Molekül ağırlığının yaklaşık onda biri hidrojen den oluşan etilendiamin-bisboran (BH<sub>3</sub>NH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>BH<sub>3</sub>; EDB), hidrojen depolama malzemesi olarak son yıllarda ilgi odağı haline gelen ve birçok çalışmaya konu olan bir bileşik olarak ön plana çıkmaktadır. EDB, hidrojen üretimi üzerine yapılan araştırma/uygulama çalışmalarında yoğun bir biçimde kullanılan amonyak borana (AB) göre daha stabil bir yapıya sahiptir. Etilen diamin bisboranın bir diğer avantajı ise amonyak borandan hidrojen üretimi sürecinde açığa çıkan uçucu ve istenmeyen boran türevi bileşiklere etilendiamin-bisborandan hidrojen üretimi sırasında rastlanılmamasıdır. EDB, uygun bir katalizör varlığında termoliz ve hidroliz yoluyla yapısındaki hidrojeni serbest bırakır. Termoliz işleminin yakıt hücresi uygulamaları için dezavantajlara sahip olması hidroliz reaksiyonunu ön plana çıkarmaktadır. EDB'nin hidroliz reaksiyonu sonucunda her mol EDB için 6 mol H<sub>2</sub> açığa çıkmaktadır.

Bu çalışmada polimerik bir malzeme olan polivinilpirolidon (PVP) kararlı tek (Rh ve Ru) veya iki metalli (Ru-Rh) nanokümeler alkol-indirgeme yöntemiyle hazırlanarak etilendiamin-bisboranın hidrolizinden hidrojen üretimindeki katalitik performansları incelendi. Hazırlanan PVP kararlı tek veya iki metalli nanokümelerin EDB'den hidroliz tepkimesi yoluyla hidrojen üretiminde tekrar kullanılabilirlik performansları da incelenerek farklı sıcaklıklarda hidroliz tepkimeleri gerçekleştirildi ve aktivasyon parametreleri hesaplandı.

**Anahtar Kelimeler:** Etilendiamin-bisboran, Hidrojen, Hidroliz, Nanoküme, PVP

#### Absract

Ethylenediamine-bisborane (BH<sub>3</sub>NH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>BH<sub>3</sub>; EDB), which consists of approximately one tenth of its molecular weight of hydrogen, stands out as a compound that has become the focus of attention in recent years as a hydrogen storage material and has been the subject of many studies. EDB has a more stable structure than ammonia borane (AB), which is used extensively in research/application studies on hydrogen production. Another advantage of ethylene diamine bisborane is that volatile and undesirable borane-derived compounds, which are released during the hydrogen production process from ammonia borane, are not encountered during the hydrogen production from ethylene diamine bisborane. EDB releases the hydrogen in its structure through thermolysis and hydrolysis in the presence of a suitable catalyst. The fact that the thermolysis process has disadvantages for fuel cell applications brings the hydrolysis reaction to the fore. As a result of the hydrolysis reaction of EDB, 6 moles of H<sub>2</sub> are released for each mole of EDB.

In this study, single (Rh and Ru) or bimetal (Ru-Rh) nanoclusters stabilized by polyvinylpyrrolidone (PVP), a polymeric material, were prepared by alcohol-reduction method and their catalytic performance in hydrogen production from the hydrolysis of ethylenediamine-bisborane was examined. The reusability performances of the prepared PVP-stabilized mono- or bi-metallic nanoclusters in hydrogen production through hydrolysis reaction from EDB were also examined, hydrolysis reactions were carried out at different temperatures and activation parameters were calculated.

**Key Words:** Ethylenediamine-bisborane, Hydrogen, Hydrolysis, Nanocluster, PVP

## GİRİŞ

Endüstri devriminden itibaren dünyamızda gözlemlenen ekonomik, sosyal ve teknolojik gelişmelerin en kritik parametresi olarak kabul edilen enerji her geçen gün artan önemiyle küresel gündem maddelerinden biri haline gelmiştir. Yaşam tarzında meydana gelen değişiklikler ve hızla artan nüfus, enerjiye olan talebi artırmış ve bu talep uzun bir süre yoğunluklu olarak fosil yakıtlardan karşılanmıştır. Fosil yakıtlardan enerji üretim süreci sonucu açığa çıkan ve atmosfere yayılan zararlı ve zehirli gazların miktarının kabul edilebilir oranların çok üzerine çıkması başa çıkılması oldukça zor birçok soruna neden olmuştur. Bu sorunlar; küresel ısınma, bitki örtüsünün bozulması, sağlık sorunları, asit yağmurları, iklim değişiklikleri, temiz su kaynaklarının ve toprağın kirlenmesi şeklinde sıralanabilir. Bu denli büyük ve küresel sorunlar alternatif enerji kaynaklarına yönelimi ve bu alanda yapılan araştırma çalışmalarının sayısını artırmıştır. Güneş enerjisi, rüzgar enerjisi, jeotermal enerji, hidroelektrik enerjisi, biyoenerji, dalga enerjisi, okyanus termal enerjisi ve hidrojen enerjisi bilim insanlarının çalışmalarına konu olan önemli alternatif enerji kaynakları olarak sıralanabilir. Bu enerji kaynakları sürdürülebilirlik, kaynak çeşitliliği, verimlilik ve çevre temizliği gibi kriterlere göre değerlendirildiğinde diğer alternatif enerji kaynaklarına göre öne çıkan enerji kaynağı hidrojen enerjisi olmaktadır [1-3]. Enerji sistemleri içerisinde enerji aktarıcısı, taşıyıcısı veya değiştiricisi olarak değerlendirilebilen hidrojen, evrenin en basit ve en çok bulunan elementi olup, renksiz, kokusuz, havadan 14,4 kez daha hafif ve tamamen zehirsiz bir gazdır. Yanma tepkimesi sonucu hiçbir zararlı veya zehirli atığın oluşmadığı hidrojen, bütün yakıtlar içerisinde birim kütlede en yüksek enerji içeriğine sahip gaz olarak dikkat çekmektedir. Yukarıda sayılan avantajlarına rağmen, hidrojenin güvenli, verimli ve ekonomik depolama ve nakliye koşullarının oluşturulmasında yaşanan zorluklar, hidrojen enerjisinin yaygınlaşmasının önündeki en büyük engel olarak görülmektedir. Hidrojenin çok küçük bir miktarının bile gaz halinde çok fazla hacim kaplaması hidrojenin gaz halinde depolanmasını zorlaştırmaktadır. Hidrojenin sıvı halde depolanması için ise yüksek basınçlı ve dayanıklı kaplara ihtiyaç duyulmaktadır. Bu tür yüksek basınçlı kapların üretiminde yaşanan zorluklar ve bu kapların oldukça pahalı malzemeler olması hidrojenin sıvı halde depolanmasını da zorlaştırmaktadır. Sıvı ve gaz fazında karşılaşılan güvenlik ve maliyet ekseni bu zorluklar katı fazda hidrojen barındıran katı maddelere yönelik çalışmaların artmasına neden olmuştur. [4-6]. Katı fazda yapısında hidrojen barındıran malzemelerin başında amin boran türevleri gelmektedir. Diğer hidrojen kaynaklarına oranla daha fazla çalışmaya konu olmuş bu bileşiklerin en önemli avantajları kararlı yapıları, yüksek hidrojen içerikleri ve düşük toksisiteleri şeklinde sıralanabilir. Hidroliz, termoliz veya hidrotermoliz yöntemleri ile hidrojen elde edilebilen bu bileşiklerden amonyak boran ağırlıkça %19,6, hidrazin boran ağırlıkça %15,4 ve dimetilamin boran ağırlıkça %16,9 ve etilendiamin-bisboran ağırlıkça %11,4 hidrojen kapasitesine sahiptir. Bu bileşiklerden etilendiamin-bisboran hidrojen üretimi üzerine yapılan çalışmaların uzunca bir süre yoğunlaştığı bileşik olan amonyak borana oranla daha kararlı bir yapıya sahiptir. Etilendiamin-bisboranın bir diğer avantajı ise amonyak borandan hidrojen üretimi sürecinde açığa çıkan zararlı ve istenmeyen bileşiklere etilen etilendiamin-bisborandan hidrojen üretimi sırasında rastlanılmamasıdır [7-9].

Etilendiamin-bisboran ılımlı koşullar altında ve sulu ortamda yapısındaki hidrojeni salabilmektedir. Ancak bu tepkimenin hedeflenen hızda ve yüksek verimle gerçekleştirilebilmesi için ihtiyaç duyulan en temel faktör uygun destekleyici ve metallerin bir araya getirilmesi sonucu katalitik aktivitesi yüksek nanokatalizörlerin hazırlanmasıdır [10,11].

Yapılan çalışmada katalizör ömrünü kısaltan ve katalizör performansını düşüren en temel sorun olan metal topaklaşmasına karşı oldukça yüksek stabiliteye sahip organik bir polimer olan Poli(N-vinil-2-pirolidon) (PVP) kullanıldı.

Şekil 1. Poli (N-vinil-2-pirolidon) bileşiğinin molekül yapısı

Birçok polar çözücüde çözünebilir ve oldukça non-iyonik bir karaktere sahip olan PVP NC=O fonksiyonel yapılarının çoklu koordinasyonu yoluyla elde edilen oldukça geniş bir yüzey alanına sahiptir [12-17]. Geniş yüzey alanı sayesinde metal nanopartiküllerin mükemmel bir şekilde dağıtılabilmelerine olanak sağlayan PVP'nin destek malzemesi olarak kullanılması sonucu sentezlenen nanokatalizörlerin etilendiamin-bisborandan hidroliz yoluyla hidrojen üretiminde oldukça verimli bir katalizör olduğu belirlendi.

## MATERYAL

Rutenyum (III) klorür hidrat ( $\text{RuCl}_3 \cdot x\text{H}_2\text{O}$ ), Rodyum(III) klorür hidrat ( $\text{RhCl}_3 \cdot x\text{H}_2\text{O}$ ), poli(N-vinil-2-pirolidon) (PVP) ve etanol Sigma-Aldrich'ten ticari olarak temin edildi. Saf su, su arıtma sistemi (Milli Q-pure WS) ile damıtıldı. Çalışmada kullanılan cam malzemeler ve manyetik karıştırma çubukları yıkandıktan sonra saf su ve aseton ile durulandı, ardından 160 °C'de etüvde kurutuldu.

## YÖNTEM

### EDB Sentezi ve Karakterizasyonu

Yapılan çalışmanın ilk aşamasında EDB sentezi gerçekleştirildi. Bu amaçla, 500 mL iki boyunlu balon içerisine 2.9 g (76.66 mmol)  $\text{NaBH}_4$  konulduktan sonra üzerine 300 ml THF ilave edildi. Oda sıcaklığında 30 dk karıştırılan karışım üzerine 4.87 g (36.61 mmol) etilendiamin hidroklorür eklendikten sonra tepkime kabının ağzı kapatılarak 24 saat boyunca oda sıcaklığında ve Ar atmosferinde karıştırıldı. Katı kısım izole edildikten sonra geriye kalan sıvı kısımdan bütün THF uzaklaştırıldı. Elde edilen katı ürün üzerine 100 mL önceden kurutulmuş dietileter eklenip 0 °C'de iki saat boyunca karıştırıldı. İki saatin sonunda katı kısım tekrar süzüldü ve eter fazındaki ürün (EDB) oda sıcaklığında bir gece bekletildi. Dietileterin tamamen uçması sonucu elde edilen beyaz renkli kristaller kullanılmak üzere amber renkli cam bir kaptaki saklandı.

### PVP Kararlı Tek Metalli (Rh ve Ru) Nanokümlerin Hazırlanması

PVP kararlı tek metalli (Rh ve Ru) nanokümleri ( $\text{Rh@PVP}$  ve  $\text{Ru@PVP}$ ) alkol indirgeme yöntemine göre sentezlendi. Bu sentez protokolüne göre, etanol-su karışımı içinde 0.25 mmol  $\text{RhCl}_3 \cdot x\text{H}_2\text{O}$  ve  $\text{RuCl}_3 \cdot x\text{H}_2\text{O}$  tuzlarıyla ayrı ayrı hazırlanan çözeltilere 2.5 mmol (200 mg) PVP ilave edildi ve iki saat kaynatıldı. İki saatin sonunda renk değişiminin gözlemlendiği çözeltide PVP hem kararlılaştırıcı ve hem de indirgen rolü oynamaktadır.

### PVP Kararlı İki Metalli (Rh-Ru) Nanokümlerin Hazırlanması

PVP kararlı iki metalli (Rh-Ru) nanokümleri ( $\text{Rh-Ru@PVP}$ ) alkol indirgeme yöntemine göre sentezlendi. Bu amaçla etanol-su karışımı içinde 0.125 mmol  $\text{RhCl}_3 \cdot x\text{H}_2\text{O}$  ve 0.125 mmol  $\text{RuCl}_3 \cdot x\text{H}_2\text{O}$  tuzlarının birlikte bulunduğu çözeltiye 2.5 mmol (200 mg) PVP ilave edildi ve iki saat kaynatıldı. Çözeltide hedeflenen renk değişimi gerçekleşikten sonra çözelti kullanılmak üzere soğumaya bırakıldı.

## BULGULAR VE TARTIŞMA

Poli(N-vinil-2-pirolidon) ile kararlılaştırılmış tek metalli (Rh ve Ru) nanokümleri ( $\text{Rh@PVP}$  ve  $\text{Ru@PVP}$ ) ve iki metalli (Rh-Ru) nanokümleri ( $\text{Rh-Ru@PVP}$ ) alkolle indirgenme yöntemine göre, uygun rodyum ve

rutenyum tuzlarının PVP varlığında eşzamanlı olarak indirgenmesiyle sentezlendi. Bu yöntemde, PVP hem kararlılaştırıcı hem de indirgen olarak kullanıldı. Çözeltinin 2 saat boyunca kaynatılması sonucu renginin siyaha dönmesi, çözeltideki  $Rh^{3+}$  ve  $Ru^{3+}$  iyonlarının indirgenerek  $Rh^0$  ve  $Ru^0$  'a dönüştüğünü ve hedeflenen nanokümelerinin elde edildiğini göstermektedir.

Poli(N-vinil-2-pirolidon) ile kararlılaştırılmış rodyum-rutenyum nanokümelerindeki (Rh-Ru@PVP) parçacık boyutunun belirlenebilmesi amacıyla taramalı elektron mikroskobu (SEM) kullanıldı. Rh-Ru@PVP örneklerine ait 500 nm ve 1  $\mu m$  büyüklükteki SEM görüntüleri incelendiğinde Rh ve Ru parçacıklarının homojen olarak dağıldığı ve herhangi bir topaklaşmanın söz konusu olmadığı net bir şekilde anlaşılmaktadır (Şekil 2).

Şekil 2. Rh-Ru@PVP katalizörüne ait SEM görüntüleri

Yapılan kontrol deneyleri sonucunda Poli(N-vinil-2-pirolidon) ile kararlılaştırılmış rodyum-rutenyum nanokümelerinin (Rh-Ru@PVP) etilendiamin-bisboran'dan hidroliz tepkimesiyle hidrojen eldesinde oldukça aktif katalizörler oldukları belirlendi.

Şekil 3, etilendiamin-bisboran'dan Rh-Ru@PVP nanokümeleri katalizörlüğündeki hidroliz tepkimesine ilişkin (25 °C'de) farklı katalizör hacimlerinde (1 ml, 2ml, 3 ml, 4ml)) tepkime süresine karşı açığa çıkan  $H_2$  grafiklerini göstermektedir. Tepkimenin başından itibaren çok hızlı bir hidrojen gazı çıkışının gözlemlendiği hidroliz tepkimesinde hidrojen oluşum hızları ile katalizör miktarı beklenildiği gibi doğru orantılı bir şekilde değişmektedir.

Şekil 3. Etilen di amin bisboranın farklı Rh-Ru@PVP nanokümesi miktarlarındaki hidroliz tepkimesine ait tepkime süresine karşı açığa çıkan H<sub>2</sub> grafiği.

Rh-Ru@PVP nanokatalizörü ile katalizlenen EDB'nin hidroliz tepkimesinde tepkime hızına substrat derişiminin etkisini incelemek amacıyla, nanokatalizör derişimi sabit tutulup farklı derişimlerde EDB kullanılarak katalitik hidroliz tepkimesi gerçekleştirildi. Şekil 4'te farklı derişimlerde ([EDB] = 50 mM, 75 mM, 100 mM ve 125 mM) substrat kullanılarak katalizlenen EDB'nin hidroliz tepkimesinde açığa çıkan H<sub>2</sub> gazının zamana karşı grafiği verilmektedir. Grafikler incelendiğinde substrat derişimindeki artışın tepkime hızını artırdığı görülmektedir.

Şekil 4. Farklı derişimlerde EDB kullanılarak Rh-Ru@PVP nanokatalizörü ile katalizlenen EDB'nin hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) zamana karşı grafiği

Rh-Ru@PVP nanokatalizörü varlığında EDB'nin hidroliz tepkimesine sıcaklığın etkisini belirlemek ve tepkimeye ait termodinamik parametreleri hesaplamak amacıyla farklı sıcaklıklarda katalitik hidroliz tepkimeleri gerçekleştirildi. Şekil 5'te farklı sıcaklıklarda gerçekleştirilen hidroliz tepkimesinde açığa çıkan gazın zamana karşı grafiği verilmiştir. Katalitik hidroliz tepkime hızının sıcaklıkla doğru orantılı olarak arttığı görülmektedir.

Şekil 5. Rh-Ru@PVP nanokatalizörü ile katalizlenen EDB'nin farklı sıcaklıklarda gerçekleştirilen hidroliz tepkimesinde açığa çıkan gazın (H<sub>2</sub>) zaman karşı grafiği.

## SONUÇ

Yapılan çalışmada, poli(N-vinil-2-pirolidon) ile kararlaştırılmış bimetalik rodyum-rutenyum nanokümleri (Rh-Ru@PVP) sentezlendi, tanımlandı ve etilendiamin-bisboran'ın hidrolizinde katalizör olarak kullanıldı. Gerçekleştirilen deneysel çalışmaların sonuçları genel olarak şu şekilde özetlenebilir:

Poli(N-vinil-2-pirolidon) ile kararlaştırılmış rodyum-rutenyum nanokümleri (Rh-Ru@PVP), uygun rodyum ve rutenyum tuzlarının etanol-sulu karışımında poli(N-vinil-2-pirolidon) varlığında kaynatılması ve eşzamanlı indirgenmesi sonucu sentezlendi. Bu yöntemde, poli(N-vinil-2-pirolidon) hem kararlaştırıcı hem de indirgen rolü oynamaktadır. Sentezlenen Rh-Ru@PVP nanokümlerinin tanımlanmasında ileri spektroskopik ve analitiksel yöntemler kullanıldı.

Verimli ve çevreci bir şekilde sentezlenen ve tanımlanan Rh-Ru@PVP nanokümleri önemli amin boran bileşiklerinden biri olan etilendiamin-bisboran'ın hidroliz tepkimesinde katalizör olarak kullanıldı. Gerçekleştirilen kinetik çalışmalar sonucunda Rh-Ru@PVP nanokümlerinin etilendiamin-bisboran'ın hidrolizinde yüksek katalitik etkinliğe sahip oldukça etkin katalizörler oldukları tespit edildi.

Etilendiamin-bisboran'ın hidroliz tepkimesindeki dayanıklılık deneyleri Rh-Ru@PVP nanokümlerinin bu hidroliz tepkimesinde birbirini takip eden beşinci katalitik çevrim sonunda bile hala etkin olduklarını göstermektedir.

## Teşekkür

## ORAL PRESENTATION

### MIL-101 Yapısında Kararlılaştırılmış Altın (0) Nanokümlerinin Hazırlanması, Karakterizasyonu ve Nitrofenol Türevlerinin İndirgenmesinde Katalitik Performanslarının Araştırılması\*

Berfin Pehlivan<sup>1</sup>, Adem Rüzgar<sup>2</sup>, Mehmet Gülcan<sup>1</sup>

<sup>1</sup>Van Yüzüncü Yıl Üniversitesi Fen Fakültesi, Kimya Bölümü, Van, Türkiye

<sup>2</sup>Van Yüzüncü Yıl Üniversitesi Muradiye Meslek Yüksekokulu, Kimya ve Kimyasal İşleme Teknolojileri Bölümü, Van, Türkiye

#### Özet

Endüstriyel üretim süreçlerinin önemli bir kısmında ortaya çıkan nitrofenol ve türevlerinin verimli, çevreci ve ekonomik bir şekilde arıtılmaları veya dönüştürülmeleri önemli bir çalışma alanı olarak karşımıza çıkmaktadır. Yapılan araştırmalar kimyasal indirgeme (katalitik hidrojenasyon) yönteminin maliyet, verimlilik, zaman ve uygulanabilirlik açısından oldukça etkili bir arıtma yöntemi olduğunu göstermiştir. Bu yöntemin bir diğer avantajı da indirgenme sonucu elde edilen aminofenollerin nitrofenollere göre çok daha düşük toksisiteye sahip olmasıdır. Bununla birlikte, aminofenoller ve türevleri birçok analjezik ve antipiretik ilacın hazırlanmasında ara ürün veya ilaç etken maddesi olarak kullanılmaktadır. Boya ve kozmetik sanayiinde de yaygın olarak kullanılan aminofenoller yakıtlarda korozyon önleyici ve yağlayıcı olarak da kullanılmaktadır. Yapılan çalışmada oldukça zararlı ve tehlikeli kimyasallar olan 2-nitrofenol ve 4-nitrofenolün, 2-aminofenol ve 4-aminofenole verimli bir şekilde indirgenebilmesi amaçlandı. Bu amaç doğrultusunda MIL-101 destekli Au (0) nanokümleri tepkime içi hazırlanarak bu katalizörlerin farklı sıcaklık ve derişimlerde indirgenme tepkimelerindeki katalitik performansları incelendi. Hazırlanan katalizörün yapısal ve morfolojik özellikleri XRD, SEM, SEM/EDX ve UV-vis teknikleriyle ortaya konuldu. Nitrofenollerin aminofenollere katalitik indirgenmesi oda koşullarında UV-vis spektrofotometre kullanılarak takip edildi.

**Anahtar Kelimeler:** Nitrofenol, Hidrojenasyon, Katalizör, Nanoparçacık, MIL-101

#### Abstract

Efficient, environmentally friendly and economical purification or transformation of nitrophenol and its derivatives, which occur in a significant part of industrial production processes, emerges as an important field of study. Research has shown that the chemical reduction (catalytic hydrogenation) method is a very effective treatment method in terms of cost, efficiency, time and applicability. Another advantage of this method is that the aminophenols obtained as a result of reduction have much lower toxicity than nitrophenols. However, aminophenols and their derivatives are used as intermediate products or drug active ingredients in the preparation of many analgesic and antipyretic drugs. Aminophenols, which are widely used in the paint and cosmetics industry, are also used as corrosion inhibitors and lubricants in fuels. The aim of the study was to efficiently reduce 2-nitrophenol and 4-nitrophenol, which are very harmful and dangerous chemicals, to 2-aminophenol and 4-aminophenol. For this purpose, MIL-101 supported Au (0) nanoclusters were prepared for the reaction and the catalytic performances of these catalysts in reduction reactions at different temperatures and concentrations were examined. Structural and morphological properties of the prepared catalyst were revealed by XRD, SEM, SEM/EDX and UV-vis techniques. The catalytic reduction of nitrophenols to aminophenols was monitored using a UV-vis spectrophotometer under room conditions.

**Key Words:** Nitrophenol, Hydrogenation, Catalyst, Nanoparticle, MIL-101

#### GİRİŞ

Son yıllarda sıkça gündeme gelen “atık su” kavramı; genel olarak başta sanayi olmak üzere tarım, hayvancılık ve konutlarda kullanıldıktan sonra çevreye aktarılan ve yapısındaki zararlı kimyasallar ile insan yaşamını doğrudan ve dolaylı yollarla tehdit eden küresel bir sorun olarak tanımlanmaktadır. Hızlı nüfus artışı, iletişim teknolojilerindeki gelişmeler ve kentleşme gibi birçok parametreye bağlı olarak değişen ve çeşitlenen üretim ve tüketim süreçleri hem çevreye aktarılan atık su miktarını hem de atık suların yapısında bulunan ve toksik etki gösteren bileşiklerin çeşitliliğini ve sayısını artırmaktadır. Bu zararlı bileşiklerin önemli bir kısmını oluşturan organik bileşikler canlılar üzerindeki hayati etkileri nedeniyle öncelikle incelenmesi, arıtılması veya dönüştürülmesi gereken bileşikler olarak değerlendirilmektedir. Bu amaçla yapılan çalışmalar, incelen organik bileşiklerin önemli bir yüzdesinin nitrofenol ve türevlerine ait olduğunu ortaya koymuştur [1-4]. Yüksek

toksositeye, korrozif ve uyuşturucu özelliğe sahip olan nitrofenoller ve türevleri çok düşük konsantrasyonlarda bile temiz su kaynaklarını kirleterek tat ve koku değişikliğine neden olmakta ve suyun biyokimyasal yapısını bozabilmektedir. Bu nedenle Dünya Sağlık Örgütü (WHO) her türlü üretim tesisinden çevreye aktarılan atık suların yapısındaki nitrofenol ve türevlerinin arıtılmasını veya zararsız bileşiklere dönüştürülmesini talep etmektedir [5-9].

