution of predicted motifs in TALE genes

## Exon and Intron Regions of TALE Proteins

Exon and intron regions of TALE proteins were determined from Gene Structure Server 2.0. Within the scope of the study, it was determined that most of these genes contain approximately equal amounts of exon and intron regions, but predominantly exon regions. Within the scope of the study, the most exon region was determined in Bvul-TALE-39.

**Figure 4.** Number, length, and position of exons and introns in TALE genes

## Homology Modeling of TALE Proteins

BLASTP scanning was performed with TALE proteins in Protein Data Bank[PDB] using the Phyre2 database and 3D homology modeling of these proteins was performed. This database was used to predict the structure and functions of TALE proteins. In this study, results with 90% and above reliability were taken as basis. Among the TALE proteins, the proteins with a reliability of 90% and above were determined.

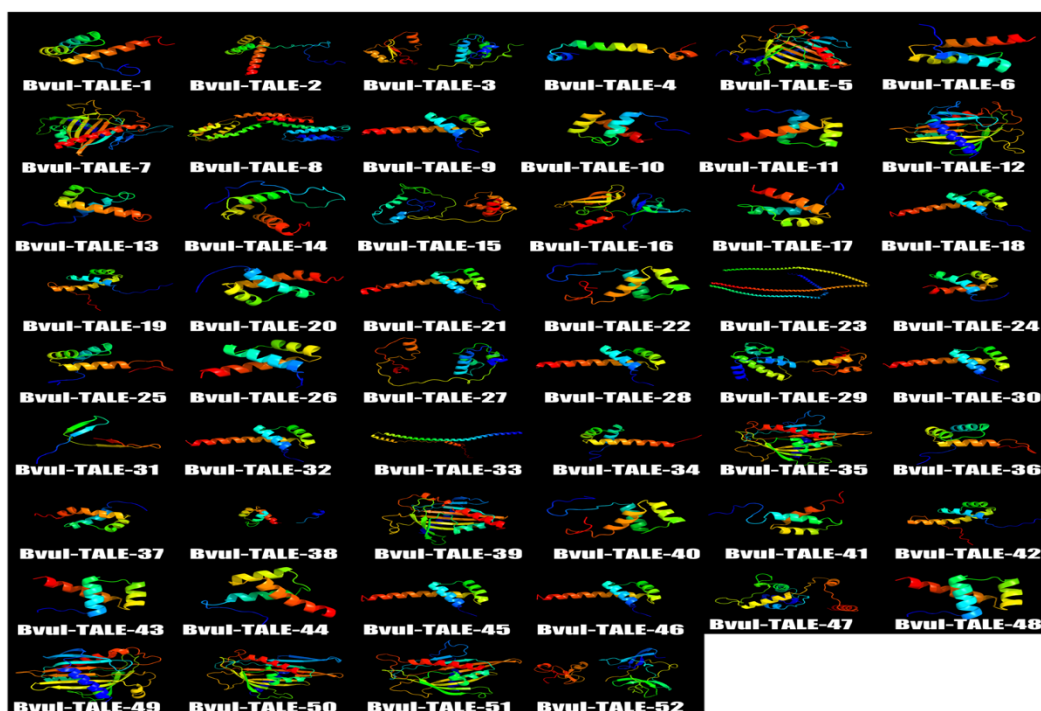

Figure 5. Homology images of TALE proteins

## CONCLUSION

In this study, which was performed in silico with the TALE gene family in the *Beta vulgaris* genome, 52 TALE members were identified. The expression profiles of TALE genes revealed that these genes are expressed in different tissues and also showed that they can take part in various physiological functions during the development of the plant. It provides a basis for further functional research on the TALE gene family in *Beta vulgaris*. In conclusion, our study is shed light on future studies to study the functions of TALE genes and may make important contributions to the understanding of the evolution of TALE genes in different species.

## ACKNOWLEDGEMENTS

This project was supported within the scope of TUBITAK 2209/A Support Program. We thank TÜBİTAK for their contribution.

#### Abstract

The aim of this study was to identify and characterize members of the expansin gene family in silico at a genome-wide level in *Medicago truncatula*. Expansin genes are distributed in chromosomes 1,2,3,4,5,6,7 and 8 in the *Medicago truncatula* genome. Expansin proteins were determined to have the amino acid sequence range of 123-457. Their molecular weights are between 13303.12-50362.36 DA, 33 of these proteins have acidic character, and 46 of them have basic character. As a result of the phylogenetic analyses carried out to elucidate the evolutionary status of the conserved region structures of expansin genes, it was determined that they were clustered in 5 different groups. Accordingly, it can be said that those located in similar regions in the classification have amino acid structures close to each other and therefore are in the same group. The most motifs were obtained from Med -Expansin-2,3,4 (10 motifs), and the least motif was from Med-Expansin-1 (1 motifs). Among the expansin proteins found in *Medicago truncatula*, 5 Expansin proteins with a reliability of 90% and above were determined. The highest exon and intron numbers were obtained in Med-Expansin-24, 27. We believe that the results obtained from this study may be useful for future functional studies on the expansin gene family in *Medicago truncatula*.

**Keywords:** Bioinformatic, Expansin, in silico analysis, *Medicago truncatula*

#### INTRODUCTION

Expansins are proteins localized in the cell walls of plants and are quite small in size, with an approximate molecular weight of 25-30 kDa. They were first isolated from cucumber coleoptiles in 1992 (McQueen-Mason et al., 1992). These proteins can break the hydrogen bonds between cellulose microfibrils by acting on the pectin matrix, or it is hypothesized that they are involved in cell wall modification by making the carbohydrate polymers more accessible to the enzymes in the cell wall (Cosgrove, 1998). It is known that this family of proteins plays a role in plant cell growth and fruit softening. In a study on tomato, it was proven that the LeExp1 gene is expressed. Accordingly, there is a correlation between the degradation of expansin proteins and cell wall components (Rose et al., 1997). Therefore, when the fruit of the plant begins to soften, that is, when the cell wall begins to break down, this gene reaches its maximum level (Wei et al., 2011). According to another study to support all data; It was determined that the fruits in which the expansin protein was expressed were softer than the control samples, and these reactions were activated before the ripening stage (Zhang vd., 2017). Expansin transcripts were found in non-climacteric fruits such as grapes and strawberries, and it was determined that these fruits also participated in softening and carbohydrate degradation reactions (Backiyarani vd., 2022). In addition to all these effects of the expansin protein family, it is thought to be a factor in the emergence of root hair, meristem functions and many important developments. The aim of this study is to identify expansin gene family members in the *Medicago truncatula* genome for the first time, using in silico methods, at a genome-wide scale. In this study, the phylogenetic relationships of the expansin gene family, their distribution in the genome, gene structure arrangement, composition of motifs, and 3-dimensional protein structures were characterized. Identification and functional analysis of the *Medicago truncatula* expansin gene family provide a basis for a better understanding of the genetic mechanism of tolerance to biotic and abiotic stresses in the *Medicago truncatula* genome.

## MATERIALS AND METHODS

### Identification of Expansin Genes in the *Medicago truncatula* Genome

The protein sequences of the expansin gene family in the *M.turuncatula* genome were obtained from the Phytozome database v12.1 (Anonymous, 2018a) using the Pfam Access Number for expansin proteins (PF03330) obtained from the Pfam database. In order to identify all possible expansin proteins in the bean genome, both the Phptozome database's v12.1 blastp and latent Markov model (HMM) (Anonymous, 2018b) search were scanned in the *M.turuncatula* genome with assumed parameters. Unrelated arrays were obtained using the “decrease redundancy tool Anonymous (Anonymous, 2018c). Presence of expansin proteins in related sequences was investigated using HMMER (Anonymous, 2018d) database. The molecular weight and theoretical isoelectric point (pI) of the obtained expansin proteins were determined using the ProtParam tool Anonymous (Anonymous, 2018e).

### Sequence Alignment, Phylogenetic Analyzes and Determination of Conserved Motifs

Sequence alignment was done using ClustalW via MEGA program. Sequence alignment was used for phylogenetic tree plotting. The phylogenetic tree was created using the Maximum Neighbour-joining method in the MEGA7 program and visualized using the iTOL database. iTOL database is used to create a new phylogenetic tree and to visualize the phylogenetic tree to make the relationship between evolutionary processes more evident. Exon-intron analysis was performed with the GSDS2.0 (<http://gsds.cbi.pku.edu.cn/>) database so that the phylogenetic tree could give as accurate results as possible. Exon-intron regions were created using the genomic sequences of expansin sequences and CDS sequences. This program was used because the upgraded GSDS 2.0 has more annotation features and formats with a newly designed face. MEME Suite (MEME 4.11.1; <http://meme-suite.org/>) database was used to identify conserved motifs. While performing the analysis, care was taken to ensure that the motif widths were optimum  $\geq 2$  and  $\leq 300$  by taking the maximum number of 5 motifs to determine the motifs. The motifs determined in the MEME Suite program were taken and the Publisher program was used to combine the motifs, and thus the preserved motif regions were determined (Bailey et al., 2009).

### Determination of Chromosome Distribution

Using the obtained data, chromosome distribution was found via MapChart and the results were determined (Voorrips, 2002).

### Homology Modeling of Expansin Proteins

Using previously identified protein sequences for homology modeling, the 3D structure of the proteins was predicted with Phyre2. The reliability of the model was verified with the specified numerical data (Kelley, 2009).

## RESULTS and DISCUSSION

### Bioinformatics Analysis of Expansin Proteins

As a result of the analysis using the sequences of expansin proteins identified in *Medicago truncatula*, 79 expansin genes were identified. These identified expansin genes were named Med-Expansin using their Latin names. The expansin proteins identified in the *M.truncatula* genome are 123-457 amino acids long, their molecular weights are between 13303.12-50362.36 DA, and 33 of these proteins have acidic character, and 46 of them have basic character (Table 1).

Table 1. Information about the expansin genes found in the *M.truncatula* genome

According to the results of the chromosomal distribution studies, it was determined that the chromosome with the highest number of expansin genes was the 7th chromosome with 18 genes, and the chromosomes with the least genes were the 1st, 5th, and 6th chromosomes with 5 genes.

Figure 1. Distribution of expansin genes in *M.truncatula* chromosomes

### Phylogenetic Analyses

Phylogenetic tree analysis was performed using the MEGA7 [MolecularEvolutionaryGenetic Analysis] program to determine the evolutionary relationships between expansin genes. Maximum neighbor-joining approach was used in this analysis. According to phylogenetic tree analysis, expansin genes were divided into 5 main groups. Sequences were aligned with ClustalOmega[Clustal W] in MEGA7 and an unrooted phylogenetic tree was constructed. The created phylogenetic tree was colored in a different color for each family using the ITOL database (Tamura et al., 2011).

## Exon and Intron Regions of Expansin Proteins

Exon and intron regions of expansin proteins were determined from Gene Structure Server 2.0. Within the scope of the study, it was determined that most of these genes contain approximately equal amounts of exon and intron regions, but predominantly exon regions. Within the scope of the study, the most exon region was determined in Med-Expansin-24, 27.

**Figure 4.** Number, length, and position of exon s and introns in expansin genes

## Homology Modeling of Expansin Proteins

BLASTP scanning was performed with expansin proteins in Protein Data Bank[PDB] using Phyre2 database and 3D homology modeling of these proteins was performed. This database was used to predict the structure and functions of expansin proteins. In this study, results with 90% and above reliability were taken as basis. Among the expansin proteins, the proteins with a reliability of 90% and above were determined.

Figure 5. Homology images of expansin proteins

## CONCLUSION

In this study, which was performed in silico with the expansin gene family in the *M. truncatula* genome, 79 expansin members were identified. The expression profiles of expansin genes revealed that these genes are expressed in different tissues and also showed that they can take part in various physiological functions during the development of the plant. It provides a basis for further functional research on the expansin gene family in *M. truncatula*. In conclusion, our study is shed light on future studies to study the functions of expansin genes and may make important contributions to the understanding of the evolution of expansin genes in different species.

## ACKNOWLEDGEMENTS

This project was supported within the scope of TUBITAK 2209/A Support Program. We thank TÜBİTAK for their contribution.

#### Abstract

In this study, the potential utilization prospects of non-wood forest products (NWFPs) as food sources, their various forms of utilization, and their significance as sustenance for communities have been emphasized. In contemporary society, the assessment of NWFPs products as potential food sources tends to be underemphasized. These resources, inherent to their natural habitats, function as both nutritional provisions and sources of economic livelihood for local communities. To optimize the utility and output of non-wood forest products, it is imperative to advance their utilization and production opportunities.

Research efforts should be directed towards forest-related subjects, concentrating particularly on the advancement of nutritionally valuable forest products. This strategic focus extends to safeguarding the integrity and value of non-wood forest products. Encouragingly, organizations such as non-governmental entities, educational institutions, hospitals, and health centers ought to be motivated to champion the merits of non-wood forest products.

Creating collaborative platforms across sectors encompassing the environment, health, development, and agriculture is pivotal. This step is essential to seamlessly incorporate knowledge pertaining to nutritious forest foods and their conservation into the broader context of national nutrition strategies and programs. These platforms serve as conduits for the widespread dissemination of strategies aimed at harnessing the nutritional potential embedded within high-value tree biodiversity. In doing so, they contribute significantly to the domains of food security, nutrition, and conservation.

**Keywords:** Forest, Non-wood forest product, Food, Free fruit

#### INTRODUCTION

Non-wood forest products are special products or services naturally found on Earth that are distinct from timber raw materials. A portion of these products are cultivated and produced through agricultural activities due to their high demand. Thyme consumed as tea, and marigold used as an ornamental plant, are examples of plants that are both harvested from natural habitats and cultivated through agricultural practices in Turkey. However, the majority of non-wood forest products are still collected from nature and consumed as such (Ok & Tengiz, 2018).

Non-wood forest products" (NWFP) is a comprehensive term that encompasses various animal and plant resources, excluding timber, obtained from forests, wooded lands, and trees beyond forests. These products serve both market and subsistence needs, spanning from wild-harvested resources to cultivated plants in agroforestry systems, and are grouped into three main categories based on their functions and utilization purposes (Ozugurlu & Duzgun, 2000) (Table 1).

Due to its geographical location, Turkey possesses a rich flora compared to other European countries. There are around 9,500 species distributed in our country, with about 3,000 of these species displaying endemic characteristics. Non-wood forest products (NWFPs), which play a significant role in global production, also include some endemic species. As of 1990, approximately 97% of Turkey's forest product exports consist of NWFPs. However, the sustainability of these resources is at risk, mainly due to improper utilization and lack of supervision (Türker et al., 2019).

**Table 1.** Some Non-wood forest products

Main category	Sub-categories	Examples of products
<b>Non-wood plant products</b>	Food	Wild and domesticated products. weeds. fruits. flowers.
	Forage	Food for livestock and wildlife. including birds. fishes.
	Pharmaceuticals	Drugs. salves. lotions. purgatives etc.
	Toxins	For hunting. ordeal poisons. salves. ointments. lotions.
	Aromatics	Essential oils for cosmetic and perfume industry. unguent.
	Biochemicals	Non-edible fats and oils. waxes. gums and latex. dyes.
	Fiber	Cloth. matting. cordage. basketry. brooms. cork etc.
	Wood	Wood for handicrafts
	Ornamentals	Plants for aesthetically pleasing horticulture and amenity
<b>Wild Animal Products</b>	Mammals	Meat. horn. skins. wool. bone etc.
	Birds	Meat. hides. skins. wool. bone pharmaceuticals etc.
	Fishes	Meat. eggs. feathers. edible nests. guano etc.
	Reptiles	Food. skins. shell. toxins. etc.
	Invertebrates	Plant exudates (manna). honey. wax. silk lac etc.
<b>Services and Functions of Forests</b>	Habitat	Grazing. shade. and shelter for animals
	Soil improvement and	Green manure. humus. N-fixation. hedges. soil
	Protected areas	Non-consumptive use (Tourism/recreation. wildlife
		Consumptive use (hunting. shooting. fishing etc.)
	Aesthetic. scenic. and historic sites etc.	