Nitrofenollerini atık sulardan giderme üzerine yapılan çalışmalarda test edilen yöntemlerin başında biyolojik arıtma, membran filtreleme, mikrobiyal parçalanma, elektrokimyasal oksidasyon, iyon değiştirme, adsorpsiyon ve kimyasal indirgeme gelmektedir. Nitrofenollerin arıtılmasını veya zararsız bileşiklere dönüştürülmesini hedefleyen bu yöntemler maliyet, etkinlik, uygulanabilirlik ve yüksek dönüşüm verimliliği gibi faktörler göz önünde bulundurularak karşılaştırıldığında öne çıkan ve birçok araştırma/uygulama çalışmasına konu olan yöntem kimyasal indirgeme (katalitik hidrojenasyon) yöntemi olmaktadır [10-14]. İlaç, petrokimya ve gıda sanayiinde yaygın olarak kullanılan katalitik hidrojenasyon yönteminin nitrofenollere uygulanması sonucu, bir yandan her yönüyle insan sağlığı açısından son derece tehlikeli kimyasallar olan nitrofenollerin ekonomik ve çevreci olarak arıtılması/dönüştürülmesi; diğer yandan birçok endüstriyel üretim sürecinde ihtiyaç duyulan ve oldukça önemli ara ürünler olarak değerlendirilen aminofenollerin eldesi mümkün olmaktadır [15,16].

Yapılan araştırmalar  $\text{NaBH}_4$  gibi üstün özelliklere sahip bir "hidrojen kaynağı" ile aktif metal ve destekleyicilerin uygun şartlarda bir araya getirilmesi sonucu elde edilen "katalizör sistemlerinin" birlikte kullanılması durumunda katalitik hidrojenasyon sürecinin son derece verimli ve hızlı bir şekilde gerçekleştirilebildiğini ortaya koymuştur. Metal oksitler, biyoseramik malzemeler, karbon bazlı bileşikler (karbon nanolifler, karbon nanotüpler, grafen oksit, ve grafen), metal-organik çerçeveler (MOF), zeolitik imidazol çerçeveler (ZIF) ve polimerik yapılar, hem katalitik etkinliği hem de tekrar kullanılabilirlik performansını artırmak ve aktif metal nanopartiküllerin agregasyonundan kaynaklanan olumsuzlukları ortadan kaldırmak için kullanılan destek malzemelerinin başında gelmektedir [17-20]. Bu malzemelerden metal organik çerçevelerin yapısı nanoteknoloji alanında sağlanan teknolojik gelişmeler sonucu tam olarak aydınlatılmış ve bu malzemelerin koordinasyon bağları ile üç boyutta genişleyen gözenekli bir yapıya sahip olduğu belirlenmiştir. Ayarlanabilir gözenek boyutu, geniş spesifik yüzey alanı ve çok sayıda aktif alan mevcudiyeti gibi son derece ilginç özelliklere sahip olan MOF'lar gaz depolama ve gaz karışımlarının ayrılması başta olmak üzere katalizör uygulamaları, sensör teknolojisi, ilaç salınımı, piller ve süperkapasitörler gibi bir çok alanda yaygın olarak kullanılmaya başlanmıştır. Metal-organik çerçeve ailesinin önemli bir üyesi olan ve literatürde "gözenekli krom tereftalat" olarak bilinen MIL-101 oldukça yüksek yüzey alanı ve kararlı yapısı ile birçok çalışmaya konu olmuş ve umut verici sonuçlar elde edilmiştir [21-27].

Yapılan çalışmada nitrofenollerin (2-nitrofenol, 4-nitrofenol) aminofenollere verimli, çevreci ve uygulanabilir bir şekilde indirgenbilmesi amacıyla MIL-101 destekli Au nanokümleri hazırlandı. Sodyum borhidrürün indirgeyici ajan olarak kullanıldığı çalışmalarda çözelti derişimi, sıcaklık, katalizör miktarı gibi farklı parametrelerde katalitik hidrojenasyon süreçleri kinetik ve termodinamik olarak incelendi. Sentezlenen nanokatalizörlerin yapısı FTIR, XRD, XPS, SEM gibi spektroskopik yöntemlerle ayrıntılı bir şekilde karakterize edildi.

## MATERYAL

Yapılan çalışmada gerçekleştirilen iki aşamalı sentez çalışmalarının ilk aşamasında destek malzemesi olarak kullanılan MIL-101, ikinci aşamasında ise Au@MIL-101 nanokümleri sentezlenmiştir. Sentez çalışmalarında ve katalitik indirgenme tepkimelerinde ihtiyaç duyulan krom (III) nitrat nonahidrat, tereftalik asit, sodyum borhidrit, 2-nitrofenol (2-NP), 4- nitrofenol (p-nitrofenol, 4-NP) ve altın (III) klorür trihidrat Sigma-Aldrich®ten temin edildi. Hem sentez hem de indirgenme tepkimelerinde kullanılan cam ve diğer malzemeler kromik asit temizleme solüsyonu, su ve aseton ile yıkayıp kurutularak kullanıldı.

## YÖNTEM

### Au@MIL-101 katalizörünün nitrofenol indirgemesindeki katalitik aktivitesi

$\text{Au}^{+3}$ @MIL-101 ön katalizörünün sentezlenebilmesi amacıyla ilk aşamada krom (III) nitrat nonahidrat ve tereftalik asit kullanılarak MIL-101 sentezlendi. Destek malzemesinin sentezlenmesinden sonra hedeflenen nanokatalizörlerin sentezi için 5,0 mL sulu  $\text{AuCl}_3 \cdot 3\text{H}_2\text{O}$  çözeltisi ile 100 mg MIL-101 700 rpm'de 12 saat karıştırıldı. Çözeltide oluşan katı kısım süzülerek distile su ile yıkandı. Elde edilen nihai ürün ( $\text{Au}^{+3}$ @MIL-

101) 100 C<sup>o</sup>de vakumda kurutuldu. Daha sonra çalışmada kullanılacak olan 4-nitrofenol ve 2-nitrofenol 2 mM (27.8 mg, 100 mL) stok çözeltisi hazırlandı. Bu çözeltiden 10 mL alınıp oda sıcaklığına ayarlanmış ceketli bir schlenk içerisine konuldu. Üzerine 5 mg hazırlanmış olan ön katalizör (Au<sup>+3</sup>@MIL-101) eklenerek karışım 15 dakika boyunca termal dengeye gelmesi için karıştırıldı. Sonrasında tepkime ortamına 1,0 ml suda çözünmüş 0,2 mmol NaBH<sub>4</sub> (77,2 mg) ilave edilerek 700 rpm karıştırma hızında katalitik tepkime başlatıldı. Katalitik tepkime devam ederken belirli zaman aralıklarında tepkime kabından numune alınarak Shimadzu UV-3600 UV-vis spektrofotometre ile 2-nitrofenol ve 4-nitrofenole ait karakteristik absorpsiyon piklerindeki değişim kaydedildi. Nitrofenollerin indirgenmesindeki katalitik performans absorpsiyon spektrum pikleri aracılığıyla hesaplandı.

Katalizör miktarı, sıcaklık ve substrat derişimi gibi parametrelerin katalitik performansa etkisini belirleyebilmek amacıyla farklı sıcaklık (293 K, 298 K, 303 K, 308 K), farklı derişim (0,5 mM, 1 mM, 2 mM, 3 mM) ve farklı katalizör miktarlarında (1 mg, 3 mg, 5 mg, 7 mg) deneyler yapıldı ve elde edilen veriler kullanılarak katalitik etkinlikte meydana gelen değişimler hesaplandı.

### **Au@MIL-101 katalizörünün nitrofenol indirgenmesinde tekrar kullanılabilirlik performansının araştırılması**

Katalitik hidrojenasyonda kullanılan her bir substrat için indirgenmenin tamamlanmasından sonra tekrar kullanılabilirlik performansının belirlenebilmesi amacıyla Au@MIL-101 katalizörü süzme yoluyla elde edildi. Etanol-su karışımı ile temizlenen katalizör kurutulularak tekrar kullanım için hazır hale getirildi. Kullanılacak katalizör miktarı tartıldıktan sonra reaksiyon kabına eşit miktarda substrat ilave edildi ve katalitik reaksiyon yeniden başlatıldı.

### **BULGULAR VE TARTIŞMA**

2-nitrofenol ve 4-nitrofenolün 2-aminofenol ve 4-aminofenole indirgenebilmesi amacıyla öncelikli olarak reaksiyonda kullanılacak Au@MIL-101 katalizörü hazırlandı. Hazırlanan katalizör NaBH<sub>4</sub> varlığında indirgenme tepkimesinde kullanıldı. Daha sonra sıcaklık, derişim, miktar gibi faktörlerin katalitik aktiviteye etkisini belirleyebilmek amacıyla bir dizi deney yapıldı. En son aşamada katalizörün tekrar kullanılabilirlik performansı belirlendi.

**Şekil 1.** 2-nitrofenolün 2-aminofenole indirgenmesi

Hazırlanan nanokümlerin yapısı ileri analitik ve spektral yöntemler kullanılarak aydınlatıldı. Bu amaçla yapılan XRD analizi ile Au parçacıklarının MIL-101'in yüzeyine tutunup tutunmadığı ve yüzeyde herhangi bir bozunma gerçekleşip gerçekleşmediği incelendi. MIL-101 destekli Au nanokümleri için elde edilen XRD desenlerin  $2\theta = 64.68^\circ$  ve  $76.3^\circ$ 'de olduğu ve literatür ile uyumlu olduğu belirlendi [26].

Şekil 2. MIL-101 destekli Au nanokatalizörünün  $2\theta = 10-90^\circ$  aralığındaki XRD desenleri

MIL-101 destekli Au nanokümlerin nitrofenollerin  $\text{NaBH}_4$  varlığında indirgenmesinden tepkime-içi elde edilen Au@MIL-101 nanokatalizörünün parçacık büyüklük dağılımları taramalı elektron mikroskobu (SEM) ile karakterize edildi. Şekil 2(a-b)'de görüldüğü gibi Au@MIL-101 örneklerine ait 100 ve 500 nm büyüklükteki SEM görüntüleri incelendiğinde Au parçacıklarının MIL-101 yüzeyine düzgün bir şekilde tutunduğu ve homojen olarak dağıldığı görülmektedir. Şekil 2 c'de görülen SEM EDX analizinde ise hem destek malzemesinde yer alan elementlerin hem de Au metalinin varlığı çok net bir şekilde anlaşılmaktadır.

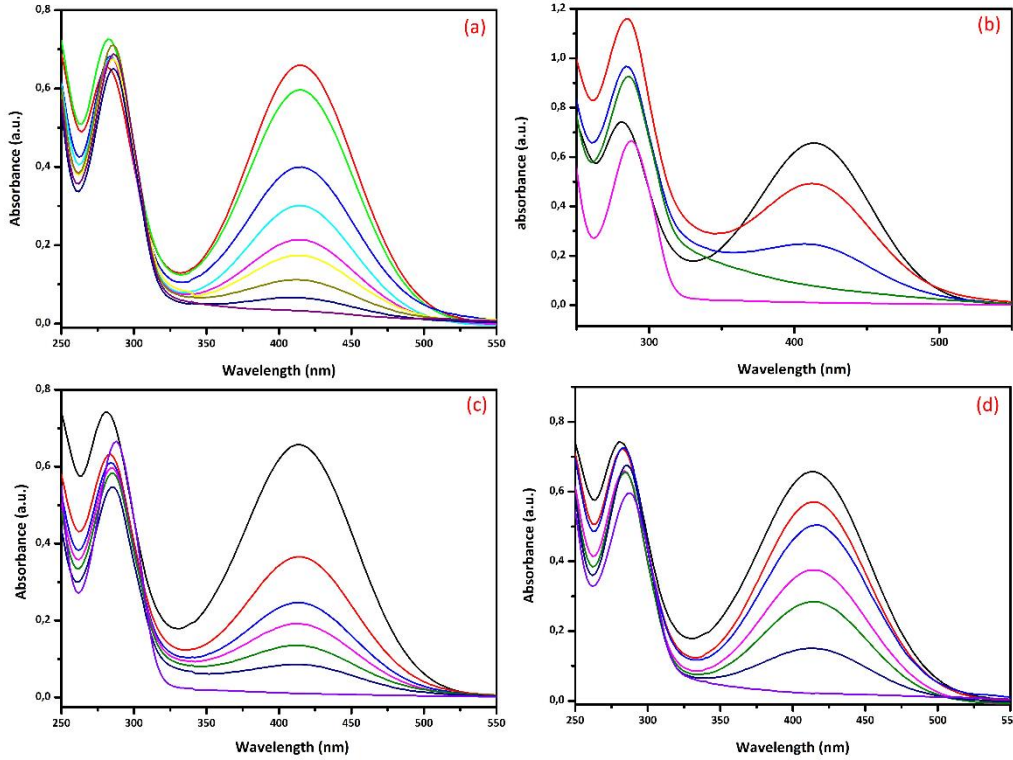

Şekil 3. Tepkime-içi koşullarda (a) 100 nm, (b) 500 nm 2- nitrofenolün indirgenmesi sonucu elde edilen Au@MIL-101 katalizörüne ait SEM görüntüleri, (c) SEM EDX analizi

Metal oranının nitrofenollerin katalitik indirgenmesi üzerindeki etkisini belirleyebilmek amacıyla destek malzemesi olarak kullanılan MIL-101 üzerine farklı oranlarda (%1, %2, %4 ve %8) metal yüklemesi yapılarak nitrofenollerin karşılık gelen aminofenollere indirgenmesi çalışması yapılmıştır. Deneysel sonuçlar metal oranı ile tepkime hızının doğru orantılı olarak değiştiğini, metal oranı azaldıkça katalitik hidrojenasyonun

yavaşladığını ortaya koymuştur. Literatür araştırmaları da göz önünde bulundurularak %2 oranında metal yüklemesi yapılan Au@MIL-101 nanokatalizörü ile çalışmaların yapılmasına karar verilmiştir.

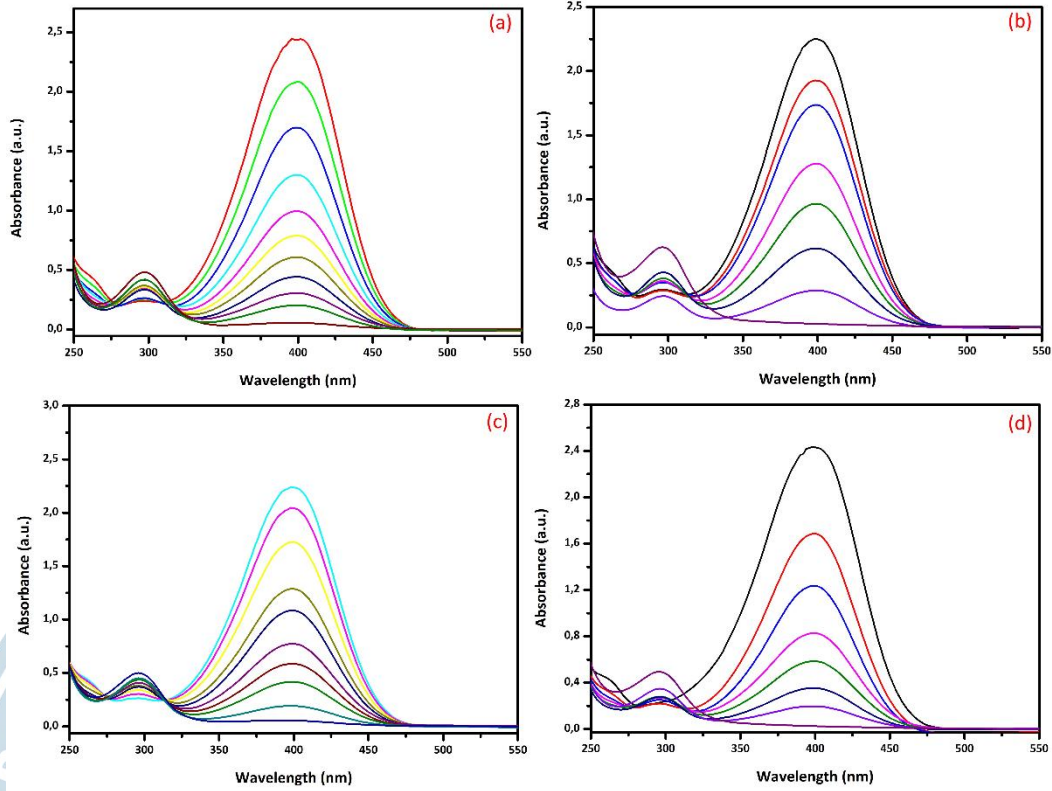

Bir sonraki aşamada sıcaklığın, nitrofenollerin Au@MIL-101 nanokatalizörü varlığında gerçekleştirilen katalitik indirgenme tepkimesi üzerindeki etkisini incelemek için 293, 298, 303 ve 308 K sıcaklıklarında deneyler gerçekleştirildi. Elde edilen UV-vis spektrumları incelendiğinde sıcaklık artışıyla indirgenme hızının doğru orantılı değiştiği belirlendi. 2-nitrofenolün katalitik hidrojenasyonu 293 K'de 90 saniye, 298 K'de 50 saniye, 303 K'de 40 saniye 308 K'de ise 25 saniye sürmüştür (Şekil 4).

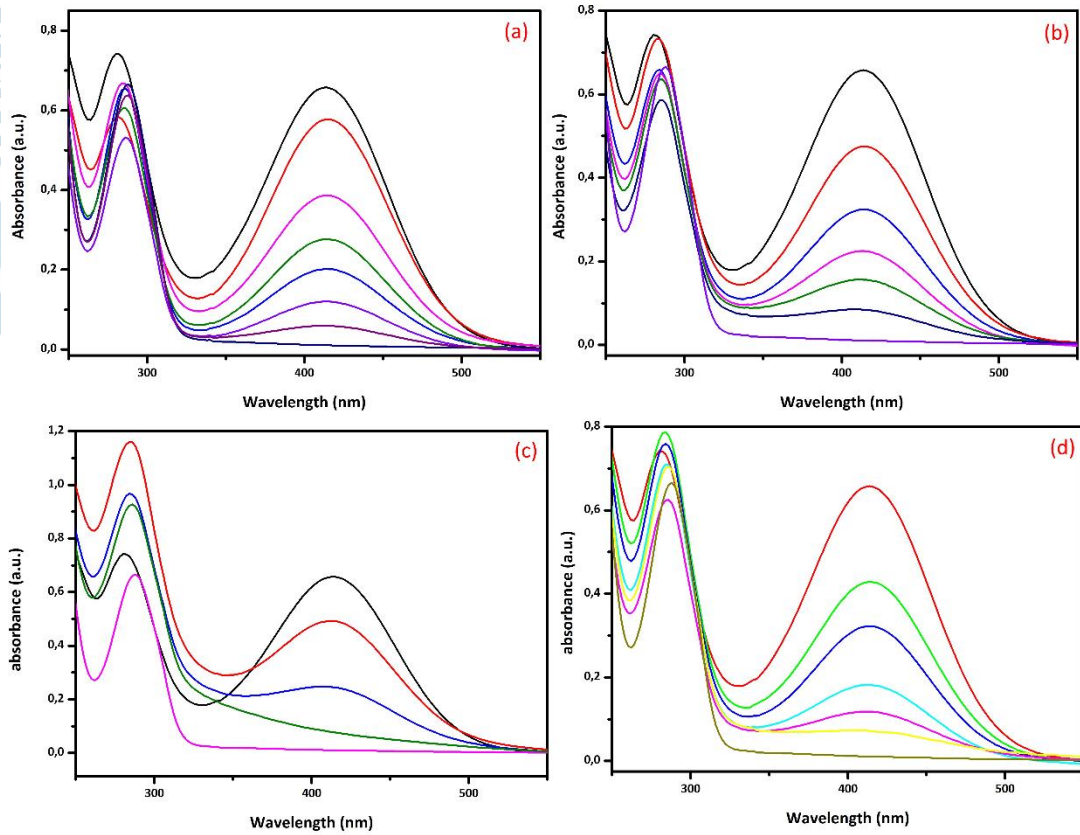

**Şekil 4.** Farklı sıcaklıklarda 2-nitrofenolün sulu  $\text{NaBH}_4$  varlığında indirgenmesine ilişkin UV-Vis spektrumları a)293 K b) 298 K c) 303 K d) 308 K

Sıcaklığın tepkime hızına olan etkisinin belirlendiği çalışmalardan sonra katalizör miktarının indirgenme hızına etkisini belirleyebilmek amacıyla yapılan deneylerde katalizör miktarının artırılmasının tepkime hızını doğru orantılı etkileyerek artırdığı belirlendi. 4-nitrofenolün katalitik hidrojenasyonunda 7 mg Au@MIL-101 nanokatalizörü kullanıldığında 40 saniyede gerçekleşen dönüşüm, 1 mg Au@MIL-101 nanokatalizörü kullanıldığında 240 saniyede gerçekleşmektedir (Şekil 5). Benzer şekilde 1 mg katalizör kullanıldığında 180 saniye süren 2-nitrofenolün indirgenmesi katalizör miktarı 7 mg'a çıkarıldığında 30 saniye sürmektedir (Şekil 6).

Şekil 5. Farklı katalizör miktarlarının 4-nitrofenölü sulu  $\text{NaBH}_4$  varlığında indirgenmesine ilişkin UV-Vis spektrumları a) 1mg b) 3 mg c) 5 mg d) 7 mg

Şekil 6. Farklı katalizör miktarlarının 2-nitrofenölü sulu  $\text{NaBH}_4$  varlığında indirgenmesine ilişkin UV-Vis spektrumları a) 1mg b) 3 mg c) 5 mg d) 7 mg

MIL-101 destekli Au@MIL-101 katalizörünün farklı konsantrasyonlarda (0.5mM, 1 mM, 2 mM ve 4 mM) hazırlanan 4-nitrofenol çözeltilerinin katalitik hidrojenasyon tepkimelerindeki etkinliğini belirleyebilmek amacıyla yapılan çalışmalarda konsantrasyonunun düşük olduğu durumda indirgenme reaksiyonunun daha hızlı gerçekleştiği belirlendi. Ortamda bulunan 4-nitrofenol miktarı arttıkça indirgenme süresinin artması doğal bir sonuç olarak değerlendirildi. Çözelti derişiminin 0.5 mM olduğu indirgenme tepkimesi 25 saniyede gerçekleşirken, derişimin 3 mM olduğu tepkime 90 saniye sürmektedir.

## SONUÇ

Yapılan çalışmada oldukça yüksek yüzey alanı ve kararlı yapısı nedeniyle destekleyici olarak MIL-101 kullanıldı ve Au@MIL-101 nanokatalizörü tepkime-içi hazırlandı. Sentezlenen nanokatalizörlerin yapısı FTIR, XRD, SEM gibi spektroskopik yöntemlerle ayrıntılı bir şekilde karakterize edildi. İndirgeyici olarak sodyum borhidrürün kullanıldığı tepkimelerde 4-nitrofenolün 4-aminofenole; 2-nitrofenolün 2-aminofenole indirgenmesi UV-Vis spektrumları ile takip edildi. Elde edilen veriler yorumlandığında elde edilen sonuçlar özetle şu şekilde sıralanabilir:

Au@MIL-101 nanokatalizörü nitrofenollerin katalitik hidrojenasyonunda oldukça yüksek aktiflik göstermektedir.

Tekrar kullanılabilirlik ve dayanıklılık açısından da oldukça yüksek performans gösteren Au@MIL-101 katalizörü, nitrofenollerin indirgenmesinde 5. çevrimden sonra bile %85 oranında etkinlik göstermektedir.

MIL-101'in yüksek yüzey alanı ve kararlı yapısı atomların homojen olarak dağılmasını sağlamakta ve topaklaşmayı önemli ölçüde engellemektedir.

## Teşekkür

#### Abstract

The Mediterranean fruit fly (medfly), *Ceratitis capitata* Wied. (Diptera: Tephritidae), is an important citrus pest that negatively affects yield and quality, causing significant economic losses in citrus-producing countries. Although the medfly is economically important, studies on the genetic structure of this species are very limited. In this study, RAPD markers were used to provide information about the genetic structure of medfly populations in Turkey, which represents a significant part of the Eastern Mediterranean basin. The mean observed number of alleles ( $n_a$ ) for all populations was  $1.44 \pm 0.49$  and the mean effective allele number ( $n_e$ ) was  $1.21 \pm 0.32$ . The rate of polymorphic loci for all populations ranged from 23.65% to 59.46%, and the gene diversity ( $h$ ) of Nei ranged from 0.0897 to 0.1740. Gene flow level ( $Nm$ ) was 1.12 and genetic differentiation value ( $G_{st}$ ) was 0.31. According to the UPGMA dendrogram, no East-West grouping was observed among the studied populations. There are significant opportunities to enhance medfly control by harnessing the knowledge of the pest's genetic diversity and population dynamics. A deeper genetic understanding of this invasive insect can enable more precise, efficient, and long-lasting management practices.