Global initiatives aiming to enhance food security and well-being emphasize the significance of a well-rounded, micronutrient-dense diet. Incorporating adequate micronutrient-rich foods is vital for sustainable strategies that address micronutrient deficiencies, which can impede child development and heighten health risks, particularly among disadvantaged populations in developing nations (Black et al., 2013). This shift towards prioritizing dietary quality alongside yield and energy availability has prompted discussions on reevaluating agricultural policies, with forests and trees potentially playing a crucial role in enhancing nutrition within the food system and wider landscape (FAO, 2013; Ruel & Alderman, 2013; Vinceti et al., 2013).

Amidst the challenges of climate change, biodiversity loss, urbanization, and socioeconomic disparities, the capacity of the current global food system to sustainably provide for a projected population of 9 billion by 2050 is uncertain, underscoring the pressing need for collaborative efforts to ensure worldwide food and nutrition security (Hunter & Fanzo, 2013).

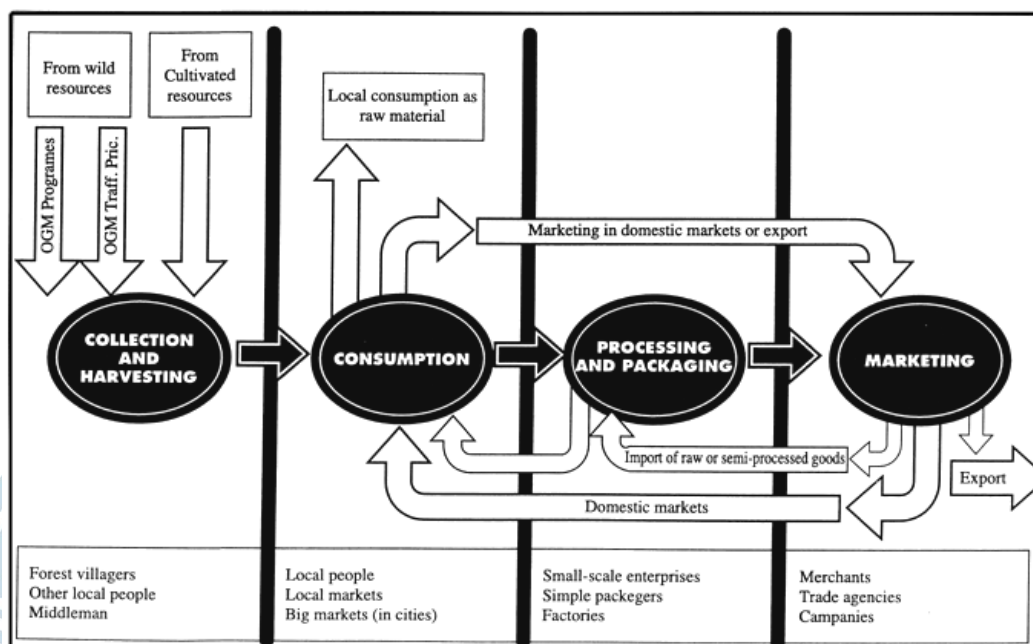

With around 40% of Indonesia's population, approximately 100 million people, experiencing micronutrient deficiencies, forests and trees in remote areas play a vital role in providing nutritious food. Examining data from the 2003 Indonesia Demographic Health Survey and the Indonesian Ministry of Forestry, the study explores the relationship between various tree-dominated land classes and the consumption of micronutrient-rich foods amidst the escalating loss of forests and tree-based systems.

Promoting the consumption of micronutrient-rich foods, including diverse fruits, vegetables, pulses, and certain animal products, is recognized as a viable, cost-effective, and sustainable approach to enhancing nutrient quality and dietary habits, while addressing multifaceted aspects of food production and consumption (Johns & Sthapit, 2004; Stephenson et al., 2010; Tontisirin et al., 2002). The challenge lies in creating food systems that are environmentally and economically sustainable, culturally sensitive, and nutritionally sound, while ensuring that both consumers and producers are equipped with the requisite information to make optimal dietary choices (Johns et al., 2013).

Forests and trees play a pivotal role in enhancing food security and nutrition in three key ways. Primarily, they indirectly bolster food security through ecosystem services benefiting agriculture (Foresight UK, 2011; Godfray et al., 2010; Sunderland, 2011). Additionally, smallholder farming practices reliant on trees, like swidden cultivation and agroforestry, tend to yield more diverse diets, indicative of better dietary quality

(Kennedy et al., 2011; Pimentel et al., 1997; Ruel, 2003)(8-10). Lastly, individuals residing close to or within forested areas can directly access wild foods from these ecosystems, bypassing market intermediaries (C. Colfer, 2012; Dounias & Froment, 2011).

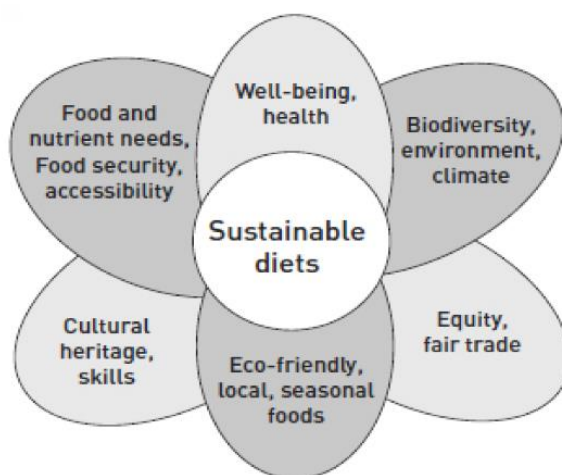

**Figure 1.** Flow chart of operation and treatment processes of NWFPs in Turkey (Ozugurlu & Duzgun, 2000)

Throughout history, forest inhabitants have exemplified how human lifestyles and genetic adaptations can harmonize with dynamic forest ecosystems. The concept of the "paleodiet" is often cited as a model for contemporary health promotion and disease prevention, even in industrialized nations. However, as forest ecosystems face mounting pressure from economic growth and industrialization, leading to deforestation, altered resource availability, and ecological shifts, forest dwellers encounter challenges in aligning their socioeconomic and cultural systems, ultimately affecting their ecological well-being and highlighting the complex trade-offs between modernity and traditional lifestyles (Dounias & Froment, 2011).

Pimentel et al. (1997) evaluated the contribution of forests and non-timber products to the food systems of developing nations, revealing that over 300 million individuals rely on forests for sustenance and livelihood each year. Additionally, forests safeguard land, water, and biodiversity, while supporting agricultural and environmental productivity, with an annual harvest value of around \$90 billion attributed to non-timber products.

### Sustainable diets

Sustainable diets prioritize low environmental impact, food security, and health across current and future generations, by being culturally appropriate, economically fair, nutritionally complete, and environmentally friendly while valuing biodiversity and optimizing resources (Burlingame & Dernini, 2012).

**Figure 2.** The many dimensions of a sustainable diet (Burlingame & Dernini, 2012)

Forest foods, encompassing items derived from trees, herbs, mushrooms, and animals, play a pivotal role in enhancing food security by offering accessible, cost-effective, and nutritionally rich sustenance (Dansie et al., 2008; Powell et al., 2011; Vinceti et al., 2008). Although few communities rely solely on forest foods for a comprehensive diet (Bailey et al., 1989; Butler, 2012), these resources provide essential micronutrients, supplementing caloric intake during lean seasons and times of agricultural scarcity (Faye et al., 2010; Humphry et al., 1993; Moreno-Black & Somnasang, 2000). By cultivating a diverse range of indigenous fruit tree species within agroforestry systems, aligned with fruit harvest seasons, a continuous supply of crucial nutrients can be maintained, contributing to sustained nutritional well-being (Jamnadass et al., 2011; Vinceti et al., 2013).

While forest foods are not a universal solution to global food security and nutrition challenges, they can play a significant role in specific geographic areas. Despite their contribution to the global food supply, the inclusion of wild foods in official economic statistics is recent and their reliability remains uncertain due to data primarily originating from the informal sector, and the lack of comprehensive inventories and standardized methodologies for documenting wild food consumption calls for caution in interpreting global estimates (Heywood et al., 2013; Penafiel et al., 2011; Scoones et al., 1992).

### **Forest Foods Quality**

Forests and trees offer essential micronutrients often lacking in diets of developing nations, with significant health and developmental benefits. Nutrients like vitamin A, critical for immune function, are found in green leafy vegetables and orange-colored fruits; while iron, zinc, and vitamin B12, essential for growth and cognitive development, are present in animal source foods like bushmeat, forest-gathered leafy greens, and legumes, holding lifelong implications for health and socio-economic outcomes (Belem et al., 2009; Jansen van Rensburg et al., 2004; Kennedy et al., 2003; Nutrition, 2004).

### **CONCLUSION**

In modern times, the evaluation of non-wood forest products (NWFPs) as food sources is often overlooked. NWFPs that naturally grow in their habitats serve as both a nutritional resource and an economic income for local communities. It is crucial to enhance and increase the utilization and production possibilities of non-wood forest products.

Amidst the uncertainties posed by a projected population of 9 billion by 2050, addressing global food demands is a complex challenge. "Sustainable diets" offer a comprehensive approach to ensure equitable access to nutritious food while navigating multifaceted issues such as poverty reduction, environmental preservation, well-being improvement, and cultural heritage preservation, aligning with the diverse challenges of the modern world. Forest foods, derived from trees, herbs, mushrooms, and animals, significantly contribute to food security by providing accessible and nutrient-rich sustenance, with their diverse nutritional benefits being particularly relevant during periods of scarcity and lean seasons, while the cultivation of indigenous fruit tree

species within agroforestry systems offers a continuous supply of essential nutrients to ensure ongoing nutritional well-being.

In order to benefit more effectively from non-wood forest products, analysis and documentation of their nutritional composition, digestibility and bioavailability, the effect on the nutritional value of certain forest foods should be determined. It is necessary to compare these systems with the nutrition and food systems of other countries and regions in terms of resilience, health, cost-effectiveness, and sustainability to explain and measure the sustainability of forest-based diets. Research on forest-related topics should be supported. Emphasis should be placed on the development of nutritionally valuable forest products, particularly targeting the protection of non-wood forest products to increase their value. NGOs, schools, hospitals, and health centers should be encouraged to promote the benefits of non-wood forest products. It is necessary to establish cross-sectoral policy platforms that bring together environmental, health, development, agriculture, and other sectors in order to better integrate information and knowledge about nutritious forest foods and their conservation into national nutrition strategies and programs. These platforms will facilitate the wider dissemination of strategies for utilizing high-nutrient-value tree biodiversity in food security, nutrition, conservation.

## ACKNOWLEDGEMENTS

This study was conducted by searching academic research on non-wood forest products. We extend our gratitude to all academics who have contributed to research in this field.

### Abstract

DNA is a fundamental molecule that can be a target for various molecules, hence it has a high probability of being damaged. Genotoxicity tests include rational test systems used to evaluate the safety of drugs, industrial chemicals, pollutants, and metabolites. Remifentanil is a potent synthetic opioid analgesic drug used to relieve pain during surgical operations and for sedation purposes. This study aimed to demonstrate the previously unrevealed genotoxic effects of remifentanil on healthy human lymphocytes. To accomplish this, scientists utilized a comet assay, which is a simple, quick, and highly sensitive method for detecting genotoxic harm arising from individual strand breaks in DNA. Importantly, there was a correlation between the observed genotoxic impact and the dosage. For comet assay, the human lymphocytes were isolated from healthy individuals and exposed to 50, 150, 250, 350 µg/mL of remifentanil for an hour. In human lymphocytes analyzed through the Comet assay, the greatest concentration of remifentanil led to maximum DNA migration (mean tail length). It showed that Remifentanil triggered genotoxicity by directly affecting chromosomes and DNA in human lymphocyte cells and may have genotoxicity for humans.

In genotoxicity assessments, the changes in tail length and tail intensity parameters were evaluated by comparing them with the values of spontaneous control and positive control, and the results were analyzed.

In conclusion, this study has demonstrated that remifentanil may potentially induce genotoxic effects on healthy human lymphocytes under in vitro conditions. The degree of genotoxicity may fluctuate depending on the dosage and duration of exposure.

**Key Words:** Comet assay, DNA damage, genotoxicity, lymphocyte culture, remifentanil

### INTRODUCTION

With the discovery of modern general anesthesia, complex surgical and diagnostic procedures have advanced in patients of all age groups. Anesthetic and sedative agents interact with neurotransmitters and affect the central nervous system, disrupting the integration of neurons between different brain regions. (Liu et al., 2020). Anesthetic drugs are chemicals that temporarily induce a sleep-like state. They make painless or painless surgery possible. During general anesthesia, in other words anesthesia; consciousness, sensitivity to pain, defensive reflexes and muscle reflexes are significantly reduced. Anesthetics do not affect vital systems such as breathing and circulation, which are controlled by the spinal cord. (Wollweber, 2000).

Remifentanil is a potent synthetic opioid analgesic that has gained significant attention and utilization in the field of anesthesia and perioperative medicine. Remifentanil is characterized by its rapid onset, short duration of action, and precise titratability, making it an invaluable tool for anesthesiologists and healthcare professionals in the management of pain during surgical procedures and in critical care settings (Glass et al., 1993).

Living organisms have evolved to have the most suitable genetic structure for themselves. Genetic changes that occur in this genome are called mutations. If mutations are not corrected by DNA repair mechanisms, they can often lead to harmful or life-threatening consequences for living organisms. Damage to the genetic structure as a result of the interaction of genes with toxic substances is called genotoxicity (Ferretti et al., 2007). Substances that cause genotoxicity are called genotoxic substances or mutagens. All chemicals such as drugs, pesticides and cosmetics have toxic potential and these toxic potentials need to be evaluated. Various genotoxicity tests have been developed for this purpose. (Saygi, 2002).

DNA damage arises spontaneously during metabolism or due to the influence of certain environmental factors. Preserving the structure of DNA is crucial for the error-free transmission of genetic information. Techniques enabling the precise measurement of DNA damage are important in today's context. Single-cell gel electrophoresis, commonly referred to as the "Comet Assay," is a non-invasive, rapid, and quite sensitive

fluorescent microscopic method employed to measure DNA damage within the cell (Dinçer and Kankaya, 2010).

Based on this, it is aimed to perform the Comet test to determine the damage and strand breaks in the DNA where the genetic code is located. Evaluation of the data obtained as a result of clastogenic effects at the gene and chromosome level is important in terms of human health and its contribution to the literature.

## MATERIALS AND METHODS

Blood samples were obtained from healthy volunteer aged 25-30 years old. Lymphocyte cells were isolated by using histopaque then cells resuspended in RPMI 1640. For an effective comet assay, cells exposed to an agent must have at least 80% viability (Kılıç and Ayaz, 2020). Based on this information, remifentanyl concentrations of 50, 150, 250, and 350  $\mu\text{g}/\text{mL}$  were used for the experimental procedure. The samples were subsequently placed in remifentanyl concentrations and incubated for two hours at 37°C. At the end of the incubation time, tubes were centrifuged at 300 rpm for 5 minutes, the supernatant was removed. Next, 100  $\mu\text{L}$  of a low-melting-point agar, mixed with the 100  $\mu\text{L}$  lymphocyte sample. Afterwards soft agar and lymphocyte sample, dripped onto slides previously coated with high-melting-point agar. The slides were then covered with a coverslip (Tice et al., 2000). After incubating the slides 4+ °C for 15-20 minutes, the coverslips were separated and the slides placed in chalets containing a lysis buffer. They were incubated 4+ °C for 18 hours. End of the incubation period the slides were placed in horizontal tanks with an electrophoresis buffer (pH greater than 13) for 20 minutes to denature the DNA. Electrophoresis was performed at 25 V and 300 mA in running buffer. Following electrophoresis, the slides treated with a neutralizing buffer (pH 7.5) for 5 minutes. Subsequently, ethidium bromide (EtBr) was evenly applied over the slides, which were then covered with a coverslip. In a dark area, the fluorescence emitted by the stained DNA is easily detectable and provides clear visualization of the comets. As a result experimental steps were performed in a dark area. For comet analysis, the slides were examined at 40x magnification using a fluorescent microscope. Image analysis and comet counting were conducted on 100 comets (Kassie, 2000). Ethidium bromide fluoresces intercalates into DNA molecules by inserting itself between base pairs. This property allows it to stain DNA effectively, making DNA fragments visible under a fluorescence microscope under specific wavelengths. So EtBr staining was utilized to detect damage, and images acquired under a fluorescence microscope were analyzed using the Comet Image Processing and Analysis System Software (Comet IV).

## RESULTS and DISCUSSION

The comet assay was employed to assess DNA damage in human lymphocytes exposed to different doses of remifentanil. After a 2-hours exposure to remifentanil at concentrations of 50, 150, 250, and 350 µg/mL, the DNA tail length, tail intensity, and tail moment values in the treated cells were significantly higher than the observed in the spontaneous control group (Figure 1). Comet parameters, including comet mean, tail length, tail intensity, and tail moment, were examined in 100 cells for each concentration and compared statistically with the corresponding control data. The statistical analyses of comet parameters revealed significant differences between the control groups and the groups treated with the remifentanil doses (\*\*\*p < 0.001). An increase in tail length and intensity is indicative of DNA damage resulting from single breaks in DNA molecules (Colins 2004). Notably, this effect was particularly pronounced in human peripheral lymphocytes exposed to remifentanil at the investigated concentrations (50, 150, 250, 350 µg/mL) (\*\*\*p < 0.001).

For all remifentanil doses and the control groups, a total of 100 samples were analysed for comet parameters. Any significant differences in comet parameters (such as tail length, moment and density) recorded after 2 hours were evaluated by comparing the number of comets in the cells with the spontaneous and positive control. Comet parameters analysed via SPSS Statistics 22 (IBM). Since the differences between groups in the comet parameter were different, the Tamhane T2 test was applied and comparisons were evaluated with the control groups. The figures clearly demonstrated that comet parameter were significantly increased in a dose dependent manner when compared to spontaneous and positive control groups (Table 1). This increase indicates the disruption of DNA structure leading to the formation of DNA damage. Comet parameters (Figure 2, Figure 3, Figure 4) which are associated with DNA damage were found to be significant when compared to spontaneous and positive control especially 250 µg/mL dose of remifentanil (\*\*p<0.05).

The results of the research light on the previously undisclosed genotoxic effects of remifentanil on healthy human lymphocytes, highlighting potential concerns regarding its safety in clinical applications. Remifentanil, a powerful synthetic opioid analgesic, is widely employed for pain management during surgical procedures and sedation (Glass et al.,1993). While its clinical efficacy is well-established, this research underscores the importance of evaluating its genotoxic potential, particularly when administered at various dosages. Comet assay, a rational method for detecting DNA damage, was employed in this study to assess genotoxic harm arising from individual strand breaks in DNA. The results indicate a dose-dependent correlation between remifentanil exposure and genotoxic impact on human lymphocytes (Table 1). The highest concentration of remifentanil led to the maximum DNA migration, as evidenced by the mean tail length (Figure 1), signifying a direct effect on chromosomes and DNA within human lymphocyte cells. The evaluation of genotoxicity in this study considered changes in tail length and tail intensity parameters by comparing them with values obtained from spontaneous control and positive control groups. These assessments provide compelling evidence of remifentanil-induced genotoxicity under in vitro conditions. The genotoxic effects observed in this study emphasize the need for cautious consideration when utilizing remifentanil, especially in cases involving

prolonged or high-dose exposure. Future research should aim to further elucidate the mechanisms underlying this genotoxicity and explore strategies to minimize potential risks.

## CONCLUSION

In conclusion, this study underscores the importance of evaluating the genotoxic potential of remifentanyl, as it may induce genotoxic effects on lymphocytes culture. The extent of genotoxicity appears to vary with dosage and duration of exposure, emphasizing the need for careful consideration of remifentanyl administration in clinical settings.

## ORAL PRESENTATION

### Hidrazin-Borandan Hidrojen Üretimi İçin MIL-53(Al) Yapısına Dekore Edilen Palladyum Nanokümlerinin Geliştirilmesi ve Tepkime Kinetiğinin İncelenmesi

Nazlı Karataş<sup>1</sup>, Mehmet Gülcan<sup>1</sup>

<sup>1</sup>Van Yüzüncü Yıl Üniversitesi Fen Fakültesi, Kimya Bölümü, Van, Türkiye

#### Özet

Bu çalışmada MIL-53(Al) yapısına dekore edilen Pd (0) nanokümleri ıslak emdirme-indirgeme yöntemiyle hazırlanarak HB'nin hidrolizinden hidrojen üretimindeki katalitik performansları ve katalitik etkinliği incelendi ve katalizör miktarları, substrat ve sıcaklık değişimlerinin etkileri ortaya konuldu. Hazırlanan MIL-53(Al) yapısına dekore edilen Pd (0) nanokümleri, ICP-OES, SEM, SEM/EDX teknikleriyle tanımlandı.

**Anahtar Kelimeler:** Hidrazin-boran, Hidrojen, Hidroliz, MIL-53(Al) Nanoküme, Palladyum

#### Development of Palladium Nanoclusters Decorated to MIL-53(Al) Structure for Hydrogen Production from Hydrazine-Borane and Investigation of Reaction Kinetics

#### Abstract

In this study, Pd (0) nanoclusters decorated with MIL-53(Al) structure were prepared by the wet impregnation-reduction method, and their catalytic performance and catalytic efficiency in hydrogen production from the hydrolysis of HB were examined, and the effects of catalyst amounts, substrate and temperature changes were revealed. Pd (0) nanoclusters decorated on the prepared MIL-53(Al) structure were identified by ICP-OES, SEM, SEM/EDX techniques.

**Keywords:** Hydrazine-borane, Hydrogen, Hydrolysis, MIL-53(Al) Nanocluster, Palladium

#### GİRİŞ

Şu anda hidrojen en umut verici yenilenebilir enerji kaynağıdır. Bunun nedeni çoğunlukla hidrojen kullanımının fosil kaynakların kullanımından yenilenebilir enerjiye dayalı ekonomiye geçişi kolaylaştırmasıdır [1]. Ancak hidrojenin yaygın kullanımını sağlamak için güvenli, hafif ve verimli depolanması ve iletilmesi gibi birçok sorunun aşılması gerekmektedir [2-4]. Bu konular, uygun hidrojen içeriğine sahip kimyasalların depolanması ve uygulanmasıyla ilgili giderek daha yoğun bir araştırma çabasını motive etmiştir [5]. Bugüne kadar birçok katı hidrojen depolama malzemesi, hidrojen depolama uygulamalarında kullanılmak üzere test edilmiştir [6-10]. Son yıllarda amonyak-boran [11-22] ve hidrazin-boran [23-25] gibi kimyasallar, yüksek hidrojen içerikleri ve çoklu uygulamalarda kullanılabilme yetenekleri nedeniyle katı hidrojen depolama malzemeleri olarak kapsamlı bir şekilde incelenmiştir. Hidrojen bu kimyasallarda protik (N-H) veya hidridik (B-H) hidrojen olarak mevcuttur [26]. Amonyak-boranın yüksek hidrojen içeriğine (ağırlıkça %19,6) sahip olmasına ve basit bir B-N bağlı bileşik olmasına rağmen, NH<sub>3</sub> içeriği hidroliz koşullarında hidrolize edilmediğinden hidrojeni tam olarak salınamaz [27]. Ayrıca yüksek substrat konsantrasyonuna sahip hidrojen uygulamalarında amonyak (NH<sub>3</sub>) kullanılan katalizör için zehirleyici etki yaratmaktadır [28]. Buna karşın hidrazin boranın (N<sub>2</sub>H<sub>4</sub>BH<sub>3</sub>, HB) kullanımında durum böyle değildir [29-30]. Uygun bir katalizör kullanılarak, bir mol HB'nin hidrolitik dehidrojenasyonu, (1)'de anlatıldığı gibi 3 mol hidrojen gazı [24] verir.

Bu çalışma da öncelikle MIL-53(Al) sentezlendi. Daha sonra MIL-53 (Al) destekli palladyum nanokümleri (Pd@MIL-53(Al)) ıslak emdirme-indirgeme yöntemiyle hazırlanmıştır. Ardından hazırlanmış Pd@MIL-53(Al) nanokatalizörü ICP-OES (İndüktif Eşleşmiş Plazma-Optik Emisyon Spektrometresi), SEM (Taramalı Elektron Mikroskopu), SEM/EDX (Taramalı Elektron Mikroskopu/Enerji Dağılımlı X-Işını Spektroskopisi

gibi karakterizasyon teknikleriyle tanımlanmıştır. Daha sonra Pd@MIL-53(Al) nanokatalizörünün katalitik performansı HB'nin hidrolizinden hidrojen üretimi tepkimesinde etkinlik ve dönüşüm açısından test edilmiştir.

## MATERYAL

Al(NO<sub>3</sub>)<sub>3</sub>·9H<sub>2</sub>O, 1,4-benzendikarboksilik asid, PdCl<sub>2</sub>·xH<sub>2</sub>O kimyasalları ticari olarak temin edilmiştir. HB ve MIL-53(Al) sentezlenmiştir.

## METOT

Bu çalışma kapsamında gerçekleştirilmesi planlanan işlemler aşağıda maddeler halinde sunulmuştur:

**MIL-53(Al) destek malzemesinin hazırlanması:** Literatürde yer alan hidrotermal yöntemi kullanılarak sentezlenmiştir. Literatüre göre Al(NO<sub>3</sub>)<sub>3</sub>·9H<sub>2</sub>O (2.60 g), 1,4-benzendikarboksilik asid (0.576 g) ve deiyonize su (10 mL) 50 mL Teflon kaplı çelik otoklava yerleştirilip ve 210°C'de 3 gün ısıtılacaktır. Reaksiyon sonunda beyaz toz süzülerek deiyonize su ve etanolla birkaç defa yıkandıktan sonra 60 °C de bir gece kuruması için bekletildi [31].

**MIL-53(Al) yapısına dekore edilmiş Pd (0) nanokümlerinin hazırlanması:** Çalışmada MIL-53(Al) yapısına dekore edilmiş Pd (0) nanokümleri, çözelti fazında metal tuzunun destekleyici yüzeyine depolanması ve daha sonra NaBH<sub>4</sub> kullanılarak indirgenmesiyle hazırlandı. Bu amaçla, Pd metalinin başlangıç tuzu (PdCl<sub>2</sub>·xH<sub>2</sub>O) MIL-53(Al) katı destek malzemesinin yüzeyine emdirilmesi (3 saat boyunca 750 rpm karıştırma hızında karıştırılarak) ve daha sonra NaBH<sub>4</sub> varlığında indirgenmesi sağlandı.

**Hidrazin-boran sentezi:** HB, dihidrazin sülfatın ((N<sub>2</sub>H<sub>5</sub>)<sub>2</sub>SO<sub>4</sub>) kuru dioksan veya THF içerisinde sodyum borhidrür (NaBH<sub>4</sub>) ile aşağıda verilen tepkimesinden sentezlendi. Sentezlenen HB'nin karakterizasyonu FT-IR, erime noktası ve ihtiyaç durumunda <sup>1</sup>H-NMR teknikleri ile yapıldı, sonuçların kaynakça ile uyumu olduğu tespit edilmiştir.

**MIL-53(Al) yapısına dekore edilmiş Pd (0) nanokümlerinin HB'nin hidroliz tepkimesinde katalitik etkinliğinin incelenmesi:** Çalışmanın bu kısmında hazırlanmış MIL-53 yapısına dekore edilmiş Pd (0) nanokümlerinin HB'nin hidrolizi tepkimesinde katalitik etkinliği, tepkime sonucu açığa çıkacak gazın hacimsel ölçümü ve katalitik etkinlik göz önüne alınarak incelendi. Hazırlanmış MIL-53 yapısına dekore edilmiş Pd (0) nanokümlerinin etkinlik, seçicilik, dönüşüm ve dayanıklılık yönünden en iyi katalitik performansa sahip tepkime koşulları belirlendi.

**MIL-53(Al) ile dekore edilmiş Pd (0) nanokümlerinin tanımlanması:** Proje çalışmasında MIL-53(Al) yapısına dekore edilmiş Pd (0) nanokümleri ICP-OES, SEM, SEM/EDX gibi ileri analitiksel yöntemler kullanılarak tanımlandı. Bu analitiksel yöntemlerden ICP-OES; MIL-53(Al) yapısına dekore edilmiş Pd metal miktarının tespiti, SEM; Pd (0) nanokümlerinin parçacık boyut analizi ve morfolojilerinin belirlenmesi, SEM/EDX; SEM analizi sırasında seçili bölgelerde metal dağılımının elementel olarak incelenmesi amacıyla kullanılmıştır.

## BULGULAR ve TARTIŞMA

Çalışmanın ilk aşamasında MIL-53(Al) destek malzemesi kaynakçaya göre sentezlendikten sonra MIL-53(Al) destekli Pd (0) nanokümleri ıslak emdirme-indirgeme yöntemiyle hazırlanarak HB'nin hidrolizi tepkimesi yoluyla hidrojen üretimindeki katalitik performanslar incelenmiştir.

İlk olarak Morfolojik olarak Pd@MIL-53(Al) katalizörünün incelenmesi için SEM analizleri yapılmıştır ve bu görüntüler Şekil 1'de verilmektedir. 1 µm, 5 µm ve 200 nm'de alınan SEM görüntülerinden Pd metallerinin destek malzemesinin yüzeyine homojen olarak dağıldığı görülmektedir (Şekil 1 (a,b,c)). Ayrıca SEM analizi sırasında yapılan haritalandırmada hem Pd metalinin (Şekil 1 (d)) ve destek malzemesinde bulunan Al, C, O ve Pd (Şekil 1 (b)) elementlerinin varlığı açıkça anlaşılmaktadır.

Şekil 1. Pd@MIL-53(Al) katalizörüne ilişkin (a) 1  $\mu\text{m}$ , (b) 5  $\mu\text{m}$  ve (c) 200 nm ölçekli SEM görüntüleri d) Taramalı Elektron Mikroskopu/Enerji Dağılımlı X-Işını Spektroskopisi görüntüsü

Pd@MIL-53(Al) nanokatalizörü ile katalizlenen HB'nin hidroliz tepkimesinde, tepkime hızına katalizör miktarlarının etkisini incelemek için, HB derişimi (23 mg, 100 mM) sabit tutularak farklı miktarlarda Pd@MIL-53(Al) nanokatalizör kullanımıyla HB'nin hidroliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 2'de farklı derişimlerde Pd@MIL-53(Al) nanokatalizörü (Pd@MIL-53(Al) = 25 mg, 50 mg, 75mg ve 100 mg) varlığında katalizlenen HB'nin hidroliz tepkimesinde açığa çıkan  $\text{H}_2$  gazın HB gaz hacmine karşı zaman grafiği verilmektedir.

Şekil 2. Farklı miktarlarda Pd@MIL-53(Al) katalizörü ile katalizlenen HB'nin hidroliz tepkimesinde açığa çıkan gazın ( $\text{H}_2$ ) zamana karşı grafiği.

Pd@MIL-53(Al) nanokatalizörü ile katalizlenen HB'nin hidroliz tepkimesinde tepkime hızına substrat derişiminin etkisini incelemek amacıyla, nanokatalizör derişimi (50 mg) sabit tutularak farklı derişimlerde HB kullanılarak katalitik hidroliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 3'de farklı derişimlerde ( $[\text{HB}] = 50.0 \text{ mM}$ , 75 mM, 100 mM, ve 125 mM) substrat kullanılarak katalizlenen HB'nin hidroliz tepkimesinde açığa çıkan  $\text{H}_2$  gazın HB gaz hacmine karşı zaman grafiği verilmektedir.

Şekil 3. Farklı derişimlerde HB kullanılarak Pd@MIL-53(Al) nanokatalizörü ile katalizlenen HB'nin hidroliz tepkimesinde açığa çıkan gazın ( $H_2$ ) zamana karşı grafiđi.