**Keywords:** *Ceratitis capitata*, population genetics, RAPD, insecticide resistance management

#### INTRODUCTION

Citrus fruits are the most produced group in the world with a production of approximately 143 million tons (FAO, 2019). Considering the possible climate and water crises in the future, it is important that agricultural production, which will provide adequate nutrition for the increasing population, can be carried out with the least loss (Eckardt, 2009). Various pests cause economic product losses in agricultural products. Among these pests, the Mediterranean fruit fly (*Ceratitis capitata* Wiedemann, 1824), also known as the medfly, is one of the world's most destructive agricultural pests. It has been reported that medfly causes damage to more than 260 plants, including tropical and subtropical fruit, vegetable, and ornamental plants in more than 70 countries around the world (Magana et al., 2007). Medfly is a polyphagous species as it feeds on multiple crops, making it one of the most important quarantine species. It is native to the African Sahara but has spread to many other parts of the world, including South and North Africa, Central and South America, Western Australia, and many countries neighboring the Mediterranean such as Lebanon, Israel, Jordan, and Turkey (Thomas et al., 2013). The increase in trade routes around the world, the development of global trade policies, and the ability of the organism to feed on many hosts in many habitats are the most important factors in the spread of this organism. The worldwide distribution process of this organism was reported by Malacrida et al., (1998). Accordingly, the western Mediterranean basin is shown as the possible source of the spread of this pest to the Eastern Mediterranean basin, where our country is located (Malacrida et al., 1998). As in many species, the distribution of the medfly from its point of origin to other regions is characterized by lower genetic diversity values in newly invaded regions (Malacrida et al., 1992; Gomulski et al., 1998; Malacrida et al., 1998). Because of its adeptness at hitchhiking on human transportation routes, the medfly has been able to successfully colonize new geographic regions, despite its relatively limited flight capabilities (Malacrida et al., 1998; Malacrida et al., 2007). In many parts of the world, studies to better understand the genetic structure and colonization process of this important pest have been carried out with the help of biochemical and molecular markers (Gasperi et al., 1991; Malacrida et al., 1992; Baruffi et al., 1995; Gasparich et al., 1997; Gomulski et al., 1998; Malacrida et al., 1998; Reyes and Ochando, 1998a; He and Haymer, 1999; Bonizzoni et al., 2000; Gasperi et al., 2002; Bonizzoni et al., 2004; Reyes and Ochando, 2004; Barr et al., 2009; Karsten et al., 2013; Karsten et

al., 2015; Güler et al., 2019; Kurd et al., 2020; Nikolouli et al., 2020; Güler et al., 2022) and the results showed that genetic variation does not show a homogeneous distribution. Results from the studies indicate that Kenya is the point of origin for this organism, as it has the highest genetic diversity (Baruffi et al., 1995; Gasparich et al., 1997; Gomulski et al., 1998; Malacrida et al., 1998; Reyes and Ochando, 2004; Malacrida et al., 2007).

Medfly is responsible for economic losses in horticultural production. Therefore, it is the target of early detection, control, and eradication programs (Beroiz et al., 2012). In the fight against this important pest; (i) cultural, (ii) mechanical, (iii) biological, and (iv) chemical control methods were used. As a result of chemical control, resistance development occurs in related species (Vontas et al., 2011). Considering all these, it is of great importance to clarify the gene flow levels, population genetic structures, and colonization processes among the populations of these species in terms of demonstrating the adequacy of current control methods (Collins and Schlipalius, 2018). Overall, while pesticide and bait development initially relies on basic knowledge of medfly genetics and biology, the application and management of these control methods benefit from a genetic understanding of target populations. Customizing and monitoring the genetic interactions between flies and control measures results in a more sustainable strategy that minimizes resistance and has maximum impact. Genetics-based approaches enable an adaptive management response to this invasive pest (Kadoić et al., 2020).

The aims of this study are twofold: first, investigate the genetic structure of medfly populations to elucidate the colonization process, and second determination of gene flow levels that are important in the spread of resistance alleles.

## MATERIALS AND METHODS

### Sample collection

Medfly samples were collected from the provinces of Muğla, Antalya, Aydın, İzmir, Yalova, Adana, and Mersin (Figure 1). Adult collections were carried out by hanging “last fly” pheromone traps on trees at a certain distance in citrus orchards. Samples were stored at -80 °C for morphological identification and further experimental studies.

Figure 1. Distribution collection sites

### DNA isolation and amplification of RAPD loci

Morphological species identification of medfly samples was performed under the binocular microscope, using adult identification keys (White and Elson-Harris, 1994). DNA isolation of the collected samples was carried out by modifying the Lifton method used by Bender et al., (1983). In this study, seven RAPD primers (OPA-03, OPA-09, OPA-18, OPE-07, OPE-19, OPM-10, and OPM-20) were used. The PCR conditions used in this study were applied to the studied species based on Göçmen, (2001).

### Data analysis

The analyses of the data file created with these values were performed using computer-based computer programs such as Popgene Version 1.32 (Yeh et al., 1999) and GenAlex (Peakall and Smouse, 2006).

## RESULTS

### Genetic Structures and Population Genetic Diversity

As a result of the analysis of seven primers applied to a total of 105 individuals (OPA-03, OPA-09, OPA-18, OPE-07, OPE-19, OPM-10, and OPM-20), a total of 148 loci were detected and all of them were polymorphic.

The highest number of loci was obtained from the OPA-18 primer with 24 and the least number of loci from the OPM-20 primer with 17. The overall mean polymorphism rate was 40.93% (Table 1). In Figure 2, RAPD band patterns of individuals belonging to the Antalya, and Yalova populations are presented.

**Figure 2.** RAPD band patterns of Antalya and Yalova samples with OPA-18

The amount of genetic variation was dispersed homogeneously between studied populations. The mean expected heterozygosity ( $H_e$ ) values varied from 0.17 (Aydın) to 0.08 (İzmir). Aydın population indicated the highest levels of genetic diversity consisting of the mean, effective number of alleles, number of bands, and number of private alleles. Compared to the other populations, lower diversity amounts were observed in the İzmir population. The mean observed allele number ( $n_a$ ), which is one of the components of genetic diversity, was found to be  $1.44 \pm 0.49$  for all populations, and the mean effective allele number ( $n_e$ ) was  $1.21 \pm 0.32$ . In the studied populations, İzmir was the population with the lowest  $n_a$  value with  $1.28 \pm 0.45$ , while the population with the highest  $n_a$  value with  $1.59 \pm 0.49$  was the Aydın population. Again in the studied populations, İzmir was the population with the lowest  $n_e$  value with  $1.115 \pm 0.31$ , while the population with the highest  $n_e$  value was the Aydın population with  $1.29 \pm 0.34$ . The mean rate of polymorphic loci in the studied populations was found to be 40.93%. The population with the lowest polymorphic locus ratio was İzmir with a value of 23.65%. Aydın population, on the other hand, has the highest rate of polymorphic loci with a value of 59.46%. In this study, the gene diversity value ( $h$ ) of Nei was found to be an average of 0.13. The highest gene diversity was seen in the Aydın population with 0.17. The lowest value was observed in the İzmir population with 0.09 (Table 1).

**Table 1.** Genetic diversity parameters of *C. capitata*. Sample size (N), Observed Number of Alleles ( $n_a$ ), Effective Number of Alleles ( $n_e$ ), Gene Diversity ( $h$ ), Percentage of Polymorphic Band (%P)

Populations	N	$n_a$	$n_e$	$h$	%P
Antalya	13	1.49±0.50	1.23±0.35	0.14	49.32 %
Aydın	13	1.59±0.49	1.29±0.34	0.17	59.46 %
İzmir	12	1.28±0.45	1.15± 0.31	0.09	23.65 %
Muğla	15	1.42±0.49	1.20±0.32	0.12	36.49 %
Adana	11	1.47±0.50	1.18±0.26	0.12	40.54 %
Mersin	13	1.38±0.49	1.19±0.32	0.12	37.84 %
Yalova	15	1.44±0.50	1.21±0.32	0.13	39.19 %
Avarage	13.14	1.44±0.49	1.21±0.32	0.13	40.93 %

According to band patterns across populations, İzmir was the population with the lowest number of bands with 41, while the population with the highest number of bands with 97 was the Aydın population. Similarly, İzmir was the population with the lowest number of common bands with 5, while Aydın was the population with the highest number of common bands with 36. In total, 32 new private alleles were determined. Antalya and İzmir were the populations with the highest number of private alleles with 8, while the population with the lowest number of private alleles with 2 was the Mersin population. Even though the number of private alleles is connected with sample size, all the studied populations had private alleles (Table 2).

**Table 2.** Total band patterns for binary data by populations

Population	Antalya	Aydın	İzmir	Muğla	Adana	Mersin	Yalova
No. Bands	78	97	41	63	63	65	66
No. Bands Freq. $\geq 5\%$	78	97	41	63	63	65	66
No. Private Bands	8	8	4	3	4	2	3
No. L Comm Bands ( $\leq 50\%$ )	19	36	5	21	22	16	19
Mean $H_e$	0,14	0,17	0,08	0,10	0,10	0,12	0,11
SE of Mean $H_e$	0,02	0,02	0,01	0,01	0,01	0,01	0,01

According to the G-statistics, the total genetic diversity ( $H_T$ ) was found to be  $0.17 \pm 0.03$  at 148 loci. Of this, 0.12 is intra-population genetic diversity ( $H_S$ ) and 0.05 is inter-population genetic diversity ( $D_{ST}$ ). Also, the mean genetic differentiation coefficient ( $G_{ST}$ ) was found to be 0.31. The gene flow level ( $N_m$ ), obtained as the average of 300 loci in this study, was found to be 1.13.

The level of genetic variation between populations was determined by calculating Nei's (1978) standard genetic distance ( $DN$ ) values for the studied population pairs.  $DN$  values based on 148 loci are given in Table 5. Considering the values, although the genetic differentiation values of all populations are low, the lowest genetic distance was found between Aydın and Antalya with 0.12, while the highest genetic distance was found between Muğla and Yalova with 0.46 (Table 3).

**Table 3.** Genetic distance values between populations (Nei 1978)

Populations	Antalya	Aydın	İzmir	Muğla	Adana	Mersin	Yalova
Antalya	*****						
Aydın	0.1221*	*****					
İzmir	0.2850	0.2953	*****				
Muğla	0.2414	0.3024	0.1893	*****			
Adana	0.2426	0.2265	0.4319	0.3667	*****		
Mersin	0.1570	0.1664	0.3010	0.3096	0.2062	*****	
Yalova	0.2927	0.2699	0.4152	0.4640*	0.3374	0.1755	*****

The visual expression of genetic distances between populations is given in the UPGMA (Unweighted Pair-Group Method with Arithmetic Average) dendrogram, which was created by using  $DN$  values (Figure 3). As can be seen from the dendrogram, there is no clustering of medfly populations due to their geographical location. According to the dendrogram, two groups stand out. The first group is composed of Muğla and İzmir populations. The second group consists of Antalya, Aydın, Yalova, Adana, and Mersin. According to the results of the AMOVA analysis, it was observed that 54% of the genetic variation calculated for 148 loci originates from within the population, and 46% originates from among the populations.

**Figure 4.** UPGMA dendrogram based on Nei 1978 genetic distance matrix

## DISCUSSION

The genetic structure of medfly populations has been analyzed at macrogeographic and microgeographic levels in previous studies (Baruffi et al., 1995; Bonizzoni et al., 2001; Bonizzoni et al., 2002; Gasperi et al., 2002; Bonizzoni et al., 2004; Malacrida et al., 2007; Barr, 2009; Alaoui et al., 2010; Elfekih et al., 2010; Karsten et al., 2013; Rajabiyan et al., 2015; Güler et al., 2019; Kurd et al., 2020; Nikolouli et al., 2020; Güler et al., 2022). Turkey's geographical location and agricultural activities suggest that the medfly may have played a role in the invasion of the Mediterranean basin. However, there are very few studies conducted in our country with this organism to clarify this situation.

In this study, genetic diversity, population genetic structure, and inter-population relationships of medfly (*C. capitata*), which is the most important international agricultural pest, were determined in Turkey. For this reason, RAPD markers were used to elucidate the genetic structures of Mediterranean fruit fly populations. As a result of the study, genetic similarity was observed in all seven provinces in terms of both allele number and allele frequencies. As a result of RAPD analyses; it has been observed that there is a low level of genetic variation in medfly populations in Turkey and that there is no significant degree of differentiation between populations when evaluated geographically.

A low level of genetic diversity was observed in Mediterranean fruit fly populations sampled from different regions of Turkey and analyzed with seven polymorphic RAPD markers. This result is inconsistent with results of high genetic variation at the regional geographic scale (Gasperi et al., 2002; Alaoui et al. 2010). Among the possible reasons for this situation, can be considered that the researchers took samples from the hosts where chemical control was not carried out intensively, the use of African samples, and the use of laboratory strains. In our study, the average number of alleles ( $na$ ) was 1.44 and the average effective allele number ( $ne$ ) was 1.21 for 7 provinces. These values were reported as ( $na$ ) 4.50 for Italy and ( $na$ ) 3.3 for Greece in the studies conducted by Gasperi et al., (2002). Contrary to the results obtained from this study and the results obtained in previous studies using microsatellite and ISSR markers (Kurd et al., 2020; Güler et al., 2022), a lower level of genetic diversity was observed than the results in the literature.

Molecular analysis of variance indicated that the vast majority of the genetic variation (54% for *C. capitata*) was conserved within populations. The analysis of molecular variance (AMOVA) indicated that there is no genetic structure variation in *C. capitata* species populations. A mechanism of mixing of these agricultural pest populations from different geographical areas and probable gene flow rate is evident by these observations although a high geographical distance exists among these study sites. For this reason, the sites of the present study are attached by insect habitats, which authorize gene flow among these locations. Relatively high within-population genetic variation and migration rates can ensure the occasion for novel phenotypes to arise in pest populations (Zhou et al., 2000). In addition, the area, climatic alterations, and resistance to ecological factors (Willi et al., 2006) can also produce selection pressure on insects. Population genetic researches ensures helpful information concerning the potential for wide-ranging pest control, especially in species with wide geographical spread (Alphey and Bonsall, 2018). Comprehending the phylogenetic relationships between insect populations is very important for implementing sustainable and effective medfly management.

The UPGMA dendrogram (Figure 4) showed that medfly populations in Turkey did not exhibit geographic clustering. Gene flow between populations ( $Nm = 1.13$ ) appears to be sufficient to homogenize medfly populations in Turkey.

## CONCLUSION

There are a couple of ways in which genetic knowledge can guide bait and insecticide selection for medfly control. These are; (i) targeting attractive volatiles and pheromones, (ii) targeting susceptible genotypes, (iii) mitigating resistance development, and (iv) monitoring for resistance alleles (Vontas et al., 2011; Karlsson Green et al., 2020; Rizvi et al., 2021). The mobility of medfly populations facilitates their ability to infest new areas of land, despite control efforts. A thorough understanding of the medfly's genetic population structure can help in developing more targeted and effective control strategies, especially for recent invasions. Continued monitoring of genetic patterns can also provide early detection of new colonization events, allowing for rapid response to limit spread. Overall, exploring the medfly's genetic diversity and population dynamics provides significant insights into both its invasion biology as well as options for management and control (Karsten et al., 2013; Arias et al., 2018). The information obtained from the studies will contribute to the development of more effective and efficient control strategies against the medfly, which is the most important agricultural pest in the Mediterranean basin, including Turkey.

## ORAL PRESENTATION

### Pleopod Üzerinde İnkübasyona Tabi Tutulan Kerevit (*Astacus leptodactylus* Eschscholtz, 1823) Yumurtalarının Açılma Oranı Üzerine Etkileri

Gülşen UZUN GÖREN<sup>1,\*</sup> (ORCID 0000-0001-9109-2921), Şennan YÜCEL<sup>2</sup> (ORCID 0000-0002-0522-9846)

<sup>1</sup>Sinop University, Fisheries Faculty, 57000, Sinop, Turkey

\*Sorumlu yazar e-mail:gulsenuzn@hotmail.com

#### Özet

Bu çalışmada *Astacus leptodactylus*'un üretiminde yumurtalı dişi kerevitlerin yumurtaları açılıncaya kadar tanklarda tutularak yumurtaların açılması ile yavru alımı amaçlanmıştır. Araştırma materyalini oluşturan kerevitler (*Astacus leptodactylus*); Bafra Balık Gölleri'nden pinterlerle avlanmıştır. Avlanan yumurtalı kerevitler Sinop Üniversitesi Su Ürünleri Araştırma ve Uygulama Birimi'ne getirildi. Pleopodlar üzerinde yumurtaların inkübasyonunu sağlamak için yumurtalı kerevitler 96 x 196 x 50 cm dikdörtgen fiberglas tankların içine on litrelik plastik saklama kaplarına bireysel olarak koyuldu. Çalışmada su sıcaklığı 11.74±0.5 °C, pH 8.08, oksijen ise 5.13 mg/lit de yürütüldü. Çalışmada kerevit yumurtaları günlük olarak kontrol edildi. Yumurtalarda aynı anda kerevitlerin yaşam alanları olarak belirlenen her bir saklama kutusundaki yumurtaların üzerindeki mantarlaşma durumları çıplak gözle gözlemlendi. Bu gözlem sonucunda her bir yaşam alanındaki kerevitlerde farklı zamanlarda mantarlaşmanın başladığı anlaşıldı. İlk mantarlaşma 10. gününde görüldü. Belli bir periyot takip edilmemekle beraber, mantarlaşma diğer yaşam alanlarındaki kerevitlerde de görüldü. 45 gün içerisinde bütün kerevitlerin yumurtalarını mantar kapladı. Ayrıca bu süreçte mantarlı yumurtalar arasında sağlıklı gözükten yumurtalar da pleopodlar üzerinden düştü. Bu sürecin sonucunda anaçlarda ölmüştür. Gerek mantarlı yumurtalar gerekse pleopodlar üzerinden düşen yumurtalardan yavru elde edilemeyeceğinden dolayı yumurta sayıları ve yumurta çapları ölçülemedi. Kerevit üretiminde yumurtaların inkübasyonu, üretimin en önemli aşamasıdır. Hedeflenen üretimin elde edilebilmesi için; F1 anaçlarının kontrollü üretim ile elde edilerek sağlıklı olması ve bunların yumurtalarından yavru elde edilmesi üretimin sürekliliği açısından önemli bir tedbir olarak düşünülmelidir.

**Anahtar kelimeler:** Kerevit, *Astacus leptodactylus*, inkübasyon, açılma oranı

#### Effects of Crayfish (*Astacus leptodactylus* Eschscholtz, 1823) Eggs Incubated on Pleopod on Hatch Rate

#### Abstract

In this study, in the production of *Astacus leptodactylus*, the eggs of female crayfish with eggs were kept in tanks until they hatch, and it was aimed to get offspring by opening the eggs. Crayfish (*Astacus leptodactylus*) that make up the research material; Fished with pinters from Bafra Fish Lakes. Crayfish with eggs caught were brought to Sinop University Fisheries Research and Application Unit. To allow incubation of eggs on pleopods, egg-laying crayfish were individually housed in ten-liter plastic storage containers inside 96 x 196 x 50 cm rectangular fiberglass tanks. In the study, the water temperature was 11.74±0.5 °C, the pH was 8.08, and the oxygen was 5.13 mg/lit. In the study, crayfish eggs were checked daily. At the same time, the fungus on the eggs in each storage box, which was determined as the habitat of the crayfish, was observed with the naked eye. As a result of this observation, it was understood that the fungus started at different times in the crayfish in each habitat. The first mushrooming was seen on the 10th day. Although a certain period was not followed, fungal growth was also seen in crayfish in other habitats. Within 45 days, the eggs of all the crayfish were covered with fungus. In addition, during this process, the eggs that looked healthy among the mushroom eggs were also dropped from the pleopods. As a result of this process, the broodstocks died. Egg numbers and egg diameters could not be measured because offspring could not be obtained from eggs that fell on either mushroom eggs or pleopods. Incubation of eggs in crayfish production is the most important stage of production. Achieving the targeted production; It should be considered as an important precaution in terms of the continuity of production that F1 broodstock are healthy by means of controlled production and that

offspring are obtained from their eggs.

**Keywords:** Crayfish, *Astacus leptodactylus*, incubation, hatching rate

## Giriş

Kerevitler alt tür ile birlikte dünyada 737 türe sahiptir (Crandal ve De Grave, 2017) ve yaklaşık olarak sadece 15 tür ekonomik açıdan önemlidir (Ackerfors, 2000). Dünya genelinde ekoloji ve ekonomi bakımından önemli bir tür olan göl kerevitleri (*Astacus leptodactylus* Eschscholtz, 1823) ülkemizde yaygın bir şekilde iç sulardan elde edilen bir türdür ve aynı zamanda önemli ekonomik değeri olan bir ihracat ürünüdür. (Kozák vd., 2015). Yaşam alanlarının iklim şartlarına göre dönemsel üreme süreleri değişiklik göstermektedir. Üreme sezonu su sıcaklığının düştüğü sonbahar aylarında başlar. Ekim ve kasım ayları (7-12 °C) su sıcaklığı ile çiftleşmenin gerçekleştiği dönemdir. Bu dönemin 4-6 hafta sonrasında su sıcaklığı 6-11 °C olmaktadır ve böylece yumurta bırakma zamanı başlamaktadır. Bu aşamadan sonra yumurtalar için kuluçka süresinin kış ve ilkbahar mevsimi boyunca devam ettiği bildirilmiştir. Dişi bireyler ılıman iklim kuşağında 5-6 ay süresince, soğuk iklimler kuşaklarında 6-7 ay ya da daha uzun süre yumurtalarını taşırlar (Mazlum ve Yılmaz, 2012). Yapılmış çalışmalar *A. leptodactylus* dişilerinin çoğunun pleopodlarında 200-400 arası yumurtanın var olduğu bildirilmiştir (Köksal, 1988; Harlioğlu vd., 2004).

Dünya’da kerevitler ticari ürün olarak 1830’lu yıllarda değerlendirilip ekonomiye kazandırılmıştır. Fakat bu süreç ülkemizde 1970 ve 1985 yılları arasında gelişmeye başlamıştır. Ancak Türkiye’de 1984 yılında Çivril Gölü’nde kerevit vebası (*Aphanomyces astaci*) hastalığı ilk kez gözlenmiş olmasının ardından, hastalık hızla diğer su kaynaklarındaki kerevitlere bulaşmış, yüksek ölümler dolayısıyla stok yoğunluğunda hızlı azalma tespit edilmiştir. Avcılık yoluyla 2022 yılında elde edilen kerevit üretimi 1011 ton olarak gerçekleşmiştir (TÜİK, 2022). Türkiye’de bu türün kültüre alınarak, doğal stok varlığının korunması ve desteklenerek takviye edilmesi ciddiye alınması gereken önemli bir konudur.

Su ürünlerinin tümünde olduğu gibi kerevitlerinde üretim aşamasında en önemli konuların başında yumurtaların inkübasyonu aşaması öne çıkmaktadır. Inkübasyon sürecindeki gidişat üretimin geleceğini etkileyen en önemli faktördür. Bu maksatla yapılan çalışmalarda; araştırma aşamasında kerevitlerin yumurta inkübasyonunda züger şişeleri, elek sistemleri, tanklar yada annelerinin pleopodlarında yumurtaların açılmasını beklemek gibi bir çok metot kullanılabilirliği bildirilmiştir. (Ackerfors 1989; Carral vd., 1988; Leonard vd., 2001). Köksal (1988), *Astacus leptodactylus* üretim aşamasında yumurta taşıyan dişi bireyin yumurtalarında açılma meydana gelinceye kadar havuzlarda kalması yada dişi bireyden ayrılan yumurtaların inkübatörler üzerinde inkübe edilmesi gibi iki türlü metot kullanılabildiği belirtilmiştir. Çalışmamızda ise *Astacus leptodactylus* üretim sürecinde yumurta taşıyan dişi bireylerin yumurtaları açılma süresince tanklarda tutulmuş ve yumurtaların açılması takip edilmiştir.

## Materyal Ve Yöntem

Araştırma materyalini oluşturan kerevitler (*Astacus leptodactylus*); Bafra Balık Gölleri’nden Şubat ayında pinterlerle avlanan yumurtalı kerevitler (10 adet) Sinop Üniversitesi’nin Su Ürünleri Araştırma ve Uygulama Birimi’ne getirilmiştir. Pleopodlar üzerinde yumurtaların inkübasyonunu sağlamak için yumurtalı kerevitler; 96 x 196 x 50 cm dikdörtgen fiberglas tankların içine 10 lt’lik plastik saklama kaplarına bireysel olarak koyuldu. Plastik saklama kaplarında kerevitlerin gizlenme yeri olarak plastik boru parçaları konuldu. Çalışmada su kaynağı olarak kuyu suyu kullanıldı.

Her gün su sıcaklıkları, haftada bir kere çözünmüş oksijen miktarları olmak üzere, çalışma süresince, su sıcaklığı 11.74±0.5 °C, pH 8.08, oksijen ise 5.13 mg/lt olarak ölçülmüştür. Kerevitlerde yemleme günde 2 kez ve ad-libitum olarak yapılmıştır. Yenmeyen yemler ve artıkları günlük olarak sifonlanarak temizlendi.