Pd@MIL-53(Al) nanokatalizörü varlığında HB'nin hidroliz tepkimesine sıcaklığın etkisini belirlemek amacıyla katalizör ve substrat miktarları sabit tutularak sıcaklık deđişimi etkisi incelenmiştir. Şekil 4'te farklı sıcaklıklarda (293 K, 298 K, 303 K, 308 K) gerçekleştirilen hidroliz tepkimesinde açığa çıkan  $H_2$  gazın HB gaz hacmine karşı zaman grafiđi verilmektedir. Beklenildiđi gibi katalitik hidroliz tepkime hızının sıcaklıkla doğru orantılı olarak arttığı görülmüştür.

Şekil 4. Pd@MIL-53(Al) nanokatalizörü ile katalizlenen HB'nin farklı sıcaklıklarda gerçekleştirilen hidroliz tepkimesinde açığa çıkan gazın ( $H_2$ ) zamana karşı grafiđi.

## SONUÇ

**Bu çalışma kapsamında elde edilen sonuçlar özetle şu şekilde sıralanabilir:**

MIL-53(Al) kaynakçaya göre sentezlendi.

Pd@MIL-53(Al) nanokümelere ıslak emdirme-indirgeme yöntemiyle sentezlendi.

Sentezlenen Pd@MIL-53(Al) nanokatalizörü SEM/SEM-EDX analizleri ile morfolojik olarak tanımlanması yapılmıştır.

Sentezlenen Pd@MIL-53(Al) nanokatalizörünün Hidrazin-boranın hidroliz tepkimesi yoluyla hidrojen üretimindeki katalitik etkinliđi (katalizör miktarına, substrat derişimine ve sıcaklığa bađlı katalitik etkinliđi) incelenmiştir.

## TEŞEKKÜR

#### Özet

Bu çalışmanın ilk aşamasında önemli bir B-N bileşiği olan MeAB'nin hidroliz tepkimesinde kullanılmak üzere *nano*-ZrO<sub>2</sub> destekli Pd (0) nanokümeleri sentezlenerek tanımlandı. Bu amaç doğrultusunda hazırlanan *n*-ZrO<sub>2</sub> destekli Pd(0) nanokümeleri ICP-OES, XRD ve SEM gibi tekniklerle karakterize edildi. Hazırlanan Pd@*nano*-ZrO<sub>2</sub> katalizörü, MeAB'den hidroliz tepkimesi yoluyla hidrojen üretiminde katalizör olarak kullanılarak katalitik performansı araştırıldı. Hazırlanan Pd@*nano*-ZrO<sub>2</sub> katalizörünün MeAB'den hidroliz tepkimesi yoluyla hidrojen üretiminde sıcaklık ve derişim gibi parametreler göz önünde bulundurularak hidroliz tepkimeleri gerçekleştirildi.

**Anahtar Kelimeler:** Hidrojen, Hidroliz, Katalizör, Metilamin-Boran, Palladyum

#### Preparation of Zirconium (IV) Oxide Nanopowder Stable Palladium Nanoclusters and Investigation of their Catalytic Performance in the Hydrolysis of Methylamine-Borane

#### Abstract

In the first stage of this study, *nano*-ZrO<sub>2</sub> supported Pd (0) nanoclusters were synthesized and identified to be used in the hydrolysis reaction of MeAB, an important B-N compound. For this purpose, *n*-ZrO<sub>2</sub> supported Pd(0) nanoclusters prepared were characterized by techniques such as ICP-OES, XRD and SEM. The catalytic performance of the prepared Pd@*nano*-ZrO<sub>2</sub> catalyst was investigated by using it as a catalyst in the production of hydrogen from MeAB via hydrolysis reaction. Hydrolysis reactions were carried out by taking into account parameters such as temperature and concentration in the production of hydrogen through the hydrolysis reaction of the prepared Pd@*nano*-ZrO<sub>2</sub> catalyst from MeAB.

**Keywords:** Hydrogen, Hydrolysis, Catalyst, Methylamine-Borane, Palladium

#### GİRİŞ

Son zamanlarda insan nüfusunun artması ve teknolojinin gelişmesiyle birlikte enerji tüketimi hızla artmıştır. İklim değişikliğinin olumsuz etkileri ve benzin, petrol, doğal gaz gibi fosil yakıt kaynaklarının tükenmesi, bilim adamlarını ve sanayicileri sera gazı emisyonlarını azaltmak ve yenilenebilir enerji kullanımını artırmak için ciddi adımlar atmaya yöneltmiştir [1,2]. Küresel ısınmanın neden olduğu sera gazları ozon tabakasına zarar vermekte ve zararlı ultraviyole ışık yoğunluğunu arttırmaktadır [3]. Bu nedenle güneş, hidrojen, rüzgar enerjileri gibi yeşil ve alternatif enerji kaynaklarının araştırılması araştırmacılar için öncelik haline gelmiştir [4]. Bu alternatif yeşil enerjiler arasında hidrojen enerjisi, yüksek yoğunluğu (120 MJ/kg), zengin rezervleri, düşük yoğunluğu (0,0899 g/L), sıfır emisyonu ve geniş uygulama alanları nedeniyle en önemli adaylardan biri olarak kabul edilmektedir [5]. H<sub>2</sub> üretimi, depolanması ve hidrojen rejenerasyonu, hidrojen üretiminin ana adımlarıdır. Amonyak-boran (AB, NH<sub>3</sub>-BH<sub>3</sub>) ve metilamin-boran (MeAB, CH<sub>3</sub>NH<sub>2</sub>-BH<sub>3</sub>), hidrojen üretimi için en yaygın kullanılan amonyaklı bor (B-N) türevi bileşiklerdir [6,7,8]. AB, H<sub>2</sub> kapasitesi 0,196 mol/g = ağırlıkça %19,6 H olan oldukça kararlı B-N bileşiğidir [9]. AB ile karşılaştırıldığında MeAB ayrıca ağırlıkça %11,1 oranında önemli bir hidrojen içeriğine ve son derece stabil çalışma koşullarına sahiptir. Ayrıca bir AB türevi olan MeAB'nin AB'ye göre daha az uçucu olduğu ve dolayısıyla yakıt hücresi uygulamalarında daha avantajlı olduğu rapor edilmiştir. Önceki çalışmalar, oda sıcaklığında MeAB'nin molü başına 3 mol H<sub>2</sub> açığa çıkarabilen MeAB'nin hidrolizini bildirmiştir [10-12].

Bu proje kapsamında *nano-ZrO<sub>2</sub>* destekli Pd (0) nanoküpleri ıslak emdirme-indirgeme yöntemiyle hazırlandı ve detaylı karakterizasyon yapıldı. Ardından hazırlanmış olan nanoküpler MeAB'ın hidrolizi tepkimesinde ilk kez katalizör olarak kullanılarak ve katalitik performansları ortaya konulmuştur.

## MATERYAL

Nano-ZrO<sub>2</sub>, NaBH<sub>4</sub>, THF, metilamin hidroklorür, PdCl<sub>2</sub> ×H<sub>2</sub>O, kimyasalları ticari olarak temin edilmiştir. MeAB ise sentezlenmiştir.

## METOT

Bu çalışma kapsamında gerçekleştirilen işlemler aşağıda maddeler halinde sunulmuştur:

**Metilamin-Boran (CH<sub>3</sub>NH<sub>2</sub>BH<sub>3</sub>, MeAB) Sentezi ve Tanımlanması:** Çalışmanın ilk aşamasında ilgili kaynakça kullanılarak MeAB sentezi gerçekleştirildi [13]. Bu amaçla, 250 mL iki boyunlu balon içerisine 3.88 g (0.1 mol) NaBH<sub>4</sub> konularak ve üzerine 200 mL önceden kurutulmuş THF eklendi. Oda sıcaklığında 30 dk karıştırıldıktan sonra karışım üzerine 6.752 g (0.1 mol) metilamin hidroklorür eklenerek ve tepkime kabının ağzı kapatılarak 24 saat boyunca oda sıcaklığında ve Ar atmosferinde karıştırıldı. 24 saat sonunda 3 numara kroze kullanılarak karışım süzüldü. Katı kısım izole edildikten sonra geriye kalan sıvı kısım evaporatöre edilerek ve bütün THF uzaklaştırıldı. THF tamamen uzaklaştırıldıktan sonra katı ürün üzerine 100 mL önceden kurutulmuş dietileter eklenip kriyostat ile sıcaklığı 0 °C'ye ayarlanmış sistemde iki saat boyunca karıştırıldı. İki saatin sonunda katı kısım tekrar süzülerek izole edilecek ve eter fazındaki ürün oda sıcaklığında bir gece bekletilerek dietileterin tamamen uçması sağlandı ve oluşan beyaz renkli kristaller kullanılmak üzere amber renkli cam bir kaptaki saklandı.

Elde edilecek MeAB'ı karakterize etmek için tanımlanması erime noktası tayini ile FT-IR tekniği kullanıldı.

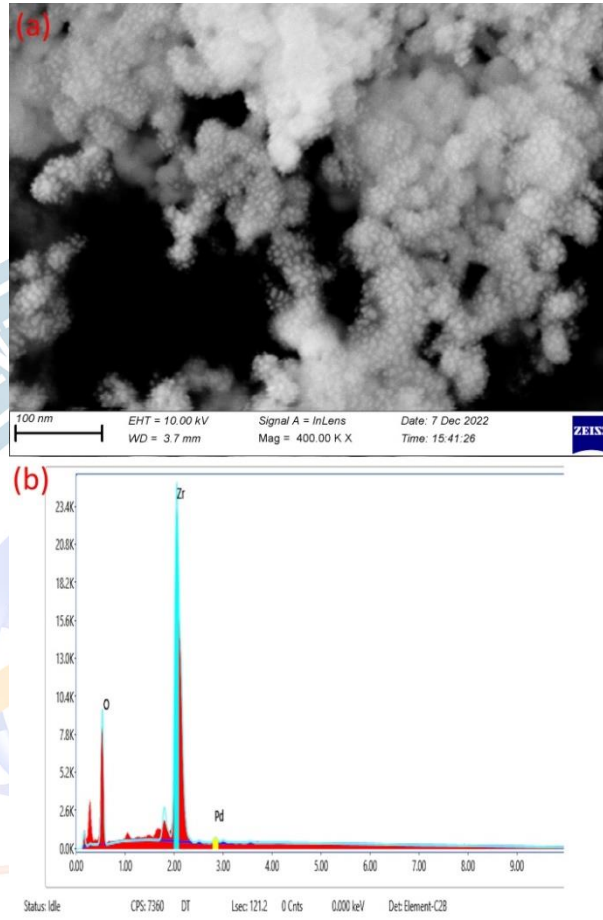

**Pd@*nano-ZrO<sub>2</sub>* Nanokatalizörünün Hazırlanması ve Tanımlanması:** Çalışmada kullanılacak destek malzemesi olan *nano-ZrO<sub>2</sub>* ticari olarak temin edildi. Daha sonra *nano-ZrO<sub>2</sub>* destekli Pd (0) nanoküpleri, çözelti fazında metal tuzunun destekleyici yüzeyine depolanması ve daha sonra NaBH<sub>4</sub> kullanılarak indirgenmesiyle sentezlendi. Bu amaçla, Pd metal başlangıç tuzu, *nano-ZrO<sub>2</sub>* malzemesinin yüzeyine emdirilmesi (3 saat boyunca 750 rpm karıştırma hızında karıştırılarak) ve daha sonra da kuvvetli bir indirgeyici ajan varlığında indirgenmesi sağlandı. Hazırlanan bu katalitik malzemeler MeAB'nin hidroliz tepkimesinde katalizör olarak kullanılarak ve gaz çıkış hızları ile dönüşümleri incelendi. Son olarak elde edilen Pd@*nano-ZrO<sub>2</sub>* malzemesi; ICP-OES (İndüktif Eşleşmiş Plazma Optik Emisyon Spektrometresi), P-XRD (Toz X-Işınları Kırınımı), SEM (Taramalı Elektron Mikroskopu), gibi ileri analitiksel ve spektroskopik yöntemler kullanılarak tanımlandı. Bu analitiksel yöntemlerden ICP-OES; *nano-ZrO<sub>2</sub>* yüzeyine tutturulan Pd miktarının tespiti, XRD; metal (0) nanoküplerinin yüzeyde oluşumu sonucu destek malzemesinin kristal yapısının incelenmesi, SEM; metal (0) nanoküplerinin dağılım analizi ve katalitik tepkimeler sonrasında elde edilen ürünlerin analiz edilmesi ve muhtemel tepkime mekanizmasının belirlenmesi amacıyla kullanıldı.

**Pd@*nano-ZrO<sub>2</sub>* Nanokatalizörünün Metilamin-Boran Hidroliz Tepkimesinde Katalitik Etkinliğin Belirlenmesi ve Tepkime Kinetiğinin İncelenmesi:** Bu çalışma kısmında *nano-ZrO<sub>2</sub>* destekli Pd (0) nanoküpleri hazırlanarak, metilamin-boranın hidroliz tepkimesinde katalitik etkinliği, tepkime sonucu açığa çıkacak gazın hacimsel ölçümü ve katalitik etkinlik/katalitik dönüşüm göz önüne alınarak incelendi. *nano-ZrO<sub>2</sub>* destekli Pd(0) nanoküplerinin etkinlik, dönüşüm ve kararlılık yönünden katalitik performansın tespit edildiği koşullar ve hidroliz tepkimesi farklı çalışma koşullarında (katalizör ve substrat derişimi ve farklı sıcaklıklarda) gerçekleştirilerek tepkime kinetikleri incelendi.

## BULGULAR ve TARTIŞMA

Çalışmanın ilk aşamasında *n-ZrO<sub>2</sub>* destekli palladyum nanoküpleri ıslak emdirme-indirgeme yöntemiyle hazırlanarak MeAB'nin hidrolizi tepkimesi yoluyla hidrojen üretimindeki katalitik performanslar incelenmiştir.

İlk olarak Morfolojik olarak Pd@*nano*-ZrO<sub>2</sub>-katalizörünün incelenmesi için SEM analizleri yapılmıştır ve bu görüntüler Şekil 1’de verilmektedir. 100 nm’de alınan SEM görüntüsünden Pd metallerinin destek malzemesinin yüzeyine homojen olarak dağıldığı görülmektedir (Şekil 1 (a)). Ayrıca SEM analizi sırasında yapılan haritalandırmada hem Pd metalinin (Şekil 1 (b)) ve destek malzemesinde bulunan Zr, O ve Pd (Şekil 1 (b)) elementlerinin varlığı açıkça anlaşılmaktadır.

Şekil 1. (a) Pd@*nano*-ZrO<sub>2</sub> katalizörüne ilişkin 100 nm ölçekli SEM görüntüsü (b) Taramalı Elektron Mikroskopu/Enerji Dağılımlı X-Işını Spektroskopisi görüntüsü

Şekil 2’de *nano*-ZrO<sub>2</sub> ve Pd@*nano*-ZrO<sub>2</sub> örneklerinin XRD desenleri incelendiğinde Pd metalinin destek malzemesine yüklenmesi öncesi ve sonrası XRD desenleri incelendiğinde destek malzemesi olan *nano*-ZrO<sub>2</sub>’nin kristal yapısında herhangi bir bozunmanın olmadığı tespit edilmiştir.

Şekil 2. *nano-ZrO<sub>2</sub>* ve Pd@*nano-ZrO<sub>2</sub>* örneklerine ait XRD desenleri.

Pd@*nano-ZrO<sub>2</sub>* nanokatalizörü ile katalizlenen MeAB'nin hidrolizi tepkimesinde, tepkime hızına katalizör miktarlarının etkisini incelemek için, MeAB derişimi (23 mg, 100 mM) sabit tutularak farklı miktarlarda Pd@*nano-ZrO<sub>2</sub>* nanokatalizör kullanımıyla MeAB'nin hidroliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 3'da farklı derişimlerde Pd@*nano-ZrO<sub>2</sub>* nanokatalizörü (Pd@*nano-ZrO<sub>2</sub>* = 75 mg, 100 mg, 125mg ve 150 mg) varlığında katalizlenen MeAB'nin hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazın MeAB gaz hacmine karşı zaman grafiğı verilmektedir.

Şekil 3. Farklı miktarlarda Pd@*nano-ZrO<sub>2</sub>* katalizörü ile katalizlenen MeAB'nin hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) MeAB gaz hacmine karşı zaman grafiğı.

Pd@*nano*-ZrO<sub>2</sub> nanokatalizörü ile katalizlenen MeAB'nin hidroliz tepkimesinde tepkime hızına substrat derişiminin etkisini incelemek amacıyla, nanokatalizör derişimi (100 mg) sabit tutularak farklı derişimlerde MeAB kullanılarak katalitik hidroliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 4'de farklı derişimlerde ([MeAB] = 50.0 mM, 75 mM, 100 mM, ve 125 mM) substrat kullanılarak katalizlenen MeAB'nin hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazın MeAB gaz hacmine karşı zaman grafiğı verilmektedir.

Şekil 4. Farklı derişimlerde MeAB kullanılarak Pd@*nano*-ZrO<sub>2</sub> nanokatalizörü ile katalizlenen MeAB'nin hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) gaz hacmine karşı zaman grafiğı.

Pd@*nano*-ZrO<sub>2</sub> nanokatalizörü varlığında MeAB'nin hidroliz tepkimesine sıcaklığın etkisini belirlemek amacıyla katalizör ve substrat miktarları sabit tutularak sıcaklık değışimi etkisi incelenmiştir. Şekil 5'te farklı sıcaklıklarda gerçekleştirilen metanoliz tepkimesinde açığa çıkan H<sub>2</sub> gazın MeAB gaz hacmine karşı zaman grafiğı verilmektedir. Beklenildiğı gibi katalitik metanoliz tepkime hızının sıcaklıkla doğru orantılı olarak arttığı görülmüştür.

Şekil 5. Pd@*nano*-ZrO<sub>2</sub> nanokatalizörü ile katalizlenen MeAB'nin farklı sıcaklıklarda gerçekleştirilen hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) MeAB gaz hacmine karşı zaman grafiğı.

## SONUÇ

Bu çalışma kapsamında ilk olarak MeAB kaynakçaya göre sentezlendi. Daha sonra *nano*-ZrO<sub>2</sub> destekli palladyum nanokümelere ıslak emdirme-indirgeme yöntemiyle sentezlendi. Sentezlenen Pd@*nano*-ZrO<sub>2</sub> nanokatalizörü SEM/SEM-EDX analizleri ile morfolojik olarak tanımlanması yapılmıştır. Sentezlenen Pd@*nano*-ZrO<sub>2</sub> nanokatalizörünün metiamin-boranın (MeAB) hidroliz tepkimesi yoluyla hidrojen

üretimindeki katalitik etkinliği (katalizör miktarına, substrat derişimine ve sıcaklığa bağı katalitik etkinliği) incelenmiştir.

## TEŞEKKÜR

2209-A- Lisans Öğrencilerine Yönelik Araştırma Projesi Destek Programı kapsamındaki projemize (Proje No: 1919B012207728) maddi desteği için Türkiye Bilimsel ve Teknolojik Araştırma Kurumu'na teşekkür ederiz.

#### Özet

Su kaynaklarına ve su ekosistemine zarar veren kirleticilerin başında yeterince arıtılmadan çevreye verilen nitrofenol ve türevleri gelmektedir. Bu bileşiklerin arıtılması ve zararsız hale getirilmesi amacıyla uygulanan yöntemlerin başında katalitik indirgeme tepkimeleri gelmektedir. Nitrofenollerin indirgenmesi sonucu elde edilen aminofenoller farklı endüstriyel üretim aşamalarında yoğun olarak kullanılan zararsız ve önemli ara ürünlerdir. Bu çalışmada, 2-nitrofenol ve 4-nitrofenol gibi nitrofenol türevlerinin 2-aminofenol ve 4-aminofenol bileşiklerine katalitik indirgenmesi sürecinde kullanılmak üzere ZIF-67 destekli Rh (0) nanokümesi hazırlanmış ve hazırlanan katalizörün yapısal ve morfolojik özellikleri XRD, SEM, SEM/EDX ve UV-vis teknikleriyle ortaya konulmuştur. Nitrofenollerin aminofenollere katalitik indirgenmesi oda koşullarında UV-vis spektrofotometre kullanılarak takip edilmiştir.

**Anahtar Kelimeler:** İndirgenme, Katalizör, Nanoparçacık, Nitrofenol, ZIF-67

#### Abstract

Nitrophenol and its derivatives, which are released into the environment without sufficient purification, are among the pollutants that harm water resources and the aquatic ecosystem. Catalytic reduction reactions are the primary methods used to purify and render harmless these compounds. Aminophenols obtained as a result of the reduction of nitrophenols are harmless and important intermediate products that are used extensively in different industrial production stages. In this study, ZIF-67 supported Rh (0) nanoclusters were prepared to be used in the catalytic reduction process of nitrophenol derivatives such as 2-nitrophenol and 4-nitrophenol to 2-aminophenol and 4-aminophenol compounds. Structural and morphological properties of the prepared catalyst were revealed by XRD, SEM, SEM/EDX and UV-vis techniques. Catalytic reduction of nitrophenols to aminophenols was monitored using a UV-vis spectrophotometer under room conditions.

**Key Words:** Reduction, Catalyst, Nanoparticle, Nitrophenol, ZIF-67

#### GİRİŞ

21. yüzyılda nüfusun hızla artması ve teknolojik gelişmeler üretim ve tüketim süreçlerini önemli ölçüde değiştirerek her alanda daha fazla ve daha tehlikeli atığın açığa çıkmasına neden olmuştur. Bu atıkların arıtılmadan çevreye verilmesi; temiz su kaynaklarına ve bu kaynaklardan etkilenen bütün ekosisteme telafisi çok zor zararlar vererek en önemli küresel sorunlardan biri haline gelmiştir. Gelişmiş ve gelişmekte olan bütün ülkelerin en önemli gündem maddelerinden biri haline gelen su kirliliğine neden olan kirleticilerin başında heterohalkalı aromatik bileşikler gelmektedir [1-5]. Petrokimya, kozmetik ve tekstil başta olmak üzere bir çok endüstri alanında açığa çıkan heterohalkalı aromatik bileşiklerin önemli bir kısmını nitrofenol ve türevleri oluşturmaktadır. Zehirli ve kanserojen yapıları nedeniyle çok düşük konsantrasyonlarda bile son derece toksik etkiler oluşturabilen bu bileşikler sahip oldukları kimyasal kararlılıkları nedeniyle doğal bozunma süreçlerinden etkilenmeden çok büyük bir alana yayılabilmekte ve uzun süre varlığını sürdürebilmektedir [6-8]. Bütün bu özellikleri nedeniyle insan sağlığı açısından son derece tehlikeli kimyasallar olarak kabul edilen nitrofenol ve türevleri ani solunum yolu rahatsızlıklarına deri altı iltihap birikimlerine ve görme kaybı oluşturabilecek derecede göz sorunlarına neden olabilmektedir. Bununla birlikte insan vücudunda protein dejenerasyonu sürecini de başlatabilen bu bileşikler böbrek, pankreas ve karaciğerde geri dönüşü mümkün olmayan zararlara neden olabilmektedir. İnsan vücudunda bu denli ciddi sorunlara yol açan nitrofenol ve türevleri Dünya Sağlık Örgütü tarafından yakından incelenmiş ve oluşturulan içme suyu standartlarına göre izin verilen fenol sınır değeri 0,002 mg/L olarak üye ülkelerin tamamına duyurulmuştur. Dünya sağlık örgütü tarafından belirlenen sınır değer ABD Çevre Koruma Ajansı tarafından ABD’de uygulanmak üzere 0,001

mg/L'ye düşürülmüştür [9-11]. Bütün bu değerler nitrofenol ve türevlerinin verimli ve çevreci yöntemlerle arıtılmasını önemli bir çalışma alanı haline dönüştürmüş ve bu alanda birbirinden farklı birçok yöntem denenmiştir. Bütün bu yöntemler içerisinde nitrofenollerin aminofenollere indirgenmesi; Tepkimenin çevreci koşullarda ve ekonomik olarak gerçekleşmesi Tepkime veriminin sentezlenen yeni nanokatalizör sistemleri ile geliştirilebilmesi Tepkime sonucu istenmeyen ara ürünlerin oluşmaması İndirgenme sonucu elde edilen aminofenollerin nitrofenollere göre çok daha az toksik etki göstermesi ve çok farklı endüstri dallarında kullanılan önemli ve değerli bir ara ürün olması gibi nedenlerle diğer arıtma yöntemlerine göre öne çıkmıştır. Nitrofenollerin aminofenollere indirgenmesi amacıyla hidrojen kaynağı olarak ekonomik ve çevreci oluşu, kolay saklanabilirliği, su içindeki yüksek çözünürlüğü gibi avantajları nedeniyle çoğunlukla NaBH<sub>4</sub> kullanılır. NaBH<sub>4</sub> oldukça kolay sayılabilecek koşullar altında hidroliz olur ve hidroliz sonucu NaBO<sub>2</sub> ve H<sub>2</sub> elde edilir. Elde edilen H<sub>2</sub> gazının halkadaki nitro grubunu amin grubuna indirgemesi sonucu zararlı ve tehlikeli kimyasallar olan 2-nitrofenol (2-NP) ve 4-nitrofenol (4-NP) zararsız ve değerli bileşikler olan 2-aminofenol (2-AP) ve 4-aminofenole (4-AP) dönüştürülmüş olur. Hidroliz sonucu gerçekleşen indirgenme sürecinin bir diğer avantajı ise ara ürün olarak açığa çıkan NaBO<sub>2</sub>'nin zararsız ve geri dönüşümü kolay olan bir bileşik olmasıdır [12-17].

Yukarıda değinilen avantajlı durumlara rağmen nitrofenollerin aminofenollere indirgenmesinde sadece NaBH<sub>4</sub>'ün kullanıldığı çalışmalar verimli bir arıtma ve dönüştürme yöntemi olarak yaygınlaşmamıştır. Bunun en önemli sebebi NaBH<sub>4</sub>'ün tek başına kullanıldığı indirgenme tepkimelerinin düşük verimle ve çok uzun sürede gerçekleşmesidir. Örneğin herhangi bir katalizör sisteminden faydalanılmadan sadece NaBH<sub>4</sub>'ün kullanıldığı indirgenme tepkimelerinde 4-NP'ün 4-AP'e dönüşümü 229 dakika ve 2-NP'ün 2-AP'e dönüşümü 239 dakika sürmektedir [18,19]. Bu durum nitrofenollerin aminofenollere verimli bir şekilde dönüştürülebilmesinin ön şartının uygun nanokatalizör sistemlerinin geliştirilmesine bağlı olduğunu göstermektedir. Bu alanda yapılan çalışmalar verimli nanokatalizör sistemlerinin geliştirilmesine;

ekonomik ve verimli metalin belirlenmesi metalde zamanla gözlemlenen topaklaşma gibi katalizör performansını ve ömrünü olumsuz etkileyen sorunların giderilmesi amacıyla kullanılacak destek malzemelerinin belirlenmesi ve ihtiyaç durumunda sentezlenmesi şeklinde iki aşamadan oluştuğunu ortaya koymuştur.

Çalışmada kullanılan nanokatalizör sistemlerinin sentezlenmesi aşamasında destek malzemesi olarak metal-organik çerçeve (MOF) ailesinin ilginç özelliklere sahip bir alt grubu olan zeolitik imidazol çerçeve (ZIF) kullanılmıştır. Yüksek ısısal/kimyasal kararlılık ve yüksek yüzey alanı gibi son derece önemli iki avantaja sahip olan zeolitik imidazol çerçeveler son yıllarda araştırmacıların ilgisini çeken destek malzemelerini başında gelmektedir.

Yapılan çalışmada Hazırlanan ZIF-67 destekli Rh (0) nanoküpleri nitrofenollerin aminofenollere indirgenmesinde kullanılmış ve yüksek katalitik etkinlikle birlikte yüksek tekrar kullanılabilirlik performansı rapor edilmiştir.

## MATERYAL

Yapılan çalışmada destek malzemesi olarak kullanılan ZIF-67 sentezlendikten sonra Rh@ZIF-67 nanoküpleri elde edildi. Katalizör sistemlerinin hazırlanması ve nitrofenollerin indirgenmesi süresince ihtiyaç duyulan Kobalt (II) nitrat heksahidrat (Co(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O), 2-metilimidazol, sodyum borhidrit, 2-nitrofenol (2-NP), 4-nitrofenol (p-nitrofenol, 4-NP) ve Rodyum (III) klorür hidrat (RhCl<sub>3</sub>·xH<sub>2</sub>O) Sigma-Aldrich®ten temin edildi. Tüm cam eşyalar ve teflon kaplı manyetik karıştırma çubukları damıtılmış su ve aseton ile temizlendikten sonra 423 K'deki fırında kurutuldu.

## YÖNTEM

### Rh@ZIF-67 katalizörünün nitrofenol indirgenesindeki katalitik aktivitesi

Rh<sup>3+</sup>@ZIF-67 ön katalizörü iyon değiştirme yöntemiyle hazırlandı. Bu amaçla ilk olarak ZIF-67 sentezlendi. Daha sonra 5,0 mL sulu RhCl<sub>3</sub>·xH<sub>2</sub>O çözeltisi ile 100 mg ZIF-67 700 rpm'de 12 saat karıştırılarak metal tuzunun katı desteğe tutturulması sağlandı. Elde edilen katalizör (Rh<sup>3+</sup>@ZIF-67) süzülerek izole edildi ve 373 K'de vakumda kurutuldu. Her substrat için, 5 mg Rh<sup>3+</sup>@ZIF-67 ve 2,0 mM nitrofenol türevinin sulu çözeltisi (10 mL) (2-NP için 2,78 mg, 4-NP için 2,78 mg) alınarak sıcaklığı 298 K'e ayarlanmış ceketli schlenk içerisinde karıştırıldı. İndirgenmenin başlatılabilmesi için 1,0 ml suda çözülmüş 0,2 mmol NaBH<sub>4</sub> (77,2 mg) tepkime ortamına ilave edildi ve katalitik reaksiyon, 800 rpm'lik bir karıştırma hızında başlatıldı. Nitrofenol türevinin karşılık gelen aminofenole dönüşümü, belirli zaman aralıklarında 100 µL reaksiyon çözeltisi çekilerek 1 mL'ye seyreltikten sonra Shimadzu UV-3600 UV-Vis spektrometresi ile analiz edildi. Nitrofenol türevlerinin optik absorpsiyon spektrumları 2-NP için 414 nm, 4-NP için 399 nm olarak ölçüldü.

Katalitik aktivitenin sıcaklıkla değişimini belirleyebilmek amacıyla 4 farklı sıcaklıkta (293 K, 298 K, 303 K, 308 K) deneyler yapıldı. Benzer şekilde katalizör miktarı ve substrat derişiminin katalitik performansa etkisini belirleyebilmek amacıyla farklı derişim (0,5 mM, 1 mM, 2 mM, 3 mM) ve farklı miktarlarda (1 mg, 3 mg, 5 mg, 7 mg) deneyler yapıldı ve elde edilen veriler kullanılarak katalitik etkinlikte meydana gelen değişimler hesaplandı.

### Rh@ZIF-67 katalizörünün nitrofenol indirgenesinde tekrar kullanılabilirlik performansının araştırılması

Her substrat için katalitik reaksiyonun tamamlanmasından sonra Rh@ZIF-67 katalizörü, süzme yoluyla ayrıldı ve etanol-su karışımı ile temizlendi ve 373 K'de vakumda kurutuldu. İyice kurutulmuş katalizör miktarı tartıldıktan sonra reaksiyon kabına eşit miktarda substrat ilave edildi ve katalitik reaksiyon yeniden başlatıldı.