Araştırmada kerevit üretiminde yavru alınması için yumurtaların açılıncaya kadar tanklarda tutulması hedeflenmiştir.

## Bulgular

Çalışmada kerevit yumurtaları günlük olarak kontrol edildi. Yumurtalarda aynı anda kerevitlerin yaşam alanları olarak belirlenen her bir saklama kutusundaki yumurtaların üzerindeki mantarlaşma durumları çıplak gözle gözlemlendi. Bu gözlem sonucunda her bir yaşam alanındaki kerevitlerde farklı zamanlarda mantarlaşmanın başladığı anlaşıldı. İlk mantarlaşma 10. gününde görüldü. Belli bir peryotta takip edilmemekle ve yaşam alanları arasında su geçişleri olmamakla beraber mantarlaşma diğer yaşam alanlarındaki kerevitlerde de

görüldü. Bir kerevitte yumurtaların üzerinde mantar görüldüğünde hızla diğer yumurtalara da yayıldığı gözlemlendi. 45 gün içerisinde bütün kerevitlerin bütün yumurtalarını mantar kapladı. Ayrıca bu süreçte mantarlı yumurtalar arasında sağlıklı gözükten yumurtalarda pleopodlar üzerinden düştü. Bu sürecin sonucunda anaçlarda öldü. Gerek mantarlı yumurtalar gerekse pleopodlar üzerinden düşen yumurtalardan yavru elde edilmeye uygun olmadığından, yumurta sayıları ve yumurta çaplarını ölçülmemiştir.

## Tartışma Ve Sonuç

Astacidae türlerinin, yumurta inkübe sürecinin çok uzun (7-9 ay) olması, kerevit vebası hastalığının olması ile yaşama oranı (% 0-70) düşüktür. Embriyonik gelişim periyodu boyunca, anaçları etkileyen herhangi bir faktör yavrularda büyük kayıplara yol açabilir. Agresif etkileşimler, el ile müdahale, pleopodlara yumurtanın zayıf olarak yapışması ve yumurtaların pleopodlardan atılması mortalite nedenleri olarak kabul edilmektedir (Carral vd., 1992). Kerevit yumurtalarının doğal koşullar altında %10-20'sinin çıkma vasfına sahip olduğu, başka bir deyişle bir kerevitin bıraktığı 200 adet yumurtadan 10-20 adet arasındaki bir sayıda larvanın geliştiği belirtilmiştir (Alpbaz, 2005).

Başarılı bir yumurtlama süreci yumurtaların döllenmesi ve pleopodlara bağlanması evreleri kerevitlerin hayatta kalma oranlarının yüksek olması için önemli bir süreçtir. Ancak yumurtlamayı takiben uzun inkübasyon periyodu süresince belki de yaygın olarak Saprolegnia ve diğer mantar türlerinin sebep olduğu enfeksiyonlar ya da inkübasyon sürecinde yumurta sapının incilmesi sebebiyle yumurta sayıları çeşitli oranlarda azalmaya devam etmektedir. Bazı dişilerde, yumurtlamayı takiben %40-100 oranlarında yumurta kayıpları meydana gelebilir (Reynolds vd., 1992). Leonard vd. (2001) yapmış oldukları araştırmada benzer sonuç elde ederek; bentik ve süspansiyon olmaksızın inkübe sistemlerde *Cherax destructor* yumurtaları %0 oranında yaşamışlardır.

Yapay inkübasyon sırasında, ölü yumurtalar genellikle çevredeki sağlıklı yumurtalara yayılma kabiliyetine sahip mantarlar tarafından istila edilir. Cansız yumurtaların periyodik olarak uzaklaştırılması yoluyla mantar çoğalması kontrol edilebilse de (Carral vd. 2004; Policar vd., 2006), mantar önleyici tedavilerin uygulanması tavsiye edilir. Fakat çalışmamızda pleopodlar üzerinde yumurtaların açılmasında herhangi bir dezenfeksiyon yöntemi kullanılan inkübasyon tekniği nedeniyle uygulanmaması dezavantaj yaratmaktadır.

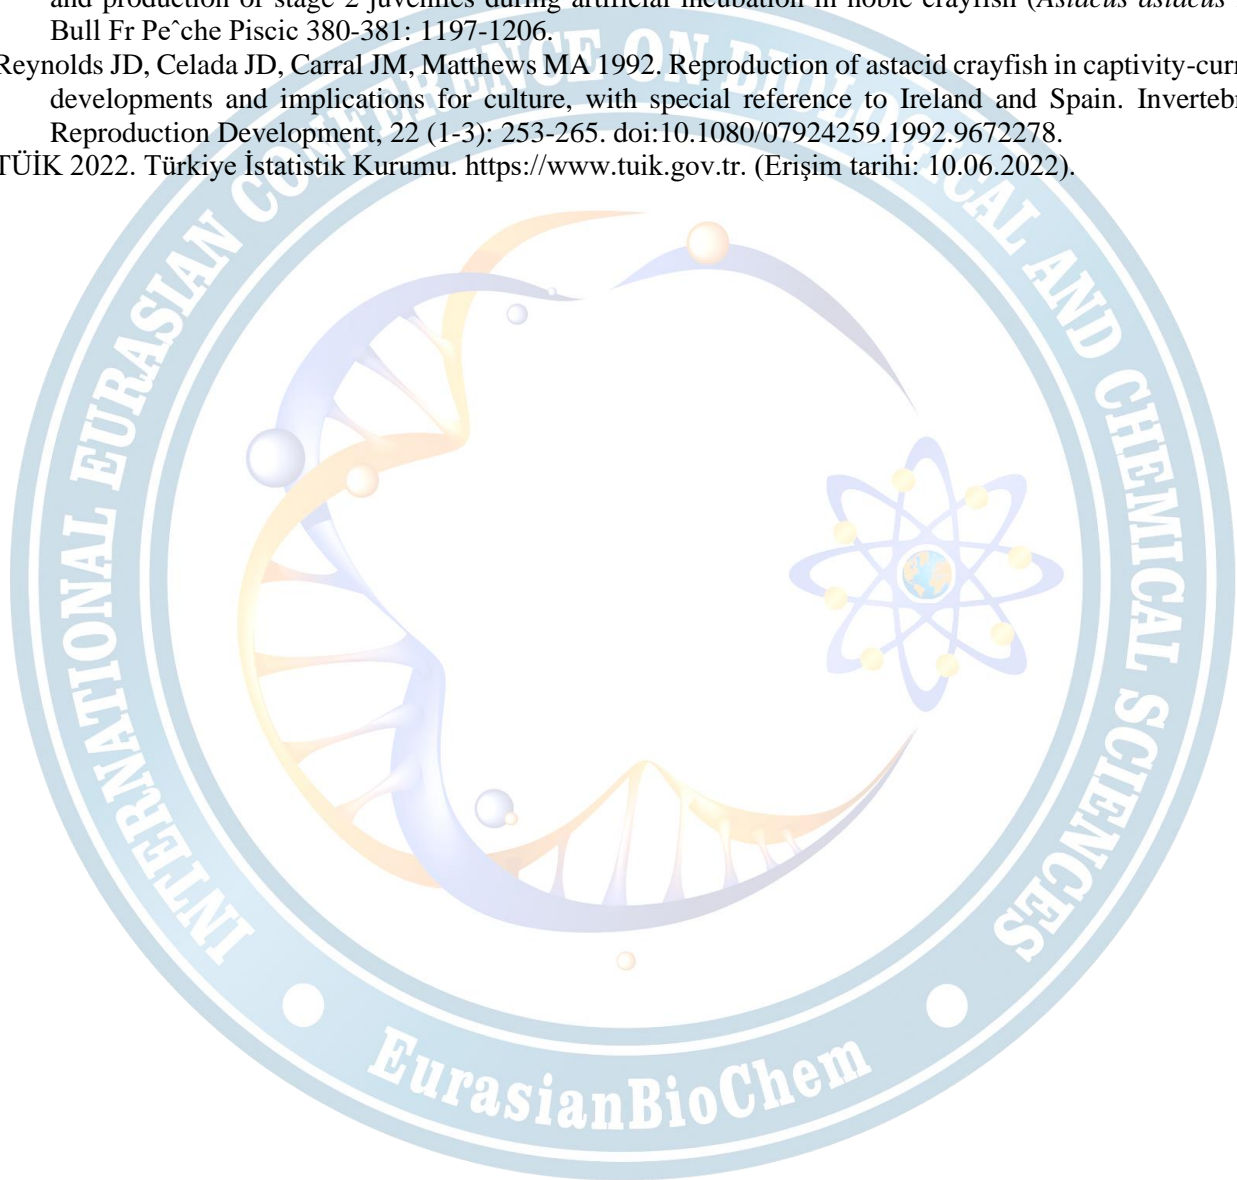

Yürüttüğümüz araştırmada mantar ve pleopodlardan yumurtaların düşmesi sonucunda yumurta kayıplarının %100 olduğu tespit edilmiştir. Bu durum anaçların doğal ortamdan alınmış olmasından ve de muhtemelen bu anaçların vebalı olduğu düşünülmektedir. Bu cümleden olarak, yukarıda belirtilen olumsuz sonucun elde edilmemesi için yumurtası alınacak anaçların hastalığa yakalanmamış olması önemli bir tedbir olarak düşünülmektedir. Bunun için ilk tedbir olarak F1 anaçlarının kontrollü üretim ile elde edilerek sağlıklı olması ve bunların yumurtalarından yavru elde edilmesi üretimin sürekliliği açısından önemli bir tedbir olarak düşünülmelidir.

#### Özet

Süt ve ürünleri içerdiği değerli besin öğeleri sayesinde toplumun tüketmesi gereken besin grupları arasında yer alır. Peynir özellikle kahvaltılarda sıklıkla tüketilen süt ürünleri içerisindedir. Ülkemizde ve dünyada çok çeşitli peynir türleri üretilmektedir. Farklı hammaddeler, farklı üretim metodları birçok peynir türünün ortaya çıkmasını sağlamaktadır. Özellikle geleneksel yöntemler üretim esnasında bazı kayıpların artmasına verimde, kalitede kayıplara sebep olmaktadır. Süte uygulanan veya peynir üretim prosesinde uygulanan yeni teknolojiler kayıpları azaltıp kalite ve mikrobiyal güvenilirliğin artmasını sağlamaktadır. Son yıllarda imitasyon peynirlerin üretimi ile ilgili çalışmalar hız kazanmaktadır. Bitkisel kaynakların kullanımı sayesinde daha ekonomik, fonksiyonel özellikler gösteren peynirlerin üretimi bu teknoloji ile sağlanmaktadır. Ayrıca üretim prosesinin daha hızlı olması istenen biyoaktif ve bitkisel bileşenlerin ilave edilebilmesi bu peynirlerin özel tüketici gruplarına hitap etmesi imitasyon peynirlerin avantajları arasında yer almaktadır. Proses esnasında uygulanan ısı işlem tat- aromada bazı istenmeyen değişikliklere sebep olmaktadır. Isısız olmayan yöntemler arasında yer alan hidrostatik basınç uygulamaları, basınç uygulaması ile gıda güvenliğini sağlayarak raf ömrünü arttırır. Böylece verim ve raf ömründe artış olgunlaşma süresinde ise kısımla sağlar. Yeni teknolojilerden biri olan membran teknolojisi de peynir altı suyu proteinleri konsantresi, süt proteinlerinin fraksiyonlanması, sütte mikrobiyal yükün azaltılmasını sağlar. Süte ısı işlem uygulanmadığı için sütte istenmeyen değişiklikler meydana gelmez. Sonuçta yüksek kuru madde oranına sahip peynir üretilmesi sağlanır. Ultrasound uygulamaları da ısısız olmayan inovatif gıda muhafaza metodları arasında yer almaktadır. Özellikle süt ve ürünlerinde mikrobiyal yükün azaltılmasında oldukça etkili bir methoddur. Bahsedilen metodlar yeni peynir türlerinin üretilmesini sağlarken verimde, kalitede de artış sağlar. Yapılan çalışmalar arttırılıp, endüstriye aktarılabilme olanakları değerlendirilmelidir.

**Anahtar Kelimeler:** Peynir, imitasyon, ultrasound, membran, hidrostatik basınç.

#### New applications in cheese and cheese technology

#### Abstract

Milk and products contain valuable nutrients, so among the food groups that the society should consume. Cheese is among the dairy products that are frequently consumed especially for breakfast. Various types of cheese are produced in our country and in the world. Different raw materials and different production methods lead to the emergence of many types of cheese. In particular, traditional methods cause some losses to increase during production, resulting in losses in efficiency and quality. New technologies applied to milk or applied in cheese production process reduce losses and increase quality and microbial reliability. In recent years, studies on the production of imitation cheeses have gained momentum. Owing to the use of vegetable sources, the production of cheese with more economical and functional properties is provided by this technology. In addition, the addition of bioactive and herbal components, which are desired to make the production process faster, is among the advantages of imitation cheeses, making these cheeses appealing to special consumer groups. The heat treatment applied during the process causes some undesirable changes in taste and aroma. Hydrostatic pressure applications, which are among the non-thermal methods, increase the shelf life by providing food safety with pressure application. Thus, it provides an increase in yield and shelf life and a shortening of ripening time. Membrane technology, which is one of the new technologies, provides whey protein concentrate, fractionation of milk proteins and reduction of microbial load in milk. Since no heat treatment is applied to the milk, undesirable changes do not occur in the milk. As a result, cheese with high dry matter content is produced. Ultrasound applications are also among the non-thermal innovative food preservation methods. It is a very effective method in reducing the microorganisms, especially in milk and its products. While the mentioned methods enable the production of new cheese types, they also increase the yield

and quality. The possibilities of increasing the studies and transferring them to the industry should be evaluated.

**Keywords:** Cheese, imitation, ultrasound, membrane, hydrostatic pressure

## GİRİŞ

Dünyada ve ülkemizde süt ve ürünleri tüketimi her geçen yıl artarak devam etmektedir. Sağlık üzerindeki etkileri süt ve ürünlerinin üretimini ve çeşitliliğini de etkilemektedir. Süt ürünleri grubunda yer alan ve ülkemizde kahvaltılarımızda vazgeçilmez olan peynir bu sektörde önemli besin grupları arasındadır. Peynir çeşitliliğine baktığımızda her yörede üretilen peynir çeşitleri bulunmakla birlikte aynı yörede farklı özelliklere sahip olan peynirlerde mevcuttur. Peynir üretiminde kullanılan hammadde koyun, keçi, inek sütü yada bu sütlerin karışımı olabilir. Çok farklı üretim metotları, kullanılan farklı starter kültürler ve olgunlaşma aşamasındaki farklılıklar son ürünün fiziksel, kimyasal, mikrobiyolojik ve duyuşal özelliklerini etkilemektedir. Peynir üretiminde farklılıklar olmasına rağmen özellikle beyaz peynir üretiminde kayıplar ve verimde azalmalar görülebilir. Ayrıca geleneksel yöntemlerle üretilen peynirlerin raf ömrü kısıtlı olup kısa sürede bozulmalar görülebilir. Mevcut teknolojilere ilave yapılan bazı uygulamalar peynir üretiminde oluşan kayıpları azaltıp, verimi arttırıp daha sağlıklı ürünlerin üretilmesini sağlamaktadır. Bu aşamada kullanılan hammadde olan süte bazı işlemler uygulanmakta, yada proses esnasında farklı teknikler geliştirilmekte ve yeni teknolojilerin kullanımları değerlendirilerek endüstriye aktarımı amaçlanmaktadır.

Son üründe istenen özellikleri sağlamak için mevcut ingrediyeentlere farklı bileşenler eklenmekte sağlık açısından daha yararlı peynirler üretilmektedir. Bu araştırmada da dünyada ve ülkemizde uygulanan peynir prosesleri ve imitasyon peynir üretimine değinilecektir. Her geçen gün peynir ve çeşitleri ile ilgili literatürde yapılan çalışmaların sayısı artmaktadır. Yapılan bu çalışmalar ve yeni teknolojiler ile gerçekleştirilen peynir üretimi, kişi başına düşen peynir tüketimini arttırarak peynirdeki kayıpları azaltacak ve peynir çeşitliliğine katkı sağlayacaktır.

## PEYNİR

Günümüzde insanlar sağlıklı besinlere yönelmekte ve temel ihtiyaçlarını bu besin gruplarından karşılamaktadır. Süt ve ürünleri bu anlamda oldukça değerli besin gruplarıdır ve yapılarında vitamin (A, B2, B6 ve B12), protein ve mineralleri muhteva ederler. Sağlıklı bir diyetle süt ve ürünleri mutlaka bulunmalıdır. Ülkemizde süt ve ürünleri insanlar tarafından sevilerek tüketilen besin gruplarının başında yer almaktadır. Ülkemizde süt üretimi hayvan ağırlığı ve laktasyon artışı ile artış göstermektedir (Çınar, 2018). Süt ve ürünleri içerisinde peynir tüketimi yılda ortalama %1.6 artış göstererek ilk sırada yer almaktadır. Yaşam standartlarının değişmesi, tüketici talepleri peynir çeşitlerinin artmasına daha fonksiyonel özellikler gösteren yeni peynir türlerinin ortaya çıkmasına ve tüm bunlar peynirle ilgili inovasyon çalışmalarının artmasına sebep olmaktadır. Doğal peynir çeşitleri yanında farklı ikameler eklenmiş peynirler, çeşitli teknolojilerle zenginleştirilmiş peynirler ve son zamanlarda ortaya çıkan imitasyon peynirler pazarda yer almaktadır (Ersan ve Gizem, 2020).

Dünyada peynir üretimi %1,5 oranında artış göstererek 2019 yılında 24 milyon tona ulaşmıştır. Dünyada peynir üretiminde ilk sırayı 5,9 milyon ton üretimle ABD alırken, önemli peynir üreticilerinden olan Brezilya, Rusya ve Türkiye de ise peynir üretimi 600-800 bin tona ulaşmıştır. Ülkemizde peynir üretimi ise 2019 yılında %6,5 azalmıştır ve 707 bin tondur. Toplam arzda %6,6 artış görülmüştür ve 714 bin tona ulaşmıştır. Aynı yıl görülen peynir ihracatı 50 bin tona ulaşmıştır. Dünyada üretilen süt özellikle peynir, tereyağı ve peynir altı suyu tozuna işlenmektedir. Dünya genelinde peynir tüketimi her geçen gün artış göstermektedir. AB, ABD, Yeni Zelanda ve Kanada da peynir tüketimi oldukça fazladır (Tepge, 2020). Ülkemizde süt ürünleri arasında en çok tercih edilen ürünlerden biri peynirdir. Ülkemizde üretimi ve tüketimi en fazla olan ve en büyük pazara sahip olan peynir beyaz peynirdir. USK 2019 yılı verilerine göre ülkemizdeki kişi başı yıllık peynir tüketim miktarı 17,5 kg'dır (USK, 2020).

Peynir çeşitli oranlarda yağ içeren süütün proteolitik enzimler yada çeşitli asitlerle pıhtılaştırılması sonrasında peynir altı suyunun ayrılması ve oluşan pıhtının şekillendirilmesi sonucunda elde edilen bir süt ürünüdür (Üçüncü, 2008). Protein ve yağ bakımından oldukça zengin olan peynir çok farklı metodlarla üretilebilir. Taze ve tuzsuz olabileceği gibi tuzlama ve olgunlaştırma işlemleri ile peynire çok çeşitli tat-aroma ve görünümde kazandırılabilir. Tuzlama işlemi peynirde ortaya çıkan proteolizi ve bu durumda yapı-kıvam, tat-aroma özelliklerini etkilemektedir (Çavuş, 2020).

Sütten elde edilen ve oldukça lezzetli olan peynir asırlardır yapılmakta ve her geçen gün çeşitliliği artış göstermektedir. Yapıldığı bölgeye kullanılan hammaddeye ve üretim metoduna göre farklılıklar

göstermektedir. Ülkemizde farklı bölgelerde farklı peynir çeşitleri bulunmaktadır. Sıcaklık, yer, kullanılan hammaddeler uygulanan farklı üretim prosesleri farklı peynirlerin ortaya çıkmasını sağlamaktadır. Peynirlerin üretiminde farklılıklar bulunmasına rağmen peynir yapımında temel aşamalar vardır. Proses kısaca şu şekildedir; sütün pıhtılaştırılması, pıhtının kesilmesi ve peynir altı suyunun ayrılması, pıhtının toplanması, birleştirilmesi ve şekillendirilmesi olarak belirtilebilir. Bunlara ek olarak tuzlama, olgunlaştırma, fermentasyon, haşlama gibi farklı işlem basamakları da peynirin çeşidine göre proses aşamaları olarak uygulanmaktadır.

## 2. PEYNİR TEKNOLOJİSİNDEKİ YENİ GELİŞMELER

### 2. 1. İmitasyon Peynir Üretimi

Değişen yaşam şartları, fonksiyonel özelliklere sahip olan yeni peynir çeşitleriyle ilgili yapılan inovasyon çalışmaları, peynir kullanımının giderek artış göstermesi peynir endüstrisinde yeniliklere sebep olmaktadır. Bu alanda doğal peynirlere yakın özelliklere sahip olan peynir benzeri ürünlerin oluşumu karşımıza çıkmaktadır. Ulusal ve uluslararası pazarda üretimi ve tüketimi giderek artış gösteren; düşük maliyetli ve farklı ingrediyeentlere sahip olan imitasyon peynirler önem kazanmaktadır. İşlenmiş peynir grubunda yer alan imitasyon peynirler peynir analogu, taklit peynir ve ikame peynir olarak da isimlendirilirler (Ersan ve Gizem, 2020). Süt yağının tamamının veya bir kısmının diğer yağlar ile yer değiştirilerek oluşturulan peynir benzeri ürünler Kodeks Alimentarius'a göre imitasyon peynirler olarak tanımlanmaktadır (Kodeks Alimentarius, 2016). FAO ise imitasyon peynirleri besin değeri daha düşük olan doğal peynirlere benzeyen peynir benzeri ürün ve peynir ikameleri olarak 2 grupta incelemektedir (FAO, 2017). Ülkemizde ise bu peynirlerle ilgili herhangi bir yasal tanımlama bulunmamaktadır. Üretimlerinde; homojen bir matriks içinde yer alan su, proteinler, tuzlar, sıvı yada katı formda bulunan yağlar, hidrokolloidler, asitleştiriciler, koruyucu ajanlar ve diğer katkı maddeleri kullanılmaktadır. Üretimlerinde kullanılan bileşenlere göre; süt bazlı, kısmi süt bazlı ve süt bazlı olmayan imitasyon peynirler olarak sınıflandırılmaktadır (Ersan ve Gizem, 2020).

Krem peynir, kaşar ve mozzarella'ya benzeyen peynir türleri kullanılarak imitasyon peynirler üretilebilmektedir. Üretimde kullanılan bileşenler, miktarları, proseste kullanılma sıraları, proses ve son ürün özelliklerine göre farklılıklar göstermektedir. Öncelikle ürün formülasyonu oluşturulur, sonra bu bileşenler karıştırılır ve ısı işlem uygulanır, sıcak olarak paketlenme ve soğutma prosesleri imitasyon peynir üretiminde kullanılan genel prosestir (Ersan ve Gizem, 2020). Toz şeklinde bulunan tuz, kazein, kazeinatlar ve hidrokolloidler suyla karıştırılıp 50 °C'ye kadar ısıtılmakta ve karıştırılmaktadır. Üretimde yer alan bitkisel yağlar koyulduktan sonra 85°C'ye kadar ısıtma ve karıştırma yapılmaktadır. En son asitleştiriciler ve tat- aroma maddeleri ilave edilip soğutma aşamasına geçilmektedir. Uygulanan proses parametreleri ürünün özelliklerini ve muhafaza süresini etkilemektedir. Ayrıca kullanılan peynir bileşenlerinin türü, kimyasal ve fonksiyonel özellikleri, aralarındaki interaksiyonlar son ürünün reolojisini ve bütün özelliklerini belirleyen faktörlerdendir (Ersan ve Gizem, 2020).

İmitasyon peynirler  
Tüketiciler tarafından satın alımlarda,

Dondurulmuş ürünlerde,

Gastronomi alanında çeşitli gıdaların hazırlanmasında,

Cips, çerez gibi atıştırılabilir ürünlerin hazırlanmasında kullanılmaktadır (Ersan ve Gizem, 2020).

Bitkisel yağların süt yağı yerine kullanılması, protein olarak da hidrokolloidler yada çeşitli nişastaların kullanılması üretim maliyetlerini düşürerek daha uygun fiyatlı ürünlerin ortaya çıkmasını sağlamaktadır. Ayrıca kullanılan alet- ekipmanın az olması, iş gücünün az olması, üretim prosesinin diğer peynirlere göre kısa olması ve olgunlaşma aşamasının olmaması da maliyeti düşüren diğer faktörler arasındadır. Soya, hurma ve hindistan cevizi yağı gibi bitkisel ürünler bu alanda değerlendirilerek laktozsuz, düşük kalorili özel peynirler üretilebilir (Ersan ve Gizem, 2020). Hem bitkisel kaynaklar değerlendirilirken hem de özel diyetle olan insanların gereksinimleri imitasyon peynirler ile karşılanabilir. Hastalıkların önlenmesi ve tedavi edilmesinde kullanılan fonksiyonel zenginleştirici ajanlar sayesinde çok çeşitli ürünler üretilerek insan sağlığına ve topluma faydalı olan imitasyon peynirler üretilebilir. Örneğin; düşük fenilalanin ve düşük protein ile beslenmeleri gereken fenilketonuri hastaları bileşimleri farklılaştırılarak oluşan imitasyon peynirleri tüketebilir (Ersan ve Gizem, 2020). Farklı teknikler ile imitasyon ve doğal peynirlerin ayrımı yapılmaktadır. Örneğin lizinoalanin analizi ile imitasyon peynirlerin süt proteini bulundurup bulundurmadığı kontrol edilebilir. Ayrıca taramalı

elektron mikroskobu ile lipidlerin durumu tespit edilir. İmitasyon peynirlerde lipidlerde topaklanma, doğal peynirde ise düzgün yağ kürecikleri oluşmaktadır. Yine peynirde bulunan bitki pigmentleri ve fitosteroller için kromotografik yöntemler kullanılarak ayırım yapılabilir (Ersan ve Gizem, 2020).

## 2.2. Peynir Üretiminde Yüksek Hidrostatik Basınç Uygulamaları

Süt ürünlerinin üretiminde tat-aromada oluşan olumsuzlukları ve ısıl işlemlerden kaynaklanan diğer olumsuzlukları gidermek için ısısal olmayan yöntemler üzerinde durulmaktadır. Bu uygulamaların başında yüksek hidrostatik basınç uygulaması gelmektedir (Çınar, 2018). Katı ve sıvı gıdalara 100 ile 1000 MPa arasında basınç uygulayarak gıdayı güvenli hale getirip raf ömrünü arttıran uygulamalara yüksek hidrostatik basınç uygulamaları denir. Peynir üretiminde hammadde olarak kullanılan süt çevresel etkenlerden, sıcaklık ve pH'dan etkilendiği için bazı işlemlerden geçirilmesi gerekmektedir. Bu uygulamanın peynir teknolojisinde raf ömrünü arttırma, verimi arttırma oluşturduğu yağ kristalleri sayesinde olgunlaştırmayı hızlandırma gibi avantajları mevcuttur (Çınar, 2018).

Yeni ısısal olmayan teknolojiler gıdanın tekstür, yapı- kıvam, lezzet, tat-aroma, renk, besin değeri gibi özellikleri üzerinde sıcaklığın sebep olduğu olumsuz değişiklikleri önleyerek oda sıcaklığında ve benzer sıcaklıkta mikroorganizmaları etkisiz hale getirmektedir (Munoz-Cuevas ve ark., 2013; Barba ve ark., 2015).

Gıdanın boyutu, yapısı, şekli fark etmeksizin her noktasında aynı etkiyi gösteren bu uygulamanın ısıl işleme göre daha kısa sürmesi yöntemin avantajları arasındadır (Sezer ve İnanç, 2013). Isıl işlem uygulamaları ile kombine edilerek uygulanan yöntem sterilizasyon ile aynı etkileri göstermektedir. Isıl işleme göre mikroorganizmaları daha düşük sıcaklıklarda inaktive ederek gıdanın fizikokimyasal özelliklerinde daha iyi koruma sağlar (Heinz ve Buckow, 2009; Devi ve ark., 2015). İlk olarak süt ve ürünlerinde uygulanan yöntemle ilgili çalışmalar artmaktadır. Soğuk sterilizasyon olarak da isimlendirilen bu yöntem 400-600 MPa basınç uygulaması ile ortamdaki zararlı bakterileri yok etmektedir (Sfakianakis ve Tzia, 2014). Yöntemin temel prensibi kapalı bir ortamda sıvıya bir basınç uygulanması ve sıvının her yerine homojen olarak iletilmesine dayalı pascal prensibine dayanır. Ambalajlı yada ambalajsız katı veya sıvı gıda sistemin basınç ünitesine yerleştirilir ve genel olarak su (yada hidrokarbonlar, hidrolik yağlar) yardımıyla basınç uygulanır (Oğuzhan, 2013).

Laboratuvar ölçekli yada az miktarlardaki üretimde piston vasıtasıyla basınç iletilirken, büyük ölçekli endüstriyel üretimlerde ise pompa basınç iletimini sağlamaktadır (Oğuzhan, 2013). Ayarlanan sıcaklık, basınç ve süre sayesinde istediğimiz özellikteki gıda maddelerini bu sistemle üretebiliriz. Elektrik enerjisi kullanıldığı için atık oluşmamaktadır (Sayın ve Tamer, 2014; Bruschi ve ark., 2017). Kurulum ve yatırım maliyetlerinin yüksek olması, dilimli veya tüm halde olan gıdalarda istenmeyen tekstür değişimleri oluşturabilmesi ve enzimlerin bazılarının basınca karşı direnç göstermesi sistemin dezavantajları arasında yer almaktadır (Oğuzhan, 2013). Isıl işlem protein moleküllerinde bulunan kovalent olmayan bağları parçalamakta molekül içi ve moleküller arasında farklılıklara sebep olmaktadır (Devi ve ark., 2013). Yüksek basınç uygulaması ise kovalent bağları etkilememekte ve proteinlerin birincil yapılarında değişiklik olmamaktadır (Sezer ve İnanç, 2013).

Koyun sütüyle yapılan peynirlere 200-500MPa ve 12°C sıcaklıkta 10 dakika boyunca yüksek hidrostatik basınç uygulanmış ve olgunlaşma sonrasında kontrol grubu ile kıyaslama yapıldığında kontrol ile benzerlikler görülürken mikrobiyal yük ve enzim aktivitelerinde farklılıklar görülmüştür (Martinez-Rodriguez ve ark., 2012). Yapılan bir çalışmada peynir üretiminde farklı sütler; çiğ süt, pastörize süt ve 15 dakika 500 MPa basınç uygulanan süt kullanılmıştır. Peynirlerin lipoliz miktarlarına bakıldığında, yüksek basınç uygulanan süt ve çiğ süttten elde edilen peynirlerde benzer sonuçlar elde edilirken pastörize süttten elde edilenlerde düşük çıkmıştır (Sezer ve İnanç, 2013).

Geleneksel (%5.3), ve farklı miktarlarda tuz içeren (%2.5,%1.9,%0.2) çedar peynirlerinde 405MPa hidrostatik basınç uygulanmıştır, mikrobiyolojik yüklerinde 1, 2.5, 3, 4 log azalma gözlenirken kontrol grubuyla duysal açıdan benzer sonuçlar elde edilmiştir (Ozturk ve ark., 2013). Yüksek hidrostatik basınç uygulamalarının mikroorganizmalar üzerindeki etkileri ile ilgili çalışmalar giderek artış göstermektedir. *Bacillus cereus* sporları üzerindeki etkisini gözlemlemek için farklı basınç uygulamaları (200, 400, 600MPa) ve ısıl işlem (70°C) uygulaması yapılmıştır (Silva, 2015). Uygulanan basınç miktarındaki artış ile mikrobiyal yük azalmıştır. 600 MPa basınç uygulaması 40 dakika süre ile uygulandığında bütün mikroorganizmaların inaktif olduğu tespit edilmiştir. Sıcaklık uygulaması 70 °C'ye ulaştığında ise 3.5 log seviyesinde azalma tespit edilmiştir. Uygulanan ısıl işlem daha çok enerji tüketmekte iken yüksek hidrostatik basınç uygulamasının *Bacillus cereus* ve sporlarını yok etmede daha çok avantaja sahip olduğu sonucuna varılmıştır (Silva, 2015).

Peynir üretiminde uygulanan bu yöntem sayesinde verim artmakta, olgunlaşması esnasında gerçekleşen proteolizde biyokimyasal reaksiyonları etkilemekte ve olgunlaşma süresi azalmaktadır (Liepa ve ark., 2016). Tüketiciler az işlenmiş, fizikokimyasal ve duysal açıdan güvenli gıdalara yönelmektedir. Yüksek hidrostatik

basınç uygulamaları tüketicilerin bu isteğine cevap verecek özellikteki sağlıklı ve mikrobiyal anlamda güvenilir gıda üretimine olanak tanımaktadır. Özellikle süt ve ürünlerinden peynir teknolojisinde kullanımı istenmeyen kayıpları önleme, mikrobiyolojik açıdan güvenli hale getirme, olgunlaşma süresini kısaltma gibi avantajları yapılan çalışmalarla kanıtlanmıştır (Çınar, 2018).

### 2.3. Peynir Teknolojisinde Membran Uygulamaları

Süt endüstrisinde membran teknolojisi uygulamaları mikrofiltrasyon, ultrafiltrasyon (UF), nanofiltrasyon ve tersosmoz olarak ayrılacak olan bileşenin molekül ağırlığı ve boyutuna bağlı olarak değişkenlik göstermektedir. Membran teknolojisi ile; peynir altı suyu proteinleri konsantrasyonu, süt proteinlerinin fraksiyonlanması, süt yağının fraksiyonlanması, peynir yapımında kullanılacak olan süttten bakteri sporlarının ve mikroorganizmaların uzaklaştırılması, yüksek kurumadde oranına sahip olan peynir üretiminin gerçekleştirilmesi sağlanır. Peynir üretiminde kullanılacak olan süte ısı işlem uygulanmadığı için süttün yapısında ve bileşenlerinde herhangi bir değişiklik olmaz ve direk üretimde kullanılabilir (Henning, 2006).

Endüstriyel anlamda ultrafiltrasyon uygulamaları peynir yapımında kullanılacak sütte, peynir altı suyundan ve süttten bakterilerin uzaklaştırılmasında, peynir altı suyu ve süt proteini konsantrasyonu ve izolatında, salamura arıtmada kullanılabilir ve daha az enerji, yer ve sermayeye ihtiyaç duyulur (Henning, 2006).

İstenilen maddenin geçişini sağlamak için ayırma ve taşınmanın yapıldığı engeller sistemine membranlar denilmektedir. Genel prensibi membranın yüzeyinde olan çözeltinin yapısında bulunan bileşenlerin özelliklerine göre ayrılması işlemine dayanmaktadır (De Moraes Coutinho ve ark., 2009). Membran kısmından geçip süzülen kısma filtrat çözelti (permeat), geçemeyip kalan kısma ise derişik çözelti (retentat) adı verilmektedir. Membranın fiziksel, kimyasal yapısı ayırma prosesinde etkilidir. Ayrıca çözeltinin derişimi, uygulanan basınç, elektriksel potansiyel ve sıcaklık farkı da ayırma işlemindeki itici güç üzerinde etkilidir (Henning, 2006).

Peynir üretiminde ana basamaklardan biri kazein misellerinin pıhtılaşmasıdır. Enzimler kullanılarak sınırlı proteoliz, starter kültür veya asit ilavesi ile asitleştirme ve sıcaklık uygulamaları yada bu metodların kombinasyonu ile peynir oluşumu için gerekli olan pıhtılaşma yapılır. Bu pıhtılaşma zayıf jel kütlelerinin kesme, pişirme, haşlama gibi çeşitli metodlarla taze peynir formundan istenilen forma dönüştürülmesini sağlar (Henning, 2006). Uygulanan metodlar peynir çeşidine ve istenilen fonksiyonel özelliklere bağlıdır. Peynirlerin türleri ve üretim metodları, süttün bileşimi, oranı ve asitlik gelişimi, nem içeriği pıhtı oluşumu ve olgunlaşma şartlarına bağlıdır (Henning, 2006). UF gibi yenilikçi teknolojiler peynir altı suyu proteinlerinin geri kazanılması yoluyla verimi arttırmaktadır. Peynir altı suyu proteinlerinin geri kazanılması yoluyla verimi arttırmaktadır. Peynir yapımında kullanılan ultrafiltrasyon 3'e ayrılır (Henning, 2006).

\*Düşük konsantrasyon faktörü

\*Orta konsantrasyon faktörü

\*Yüksek konsantrasyon faktörü

Ancak bazı peynir türlerinde kesme işlemi zordur ve üretimde kayıplar artmaktadır. Membran teknolojisi feta gibi taze peynirler ve olgunlaştırılmış peynirlerde kayıpları azaltıp, verimi artırarak başarıyla uygulanabilir (Henning, 2006).

### 2.4. Peynir Teknolojisinde Ultrasound Uygulamaları

Ultrasound uygulamaları gıdalarda kalitenin ve doğallığın korunduğu ısı olmayan inovatif gıda muhafaza metodlarından biridir. Kurutma teknolojisi, ekstraksiyon uygulamaları, mikroorganizmaların ve enzimlerin inaktivasyonu gibi alanlarda kullanılmaktadır. Yapılan çalışmalar yöntemin basınçla veya ısı ile birlikte uygulandığında mikroorganizmaların inaktivasyonunda artış olduğunu tespit etmiştir (Tokuşoğlu, 2013).

Yöntemin çalışma prensibi ses enerjisinin dalgalar oluşturması sonucu oluşan hareketin dalgalar oluşturması ve ortamda bulunan materyaller üzerinde sıkışma ve gevşeme meydana getirmesidir. Mekanik titreşim, akustik dalgalanma ve kavitasyon oluşumu etki mekanizmalarındandır (Rastogi, 2011). Ultrasound uygulamaları düşük güçlü- yüksek frekanslı ve yüksek güçlü düşük frekanslı olarak 2 şekilde uygulanmaktadır. Düşük güçlü- yüksek frekanslı ultrasound uygulamaları 100 kHz frekanslarda ve 10 W/cm<sup>2</sup>'nin altındaki enerjilerde, yüksek güçlü düşük frekanslı ultrasound uygulamaları ise 20- 100 kHz frekanslarında ve 10-1000 W/cm<sup>2</sup>'nin enerjilerinde uygulanmaktadır. Düşük güçlü- yüksek frekanslı ultrasound uygulamaları gıda maddelerinde önemli fizikokimyasal değişikliklere sebep olmamakta ve oldukça hızlı, ucuz ve basit bir metoddur (Rastogi, 2011). Yüksek güçlü düşük frekanslı ultrasound uygulamaları ise gıda maddelerinde biyokimyasal ve fizikokimyasal özelliklerde modifikasyonlara sebep olmakta ve gıda sistemlerinin kalitesinde artış sağlamaktadır.

Sıcaklık, basınç ve uygulama süresi işlem parametreleridir. Süt endüstrisinde düşük frekanslı ultrasound işlemleri tercih edilmektedir (Türkmen, 2012). Süt teknolojisinde ultrasound uygulamaları ile ilgili yapılan çalışmalar da giderek artış göstermektedir. Çeşitli sütlere ultrasound uygulamasının (24 kHz frekansta, 200

W) yapıldığı çalışmada (çiğ süt, düşük sıcaklıkta kısa süre ısıtılarak uygulanan süt, homojenize pastörize süt) toplam canlı bakteri ve psikrotrof suşlar araştırılmıştır. Uygulanan işlem süresi arttıkça bakteri sayısında azalma ve raf ömründe artış görülmüştür. Mikrobiyal yükün azaltılması sağlanırken tat- aromada yanık ve yabancı tat oluşumu gözlemlenmiştir (Chouliara, 2010).

Çiğ sütün bileşimi, oksidasyonu ve peynir teknolojisindeki özellikleri üzerinde ultrasound uygulamalarının etkisinin incelendiği çalışmada ortaya çıkan kötü tat- aromayı azaltmak için HCl ve CO<sub>2</sub> ilavesi yapılmıştır. Uygulanan yöntem ile somatik hücre sayısında azalma, serbest yağ asidi miktarında artma, oksidasyon ve pH da artma gözlemlenmiştir (Marchesini, 2012). Duyusal analizlerde ise yabancı- yanık tat oluşumu görülürken ilave edilen CO<sub>2</sub> ile yabancı tat ve oksidasyon ürünlerinde azalma, ekşi tatta artış görülmüştür. Çalışmada koagülasyon artışı ile verim artışı tespit edilmiştir. Ultrasound uygulamalarında CO<sub>2</sub> kullanımının süt ve ürünlerinde kötü tat gelişimini engelleme, proteolitik aktiviteyi düşürme, oksidasyonu azaltmada etkili olduğu tespit edilmiştir (Marchesini, 2012). Latin Amerika ve Amerika'nın bazı bölgelerinde termosonikasyon uygulanan süt ile üretilen Queso Fresco peynirinde ultrasound uygulamanın etkisi araştırılmıştır. Geleneksel olarak elde yapılan bir peynir çeşidi olduğu için verimi düşük, mikrobiyal yükü fazla ve raf ömrü düşüktür. Uygulanan sonikasyon işlemi sayesinde pıhtılaşma süresi kısalmış, verimde yaklaşık %20 artış görülmüştür. Peynirin parlaklığı, mikroyapısı ve tekstürel özelliklerinde gelişme tespit edilmiştir. Üretilen peynirlerin kalitesi ve raf ömrü önemli ölçüde artmıştır (Bermudez, 2010).

Ultrasound işlemi ısıtma işlemi birlikte kullanıldığı zaman ortaya çıkan termosonikasyon, basınç ile uygulandığı zaman manosonikasyon, ultrasound işlemi, ısıtma işlemi ve basınç birlikte kullanıldığı zaman manotermosonikasyon uygulamaları da gıda alanında ve süt ve ürünlerinde kullanılabilir (Demirdöven, 2009). Peynir teknolojisinde her geçen gün değişen teknolojiler ve uygulamalar vardır. Belirtilen bu teknolojilerden farklı olarak yapılan bazı uygulamalarda mevcuttur. Peynirde olgunlaştırmayı hızlandırmak için; kullanılan sıcaklığın yükseltilmesi, enzim ilave edilmesi, peynir bulamacı kullanımı, kullanılan starter kültürlerde uygulanan modifikasyonlar (yardımcı kültür, zayıflatılmış kültür ve mutant kültür) gibi uygulamalarda kombinasyon halinde yada tek başına kullanılmaktadır (Doğan ve ark., 2022).

Peynir teknolojisinde modifiye atmosfer paketlenme yöntemi kullanarak kimyasal kullanmadan mikrobiyolojik olarak ürün güvenli hale getirilip raf ömrü arttırılmaktadır (Doğan ve ark., 2022). Peyniri biyoaktif bileşenlerce zenginleştirmek için peynire hardal tohumu özü, kırmızı biber, çeşitli mineraller ve bazı probiyotik kültürler eklenmiştir. Bazı peynir çeşitlerinde ambalaj malzemeleri farklılaştırılarak ürün özellikleri ve raf ömrü arttırılmaya çalışılmıştır. Kaşar peynirinde ambalaj malzemesi olarak balmumu ve yenilebilir filmlerin kullanımı (Yılmaz, 2011)., gouda ve kuark peynirinde nanokompozit film ve gümüş nanopartiküllerin kullanımı gibi çalışmalar bu konuda literatüre ışık tutmaktadır (Pluta-Kubica, 2021).

## SONUÇ

Dünyada ve ülkemizde peynir üretim sürecinde karşılaşılan problemler, yaşanan zorluklar ve kayıplar yapılan çalışmalarla belirlenip geliştirilen teknolojilerle bu sorunlara çözümler üretilmelidir. Ekonomik olarak peynirden daha uygun maliyetli olan imitasyon peynir üretim teknolojileri geliştirilmeli ve herkesin alabileceği düzeyde ürünler üretilmelidir. Yüksek hidrostatik basınç uygulamaları, ultrasound uygulamaları ve membran teknolojileri ile peynirde kullanılan hammaddede gereken özellikler sağlanarak kayıplar azaltılmaktadır. Bu teknolojilere alternatif olan yeni teknolojiler belirlenmeli ve bu teknolojilerin birlikte kullanımları ile ilgili çalışmalar yapılmalıdır. Sağlık üzerinde etkileri kanıtlanan bitkisel bileşenler ve farklı starter ve probiyotik kültürler peynir üretiminde kullanılarak sağlık açısından yararlı ürünler üretilmektedir. Ayrıca muhafaza şartlarında nanokompozit filmler ve farklı atmosfer şartları sağlanarak raf ömrü arttırılmaktadır. Bu alanda yapılan çalışmaların sayısı arttırılmalı ve endüstriye aktarımı gerçekleştirilmelidir. Böylece ülkemizde ve dünyada peynir tüketimi arttırılabilir. Yapılan arge çalışmaları ile sağlıklı, fonksiyonel özellikler kazandırılmış, raf ömrü arttırılmış yeni peynirler üretilebilir.

#### Abstract

Malaria is one of the most important vector-borne diseases that has long had a worldwide impact and has killed thousands of people. The most important vector organisms in the spread of malaria are mosquito species in the genus *Anopheles*. For this reason, mosquitoes of the genus *Anopheles* are one of the most important species to be controlled all over the world. Since the identification of the target species is of great importance in the fight against malaria and malaria vectors, systematic studies on these species have gained momentum. For this purpose, both morphological and molecular systematic studies have been carried out depending on the developing techniques, and *Anopheles* species and malaria vectors have been identified. In this study, *Anopheles* species in Çanakkale and Muğla provinces were determined using both morphological and molecular methods. In this context, morphological examination of adult samples of *Anopheles* species sampled between 2018-2019 was carried out and then the species diagnoses were confirmed using molecular identification methods. In Muğla province, 263 *An. superpictus*, 62 *An. hyrcanus*, 16 *An. maculipennis*, 191 *An. sacharovi*, 208 *An. claviger* species were identified from 740 individuals. In Çanakkale province, 126 *An. superpictus*, 156 *An. sacharovi*, 353 *An. maculipennis*, 191 *An. claviger* species were identified from 826 individuals. No *An. hyrcanus* species were found in Çanakkale province. Regular monitoring of *Anopheles* species that vector malaria is very important for control efforts. These monitoring studies contribute to the provision of information, planning, and resources necessary to control malaria epidemics and ultimately eradicate malaria worldwide.

**Keywords:** *Anopheles*, ITS2, Morphological and Molecular systematics.

#### INTRODUCTION

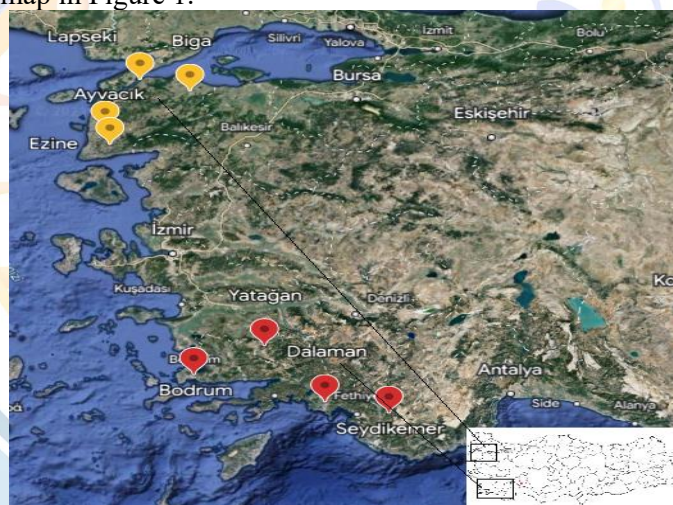

Mosquitoes are members of the Diptera family, which includes the subfamilies Anophelinae and Culicinae, and harbor about 3,500 different species (Harbach and Kitching, 2005). About 200 of these species are carriers of diseases that pose a serious threat to humans (Reinert, 2001). They pose a health threat by playing a role in the spread of diseases such as malaria, dengue fever, yellow fever, encephalitis, West Nile fever, and filariasis worldwide (Lehane, 1991; Kettle, 1995; Beaty and Marquart, 1996). Among these diseases, malaria is the most destructive, especially in the past and present. Approximately 500 million people worldwide are infected by malaria parasites carried by mosquitoes each year, and more than 1 million of them die. The World Health Organization (WHO) recognizes malaria as one of the three most important infectious diseases today, along with tuberculosis and AIDS (WHO 2009a, b; Özbilgin 2011). Therefore, mosquitoes, which are in an extremely critical position in terms of human health, represent a situation that requires increased efforts to combat them. From a global public health perspective, *Anopheles* species, in particular, are of great importance as they transmit malaria parasites to humans, making them a focal point in the fight against malaria. For effective control of malaria, the WHO emphasizes that the fight against *Anopheles* species, the main vector of malaria, plays a vital role (WHO, 2012). Accordingly, it has been emphasized that a better understanding of *Anopheles* population density is essential for a successful fight against malaria in the future (malERA, 2011). Controlling diseases such as malaria by combating these species remains a critical public health priority. In our country, a series of morphological examinations to identify mosquito species have been carried out with specimens collected from malaria-endemic areas (Parris, 1959; Postiglione et al., 1970; Postiglione et al., 1972; Kasap and Kasap, 1983; Merdivenci, 1984; Alten et al., 2000; Simsek, 2006). In this regard, studies determining

insecticide resistance levels in vector species (Kasap et al., 1992, 2000; Lüleyp et al., 2002; Alten et al., 2003), studies in which laboratory colonies were established (Kasap and Kasap, 1983b; Simsek et al., 2005; Yurttas and Alten, 2006), ecological (Kasap, 1986; Simsek, 2006) and etiologic (Demirhan and Kasap, 1995; 1996) studies were conducted. These studies have helped us to understand the distribution and diversity of *Anopheles* species in Turkey. However, despite all these studies, a complete fauna of *Anopheles* species in our country has not yet been definitively revealed, especially when compared to mosquito systematic studies in other countries (Köşluloğlu, 2017). This situation shows that the mosquito fauna in our country requires more detailed and comprehensive research. In the light of recent studies, 64 mosquito species belonging to 8 different genera have been found in our country, although the exact number has not yet been determined. Worldwide, as of 2004, 444 species belonging to the genus *Anopheles* and species complexes including 40 species that have not yet been named have been identified. In Turkey, this genus is represented by 10 different species. Under the genus *Anopheles*, *An. algeriensis*, *An. claviger*, *An. hyrcanus*, *An. maculipennis*, *An. marteri*, *An. melanoon*, *An. pulcherrimus*, *An. plumbeus*, *An. sacharovi*, and *An. superpictus* species constitute the *Anopheles* fauna of our country (Ramsdale et al., 2000; Şimşek et al., 2011; Günay, 2015). These data help us to understand the diversity of mosquito species in our country and the distribution of these species worldwide. This study aimed to identify *Anopheles* species sampled from Muğla and Çanakkale provinces using both morphological and molecular methods. In line with this goal, the project numbered 117 Z 847, supported by TUBITAK, includes adult *Anopheles* samples collected from Muğla and Çanakkale provinces between 2018 and 2019. These samples were examined morphologically under laboratory conditions and then evaluated for molecular species identification.