## BULGULAR VE TARTIŞMA

Yapılan çalışmada oldukça yüksek yüzey alanı ve kararlılığa sahip bir ZIF üyesi olan ZIF-67'nin destek malzemesi olarak kullanıldığı Rh@ZIF-67 nanokümleri klasik ıslak-empirme yöntemi ile tepkime-içi koşullarda hazırlanmış, karakterize edilmiş ve indirgeyici olarak sodyum borhidrür (NaBH<sub>4</sub>) varlığında yaygın olarak karşılaşılan iki nitrofenolün (2-nitrofenol ve 4-nitrofenol) katalitik indirgenmesinde katalizör olarak kullanılmıştır.

Şekil 1. 2-nitrofenolün 2-aminofenole indirgenmesi

Katalitik hidrojenasyonda kullanılan nanokatalizörde destek malzemesi olarak kullanılan ZIF-67'ye ve Rh@ZIF-67 nanokatalizörüne ait XRD analizi şekil 2'de gösterilmiştir. İncelenen XRD desenleri, metalin yüzeye tutunması sonucu destek malzemesinin yapısında herhangi bir bozulma olmadığını göstermektedir. Ayrıca Rh@ZIF-67 desenleri ile ZIF-67 desenlerinin yüksek oranda benzerlik gösterdiği ve literatür ile uyumlu olduğu da belirlenmiştir [20].

Şekil 2. ZIF-67 destekli Rh nanokatalizörünün  $2\theta = 10-90^\circ$  aralığındaki XRD desenleri

ZIF-67 destekli Rh nanokümlerin parçacık büyüklük dağılımları taramalı elektron mikroskobu (SEM) ile karakterize edildi. Şekil 3. (a-c), tepkime-içi koşullarda 4-nitrofenolün indirgenmesi sonucu elde edilen Rh@ZIF-67 örneklerine ait 100, 200 ve 500 nm büyüklükteki SEM görüntülerini göstermektedir. Görüntülerden de anlaşılacağı üzere Rh (0) nanokümleri ZIF-67 yüzeyine düzgün bir şekilde tutunmuştur. Bununla birlikte yapılan SEM EDX analizinde de ZIF-67 yapısındaki elementler ve Rh metali görülmektedir (Şekil 3.d)

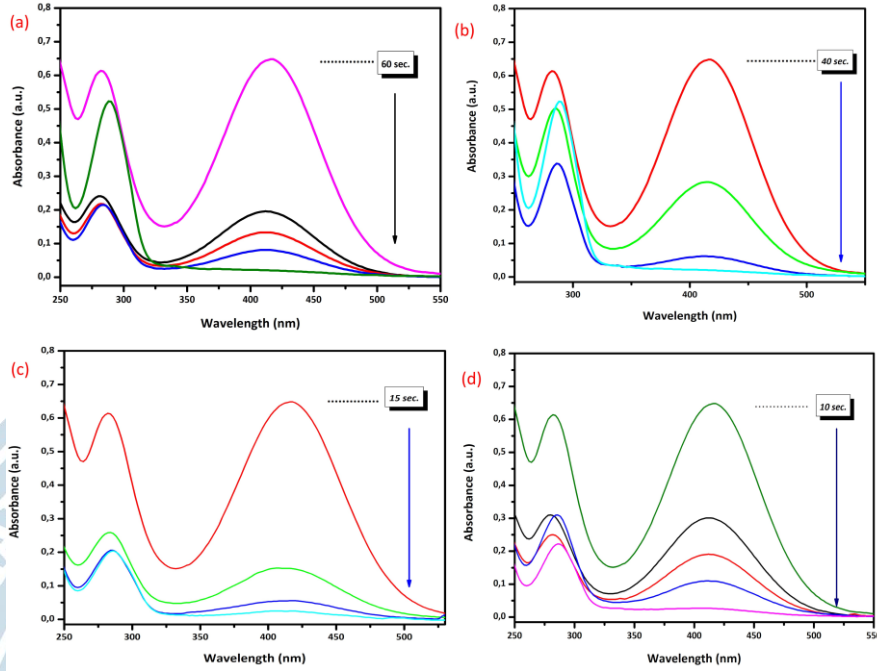

Şekil 3. Tepkime-içi koşullarda (a) 100 nm, (b) 200 nm, (c) 500 nm 2- nitrofenolün indirgenmesi sonucu elde edilen Rh@ZIF-67 katalizörüne ait SEM görüntüleri, (d) SEM EDX analizi

Alkali çözeltide en güçlü absorpsiyon bandı 2-nitrofenol için 414 nm, 4-nitrofenol için 399 nm olarak belirlendi, Absorpsiyon tepe noktasının değişiminin belirli zaman aralıklarında takip edilmesi sonucu katalitik hidrojenasyon ile ilgili kinetik parametreler elde edildi. Sıcaklığın, nitrofenollerin Rh@ZIF-67 nanokatalizörü varlığında gerçekleştirilen katalitik indirgenme tepkimesi üzerindeki etkisini incelemek için 293, 298, 303 ve

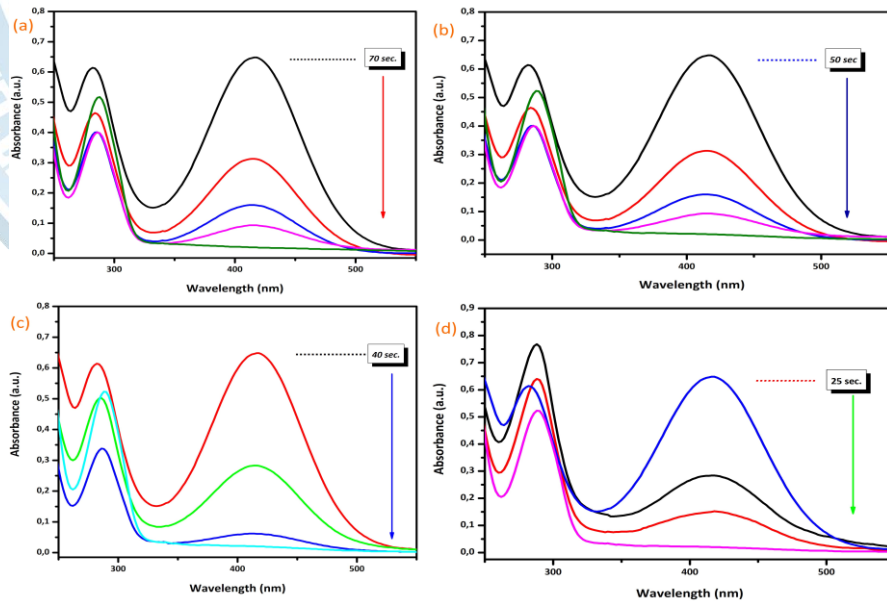

308 K sıcaklıklarında deneyler gerçekleştirildi. Elde edilen UV-vis spektrumları incelendiğinde sıcaklık artışıyla indirgenme hızının doğru orantılı değiştiği belirlendi 2-nitrofenolün katalitik hidrojenasyonu 293 K'de 60 saniyede 308 K'de ise 10 saniyede gerçekleşmiştir (Şekil 4).

Şekil 4. Farklı sıcaklıklarda 2-nitrofenolün sulu  $\text{NaBH}_4$  varlığında indirgenmesine ilişkin UV-Vis spektrumları.

Katalizör miktarının tepkime hızına etkisini belirlemek amacıyla yapılan deneylerde katalizör miktarının düşük olduğu durumlarda indirgenme reaksiyonunun beklenildiği gibi daha yavaş gerçekleştiği belirlendi. Ortamda bulunan katalizör miktarının artması etkinliğin ve tepkime hızının artmasına yol açmıştır. 2-nitrofenolün katalitik hidrojenasyonu katalizör miktarı 1 mg iken 70 saniye sürmekte iken katalizör miktarı 7 mg'a çıkarıldığında 25 saniye gibi çok daha kısa bir sürede gerçekleşmektedir (Şekil 5).

Şekil 5. Farklı katalizör miktarlarının 2-nitrofenolü sulu  $\text{NaBH}_4$  varlığında indirgenmesine ilişkin UV-Vis spektrumları.

Katalitik performansın en önemli ölçütleri olarak kabul edilen izole edilebilirlik ve tekrar kullanılabilirlik, 298 K sıcaklıkta Rh@ZIF-67 nanokatalizörü varlığında nitrofenollerin katalitik indirgenmesinde test edildi. Yapılan çalışmada 2-nitrofenolün tamamen indirgenmesinden sonra, Rh@ZIF-67 nanokatalizörü süzülüp su ile yıkandıktan sonra kurutuldu. Elde edilen Rh@ZIF-67 nanokatalizörü tekrardan 2-nitrofenolün indirgenmesinde kullanıldı. Rh@ZIF-67 katalizörünün katalitik indirgenme tepkimelerinde yine aktif olduğu belirlendi. Beş katalitik çalışmanın sonunda elde edilen sonuçlar Rh@ZIF-67 nanokatalizörünün 2-nitrofenolün indirgenmesinde 5. katalitik yeniden kullanımda bile %100 oranında tam dönüşüm sağladığı ve %80 oranında etkinliğini koruduğu belirlendi.

## SONUÇ

Bu çalışmada, ZIF-67 destekli Rodyum nanopartikülleri (Rh@ZIF-67) indirgeyici olarak NaBH<sub>4</sub> varlığında 2-nitrofenol ve 4-nitrofenolün katalitik hidrojenasyonunda kullanılmak üzere katalizör olarak sentezlendi, karakterize edildi ve test edildi. Bu çalışma sonucunda elde edilen en çarpıcı sonuçlar şu şekilde sıralanabilir.:

Rh@ZIF-67 nanokatalizörü nitrofenollerin indirgenmesinde kullanılmak üzere klasik ıslak emdirme yöntemi ile tepkime-içi koşullarda hazırlandı.

Rh@ZIF-67 nanokatalizörü P-XRD, FTIR, SEM gibi çeşitli tekniklerle karakterize edildi Elde edilen sonuçlar Rh nanoparçacıklarının ZIF-67 yüzeyine homojen bir şekilde dağıldığını ortaya koymaktadır.

Rh@ZIF-67 nanokatalizörünün hem katalitik aktivitesi hem de tekrar kullanılabilirlik performansı, 2-NP ve 4-NP'un sulu NaBH<sub>4</sub> çözeltisi içindeki hidrojenasyonlarında araştırıldı. Rh@ZIF-67'nin nitrofenollerin karşılık gelen aminofenollere dönüşümünde oldukça aktif bir nanokatalizör olduğu tespit edildi.

Ayrıca Rh@ZIF-67 nanokatalizörü katalitik çalışmalar sırasında oldukça yüksek bir dayanıklılık sergileyerek 5. katalitik yeniden kullanımda bile %80 oranında etkinliğini korudu.

## Teşekkür

## ORAL PRESENTATION

### Dimetilamin-Borandan Hidroliz Yoluyla Hidrojen Üretimi için Amin Fonksiyonel Silika Destekli Rutenyum Nanokümlerinin Hazırlanması\*

Halime Çiçek<sup>1</sup>, Mehmet Gülcan<sup>1</sup>

<sup>1</sup>Van Yüzüncü Yıl Üniversitesi Fen Fakültesi, Kimya Bölümü, Van, Türkiye

#### Özet

Bu çalışmada amin-fonksiyonel silika (SiO<sub>2</sub>-NH<sub>2</sub>) destekli Ru (0) nanokümleri hazırlanarak DMAB'ın hidrolizinden hidrojen üretimindeki katalitik performansları incelendi. Hazırlanan SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümleri, ICP-OES, XRD, SEM, SEM/EDX karakterizasyon teknikleriyle tanımlandı. Hazırlanan SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümlerinin DMAB'ın hidroliz tepkimesinde tekrar kullanılabilirlik performansları da incelenerek farklı sıcaklıklarda hidroliz tepkimeleri gerçekleştirildi.

**Anahtar Kelimeler:** Amin fonksiyonel silika, Dimetilamin-boran, Hidrojen, Hidroliz, Nanoküme

#### Preparation of Amine Functional Silica Supported Ruthenium Nanoclusters for Hydrogen Production via Hydrolysis from Dimethylamine-Borane

#### Abstract

In this study, amine-functional silica (SiO<sub>2</sub>-NH<sub>2</sub>) supported Ru (0) nanoclusters were prepared and their catalytic performance in hydrogen production from the hydrolysis of DMAB was examined. The prepared SiO<sub>2</sub>-NH<sub>2</sub> supported Ru (0) nanoclusters were identified by ICP-OES, XRD, SEM, SEM/EDX characterization techniques. The reusability performances of the prepared SiO<sub>2</sub>-NH<sub>2</sub> supported Ru (0) nanoclusters in the hydrolysis reaction of DMAB were also examined and hydrolysis reactions were carried out at different temperatures.

**Keywords:** Amine functional silica, Dimethylamine-borane, Hydrogen, Hydrolysis, Nanocluster

#### GİRİŞ

Geleneksel fosil yakıtlar, modern toplumda çok yönlü kullanımlar için devasa enerjiler sağlasa da, bunların büyük ölçekli tüketimleri ciddi enerji krizlerine ve çevre kirliliğine yol açmaktadır. Sürdürülebilir kalkınma açısından hidrojen, yüksek enerji yoğunluğu ve temiz yanma özelliğinden dolayı fosil yakıtlara alternatif olarak kabul edilmektedir [1-3]. Ancak hidrojenin güvenli bir şekilde depolanması ve taşınması hala büyük ölçekli uygulamaları engellemektedir. Bu sorunu hafifletmek için, katı hidrojen depolama malzemelerinin, hidrojen kullanımlarındaki acil gereksinimi karşılamak için güvenli ve etkili bir strateji olduğu gösterilmiştir [4-8]. Buna göre dimetil amin-boran (DMAB), hidrojen üretimi için en çok araştırılan hidrojen depolama malzemelerinden biri olarak kabul edilmiştir [9]. Hızlı reaksiyon kinetiğini hızlandırmak için DMAB hidrolizinden hidrojen salınmasını tetikleyecek etkili bir katalizör gereklidir.

Heterojen katalizörler, katalizör ayırma ve geri dönüşümdeki faydalarından dolayı yoğun ilgi görmüştür [10-18]. Bununla birlikte Ru, DMAB dehidrojenasyonuna yönelik yüksek verimliliği nedeniyle artan araştırma ilgisini uyandırırken yüksek fiyatı ve sınırlı arzı büyük ölçekli uygulamaları kısıtlamaktadır. Düşük yükleme ve yüksek katalitik verime sahip Ru bazlı katalizörlerin geliştirilmesine ihtiyaç vardır. Önceki çalışmalar, katalitik verimliliğin büyük ölçüde soy metal parçacıklarının boyutlarına bağlı olduğunu göstermiştir.

Bu çalışma da öncelikle amin-fonksiyonel silika (SiO<sub>2</sub>-NH<sub>2</sub>) destekli rutenyum nanokümleri (Ru@SiO<sub>2</sub>-NH<sub>2</sub>) ıslak emdirme-indirgeme yöntemiyle hazırlanmıştır. Ardından hazırlanmış Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü ICP-OES (İndüktif Eşleşmiş Plazma-Optik Emisyon Spektrometresi), XRD (X-Işınları Kırınımı), SEM (Taramalı Elektron Mikroskopu), SEM/EDX (Taramalı Elektron Mikroskopu/Enerji Dağılımlı X-Işını Spektroskopisi gibi karakterizasyon teknikleriyle tanımlanmıştır. Daha sonra Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörünün katalitik performansı DMAB'ın hidrolizinden hidrojen üretimi tepkimesinde etkinlik ve dönüşüm açısından test edilmiştir.

## MATERYAL

SiO<sub>2</sub>-NH<sub>2</sub>, DMAB, RuCl<sub>3</sub>·xH<sub>2</sub>O kimyasalları ticari olarak temin edilmiştir.