## MATERIALS AND METHODS

The study material consists of samples collected from Muğla and Çanakkale provinces between 2018 and 2019 within the scope of TUBITAK 1001 project number 117Z847. In each of the 8 locations sampled for the two provinces, 4 locations were sampled to best sample the location. The locations of the samples taken from each location are given on the map in Figure 1.

**Figure 1.** The locations of 8 locations belonging to 2 provinces sampled within the scope of the project are indicated on the map.

### Morphological Description

The collected adult mosquitoes were identified using adult identification keys (Glick, 1992; Becker et al. 2010) and the MosKeyTool program (<https://www.medilabsecure.com/moskeytool.html>).

### Genomic DNA Isolation and Analysis of rDNA ITS2 Region for Molecular Species Identification

Genomic DNA isolations were performed on the species, 5 individuals each from morphologically different species for each province. Genomic DNA isolations were performed using the Zymo Research Quick DNA Miniprep Plus Kit (Catalog No: D4068 & D406). rDNA ITS2 region was analyzed according to Djadid et al. (2007) and forward 5.8 S 5'-TGTGAACTGCAGGACACATG-3' and reverse 28 S 5'-TATGCTTAAATTCAGGGGGT-3' primers were used for amplification.

## Data Analysis

To compare the obtained nucleotide sequence with the same organism or with different organisms, it was queried with BLAST application ([https://blast.ncbi.nlm.nih.gov/Blast.cgi?PAGE\\_TYPE=BlastSearch](https://blast.ncbi.nlm.nih.gov/Blast.cgi?PAGE_TYPE=BlastSearch)). The DNA base sequences obtained were compared with DNA sequences registered in NCBI.

## RESULTS

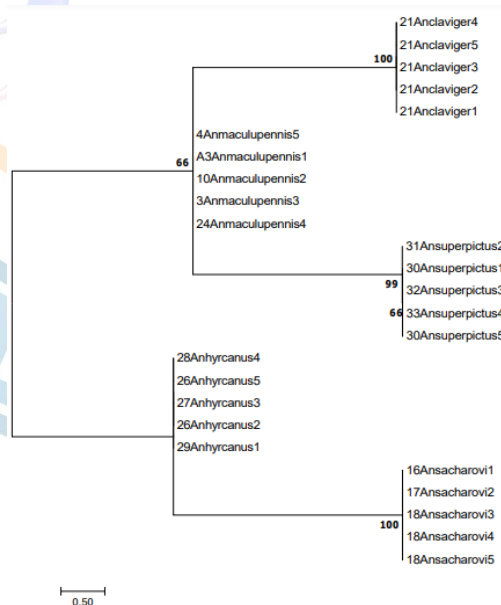

As a result of the morphological examination of the material obtained as a result of the field study in the laboratory environment, 5 *Anopheles* species (*An. sacharovi*, *An. superpictus*, *An. claviger*, *An. hyrcanus*, *An. maculipennis*) were morphologically determined. Of the 740 individuals collected from Muğla province, 263 were *An. superpictus*, 208 were *An. claviger*, 16 were *An. maculipennis*, 191 were *An. sacharovi* and 62 were *An. hyrcanus* (Table 1). Out of 826 individuals collected from Çanakkale province; 126 were identified as *An. superpictus*, 191 as *An. claviger*, 353 as *An. maculipennis*, and 156 as *An. sacharovi* (Table 1). The numbers and distributions of the identified species are given in Table 1.

**Table 1.** Number of samples collected from Çanakkale and Muğla provinces.

<b>Toplam</b>	<b>208</b>	<b>191</b>	<b>16</b>	<b>353</b>	<b>191</b>	<b>156</b>	<b>263</b>	<b>126</b>	<b>62</b>	<b>0</b>

Molecular confirmation of the morphologically identified species was performed with 5 individuals each. In this context, ABI-formatted chromatogram files were opened and visually examined in FinchTV (Geospiza, Inc.; Seattle, WA, USA; <http://www.geospiza.com>) and queried with BLAST application to compare nucleotide sequences with the same organism or with different organisms ([https://blast.ncbi.nlm.nih.gov/Blast.cgi?PAGE\\_TYPE=BlastSearch](https://blast.ncbi.nlm.nih.gov/Blast.cgi?PAGE_TYPE=BlastSearch)).

The obtained MEGA 7 package program (Kumar et al. 2016) was aligned using the Clustal W multiple sequence alignment program (Clustal W multiple sequence alignment program). As a result of the alignment, the relationships and proximity of the species with each other are given in the Maximum-Likelihood dendrogram in Figure 2.

**Figure 2.** Maximum-Likelihood dendrogram of *Anopheles* species collected from Muğla and Çanakkale provinces.

NETWORK analysis was performed to visualize and examine the relationships between the haplotypes obtained and the graph is given in Figure 3 (ver. 4.6, Bandelt et al. 1999; Polzin and Daneschmand 2003).

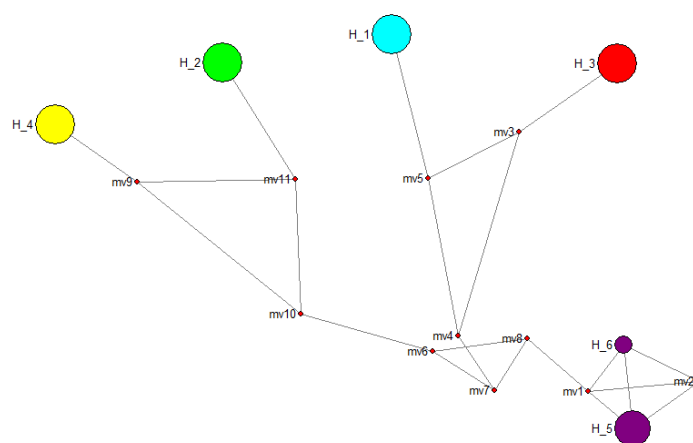

Figure 3. Network graph obtained as a result of base sequence analysis for ITS gene region of *Anopheles* species (H\_1: *An. claviger*, H\_2: *An. hyrcanus*, H\_3: *An. maculipennis*, H\_4: *An. sacharovi*, H\_5 and H\_6: *An. superpictus*).

## DISCUSSION

The World Health Organization (WHO) has highlighted the importance of vector control of *Anopheles* species (WHO, 2012). In this context, it has been emphasized that a better understanding of *Anopheles* populations is a critical factor in achieving success in the fight against malaria in the future (malERA, 2011). To reduce or prevent malaria cases in Turkey, it is necessary to determine the *Anopheles* fauna in Turkey. Many studies based on the morphological examination have been carried out for species identification of *Anopheles* mosquitoes sampled from malaria-endemic regions of our country. In this study, *Anopheles* species collected from Çanakkale and Muğla provinces were first identified by morphological methods and then by molecular methods. In total, 740 samples from Muğla province and 826 samples from Çanakkale province were examined and species identification was made. As a result of the study, 5 different species (*An. superpictus*, *An. sacharovi*, *An. hyrcanus*, *An. maculipennis*, *An. claviger*) from Muğla province and 4 different species (*An. superpictus*, *An. sacharovi*, *An. maculipennis*, *An. claviger*) from Çanakkale province were identified. After the morphological species determinations, the ITS2 gene region was confirmed by molecular identification analysis. The presence of various species belonging to the *An. maculipennis* Meigen, (1818) complex in our country started with the work of Akalın (1936), and in the following years, *Anopheles* species continued to be identified and the *Anopheles* fauna of Turkey began to be established. Parrish (1959), in his publication on the *Anopheles* fauna of Turkey, identified 13 different *Anopheles* species (*An. algeriensis*, *An. claviger*, *An. hyrcanus*, *An. maculipennis*, *An. marteri*, *An. multicolor*, *An. plumbeus*, *An. sacharovi*, *An. sergenti*, *An. sinensis*, *An. superpictus*) and subspecies. Gökberk (1961) determined that the *Anopheles* fauna of Turkey consisted of *An. algeriensis*, *An. claviger*, *An. hyrcanus*, *An. marteri*, *An. sergenti*, *An. maculipennis*, *An. sacharovi*, *An. superpictus* and *An. multicolor* species and reported the zoogeographic distribution of these species in Turkey. This study conducted in Muğla and Çanakkale provinces revealed that 5 different *Anopheles* species were encountered. These species are *An. superpictus*, *An. sacharovi*, *An. hyrcanus*, *An. maculipennis* and *An. claviger*. Compared to other studies, *An. algeriensis*, *An. marteri*, *An. sergenti*, *An. multicolor*, *An. plumbeus*, *An. sinensis* and *An. melanoon* were not found among 13 different *Anopheles* species and subspecies previously identified in the fauna of Turkey. Şimşek et al. (2011) carried out species identification using ITS2 sequence data of *An. maculipennis* complex specimens collected from 70 localities in 10 provinces in southern Turkey (Adana, Antalya, Burdur, Hatay, Isparta, Kayseri, Mersin, Muğla, Niğde, and Osmaniye). They found *An. sacharovi* species in the samples collected from Gökova and Ortaca locations in Muğla province. As a result of this study, *An. maculipennis* s.s., *An. melanoon* and *An. sacharovi* species were identified in the Mediterranean Region. With this study, the presence of *An. melanoon* species in Turkey was confirmed for the first time at the molecular level. In our study, *An. maculipennis* and *An. sacharovi* species were found in Muğla and Çanakkale provinces and *An. melanoon* species, which was found in the study of Şimşek et al. (2011), was not observed. Sevgili and Şimşek (2012) were sampled *An. maculipennis* samples from 12 provinces (Adana, Aydın, Burdur, Çankırı, Edirne, Iğdır, Kırklareli, Konya, Mersin, Muğla, Samsun and Şanlıurfa) and 70 different locations from different regions of Turkey and compared the 200 ITS2 region sequences obtained with the existing sequences in GenBank. According to the results of the study, 106 of the samples were identified as *An. maculipennis* s.s., 5 as *An. melanoon* and 89 as *An. sacharovi*. While *An. sacharovi* species was observed in the samples collected from Dalaman basin, this species was not observed in the samples from

Northern and Central Anatolia. In our study, *An. superpictus*, *An. sacharovi*, *An. hyrcanus*, *An. maculipennis* and *An. claviger* species were observed as a result of the identification of samples taken from Bodrum, Yatağan, Seydikemer and Dalaman locations in Muğla province. Although the sub-locations were different, *An. sacharovi* species were observed in common studies. Günay (2015) morphologically identified 6318 individuals from 34 different provinces of Turkey, including Muğla and Çanakkale, between 2011 and 2015. Based on the results obtained, it was determined that the mosquito species list in Turkey consists of 64 taxa in total. Samples were collected from Datça and Fethiye locations in Muğla province and Ayvacık location in Çanakkale province and only 5 *An. hyrcanus* and 10 *An. sacharovi* species were identified in Muğla province. The researcher did not find any *Anopheles* species in Çanakkale province. He observed 76 individuals of *An. claviger* from 17 different provinces, 1382 individuals of *An. maculipennis* from 22 different provinces and 68 individuals of *An. superpictus* from 3 different provinces. Günay did not find any *Anopheles* species in Çanakkale province in his study conducted in 2011-2015, and in our study with the samples collected in 2018-2019, 4 *Anopheles* species were identified in Çanakkale province. While *An. superpictus*, *An. sacharovi*, *An. maculipennis* and *An. claviger* were detected in Çanakkale province (Ayvacık, Biga, Lapseki, Ezine), *An. superpictus*, *An. hyrcanus*, *An. sacharovi*, *An. maculipennis* and *An. claviger* were detected in Muğla province (Bodrum, Yatağan, Seydikemer, Dalaman). *An. hyrcanus* and *An. sacharovi* species were commonly detected in Muğla province. In their study, Sevgili and Şimşek (2012) found a total of 5 *An. sacharovi* species from Muğla location (Akçapınar, Kapıkargın) as a result of field and molecular studies. Tüzün (2010), detected *An. algeriensis*, *An. claviger* and *An. superpictus* species in samples sampled from the Datça peninsula. Köşlüoğlu (2017) morphologically identified 7 *Anopheles* species including *An. sacharovi*, *An. melanoon*, *An. superpictus*, *An. claviger*, *An. hyrcanus*, *An. maculipennis* and *An. plumbeus* in a study conducted throughout Turkey including Muğla province (Kapıkargın). In common with the previous studies, *An. superpictus*, *An. hyrcanus*, *An. sacharovi*, *An. maculipennis* and *An. claviger* species were observed in Muğla province, while *An. algeriensis*, *An. melanoon* and *An. plumbeus* species were not observed. In our study, 126 *An. superpictus*, 156 *An. sacharovi*, 353 *An. maculipennis*, 191 *An. claviger* species were detected from 826 individuals in Çanakkale province. In the face of these data, *An. maculipennis* was determined as the most abundant and dominant species for Çanakkale province. In previous studies conducted in Çanakkale province, the dominant and rare species of these species were not fully determined. In Muğla province, 263 *An. superpictus*, 62 *An. hyrcanus*, 16 *An. maculipennis*, 191 *An. sacharovi*, 208 *An. claviger* species were identified from 740 individuals. Due to the high number of *An. superpictus* individuals in Muğla province, it was concluded that this species is the dominant species. In addition, according to the data obtained, *An. hyrcanus* was determined as a rare species (Table 1). Possible reasons for the differences in the dominant and most abundant species between localities may be the different habitats of the species and their exposure to different ecological and climatic conditions.

## CONCLUSION

The ITS2 region of ribosomal DNA has been proven to be useful in species identification by Linton et al. 2003, and successfully in the identification of *Anopheles* species by Djadid et al. 2007, Oshaghi et al. 2008, Şimşek et al. 2011. In our country, studies on the classification of species in the *An. maculipennis* complex by base sequence analysis of the rDNA-ITS2 region is also available in the literature. However, these studies were conducted on Datça, Gökova, Ortaca, and Dalaman regions in Muğla and there is not enough data for other regions of Muğla. The fauna of Çanakkale province has not been studied so far. In our study, *Anopheles* species were identified in Muğla and Çanakkale provinces using both morphological and molecular methods. Considering the studies conducted above, it is seen that different *Anopheles* species are denser and these dominant species change in different years in similar locations. Therefore, more studies are needed to determine the population densities of these important vector organisms. In conclusion, the data obtained revealed that both morphological and molecular studies should be carried out together for the determination of the *Anopheles* fauna of Turkey. In particular, more detailed and comprehensive sampling studies should be carried out for species groups, the samples obtained should be compared with the samples belonging to species in our nearby geography and analyzed by using ITS2 and other molecular markers together. Since these species are vectors of malaria, regular monitoring and analysis of these species is necessary for control efforts.

## ACKNOWLEDGMENTS

This study was financially supported by the Scientific and Technological Research Council of Turkey (TUBITAK) under the 2209/A University Students Research Projects Support Program.

#### Özet

Hünnap anavatanı Çin olup 4000 yıldan fazla bir sürede yetiştirilen bir meyvedir. Ülkemizde ise; Ege Bölgesi'nde, Akdeniz Bölgesi'nde ve Marmara Bölgesi'nde bazı illerde hünnap bitkisinin doğal yayılış alanlarını oluşturmaktadır. Bölgeye göre 6 ila 9 m arasında değişiklik gösteren sert gövdeye sahip çalı formunda bir ağaçtır. Hünnap bir ılıman iklim bitkisi olup, Deniz seviyesinden 1700 metrelere kadar çıkabilir. -20°C'ye kadar dayanır. Süzek ve verimli topraklarda aşırı yağışlara karşı dayanıklı ve kuraklıktan etkilenmez. Hünnap eldesi ve üretimi sayesinde meyve, meyve suyu, çay, sirke ve bakım ürünlerinde kullanılmaktadır. Bitkinin kabuk, meyve, tohum ve yaprak gibi kısımları besin içeriği açısından zengindir. İnsan sağlığına faydalı bileşenleri sayesinde insan sağlığı üzerine etkileri çok büyüktür.

**Anahtar Kelimeler:** Hünnap, hünnap üretimi, meyve özellikleri, sağlıklı yaşam

### The miracle fruit: Jujube (*Ziziphus jujuba* Mill.)

#### Abstract

Jujube is a fruit that is native to China and has been grown for more than 4000 years. In our country; It forms the natural distribution areas of the jujube plant in some provinces in the Aegean Region, the Mediterranean Region and the Marmara Region. It is a shrub-shaped tree with a hard trunk that varies between 6 and 9 m depending on the region. Jujube is a temperate climate plant and can reach 1700 meters above sea level. Withstands down to -20°C. Resistant to excessive precipitation in drained and fertile soils and not affected by drought. Jujube is used in fruit, fruit juice, tea, vinegar and care products thanks to its extraction and production. Parts of the plant such as bark, fruit, seeds and leaves are rich in nutrients. Thanks to its beneficial components for human health, its effects on human health are enormous.

**Keywords:** Jujube, jujube production, fruit characteristics, healthy life

#### GİRİŞ

Hünnap (*Ziziphus jujuba* Mill.) Rhamnaceae familyasına ait olup 5-10 m yüksekliğinde ağaç ya da çalı formunda bir bitkidir (Nur Gül, 2021). Hünnap, Ünnap, Hinnap, İnnap, Çiğde, Kuran İğdesi gibi yerel isimleri bulunan şifalı bir bitkidir. Birçok faydaları olan Hünnap ülkemizde yeterince tanınmamaktadır. Genellikle bazı bölgelerimizde doğal bitki örtüsü içerisinde kendiliğinden çoğalmaktadır. Üretimi ise oldukça sınırlıdır (Erdemir Gündoğmuş, 2017). Ülkemizde ise; Ege Bölgesi'nde Çanakkale ve Denizli, Akdeniz Bölgesi'nde Burdur, Isparta, Hatay ve Antalya; İç Anadolu Bölgesi'nde Kayseri, Marmara Bölgesi'nde ise Bursa illeri hünnap bitkisinin doğal yayılış alanlarını oluşturmaktadır (Gün Sefa, 2017). Rakımı 0-1500 m, yıllık ortalama sıcaklık kışın 7-13°C ve yazın 37-48°C, yıllık ortalama yağış miktarı 120-2200 mm olan bölgelerde, kumlu-tınlı nötr veya hafif alkali topraklarda iyi yetişebilir (Kavas İlknur 2014).

Hünnap ağaçları morfolojik olarak dik ve tırmanıcı olup, bitkiler ağaç ve çalı formunda, boyları 7-10 metreyi bulmaktadır. Bu türler içerisinde *Ziziphus jujuba* ve *Ziziphus mauritiana*'nın meyveleri tüketim için yaygın olarak yetiştirilmektedir. Üretilen meyveler çoğunlukla kurutulmuş ve taze olarak tüketilmektedir (Gün Sefa, 2017). Faydaları ise; düşük kalorili bir meyve olduğu aynı zamanda da enerji verdiği için kilo verme konusunda yardımcı olmaktadır, içindeki A ve bolca C vitamini sayesinde bağışıklık sistemini güçlendirir, vücudu hastalıklara karşı korur.

Hünnap, içinde bulunan ve niyasin olarak da bilinen B3 vitamini sayesinde kan dolaşımının düzenli bir şekilde devam etmesini sağlar. Yine B3 vitaminin etkisiyle hünnap sinir sistemi fonksiyonlarının da sağlıklı bir şekilde sürdürülmesine katkı sağlar. Güçlü antioksidan özelliği nedeniyle, karaciğer rahatsızlıklarından çeşitli kanser türlerine kadar birçok hastalığın iyileşme sürecine olumlu etkilerde bulunmaktadır. Hünnap meyvesinin antioksidan özelliği, cilt sağlığını koruma ve cildi güzelleştirme konusunda da önemli katkılar sağlar. Çarpıntı, uykusuzluk, anemi, halsizlik, ateş, karaciğer hastalıkları vb. hastalıklarda kullanılır(Sunar Yunus, 2022).

## HÜNNAPIN TARİHÇESİ

Hünnap, 4000 yıldan fazla bir süredir yetiştirildiği ve 400'ün üzerinde çeşidinin olduğu Çin orijinli bir meyvedir. Hünnap bitkisi asırlar önce Asya'dan dünyanın diğer bölgelerine dağılım göstermiş ve bugün Rusya, Kuzey Afrika, Güney Avrupa, Orta Doğu ve Güneybatı Birleşik Devletleri'nde yetiştirilmeye 5 başlanmıştır. Hıristiyanlık döneminin başlangıcında Avrupa'da tanınmış ve 1837'de Amerika'ya getirilmiştir(Koyuncu Büşra,2021).Hünnap vadilerde ve dağlık bölgelerde yaygın olarak dağılım gösteren Rhamnaceae familyasının yabani bir türüdür(Koyuncu Büşra,2021).Hünnap bitkisinin anavatanı Çin'in Yunan eyaleti olup, Çin'de 7000 yıldan beri gıda ve tıbbi amaçlı kullanılmak için yetiştirilmektedir. Bitkinin doğal yayılma alanı Rusya, Ortadoğu, Hindistan, Güney Avrupa, Anadolu ve Kuzey Afrika'dır(Kemeç Hürkan, 2019).

Hünnap, Hinnap, İnnap, Çiğde ve Kuran İğdesi gibi çok yerel isimleri bulunan şifalı bir bitkidir (Sunar Yunus, 2022).

## HÜNNAPIN DÜNYADA VE TÜRKİYEDE ÜRETİM MİKTARI

Hünnap meyvesi yaklaşık 50 ülkede yetiştirilmektedir. Toplam hünnap üretiminin %90' undan fazlası Çin'de yetiştirilmektedir. Son 30 yıl içerisinde Çin'de, hünnap üretimi hızlı bir şekilde artış göstermiştir(Sunar Yunus, 2022).

**Tablo1.** Türkiye'de hünnap üretim alanı ve miktarı (TÜİK,2023)

Yıllar	Üretim Alanı(da)	Üretim miktarı Hünnap(ton)
2022	2921	2248
2021	2681	1760
2020	2439	1229
2019	1772	960
2018	1621	792
2017	1306	602
2016	1028	315
2015	673	302
2014	604	248
2013	458	142

TÜİK istatistiklerine göre, Ülkemizde, 2013 yılında 142 ton olan üretim miktarı giderek artmıştır. 2018 yılından 2022 yılına kadar hünnap üretiminde %27.7 artış sağlanmıştır.

**Tablo 2.**2022 yılı itibariyle h nnap  retim alanı ve miktarı bakımından bařlıca illerimiz (T İK,2023)

İller	�retim Alanı(da)	�retim Miktarı H�nnap(ton)
Amasya	512	522
Manisa	473	252
Denizli	310	233
Balıkesir	150	187
Çanakkale	245	170
Antalya	250	137
Muęla	75	129
Hatay	33	128
Ankara	89	105
Bursa	127	86

İllere g re 2022 yılı h nnap  retim miktarlarına bakıldığında, 522 ton ile Amasya ilk sırada yer almaktadır. H nnap  retiminde,2022 yılında ikinci sırada 252 tonla Manisa yer almaktadır. Denizli, Balıkesir, Çanakkale, Antalya, Muęla, Hatay, Ankara, Bursa h nnap  retiminde  n sırada olan dięer illerimizdendir.