## METOT

Bu çalışma kapsamında gerçekleştirilmesi planlanan işlemler aşağıda maddeler halinde sunulmuştur:

**SiO<sub>2</sub>-NH<sub>2</sub> Destekli Ru (0) Nanokümlerinin Hazırlanması:** Çalışmada SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümleri, çözelti fazında metal tuzunun destekleyici yüzeyine depolanması ve daha sonra NaBH<sub>4</sub> kullanılarak indirgenmesiyle hazırlandı. Bu amaçla, Ru metalinin başlangıç tuzu (RuCl<sub>3</sub>·xH<sub>2</sub>O) SiO<sub>2</sub>-NH<sub>2</sub> katı destek malzemesinin yüzeyine emdirilmesi (3 saat boyunca 750 rpm karıştırma hızında karıştırılarak) ve daha sonra NaBH<sub>4</sub> varlığında indirgenmesi sağlandı.

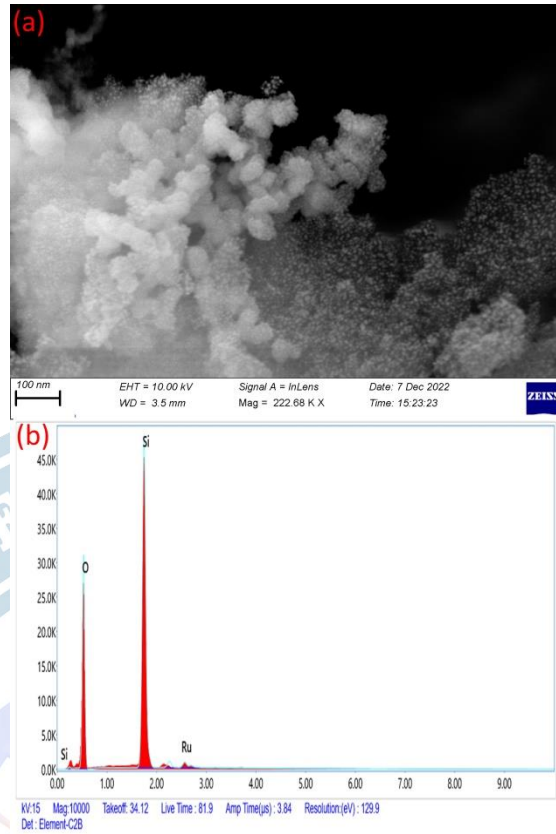

**SiO<sub>2</sub>-NH<sub>2</sub> Destekli Ru (0) Nanokümlerinin DMAB'ın Hidroliz Tepkimesinde Katalitik Etkinliğinin İncelenmesi:** Çalışmanın bu kısmında hazırlanmış SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümlerin DMAB'ın hidrolizi tepkimesinde katalitik etkinliği, tepkime sonucu açığa çıkacak gazın hacimsel ölçümü ve katalitik etkinlik göz önüne alınarak incelenir. Hazırlanmış SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümlerin etkinlik, seçicilik, dönüşüm ve dayanıklılık yönünden en iyi katalitik performansa sahip tepkime koşulları belirlendi.

**SiO<sub>2</sub>-NH<sub>2</sub> Destekli Ru (0) Nanokümlerinin Tanımlanması:** Çalışma da SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümleri ICP-OES, XRD, SEM, SEM/EDX gibi ileri analitiksel yöntemler kullanılarak tanımlanmıştır. Bu analitiksel yöntemlerden ICP-OES; SiO<sub>2</sub>-NH<sub>2</sub> desteğine tutturulmuş Ru metal miktarının tespiti, XRD; metal nanokümlerinin oluşumu sonucu SiO<sub>2</sub>-NH<sub>2</sub> destekli malzemesinin kristal yapısının incelenmesi, XPS; metalin indirgenme sonrası yükseltgenme basamağının incelenmesi ve yüzey kompozisyonunun belirlenmesi, SEM; Ru (0) nanokümlerinin parçacık boyut analizi ve morfolojilerinin belirlenmesi, SEM/EDX; SEM analizi sırasında seçili bölgelerde metal dağılımının elementel olarak incelenmesi amacıyla kullanılmıştır.

## BULGULAR ve TARTIŞMA

Çalışmanın ilk aşamasında SiO<sub>2</sub>-NH<sub>2</sub> destekli Ru (0) nanokümleri ıslak emdirme-indirgeme yöntemiyle hazırlanarak DMAB'nin hidrolizi tepkimesi yoluyla hidrojen üretimindeki katalitik performanslar incelenmiştir.

İlk olarak Morfolojik olarak Ru@SiO<sub>2</sub>-NH<sub>2</sub> katalizörünün incelenmesi için SEM analizleri yapılmıştır ve bu görüntüler Şekil 1'de verilmektedir. 100 nm'de alınan SEM görüntüsünden Ru metallerinin destek malzemesinin yüzeyine homojen olarak dağıldığı görülmektedir (Şekil 1 (a)). Ayrıca SEM analizi sırasında yapılan haritalandırmada hem Ru metalinin (Şekil 1 (b)) ve destek malzemesinde bulunan Si, O ve Ru (Şekil 1 (b)) elementlerinin varlığı açıkça anlaşılmaktadır.

Şekil 1. (a) Ru@SiO<sub>2</sub>-NH<sub>2</sub> katalizörüne ilişkin 100 nm ölçekli SEM görüntüsü (b) Taramalı Elektron Mikroskopi/Enerji Dağılımlı X-Işını Spektroskopisi görüntüsü

Şekil 2’de SiO<sub>2</sub>-NH<sub>2</sub> ve Ru@SiO<sub>2</sub>-NH<sub>2</sub> örneklerinin XRD desenleri incelendiğinde Ru metalinin destek malzemesine yüklenmesi önce ve sonrası XRD desenleri incelendiğinde destek malzemesi olan SiO<sub>2</sub>-NH<sub>2</sub>’nin kristal yapısında herhangi bir bozunmanın olmadığı tespit edilmiştir.

Şekil 2. SiO<sub>2</sub>-NH<sub>2</sub> ve Ru@SiO<sub>2</sub>-NH<sub>2</sub> örneklerine ait XRD desenleri.

Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü ile katalizlenen DMAB’nin hidrolizi tepkimesinde, tepkime hızına katalizör miktarlarının etkisini incelemek için, MeAB derişimi (23 mg, 100 mM) sabit tutularak farklı miktarlarda Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizör kullanımıyla DMAB’nin hidroliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 3’da farklı derişimlerde Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü (Ru@ SiO<sub>2</sub>-NH<sub>2</sub> = 75 mg,

100 mg, 125mg ve 150 mg) varlığında katalizlenen DMAB'nin hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazın DMAB gaz hacmine karşı zaman grafiği verilmektedir.

Şekil 3. Farklı miktarlarda Ru@SiO<sub>2</sub>-NH<sub>2</sub> katalizörü ile katalizlenen DMAB'nin hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) DMAB gaz hacmine karşı zaman grafiği.

Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü ile katalizlenen DMAB'nin hidroliz tepkimesinde tepkime hızına substrat derişiminin etkisini incelemek amacıyla, nanokatalizör derişimi (100 mg) sabit tutularak farklı derişimlerde DMAB kullanılarak katalitik hidroliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 4'de farklı derişimlerde ([DMAB] = 100.0 mM, 150 mM, 200 mM, ve 250 mM) substrat kullanılarak katalizlenen HB'nin hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazın DMAB gaz hacmine karşı zaman grafiği verilmektedir.

Şekil 4. Farklı derişimlerde DMAB kullanılarak Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü ile katalizlenen DMAB'nin hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) gaz hacmine karşı zaman grafiği.

Ru@ SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü varlığında DMAB'nin hidroliz tepkimesine sıcaklığın etkisini belirlemek amacıyla katalizör ve substrat miktarları sabit tutularak sıcaklık derişimi etkisi incelenmiştir. Şekil 5'te farklı sıcaklıklarda gerçekleştirilen hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazın DMAB gaz hacmine karşı zaman grafiği verilmektedir. Beklenildiği gibi katalitik hidroliz tepkime hızının sıcaklıkla doğru orantılı olarak arttığı görülmüştür.

Şekil 5. Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü ile katalizlenen DMAB'nin farklı sıcaklıklarda gerçekleştirilen hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) DMAB gaz hacmine karşı zaman grafiği.

## SONUÇ

### Bu çalışma kapsamında elde edilen sonuçlar özetle şu şekilde sıralanabilir:

SiO<sub>2</sub>-NH<sub>2</sub> destekli rutenyum nanoküpleri ıslak emdirme-indirgeme yöntemiyle sentezlendi.

Sentezlenen Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörü SEM/SEM-EDX analizleri ile morfolojik olarak tanımlanması yapılmıştır.

Sentezlenen Ru@SiO<sub>2</sub>-NH<sub>2</sub> nanokatalizörünün Dimetil-aminboranın (DMAB) hidroliz tepkimesi yoluyla hidrojen üretimindeki katalitik etkinliği (katalizör miktarına, substrat derişimine ve sıcaklığa bağlı katalitik etkinliği) incelenmiştir.

## TEŞEKKÜR

2209-A- Lisans Öğrencilerine Yönelik Araştırma Projesi Destek Programı kapsamındaki projemize (Proje No:1919B012206282) maddi desteği için Türkiye Bilimsel ve Teknolojik Araştırma Kurumu'na teşekkür ederiz.

## ORAL PRESENTATION

### Grafen Oksit Katkılı Metal Oksit Esaslı Katı Destek Yapısında Kararlılaştırılmış Manyetik Rutenyum (0) Nanokümlerinin Hidrazin-Boran Metanolizinden Hidrojen Üretiminde Katalitik Performanslarının İncelenmesi

Sidar Dündar<sup>1</sup>, Mehmet Gülcan<sup>1</sup>

<sup>1</sup>Van Yüzüncü Yıl Üniversitesi Fen Fakültesi, Kimya Bölümü, Van, Türkiye

#### Özet

Bu çalışmada Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO kompoziti destekli Ru (0) nanokümleri ıslak emdirme-indirgeme yöntemiyle hazırlanarak HB'in metanolizinden hidrojen üretimindeki katalitik performansları (etkinlik, tekrar kullanılabilirlik ve kinetik çalışmalar açısından) araştırıldı. Hazırlanan Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>- Fe<sub>3</sub>O<sub>4</sub>-rGO kompoziti destekli rutenyum nanokümleri, ICP-OES, SEM, SEM/EDX gibi karakterizasyon teknikleriyle tanımlandı.

**Anahtar Kelimeler:** Hidrazin-boran, Hidrojen, Metanoliz, Nanoküme, Rutenyum

#### Investigation of Catalytic Performances of Stabilized Magnetic Ruthenium (0) Nanoclusters in Graphene Oxide Doped Metal Oxide Based Solid Support Structure in Hydrogen Production from Hydrazine-Borane Methanolysis

#### Abstract

In this study, Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO composite supported Ru (0) nanoclusters were prepared by the wet impregnation-reduction method and their catalytic performance (in terms of efficiency, reusability and kinetic studies) in hydrogen production from the methanolysis of HB was investigated. The prepared Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO composite supported ruthenium nanoclusters were identified by characterization techniques such as ICP-OES, SEM, SEM/EDX.

**Keywords:** Hydrazine-borane, Hydrogen, Methanolysis, Nanocluster, Ruthenium

#### GİRİŞ

Yenilenebilirliği ve yüksek enerji yoğunluğu sayesinde hidrojen, çevre kirliliğini ve enerji kıtlığı engellerini azaltmak için umut verici bir temiz enerji taşıyıcısı olarak geniş çapta kabul görmektedir. Hidrojenin uygulanabilir bir enerji taşıyıcısı olarak kullanılabilmesi için güvenli ve verimli depolanması çok önemlidir [1,2]. Birçok hidrojen depolama yöntemi geliştirilmiş olmasına rağmen, metal borohidrür [3-5], amonyak-boran [6-8], gibi sıvı fazda kimyasal hidrojen depolama malzemeleri [6], sulu hidrazin [9], formik asit [10], etilendiamin-bisboran [11], metilamin-boran [12,13] ve hidrazin-boran, (N<sub>2</sub>H<sub>4</sub>BH<sub>3</sub>, HB) [14,15], bunlar gaz veya sıvı hidrojen depolama sistemlerine göre daha yüksek enerji yoğunlukları, daha yüksek stabilite ve daha düşük potansiyel riskleri nedeniyle hidrojeni depolamanın en etkili yolları olarak kabul edilmektedir. Ağırlıkça %15,4'lük hidrojen depolama kapasitesiyle HB, önemli bir bor-azot bileşiği olarak kabul edilir. HB'de depolanan hidrojen, termoliz, sulu olmayan çözücülerde dehidrojenasyon veya solvoliz (hidroliz veya metanoliz) yoluyla serbest bırakılabilir. Solvoliz, diğer yöntemlerin sert reaksiyon koşullarına sahip olması ve hidrojen üretim hızının yavaş olması nedeniyle tercih edilmektedir. HB'nin metanolizi ayrıca uygun katalizör varlığında 3.0 eşdeğer hidrojen açığa çıkarabilir [14].

Ayrıca katalitik reaksiyonun mekanik özellikleri göz önüne alındığında, HB'nin yapısındaki BH<sub>3</sub> grubunun hidrolizinden hidrojen üretmek mümkün olduğu gibi, seçici olarak gerçekleştirilen hidrojen üretim süreçlerinde N<sub>2</sub>H<sub>4</sub> grubundaki hidrojenleri de ortaya çıkarmak mümkündür. Seçici olarak gerçekleştirilebilen bu reaksiyonlarda 1 mol HB'nin tamamen dehidrojenasyonu sonucunda 5:1 mol oranında H<sub>2</sub> ve N<sub>2</sub>'nin oluşabileceği rapor edilmiştir [16-19].

Bu çalışmada öncelikle grafen oksit katkılı metal oksit esaslı kompozit katı destek malzemesi (Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO) sentezlendi. Ardından Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO kompoziti destekli Ru (0) nanokümleri ıslak

emdirme-indirgeme yöntemiyle hazırlanarak hazırlanmış olan Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO katalizörü ICP-OES (İndüktif Eşleşmiş Plazma-Optik Emisyon Spektrometresi), SEM (Taramalı Elektron Mikroskopu), SEM/EDX (Taramalı Elektron Mikroskopu/Enerji Dağılımlı X-Işını Spektroskopisi) gibi karakterizasyon teknikleriyle tanımlandı. Daha sonra Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO katalizörünün katalitik performansı HB'ın metanolizinden hidrojen üretimi tepkimesinde etkinlik ve dönüşüm açısından test edilmiştir. Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO katalizörünün HB'ın metanolizi tepkimesindeki tekrar kullanılabilirlik performansları da incelendikten sonra farklı sıcaklıklarda katalitik metanoliz tepkimeleri gerçekleştirilerek tepkimenin aktivasyon parametreleri hesaplanmıştır.

## MATERYAL

SnCl<sub>2</sub>·2H<sub>2</sub>O (kalay (II) klorür 2.hidrat), sodyum sitrat (Na<sub>3</sub>C<sub>6</sub>H<sub>5</sub>O<sub>7</sub>·2H<sub>2</sub>O), NaOH, FeCl<sub>2</sub>·4H<sub>2</sub>O, FeCl<sub>3</sub>·6H<sub>2</sub>O, CoCl<sub>2</sub>, NaBH<sub>4</sub>, Na<sub>2</sub>CO<sub>3</sub>, RuCl<sub>3</sub>·3H<sub>2</sub>O, dihidrazin sülfat kimyasalları ticari olarak temin edilmiştir.

## METOT

Bu çalışma kapsamında gerçekleştirilen işlemler aşağıda maddeler halinde sunulmuştur:

**Grafen Oksit Katkılı Metal Oksit Esaslı Katı Destek Yapısının Sentezi:** Bu aşamada manyetit (Fe<sub>3</sub>O<sub>4</sub>), kalay (II,III) oksit (Sn<sub>3</sub>O<sub>4</sub>), kobalt (II,III) oksit (Co<sub>3</sub>O<sub>4</sub>), indirgenmiş grafen oksit (rGO) ve bu yapıların belirli oranlardaki kompozisyonlarından elde edilerek kompozit yapı (Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO) katı destek malzemeleri sentezlenmiştir. Uygulanacak sentez protokolleri aşağıda detaylı olarak verilmiştir:

**Kalay (II, III) oksit (Sn<sub>3</sub>O<sub>4</sub>) Sentezi:** Sn<sub>3</sub>O<sub>4</sub> yapısı hidrotermal yöntemle sentezlenmiştir. Bu amaçla kalay (II) klorür (SnCl<sub>2</sub>·2H<sub>2</sub>O) ve sodyum sitrat (Na<sub>3</sub>C<sub>6</sub>H<sub>5</sub>O<sub>7</sub>·2H<sub>2</sub>O) 10 mL saf suda çözülerek bir karışım elde edildi. Bu karışım üzerine 0.2 M NaOH çözeltisi karıştırılarak eklendi ve karışım 100 mL hacimli bir otoklav içerisine alınarak ve 180 °C'de 12 saat boyunca bekletildi. Ardından otoklav oda sıcaklığına kadar soğutulmuş ve katı ürün izole edilerek yıkanıp (saf su ve 0.2 M NaOH çözeltisi ile) vakum etüvde 70 °C'de kurutulmuştur [20].

**Kobalt (II, III) oksit (Co<sub>3</sub>O<sub>4</sub>) Sentezi:** Co<sub>3</sub>O<sub>4</sub> partiküllerinin sentezi için öncü olarak CoCl<sub>2</sub> ve NaOH kullanılmıştır. Öncelikle CoCl<sub>2</sub> ve NaOH'in ayrı beherlerde 25 mL 0.4 M'lık çözeltileri hazırlandı. NaOH çözeltisi, sürekli karıştırılarak CoCl<sub>2</sub> çözeltisine 80 °C'de damla damla ilave edildi. Mavi çökeltilerin yavaş yavaş pembe çökeltilere dönüşümünün gözlenmesinin ardından, kuvvetlice karıştırılarak yukarıdaki süspansiyonlara 5 mL %30'luk H<sub>2</sub>O<sub>2</sub> çözeltisi eklendi. Pembe çökeltiler yavaş yavaş kahverengiye dönüşümü gözlemlendi. Renk değişimi, H<sub>2</sub>O<sub>2</sub> eklenmesiyle Co (II)'nin Co (III)'e oksidasyonu olarak yorumlandı. Nihai çözelti, 100 mL iç hacme sahip paslanmaz çelik otoklava konularak ve 12 saat 150 °C'de bekletildi. Bu süre sonunda hidrotermal reaktör oda sıcaklığına soğutulmuş ve kahverengi ürün birkaç kez saf su ve etanol ile yıkandı. Yıkanan katı ürün 8000 rpm'de 20 dakika santrifüjlenerek ve vakum altında 60 °C'de 24 saat bekletilerek kurutuldu [21].

**İndirgenmiş Grafen Oksit (rGO) Sentezi:** Grafen oksit (GO) sentezi, grafitten başlanarak kaynakçada iyi bilinen ve modifiye Hummers yöntemi [22] kullanılarak gerçekleştirildi. rGO da yine kaynakçada bildirilen prosedüre uygun biçimde hazırlanmıştır [23]. Bu amaçla, 0.15 g GO 150 mL distile suya konulacak ve yaklaşık 30 dakika ultrasonik banyoda işleminden geçirildi. 1.2 g NaBH<sub>4</sub>, 30 mL saf su içinde çözüldükten sonra GO karışımına damla damla ilave edildi. Ardından karışımın pH'ı %5 Na<sub>2</sub>CO<sub>3</sub> ile 9-10'a ayarlanarak ve pH ayarlı karışım 80 °C'de 1 saat karıştırıldı. Koyu renkli karışım, 20 dakika boyunca 8000 rpm'de birkaç kez santrifüjlendikten sonra elde edilen rGO, 60 °C'de 24 saat vakum altında bekletilerek kurutuldu.

**Grafen Oksit Katkılı Metal Oksit Esaslı (Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO) Katı Destek Malzemesinin Sentezi:** Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO kompoziti, Sn<sub>3</sub>O<sub>4</sub>/Co<sub>3</sub>O<sub>4</sub>/Fe<sub>3</sub>O<sub>4</sub>:rGO'nun 10:1 ağırlık oranına uyacak şekilde hazırlandı. İlk olarak, 0.23 g hazırlanmış rGO, 20 mL distile su içinde dağıtılarak ve 30 dakika boyunca ultrasonik banyoda karıştırılarak iyice dağılması sağlandı. Ardından, önceden sentezlenmiş Sn<sub>3</sub>O<sub>4</sub> ve Co<sub>3</sub>O<sub>4</sub> partikülleri, 40 dakika arayla rGO karışımına ayrı ayrı ilave edilerek ve kuvvetlice karıştırıldı. Daha sonra 20 mL distile suya 1:2 molar oranda FeCl<sub>2</sub>·4H<sub>2</sub>O ve FeCl<sub>3</sub>·6H<sub>2</sub>O ilave edilecek ve bu çözelti rGO, Sn<sub>3</sub>O<sub>4</sub> ve Co<sub>3</sub>O<sub>4</sub> partikülleri içeren önceki çözeltilere eklenerek ve nihai karışım, 80 °C'de 30 dakika karıştırıldı. Ardından bu karışıma 20 mL distile su içerisinde 0.4 M NaOH damla damla ilave edildi. Çözeltinin pH'ı 9-10'a ulaştıktan sonra karışım, 80 °C'de 4 saat boyunca karıştırılarak ve bu süre sonunda oda sıcaklığına kadar soğutuldu. Süzülerek ayrılan karışım birkaç kez etanol ve damıtılmış su ile yıkanarak, ardından 8000 rpm'de 20 dakika santrifüjlenerek ayrılarak ve vakum altında 24 saat 60°C'de tutularak kurutuldu [15].

**Ru (0) Nanokümlerinin Hazırlanması ve Tanımlanması:** Çalışmada grafen oksit katkılı metal oksit esaslı kompozit (Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO) katı destek yapısında kararlı manyetik Ru (0) nanokümleri, çözelti

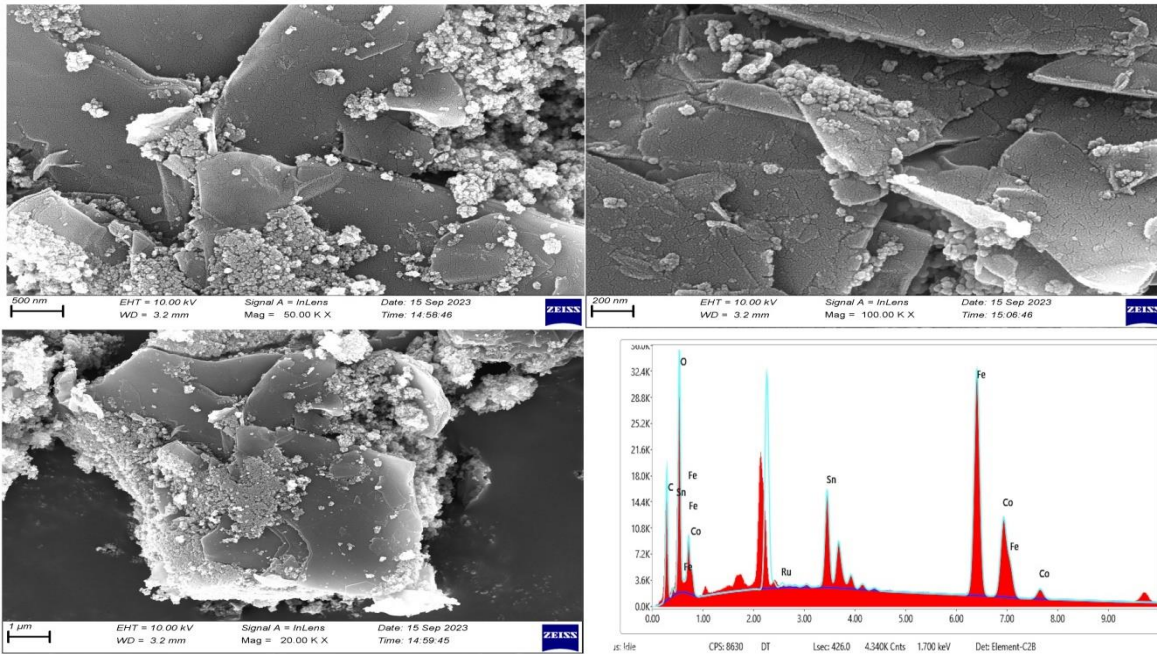

fazında metal tuzunun destekleyici yüzeyine depolanması ve daha sonra  $\text{NaBH}_4$  kullanılarak indirgenmesiyle tepkime dışı (*ex-situ*) olarak hazırlandı. Bu amaçla, Ru metalinin başlangıç tuzu  $\text{Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  katı destek malzemesinin yüzeyine emdirilmesi (3 saat boyunca 750 rpm karıştırma hızında) ve daha sonra indirgeyici ajan varlığında indirgenmesi sağlandı. Hazırlanan katalitik malzeme ( $\text{Ru@Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$ ) HB'nin metanoliz tepkimesinde katalizör olarak kullanılarak ve gaz çıkış hızları ve dönüşümleri incelenerek katalitik etkinliğin en yüksek olduğu optimum çalışma koşulları belirlendi. Son olarak elde edilen katalitik malzeme; ICP-OES (İndüktif Eşleşmiş Plazma-Optik Emisyon Spektrometresi), SEM (Taramalı Elektron Spektroskopis), SEM-Elementel Haritalama v gibi ileri analitiksel ve spektroskopik yöntemler kullanılarak tanımlanmıştır. Bu analitiksel yöntemlerden ICP-OES; grafen oksit katkılı metal oksit esaslı kompozit yapıları katı destek malzemesinin yüzeyine tutturulan Ru metal miktarının tespiti, SEM; Ru (0) nanokümlerinin morfolojilerinin belirlenmesi, SEM-Elementel Haritalama; seçili bölgelerde Ru (0) nanokümlerine ilişkin elementel bileşimin belirlenmesi amacıyla kullanılmıştır.

**HB'nin Metanoliz Tepkimesinde Katalitik Performansın Belirlenmesi ve Tepkime Kinetiğinin İncelenmesi:** Çalışmanın bu kısmında  $\text{Ru@Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  katalitik malzemesinin HB'nin metanoliz tepkimesinde katalitik performansı, tepkime sonucu açığa çıkacak gazın hacimsel ölçümü ve katalitik etkinlik göz önüne alınarak incelendi. Ru (0) nanokümlerinin etkinlik, seçicilik, dönüşüm ve dayanıklılık yönünden en iyi katalitik performansın tespit edildiği koşullar için metanoliz tepkimesi farklı çalışma koşullarında (katalizör ve substrat derişimi ve farklı sıcaklıklarda) gerçekleştirildi.

## BULGULAR ve TARTIŞMA

Çalışmanın ilk aşamasında grafen oksit katkılı metal oksit esaslı kompozit katı destek malzemesi ( $\text{Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$ ) sentezlendi. Ardından  $\text{Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  kompoziti destekli rutenyum nanokümleri ıslak emdirme-indirgeme yöntemiyle hazırlanarak HB'nin metanolizinden hidrojen üretimindeki katalitik performanslar incelenmiştir.

Morfolojik olarak  $\text{Ru@Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  katalizörünün incelenmesi için SEM analizleri yapılmıştır ve bu görüntüler Şekil 1'de verilmektedir. Farklı çözünürlükte ve büyütme oranlarında alınan SEM görüntülerinden Ru metallerinin destek malzemesinin yüzeyine homojen olarak dağıldığı görülmektedir (Şekil 1 (a, b ve c)). Ayrıca SEM analizi sırasında yapılan haritalandırmada hem Ru metalinin (Şekil 1 (d)) ve destek malzemesinde bulunan C, Sn, Co, Fe ve O (Şekil 1 (d)) elementlerinin varlığı açıkça anlaşılmaktadır.

Şekil 1.  $\text{Ru@Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  katalizörüne ilişkin (a) 500 nm ölçekli SEM görüntüsü (b) 200 nm ölçekli SEM görüntüsü (c) 1 μm ölçekli SEM görüntüsü, (d) Taramalı Elektron Mikroskopu/Enerji Dağılımlı X-Şışını Spektroskopisi görüntüsü

$\text{Ru@Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  nanokatalizörü ile katalizlenen HB'nin metanoliz tepkimesinde, tepkime hızına katalizör miktarlarının etkisini incelemek için, HB derişimi (23 mg, 100 mM) sabit tutularak farklı miktarlarda  $\text{Ru@Sn}_3\text{O}_4\text{-Co}_3\text{O}_4\text{-Fe}_3\text{O}_4\text{-rGO}$  nanokatalizör kullanımıyla HB'nin metanoliz tepkimesi 298 K sıcaklıkta

gerçekleştirilmiştir. Şekil 2’de farklı derişimlerde Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörü (Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO = 50 mg, 75 mg, 100 mg ve 125 mg) varlığında katalizlenen HB’nin hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazın HB gaz hacmine karşı zaman grafiği verilmektedir.

Şekil 2. Farklı miktarlarda Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO katalizörü ile katalizlenen HB’nin metanoliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) HB gaz hacmine karşı zaman grafiği.

Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörü ile katalizlenen HB’nin metanoliz tepkimesinde tepkime hızına substrat derişiminin etkisini incelemek amacıyla, nanokatalizör derişimi (50 mg) sabit tutularak farklı derişimlerde HB kullanılarak katalitik metanoliz tepkimesi 298 K sıcaklıkta gerçekleştirilmiştir. Şekil 3’de farklı derişimlerde ([EDB] = 50.0 mM, 75 mM, 100 mM, ve 125 mM) substrat kullanılarak katalizlenen HB’nin metanoliz tepkimesinde açığa çıkan H<sub>2</sub> gazın HB gaz hacmine karşı zaman grafiği verilmektedir.

Şekil 3. Farklı derişimlerde HB kullanılarak Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörü ile katalizlenen HB’nin metanoliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) gaz hacmine karşı zaman grafiği.

Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörü varlığında HB’nin metanoliz tepkimesine sıcaklığın etkisini belirlemek amacıyla katalizör ve substrat miktarları sabit tutularak sıcaklık derişimi etkisi incelenmiştir. Şekil 4’te farklı sıcaklıklarda gerçekleştirilen metanoliz tepkimesinde açığa çıkan H<sub>2</sub> gazın HB gaz hacmine karşı zaman grafiği verilmektedir. Beklenildiği gibi katalitik metanoliz tepkime hızının sıcaklıkla doğru orantılı olarak arttığı görülmüştür.

Şekil 4. Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörü ile katalizlenen HB'nin farklı sıcaklıklarda gerçekleştirilen metanoliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) HB gaz hacmine karşı zaman grafiği.

## SONUÇ

### Bu çalışma kapsamında elde edilen sonuçlar özetle şu şekilde sıralanabilir:

Çalışmanın ilk aşamasında grafen oksit katkılı metal oksit esaslı kompozit katı destek malzemesi (Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO) başarıyla sentezlendi.

Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO kompoziti destekli rutenyum nanokümleri ıslak emdirme-indirgeme yöntemiyle sentezlendi.

Sentezlenen Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörü SEM/SEM-EDX analizleri ile morfolojik olarak tanımlanması yapılmıştır.

Sentezlenen Ru@Sn<sub>3</sub>O<sub>4</sub>-Co<sub>3</sub>O<sub>4</sub>-Fe<sub>3</sub>O<sub>4</sub>-rGO nanokatalizörünün hidrazin-boranın (HB) metanoliz tepkimesi yoluyla hidrojen üretimindeki katalitik etkinliği (katalizör miktarına, substrat derişimine ve sıcaklığa bağlı katalitik etkinliği) incelenmiştir.

## TEŞEKKÜR

\* 2209-A- Lisans Öğrencilerine Yönelik Araştırma Projesi Destek Programı kapsamındaki projemize (Proje No: 1919B012220946) maddi desteği için Türkiye Bilimsel ve Teknolojik Araştırma Kurumu'na teşekkür ederiz.