### H NNAP AęACININ GENEL  ZELLİKLERİ

H nnap (*Ziziphus jujuba* Mill.), Rhamnaceae ailesine ait olup *Ziziphus* t rlerinin en  nemlisidir. B lgeye g re 6 ila 9 m arasında deęişim g steren g çl  ve sert g vdeye sahip bir aęacıdır. Aęaçları, yarı yaprak d ken ve  ok dallı yapıdadır. Kabuęu derin boylamasına oluklara sahiptir ve grimsi kahverengi ya da kırmızımsı renklidir. H nnap, 4 t r filiz yapısına sahiptir; birincil filiz (uzayan), ikincil filizler (yan dallar), ana tařıyıcı filizler (meyveli mahmuz) ve meyve tařıyan s rg nler (dalcık). Dalcıklar,  zellikle de gen  zamanlarında, yoęun beyaz t yl  ve zigzag řekline eęilimlidir; daha sonra dik yayılarak gri kahverengi ve esnek bir hal alır. Meyve veren dalları, yaprak d ken  zellikte deęildir. Yaprakları, parlak ve oval řekilde olup dal yapısına sahip deęildir. Yapraklar 2,5 ila 5,5 cm. uzunluęunda ve 2 ila 4 cm. geniřlięindedir.  içekleri kokulu, soluk yeřilimsi veya sarı renkte ve 4 ila 8 mm. arasında deęişen  aplarda olup k ç kt r. Bir h nnap  içeęi, 5  anak yaprak (sepal), 5 ta  yaprak (petal), 5 bařcık (anter) i eren 2 yumurtalıklı yapıdadır.  içekler, tek bařlarına veya her yaprak aksilinde k me halinde bulunabilir.  içeklenme, aęacın  eşidine ve bulunduęu kısma g re deęişim g sterir. H nnap, sert  ekirdekli bir meyvedir ve ortasındaki tek  ekirdekli kısımda, 2 adete kadar tohum i erir. Meyvesi, yumurtalık ve nektar diskten meydana gelir. Meyve b y kl ę ,  eşidine baęlı olarak bařparmak b y kl ę nden golf topuna kadar deęişir. Meyve řekli de yuvarlak, oval, elma benzeri veya anormal řekilli olabilir. Meyve dokusu; asidik ve tatlı, rengi yeřilimsi, sarı veya bazen de kırmızımsıdır(Korkut Serkan,2022).H nnap,  ok  eşitli toprak tiplerine ve hava kořullarına iyi uyum saęlar. 0 ila 2.000 m arasındaki rakımda ve pH'sı 5,5 ila 8,5 arası toprakta b y rl r. Yazın 48,9  C sıcaklıęı bile tolere edebilir ve kışın da -30 C soęuęa dayanabilirler(Korkut Serkan, 2022).

### H NNAPIN BİLEŐİMİ VE BESİN İÇERİęİ

Genel olarak makro besinler, t kettięimiz besinlerdeki proteinler, yaęlar, karbonhidratlar ve lifler gibi ana besinlerdir. H nnap meyveleri zengin makro besin kaynaklarıdır. Mikro besinler, besinlerde k çük miktarlarda bulunan genellikle mineraller ve vitaminler olarak belirtilen  nemli maddelerdir. Mikro besinler, saęlıklı b y me, geliřme ve hastalıkların  nlenmesi i in hayati unsurlardır.  nceki  alıřmalar, h nnap meyvelerinin vitaminler, makro elementler (N, K, Mg, Ca, P vb.) ve mikro elementler (Fe, Mn, Cu, Zn vb.) dahil olmak  zere zengin mikro besin kaynakları olduęunu g stermiştir(İkinci Ali, 2022).

H nnap meyvesi dięer meyvelerle karřılařtırıldığında nispeten daha y ksek řeker i erięine sahiptir. Bileřimindeki temel monosakkaritler ramnoz, ksiloz, mannoz, arabinoz, glukoz ve galaktoz olarak rapor edilmiştir(Koyuncu B řra,2021).

H nnap, esansiyel yaę asitlerinin  nemli bir kaynaęıdır; dolayısıyla meyvesi de doymamıř yaę asitleri bakımından zengindir. Kurutulmuř meyvesinden elde edilen 33 yaę asidi bulunmaktadır. Yoęun bulunan yaę asitleri; oleik, linoleik, palmitik ve palmitoleik asitlerdir. Y ksek C vitamini i erięine sahip olması, bir dięer

dikkat çekici özelliğidir. Daha az olmakla birlikte hünnap meyvesi tiamin, riboflavin, niasin, B6 ve A vitaminleri gibi vitaminleri de içermektedir. Hünnap meyvesi; magnezyum, fosfor, potasyum, sodyum ve çinko açısından da iyi bir kaynaktır(Korkut Serkan,2022).

## HÜNNAP ÜRETİMİ

Hünnap meyvesi yaş veya kurutulmuş olarak üretimi ve pazarı olabilecek bir potansiyele sahiptir. Kurutulmuş hünnap, Çin'de yerel ve ihracat pazarlarında hâkim bir üründür. Hünnap meyveleri tamamen kırmızı ya da olgunlaşmış olarak toplandığında, meyve olgunluğundan ötürü şeker içeriği ve kurutma kalitesi daha yüksek olmaktadır. Toplandıktan sonra meyveler geleneksel yöntemler veya kurutma fırınında kurutulabilir.

Isıyla kurutma en uygun yöntemdir. C vitamini kaybının az olması ve daha iyi meyve kalitesi vermesi açısından tercih edilmektedir. Kurutulmuş hünnaplar doğrudan atıştırmalık olarak tüketilebilir. Yulaf lapası, güveç, çorba veya çayda kullanılır veya hünnap ezmesi olarak da işlenebilir (Koyuncu Büşra,2021).Kurutulmuş meyvelerin çay içeriği, atıştırmalık, ekmekek, kekler gibi gıda endüstrilerinde aktif bileşen olarak kullanılabilmesine ek olarak keçi sütü yoğurdu, kırmızı hünnap yoğurdu gibi ürünlerin besin değerini ve kalitesini artırmak için diğer yiyeceklere de eklenebildiği belirtilmektedir(Çıtıl Rıza,2022).Çin'de, hünnap meyvesinden üretilen şaraplar "hong zao jiu" olarak isimlendirilmektedir. Meyveler tamamen kırmızı renge ulaştığı zaman toplanır. Böylece meyvenin %60-70 olan C vitamini içeriği korunur. Hünnap meyve parçaları, özellikle kış boyunca taze tutabilmeleri için likör içine konur ve tamamen likör ile kaplanır. Daha sonra kavanoz veya kilitli torbalara konularak ve 6 ay ile 1 yıl arasında saklanabilirler. Ayrıca küçük paketler halinde de hazırlanarak ve birkaç ay sonra doğrudan bu ambalajlarda satılabilirler(Koyuncu Büşra,2021).Meyve, çay veya sirke olarak farklı şekillerde tüketilebilmektedir(Çıtıl Rıza.,2022).

Hünnabın su ve hidroalkolik ekstraktları, cilt bakım ürünlerinde antiinflamatuvar, nemlendirici, yatıştırıcı, kırışıklık karşıtı ve güneşten koruma özellikleri için kullanılmaktadır Kapsül, tablet veya sıvı formda bitkisel tonik formüllerinde bir bileşen olarak hünnap ekstraktları kullanılmaktadır. Ayrıca hünnabın ham hali çorba karışımlarında da kullanılır. Meyve suyu, şarap ve sirke yapımında da hünnaplar kullanılabilir. Taze hünnap meyveleri, dondurma veya meyve salatası olarak da tüketime sunulabilir. Kurutulmuş hünnaplar doğrudan meyve ve fındık karışımlarında kullanılabilir veya kek, tart ya da fırın ürünlerinin üretiminde, pişirmede kuru üzüm ya da hurmaya ikame edilir(Koyuncu Büşra,2021).

## HÜNNAPIN SAĞLIK ÜZERİNE ETKİLERİ

Hünnap, tıbbi bitkilerden biri olarak kabul edilmektedir. Hünnap meyvesinin biyolojik aktiviteleri ve insan sağlığı üzerine faydaları üzerinde uzun süre çalışılmaktadır. Doğal şifalı otlar, özellikle yenilebilir ve şifalı çift amaçlı bitkiler, pişirme işlemleri sırasında malzeme olarak kullanılarak tedavi edici işlevlerin gerçekleştirilmesine yönelik bir uygulamadır. Hünnap, binlerce yıla yayılan sağlık özellikleri nedeniyle günlük hayatta favori bir meyve olarak kabul edilmiştir. Bahsedilen hücrel ve hayvansal bulgulara göre hünnabın anemi, iltihaplanma ve demir/vitamin eksikliğine karşı korunma için tıbbi gıda ve takviye geliştirmede umut verici bir potansiyel taşımaktadır(İkinci Ali,2022).Antik çağlardan beri kanser tedavisi için bitkisel ilaçlar kullanılmıştır. Amerika Birleşik Devletleri'nde ölüme yol açan en önemli 4 hastalık olan diyabet, kanser, hipertansiyon ve kardiyovasküler hastalıkların önlenmesi ve tedavisinde fitokimyasal maddelerden yararlanılmaktadır. Bitkisel ilaçlar, ABD'de ve tüm dünyada yaygın olarak kullanılmaya devam etmekte ve şu anda tamamlayıcı ve alternatif tıp adı altında değerlendirilmektedir. Hünnap bitkisi de içeriğinde var olan fitokimyasallar sayesinde bazı ülkelerde alternatif tıpta kullanılan başlıca bitkiler arasında yer almaktadır(Kemeç Hürkan,2019).Hünnap meyvesi sağlıklı bir gıda seçimini temsil eder. Her şeyden önce, diyet lifi ve fruktoz13 içeriği, sindirimi yavaşlatarak kan şekeri seviyelerinin düzenlenmesine katkıda bulunabilir; lif içeriği ayrıca doyurucu etkisi ile kalori alımının kontrol edilmesine de katkıda bulunabilir (Gao Qing-Han,2013).

Hünnap, lezzetli olmasının yanı sıra etkili bir bitkisel ilaç olarak görülmektedir. Kilo alımına katkı sağlamakta, kas gücünü ve dayanıklılığı artırmaktadır. Çin tıp alanında karaciğer fonksiyonunu güçlendirmek için bir tonik olarak reçetelendirilmektedir. Japon araştırmaları hünnap meyvesinin bağışıklık sistemi direncini artırdığını göstermiştir. Çin'de yapılan bir klinik denemede karaciğer şikâyeti olan 12 hastaya hünnap, yer fıstığı ve esmer şeker verilmiş ve dört hafta sonrasında karaciğer fonksiyonlarının iyileştiği görülmüştür. Hünnap, idrar ve

balgam söktürücü olarak da kullanılmaktadır. Kontrollü bir klinik çalışmada hünnap meyvelerinin kronik kabızlık için yararlı olduğu tespit edilmiştir. Ayrıca hünnap boğaz ağrısını tedavi etmek için eczacılıkta da kullanılmıştır(Koyuncu Büşra,2021).Birçok şifalı bitkinin, bağışıklık sistemini düzenleyici özelliklere sahip olduğu ve vücudun bağışıklık sistemini yeniden düzenleyerek enfeksiyonlara karşı koruduğu bilinmektedir. Alkaloidler, terpenoidler, steroidler, proteinler ve polisakkaritler gibi fitokimyasal bileşenlerin bağışıklık sistemini düzenleyici özelliği olduğu düşünülmektedir(Kemeç Hürkan,2019). Hünnap bitkisinin çeşitli kısımlarının antikanser, antiinflamatuvar, anti-obezite, antihelminthic, antioksidan, hepatoprotektif ve gastrointestinal koruyucu aktiviteler gibi biyolojik etkiler ortaya çıkardığı rapor edilmiştir (Goswami Priya,2019).

## SONUÇ

Hünnap (*Ziziphus jujuba* Mill.), Rhamnaceae ailesine ait olup *Ziziphus* türlerinin en önemlisidir. Meyve şekli de yuvarlak, oval, elma benzeri veya anormal şekilli olabilir. Zengin besin içeriği sayesinde aktivite gösteren hünnapın sağlık üzerine de birçok olumlu etkisi bulunmaktadır. Hünnap meyvelerinin vitaminler, makro elementler (N, K, Mg, Ca, P vb.) ve mikro elementler (Fe, Mn, Cu, Zn vb.) dahil olmak üzere zengin mikro besin kaynakları olduğunu göstermiştir. Özellikle, yapılan çalışmalar sonucunda karaciğer fonksiyonunu güçlendirme, idrar ve balgam söktürücü olarak, boğaz ağrısı enfeksiyonu için bitkisel bir ilaç olarak kullanılabilirliği belirtilmiştir. Yulaf lapası, güveç, çorba veya çayda kullanılır veya hünnap ezmesi olarak da işlenebilir. Taze hünnap meyveleri, dondurma veya meyve salatası olarak da tüketime sunulabilir. Kurutulmuş hünnaplar doğrudan meyve ve fındık karışımlarında kullanılabilir veya kek, tart ya da fırın ürünlerinin üretiminde, pişirmede kullanılabilir. Ülkemizde Hünnapın üretimi yıllar geçtikçe artmaktadır ve daha da çok artırılması gerekmektedir. Hünnapın sağlık ve beslenme açısından önemi büyüktür. Bu araştırma ile hünnap meyvesi hakkında yapılacak çalışmalara ön ayak olunması hedeflenmekte ve bu meyvenin üreticilere sağlayacağı gelir ve tüketicilere de sağlıklı yaşama katkı sunması açısından öneminin vurgulanması amaçlanmıştır.

#### Özet

Antikor taramasına dayalı serolojik çalışmalar, popülasyonda hastalık dinamiklerinin izlenmesinde beşeri ve hayvan hastalıklarının kontrolünde çok önemli bir yer tutar. Dünya üzerinde farklı hastalık etkenleri için çok sayıda in-house ve ticari serolojik test kiti mevcuttur. Her bir kitin tanısal değerinin incelenmesinde pek çok parametre (sensitivite, spesifite, pozitif ve negatif prediktif değeri, tekrar edilebilirlik, intra assay-gün içi ve interassay-günler arası tutarlılığı vb.) bulunmaktadır. Test sensitivite ve spesifitesi; test sonuçlarının örneklenen hasta grubunu doğru (negatif, pozitif veya şüpheli) olarak belirleyebilmesi için öncelikle bakılması gereken iki önemli parametredir. Serolojik antikor tarama ticari test kitlerinin veya yeni laboratuvarında geliştirilen bir in-house test kitinin tanısal değerinin doğru olarak tespit edilmesinde referans serum panellerinin hazırlanması önemlidir. Bu bildiri de beşeri ve hayvan sağlığında antikor tanı kitlerinin değerlendirilmesinde kullanılacak referans serum paneli hazırlanmasında nasıl yol izleneği üzerinde durulmuştur.

**Anahtar Kelimeler:** Beşeri, hayvan, seroloji, serum, panel

#### Abstract

Serological studies based on antibody screening play a very important role in monitoring the dynamics of diseases in the population both in the control of human and animal diseases. There are many in-house and commercially available serological tests for different disease agents around the world. There are many parameters (sensitivity, specificity, positive and negative predictive value, repeatability, intra and interassay consistency, etc.) for evaluation for kit diagnostic value. Test sensitivity and specificity are two important parameters that should be looked at first in order for the test results to determine the sampled patient group correctly (negative, positive or suspicious). In order to accurately determine the diagnostic value of serological antibody screening commercial test kit or a newly developed in-house test, it is to prepare reference serum panels. In this paper, reference serum panel preparation to be used in the evaluation of antibody diagnostic kits in human and animal health was stressed.

**Keywords:** Human, animal, serology, serum, panel

#### GİRİŞ

Antikor tarama serolojik testleri, hastalık dinamiklerinin izlenmesinde insan ve hayvan hastalıklarının kontrolünde çok önemli bir yer tutar (Burgu ve Akça, 1983; Gürhan ve ark., 1984; Presta, 1992; Haselbeck ve ark., 2022). COVID-19 pandemisi de serolojik tarama testlerinin önemini tekrar vurgulamıştır (Winter ve Hedge, 2020; Kaya ve ark., 2022). Hastalık etkenine yönelik antikor tespiti, popülasyonda hastalık taraması ve izlenmesi yanında ayrıca aktif hastalık etkeninin tespit edilemediği durumlarda anahtar rol oynayan tanı enstrümanlarından biridir.

Dünyada sadece önemli enfeksiyöz ajanları dikkate aldığımızda dahi insan ve hayvan sağlığında kullanılan çok sayıda ticari ve in house antikor dayalı serolojik test kiti mevcuttur (Öztürk, 1997; Pinto ve ark., 2011; 2019<sup>b</sup>; Infantino ve ark., 2020). Her bir tanı kitinin değerlendirilmesinde olduğu gibi serolojik kitlerin de değerlendirilmesinde temel parametreler oldukça fazladır. Değerlendirme, testin sensitivite ve spesifitesi yanında, test tekrarlanabilirliği, pozitif/negatif prodüktif değeri, intra-inter assay (gün içi ve günler arası tutarlılık) gibi pek çok parametreye bağlıdır (Parikh ve ark., 2008; Mallett ve ark., 2012; Trevethan, 2017; 2019<sup>b</sup>). Testin tanısal değerinin yüksek olması, test sonuçlarının örneklenen hasta grubunu doğru (negatif, pozitif veya şüpheli) olarak belirleyebilmesi için elzem gereksinimdir. Bir kitin tanısal değerinin doğru olarak

tespit edilmesinde elbette tüm referansların hazırlanması önemlidir. Bu bildiride ise üzerinde çok durulmayan referans serum paneli hazırlanmasında nasıl bir yol izleneceği üzerinde durulmuştur.

Hayvan sağlığında, Dünya Hayvan Sağlığı Manualinde (OIE Manual), referans panellerin seçimi ve hazırlanması ile ilgili genel kısımda; serum örnekleri için yer verilmiş kısımlar yer almaktadır (OIE 2019<sup>a</sup>). Brusella, Tüberküloz gibi zoonoz hastalık etkenleri için OIE referans Laboratuvarı (ANSES)' de etkene yönelik serum referansları koleksiyon halinde sunulmuştur. OIE' nin ayrı bir bölümünde ise “antikör belirlemeye yönelik serolojik testlerinin optimizasyonu” kısmında referans serumlarının hazırlanma koşullarından bahsedilmektedir (OIE 2019<sup>c</sup>)

**Referans serum**, kısaca bir patojen etkenin ilgili referans suşuna karşı hazırlanan anti-serumdur (Wright ve ark., 1993; OIE 2019<sup>a</sup>). Bir serolojik teste ait çok fazla ticari/in house kit var ise onların laboratuvarında ilk defa test edilmesinde ve bir serolojik in-house test ilk defa geliştirildiğinde tanısal değerinin kontrol edilmesinde veya önemli bir hastalık etkeni için (kuduz, SARS-COV 2 gibi) ülke-laboratuvarlar arası yeterlilik testlerinin (VNT, ELISA, PCR gibi) karşılaştırmasında (inter laboratory comparison) **referans serum panelleri** kullanılır. Referans serum bilinen düzeyde ve aktivitede aranılan antikoru içermesi gerekir. Bu genelde serumun içeriğindeki antikör titresi tespit edilerek yapılır. Bu amaçla, serumu tanımlamak için (titresine göre kuvvetli, zayıf, negatif serum gibi) etkene yönelik bilinen altın standart testler kullanılmaktadır (Virus Nötralizasyon Testi-VNT, ELISA vd). Çoğu enfeksiyöz ajan için internal referans standart serumlar ANSES'de (OIE referans laboratuvarı) bulunmaktadır. Ancak uluslararası koleksiyonlarda bulunmayan referansların, özellikle ilgili enfeksiyöz ajan için hastalık dinamiği yüksek endemik ülkelerde, ülke tarafından referans serumlarının hazırlanması gerekmektedir. Referans serum panelleri ilgili serumun toplandığı popülasyonun sınıflandırmasına göre aşağıdaki gibi gruplara ayrılabilir (OIE 2019<sup>a</sup>)

**Pozitif referans serum setleri**; serolojik test kitinin amaçlanan çalışma aralığı veya diğer ifadeyle dinamik aralığın üzerindeki antikör konsantrasyonlarını içeren bu serumlar (kuvvetli pozitif), bir antikör testinin geliştirilmesi ve/veya standardizasyonu süresince kullanılmalıdır. Kitin doğrulamanın çeşitli yönlerinde kullanılabilirlik (tekrar edilebilirlik, analik limit vb.) için yeterli miktarlarda hazırlanmaları önerilmektedir. Pozitif serumlar; hedef popülasyonda bilinen enfekte hayvanları temsil etmelidir. Tercihen bireysel tek bir hayvandan toplanmalıdır. Ancak birkaç hayvandan da örnek havuzu (örnek pool) oluşturulabilir (OIE 2019<sup>b</sup>, 2019<sup>c</sup>)

**Bilinen enfekte ve enfekte olmamış referans hayvanlardan toplanan serum setleri-eşit olmayan referans standart**; tanısal sensitivite ve spesifiteyi belirlemek için ideal referans serum örnekleridir. Bu serum panelleri, “altın standart” olarak tanımlanan testler ile öncelikle doğrulaması yapılmış serumlardır. Bununla birlikte, bu tür örneklerin oluşturulması zordur. Çünkü, bazı etkenler için altın standart test yoktur (Abiha ve Kanık, 2016). Bu panel, tanısal sensitivitenin (konfirme enfekte hayvanları içeren serum paneli -pozitif serum paneli) ve spesifitenin (konfirme enfekte olmamış hayvanları içeren serum paneli - negatif serum paneli) belirlenmesi için kullanılır. Bu panellerin hazırlanmasında bazı durumlar dikkatlice irdelenmelidir. Bu tip serum örneklerinin toplanmasında sahada hayvan/insan klinik belirti veriyordur ancak organizmada antikör şekillenmemiştir. Serum enfeksiyonun erken döneminde toplanmış olabilir. Aksine durum olarak, enfeksiyonun ilerleyen döneminde kronik süreçte toplanan örnekler çok yüksek düzeyde antikör içeriyor olabilir. Bu durumlar, değerlendirilen test kitinin yanlış-yüksek düzeyde sensitivite değerinde görünmesine neden olabilir. Bu nedenle, enfeksiyonun pozitif olduğu bir popülasyonda; hastalığı değişik düzeyde geçiren (eşit olmayan antikör düzeyine sahip bireyler), özellikle zayıf pozitif bireylerden de yeterli miktarda serum toplanmalıdır. Genelde toplanmasının ve belirlenmesinin güçlüğü nedeniyle serum panellerinde zayıf pozitif serum panelleri atlanmaktadır. Üretilen bazı kitler içinde zayıf pozitif serumlar maalesef referans olarak yer almayabilir (Jacobson, 1998; OIE 2019<sup>c</sup> ; Edouard ve ark., 2021).

**Naif veya enfeksiyona maruz kalmamış hayvanlardan toplanan serum paneli (negatif serum paneli)** Bu amaçla, ilgili enfeksiyonun olmadığı coğrafyalardan serum toplanır. Bu panel için toplanan birey ya da bir kaç bireyden oluşturulan-pool serumda spesifik antikör olmadığı; popülasyon klinik gözlem öyküsü, önceki test sonuçları incelenerek altın standart test ile gösterilmelidir. Tanısal spesifite tespitinde kullanılan temel serum panelidir (Jacobson, 1998; OIE 2019<sup>c</sup>).

**Rölatif referans standart;** Bu standart, aynı numuneler üzerindeki başka bir serolojik analiz metodunun test sonuçlarına kıyaslanarak, enfeksiyon durumlarına göre sınıflandırılmış referans hayvanlarla karakterize edilir. Genellikle yeni bir serolojik testin değerlendirilmesi için mevcut olan tek pratik referans materyal kaynağıdır. Ancak ortaya çıkan tanısal sensitivite ve spesifite tahminleri, yalnızca referans testin belgelenebilir, belirlenmiş ve kabul edilebilir performans özelliklerine sahipse kabul edilebilir, yani görecelidir. Göreceli referans standardın getirdiği doğal önyargı tanı kitini değerlendirirken dikkate alınmalıdır (OIE, 2008; OIE 2019<sup>c</sup>).

**Deneyel enfeksiyon veya aşılama ile oluşturulmuş serum paneli** (Ek referans standart); Sahada enfeksiyon olmayabilir ya da daha hızlı ve kontrol edilebilir (enfeksiyon sonrası ve öncesi sürelerin hesaplanması sorunun giderilmesi) pozitif örnekler elde etmenin tek yolu deneyel enfeksiyondur. Bu yaklaşım, teorik olarak çok iyi bilinen enfeksiyonun dinamiklerini modellemek için uygundur. Ancak aynı hayvanlardan tekrarlanan gözlemleri temsil eden veriler, sensitivite ve spesifite hesaplanmasında kullanılamaz. Tanısal sensitivite ve spesifiteyi hesaplamak için kullanılan istatistiksel modeller bağımsız gözlemler gerektirir (her hayvandan yalnızca bir örnek). Deney hayvanlarının kaynakları ve tarihçesi, enfeksiyon sonrası serumun kaçınıcı gün toplandığı çok iyi bilinmelidir. Deneyel enfeksiyonun hiçbir zaman sahadaki doğal enfeksiyonu tam olarak ifade edemeyeceği bilinmelidir. Bu nedenle kitin tanısal değerine deneyel olarak toplanmış serum paneliyle asla karar verilmemelidir (OIE 2019<sup>c</sup> Ringa ve Bauch , 2014).

İnsan sağlığında referans serum hazırlanmasında; ülkemizde Sağlık Bakanlığına bağlı Mikrobiyoloji Referans Laboratuvarları ve Biyolojik Ürünler Daire Başkanlığı, dünyada ise Dünya Sağlık Teşkilatı (WHO) görevlidir. WHO; referans serum standartlarının hazırlanmasında, primer, sekonder, tersiyer setler olarak tanımlamalar bulunur. Primer serum referans setlerini oluşturmaktan Dünya Sağlık Teşkilatı (WHO) sorumludur. COVID-19 pandemisinin de etkisiyle sekonder serum referans panelleri adıyla hastalığın mevcut olduğu diğer ülkeler için ulusal serum standartlarını hazırlamaları için WHO bir manual hazırlamıştır (WHO, 2022). Manual içindekiler kısmı incelendiğinde, aday serumun seçiminden, serumların kalibrasyon ve etiketlenip stoklanmasına kadar detaylı hazırlanmış bir manual bulunur.

Gerek insan gerekse hayvan sağlığında hazırlanan serum panellerinin, hazırlandıktan sonra uzun yıllar (en az 5 yıl) kullanılabilmesi için mümkün olduğunca yüksek miktarda toplanması, uygun biçimde porsiyonlanması ve stabilitesinin sağlanması en önemli konudur. Serumlar; stabilitesinin artırılması için filtre ve toksisitenin giderilmesi için ısı ile inaktive edilebilir. Genelde serum porsiyonlandıktan sonra -20 °C'de stoklandığında uzun süre etkinliğini kaybetmez. Porsiyonlar test kitlerinin değerlendirilmesi için kullanılırken dondur-çözdür yapılmaması önerilir. O nedenle referans serumlar genel olarak -20 °C'den çıkarıldıktan sonra bekletilmemesi, eğer gerekirse ancak çok kısa süreler (max 1 hafta) +4 °C'de bekletilebilir. Çoğunlukla liyofilize paneller de hazırlanabilir. Ancak liyofilizasyon işlemi sırasında ürün hacim ve etkinlik kaybı olabileceğinden bu konu detaylı bir biçimde irdelenmelidir (Marcovovina ve ark., 1990; OIE 2019<sup>a</sup>, OIE 2019<sup>c</sup>, WHO 2020)

## SONUÇ

Sonuç olarak, ülkemizde ve dünyada var olan enfeksiyonlar ve hızla yeni enfeksiyonların gözlenmesi, hastalık tarama stratejisinin önemli bir aracı olarak serolojik antikor tarama testlerinin daha doğru değerlendirilmesini gerektirmektedir. Bu nedenle enfeksiyöz hastalıklara yönelik referans serum setlerinin hazırlanması önemlidir. Bu çalışmada insan ve hayvan sağlığına yönelik farklı amaçlarla kullanılan referans serum panellerinin hazırlanmasında nasıl bir yol izleneceği derlenmiştir.

#### Abstract

Olive oil consumption has been increasing in recent years due to its beneficial effects on health (Yılmaz and Özcan; Bayram and Özçelik, 2012). Our country is one of the most important olive producing countries in the world. According to the International Olive Council data, olive oil production in Turkey in the 2021-2022 season is determined as 227,500 tons (Özkan, 2022). In olive oil production enterprises, three phases emerge at the end of the process: olive oil, solid waste and liquid waste (olive mill wastewater). Approximately 1 ton of liquid waste is discharged for 1 ton of olives (Beccari et al., 1996; Elibol et al., 2008). The composition of olive mill wastewater includes oil, tannins, polyphenols, polysaccharides and proteins. In addition to the high chemical and biological oxygen demand, the olive mill wastewater formed during olive oil extraction creates a significant environmental burden, especially with the oil in its composition, dark color and bad odor. Direct discharge of olive mill wastewater into soil or streams without any treatment brings about significant environmental problems (Elkacmi and Bennajah, 2019). However, there are components in the composition of olive mill wastewater that can be recovered and have economic value. Thus, it can be a resource with economic value instead of waste. In this study, the possibilities of using olive mill wastewater, which is abandoned to nature as waste with high environmental burden, in the textile industry were examined. By reusing waste, an alternative sustainable method has been introduced to coloring which is done using water and various chemicals in classical production. An attempt was made to reveal a sustainable method by performing physical and biological characterization of the dyed textile materials. Additionally, the environmental impact (carbon and water footprint, etc.) of dyeing made in this way was analyzed and compared with the conventional method. Thus, by utilizing olive mill wastewater, which creates a significant environmental burden, in the textile industry, a waste product will be converted into different resources, contributing to the sustainable production approach.

**Keywords:** Olive mill wastewater, waste management, textile, sustainability

#### INTRODUCTION

Olives are an important and traditional product in Mediterranean countries since ancient times and hold an important place in the economy of their countries. The most important product of the olive plant is olive oil (Aslan, 2017). The production of olive oil has been increased rapidly in response to growing demand of olive oil (Doğan, 2021). 90% of the world's olive cultivation is done in Mediterranean countries (Aslan, 2017). Turkey, with its geographical location and Mediterranean climate characteristics, is one of the world's leading olive and olive oil producers, along with other Mediterranean countries such as Spain, Italy, Greece and Tunisia (Apohan, 2007). Olive oil is produced from olive trees that yield between 15 and 40 kg of olives per year from each olive tree (Paraskeva and Diamadopoulos, 2006; Tunç and Ünlü, 2015; Avcı, 2016). Considering that 1 liter of olive oil is extracted from an average of 5 kg of olives, 1 olive tree can produce an average of 3 L or 4 L of olive oil per year (Apohan, 2007).

The production of olive oil yields a considerable amount of waste water, which is a powerful pollutant and is currently discarded (Mulinacci et al., 2001).

Two different methods are used in olive oil production: batch (press) and continuous (centrifuge). In both methods, two by-products such as pomace and olive mill wastewater are formed as a result of production (Elibol et al., 2008). The amount and characteristics of olive mill wastewater released during olive oil production; It varies depending on the olive oil production process, the type of olive processed, the type of pesticide and fertilizer used during olive cultivation, the climate of the growing region and the years (Değirmenbaşı, 2016).

Mediterranean countries produce 30 million m<sup>3</sup> of wastewater annually during the extraction of olive oil from olives. More than 400,000 tons of olive mill wastewater are produced annually in Turkey (Apoohan, 2007).

OMWW is characterized by a brownish black color, slightly acidic nature (pH 3-6), strong specific olive oil odor, high electrical conductivity, and high content of polyphenols (0.4-5.45 %), reducing sugar (1.5-19.3 %), potassium as a major inorganic element (4 g/L), organic load (0.8-220 g/L COD; 0.3-110 g/L BOD; 25-45 g/L TOC) and suspended solids (1-9 g/L) (Çelik, 2018).

Olive mill wastewater covers the surface in environments where it is discharged, preventing the oxygen exchange necessary for living things (Avcı, 2016).

The most important reasons for the difficulties experienced in olive mill wastewater treatment are; this water contains toxic substances such as high organic matter and polyphenols, seasonal production is made and a production season lasts about 3-4 months (Elibol et al., 2008; Rozzi and Malpei, 1996). Many studies have been carried out and different treatment technologies have been developed to eliminate or reduce the polluting effect of this wastewater. Various methods have been applied to purify and dispose of olive mill wastewater (Elibol et al., 2008; Kasırğa, 1988). Since olive mill wastewater contains components that can be recycled and have economic value, wastewater should be seen as a resource with economic value, not a waste, in disposal scenarios (Elibol et al., 2008; Vlyssides et al., 2004).

Based on this point and some preliminary studies, it has been seen that olive oil wastewater can also be considered as a natural dyestuff for dyeing textile materials. Utilizing olive mill wastewater in this way results in finding a zero-cost, high-quantity and renewable alternative natural dye.

## MATERIALS AND METHODS

Some physical properties of olive mill wastewater are examined. The values were given in Table 1.

**Table 1.** Some physical properties of olive mill wastewater (Elibol et al., 2008)

pH	8
Chemical Oxygen Demand (g/l)	80
Biochemical Oxygen Demand (g/l)	55
Suspended Solids (g/l)	15
Oil-Grease (mg/l)	400
Phenol (Caffeic Acid) (mg/l)	3500

100% cotton woven fabric was used in this study. The properties of the cotton fabric is given in Table 2.

**Table 2.** The Properties of The Cotton Fabric

Fabric	Weight	Density	Yarn Count
Woven Cotton	126,1 g/m <sup>2</sup>	Weft: 30 tel/cm Warp: 47 tel/cm	Weft: Ne 39/1 Warp: Ne 41/1

Before being treated with olive mill wastewater, cotton fabrics were pre-treated to increase color yield. The results of different pretreatments were compared each other. The fabric samples were pretreated with chitosan and mordanted by potassium aluminium sulfate (KAl(SO<sub>4</sub>)<sub>2</sub>).

For pre-treatment with chitosan, cotton fabrics were impregnated with chitosan solutions at 1% and 2% concentration, prepared by dissolving in 1% acetic acid (CH<sub>3</sub>COOH), to AF = 100%, and then dried at 40°C.

For the mordanting process, cotton fabrics were treated with distilled water containing 10% and 20% potassium aluminium sulfate at boiling temperature for 1 hour.

All dyeing processes were carried out in a water bath at a liquor ratio of 1:60, according to the specified dyeing conditions.

The color yield (K/S) measurement of the dyed fabrics was determined on a spectrophotometer. K/S values obtained as a result of the analysis are calculated according to the Kubelka Munk equation given below. At least 3 measurements were made for each sample and the average of these measurements was taken. K/S values at the maximum absorption wavelength of dyed fabrics were taken into account.

$$\text{Kubelka Munk: } K/S = (1-R)^2 / 2R$$

K: Light absorption

S: Light reflection

R: Remission value at maximum absorption wavelength

The Fourier transform infrared (FTIR) spectra of cotton fabrics were determined by means of a Perkin Elmer 100 FTIR spectrometer in the attenuated total reflectance (ATR) mode using a diamond/zinc selenide crystal.

## RESULTS AND DISCUSSION

### FTIR Results

The FTIR of cotton fabrics that have undergone different treatments results are shown in Figure 9.

**Figure 9.** The FTIR of cotton fabrics that have undergone different treatments

The peaks in the range of 3300-3100  $\text{cm}^{-1}$  in cotton fibers belong to the hydroxyl (-OH) groups of cellulose. The C-H stretching peak in the 2800-3000  $\text{cm}^{-1}$  region, and the peaks at 1600-1650  $\text{cm}^{-1}$  belong to the asymmetric COO- or C=O peak. The absorption band around 1050-1030  $\text{cm}^{-1}$  originates from different functional groups of cellulose (C-C, C-O and C-O-C vibrations) (Dilsiz, 2016; Gündüz Balpetek, 2017; Hartzell-Lawson and Hsieh, 2000; Uğur and Sarıışık, 2015; Türemen, 2017).

From the FTIR spectra, it can be seen that there are characteristic peaks related to the cellulose structure in cotton fibers (around 3300, 1050 and 1035  $\text{cm}^{-1}$ ) (Dilsiz, 2016; Hartzell-Lawson and Hsieh, 2000; Türemen, 2017).

### Dyeing Results

**pH Optimization:** The pH value of olive mill wastewater was measured as 8. To see the effect of pH change in the dye bath, the pH value was changed to 4-5-6, and dilute formic acid solution was used to adjust the pH. During the dyeing process, the temperature was kept constant at 100°C and the duration was 60 minutes.

	pH	Temperature	Time
pH Optimization	4-5-6	100°C	60 Minutes

K/S values of cotton fabrics after the above mentioned dyeing conditions are given in Figures 1 and 2. Measurements were carried out at a wavelength of 360 nm.

**Figure 1.** The effect of pH change on K/S values of cotton fabrics

The color tones of cotton fabrics dyed at different pH values are shown in Figure 2.

**Figure 2.** The color tones of cotton fabrics dyed at different pH values

**Time Optimization:** In order to see the effect of the time change, 3 different periods were chosen: 30-60-90. pH was kept constant at 4 and temperature at 100°C.

	pH	Temperature	Time
Time Optimization	4	100°C	30-60-90 m

K/S values of cotton fabrics after the above mentioned dyeing conditions are given in Figures 3 and 4. Measurements were carried out at a wavelength of 360 nm.

**Figure 3.** The effect of time change on K/S values of cotton fabrics

The color tones of cotton fabrics dyed for different periods of time are shown in Figure 4.

**Figure 4.** The color tones of cotton fabrics dyed at different times

**Temperature optimization:** To see the effect of temperature change, three different temperatures were chosen: 60-80-100°C. pH was kept constant at 4 and time at 60 minutes.

	pH	Temperature	Time
Temperature Optimization	4	60-80-100°C	60 Minutes

K/S values of cotton fabrics after the above mentioned dyeing conditions are given in Figure 5 and 6. Measurements were carried out at a wavelength of 360 nm.

**Figure 5.** The effect of temperature change on K/S values of cotton fabrics

The color tones of cotton fabrics dyed at different temperature values are shown in Figure 6.

**Figure 6.** The color tones of cotton fabrics dyed at different temperatures

As a result of the optimization made by changing pH, temperature and time in dyeing cotton fabrics with olive mill wastewater, it was determined that the best color values were obtained in dyeing at pH 4, 100°C temperature and 60 minutes.

The K/S values of the dyeing of cotton fabrics dyed in different processes according to optimization conditions are given in Figures 7 and 8. Measurements were made at 360 nm wavelength.

**Figure 7.** The effect of temperature change on K/S values of cotton fabrics

The color tones of dyed cotton fabrics that have undergone different treatments values are shown in Figure 8.

**Figure 8.** The color tones of dyed cotton fabrics that have undergone different treatments

It has been determined that cotton fabric can be dyed without using salt or any other chemicals after pre-treatment with chitosan. Thus, the use of chitosan can reduce the salt load mixed into agricultural lands and groundwater by reducing the pollution of wastewater originating from the textile industry.

As a result, dyeing of cotton fabrics with olive mill wastewater with the help of chitosan; by utilizing the shell waste left over from creatures consumed as food, such as crayfish and shrimp, it will provide many advantages such as reducing the amount of waste and turning it into a value-added product, reducing dyeing process costs and dyeing time, consuming less energy, and reducing the use of auxiliary chemicals used in dyeing (Yüce et al., 2020).

In the use of products obtained from cotton fiber in natural dyeing technology, cotton fiber has some structural limitations such as weak dye interaction, lower dye uptake and low color fastness. There are two reasons why cotton fibers are difficult to dye with natural dyes compared to protein fibers. The first of these reasons is that cotton fiber is cellulose-based and has a high crystalline region ratio, which reduces the cellulose dye population. The other reason is D-glucopyranose, the monomer of cotton fiber, which contains dehydrated hydroxyl groups and ether bonds with negative surface density. This high negative charge density makes it unsuitable for dyeing with negatively charged polyphenolic dyes.

Mordanting is one of the processes used to overcome these disadvantages in dyeing cotton fiber with natural dyes (Merdan and Eyüpoğlu, 2023). The process of binding dyestuffs to textile fibers is called mordanting, and the substances used for this purpose are called mordant substances. Some of the natural dyestuffs change their colors after complexing with certain metallic cations (Aluminium (Al<sup>+3</sup>), Iron (Fe<sup>+2</sup>), Calcium (Ca<sup>+2</sup>) and Tin (Sn<sup>+2</sup>)). Most natural dyestuffs have low light and washing fastness. Therefore, in order to increase fastness, it is subjected to another process with appropriate chemicals before, during or after dyeing. Water-soluble metal salts and substances with weak acid or base properties are used as mordant substances (Avcı, 2016).

In addition, the mordanting process applied to cotton fiber aims to minimize the negative repulsive force exerted by the cotton fiber monomer on the natural dyestuff molecules (Merdan and Eyüpoğlu, 2023).

Potassium aluminium sulfate, an ecological mordant, was used in this study. The experiment results are given in Figure 7. From the experiment results, it is seen that as a result of pre-treatment with 10 and 20% mordant and 1 and 2% chitosan, the color yield values increased by 172%, 220%, 210% and 194%, respectively, compared to the untreated dyed fabric.

## CONCLUSION

In the industry, some waste materials that are generated when raw materials are processed for a specific purpose and cause environmental pollution need to be eliminated or their pollution load should be reduced. However, the economic evaluation of these wastes, if possible, has become even more important, especially in recent years.

Based on this understanding, in this study, studies were carried out on the use of olive mill wastewater as a dyestuff in textiles. In the studies, the best dyeing conditions for woven fabric containing 100% cotton were first determined by optimization (temperature, time and pH). Then, cotton fabrics that had undergone different treatments (1% and 2% chitosan, 10% and 20% potassium aluminium sulfate ( $KAl(SO_4)_2$ )) were dyed under the best conditions and their dyeing efficiencies were compared.

As a result of the optimization made by changing the pH, temperature and time in dyeing the fabrics with olive mill wastewater, the test results with the best color values were obtained at pH 4, 100°C and 60 minutes. As a result of pre-treatment with mordant and chitosan, it is seen that even the use of low amounts increases the dyeing efficiency by 172% and 210%, respectively.

It can be seen from color measurements that olive mill wastewater, which is a waste and brings with it significant environmental problems, can be evaluated in the textile industry as an alternative natural dyestuff.

The study is a part of the project and still ongoing. The experiments about biological properties will be carried out in the future.

## Özet

Phytoseiidae familyasında yer alan *Neoseiulus californicus* (McGregor) (Acari: Phytoseiidae), fitofag akar mücadelesinde etkinliği ve alternatif besinlerle beslenebilmesi ile bilinen bir akardır. Zararlıları kontrol altına almak için yapılan akarisit/insektisit uygulamaları ile *N. californicus* gibi hedef dışı organizmalarda da direnç gelişimi gözlemlenmektedir. Bu çalışmada, sabit koşullar altında, predatör akar *N. californicus* (McGregor) popülasyonunda seleksiyon baskısı sonucunda tebufenpyrad direnç gelişimi araştırılmış ve 9 kez selekte edilen popülasyonda LC<sub>50</sub> değeri 53.9 olarak belirlenmiştir. Tebufenpyrad seleksiyonu sonucu elde edilen dirençli ve hassas popülasyonlarda sinerjistlerin akarisit üzerindeki etkinliğini anlamak ve yapılan biyokimyasal çalışmalar sonucu enzimlerle olan ilişkilerini ortaya koymak amacıyla PBO ve IBP sinerjistleri ile çalışmalar yapılmıştır. S9 popülasyonlarında PBO ve IBP sinerjistlerinin etki oranları sırasıyla 2.61 ve 1,17 kat olarak belirlenmiştir. Popülasyonlarda esteraz ve monooksijenaz enzimlerinin aktiviteleri de uygun metotlarla belirlenmiştir. Esteraz enzim seviyesinde tebufenpyrad dirençli S9 popülasyonu ile başlangıç popülasyonu arasında önemli bir fark bulunmazken, monooksijenaz enzim aktivitesi için istatistiksel olarak fark önemli bulunmuştur. Bu çalışma, pestisitlere dirençli *N. californicus*'un laboratuvar koşullarında kısa sürede direnç geliştirmesi nedeniyle arazi şartlarında kullanımları da dahil olmak üzere entegre bir akar yönetimi programının daha iyi tasarlanmasına katkıda bulunacaktır.

**Anahtar Kelimeler:** akarisit, direnç, METI's, phytoseiid

**The relationship between tebufenpyrad resistance and some detoxification enzymes in predator mite *Neoseiulus californicus* (McGregor) (Acari:Phytoseiidae)**

## Abstract

*Neoseiulus californicus* (McGregor) (Acari: Phytoseiidae), belonging to the Phytoseiidae family, is a mite known for its effectiveness in combating phytophagous mites and its ability to feed on alternative foods. Insecticide applications used to control pests cause side effects on non-target organisms such as *N. californicus*. In this study, the development of tebufenpyrad resistance as a result of selection pressure in the predator mite *N. californicus* (McGregor) under constant conditions was investigated and the LC<sub>50</sub> value was determined as 53.9 in the population selected 9 times. The effect ratios of PBO and IBP synergists in S9 populations were determined as 2.61 and 1.17 fold, respectively, in order to understand the effectiveness of synergists on acaricide in resistant and sensitive populations obtained as a result of Tebufenpyrad selection and to reveal their relationship with enzymes as a result of biochemical studies. The activities of esterase and monooxygenase enzymes in the populations were also determined by appropriate methods. While there was no significant difference between the tebufenpyrad resistant S9 population and the initial population in esterase enzyme level, the difference was statistically significant for monooxygenase enzyme activity. This study will contribute to the better design of an integrated mite management program, including the use of pesticide-resistant *N. californicus* in field conditions, as it develops resistance in a short time under laboratory conditions.

**Keywords:** acaricides, METI's, Phytoseiid, resistance

## GİRİŞ

Dünya genelinde tarım ürünlerinde en önemli zararlılardan biri olan, iki noktalı kırmızı örümcek, *Tetranychus urticae* Koch (Acari: Tetranychidae) polifag bir zararlıdır. 70'ten fazla farklı bitki cinsine ait 1100'ün üzerinde konukçuya sahip kozmopolit zararlıdır (Bolland ve ark., 1998; Grbić ve ark., 2011). Yapraklarda beslenme sonucu küçük noktacıklara, sararmaya, erken yaprak dökülmesine, bodur büyümeye ve nihayetinde tüm bitkinin ölümüne neden olurlar (Patil ve ark., 2014). İki noktalı kırmızı örümceğin kontrolü biyolojik, kimyasal veya entegre mücadele gibi yöntemler ile sağlanabilmektedir. Fakat genellikle kısa sürede etki göstermeleri sebebiyle insektisitlerin ve akarisitlerin kullanımı tercih edilmektedir. *T. urticae*'nin kimyasal mücadelesi, kısa yaşam döngüsüne ve yüksek üreme potansiyeline sahip olduğundan, pestisit direncinin hızla gelişmesi nedeniyle kolay değildir (Stumpf ve ark., 2001; Adesanya ve ark., 2021).

Kırmızı örümceklerin biyolojik mücadelesinde en çok kullanılan avcı grubu, Phytoseiidae familyası içerisinde yer alan akarlardır (Pickett ve ark., 1987; McMurtry ve Croft, 1997). Bu familyadaki türler genellikle predatör akarlar olarak bilinir ve bazıları dünya genelinde fitofag akarların kontrolünde aktif olarak kullanılırlar. Phytoseiidae familyasında yer alan *Neoseiulus californicus* (McGregor) (Acari: Phytoseiidae), fitofag akar mücadelesinde etkinliği ve alternatif besinlerle beslenebilmesi ile bilinen bir predatördür (Rhodes ve Liburd 2006; Sato ve ark., 2007; El Taj ve Jung 2012). Ayrıca tetranychid türlerinde en etkili biyolojik mücadele etmenlerinden biridir. Dünya'nın farklı ülkelerinde yaygın olarak dağılmakta ve ticari olarak da kullanılmaktadır (Gotoh ve ark., 2004; Canlas ve ark., 2006; McMurtry ve ark., 2013).

Entegre Zararlı Yönetim (IPM) programları içerisinde kullanılan spesifik insektisitlerin BCAs'lar üzerindeki etkilerinin belirlenmesi programın sağlıklı bir şekilde yürütülebilmesi açısından önem taşımaktadır (Desneux ve ark., 2007). Çünkü insektisitler ve akarisitler phytoseiid akarlar üzerinde yan etkilere sebep olabildiği gibi seleksiyon baskısı sonucunda direnç gelişimine de neden olabilmektedirler (Bostanian ve Akalach 2006; Duso ve ark., 2008; Cong ve ark., 2016; Ditillo ve ark., 2016; Wu ve Hoy 2016). Pestisit direnci, kimyasal mücadeleyi etkisiz kılması nedeniyle genellikle olumsuz bir özellik gibi görülmesine karşın, faydalı böcek ve akarlarda olumlu bir özellik olarak öne çıkmaktadır (Ghazy ve ark., 2016).

METI-I direnci genellikle artan P450 aktivitesi ile ilişkilendirilmiştir ve bu, farklı METI-I bileşikleri arasında yaygın olarak gözlemlenen çapraz direnç modellerinin nedeni olarak ileri sürülmüştür (Stumpf ve ark., 2001; Kim ve ark., 2004, 2006; Van Pottelberge ve ark., 2009). İçerisinde tebufenpyrad etken maddesinin de yer aldığı METI I akarisitleri (IRAC grup 21) olarak adlandırılan grup, NADH:ubikinon oksidoredüktaz'ı inhibe ederek mitokondriyal elektron taşıma sistemini bozmaktadır. METI I akarisitleri dünyada 1990 yılların başından beri tetranychid, tarsonemid ve eriophyd akarların tüm dönemlerine karşı kullanılmaktadır (Tomlin, 2003). METI I akarisitlerinin yoğun olarak uygulandığı alanlarda bulunabilecek olan phytoseiid akarların da bu akarisitlerden etkilenme olasılığı oldukça yüksektir. Özellikle tarla koşullarında akarisit seleksiyon baskısına maruz kalan predatör akarların çeşitli mekanizmalarla direnç geliştirebildiği bilinmektedir. METI I akarisitleri için Phytoseiidae akarlarda direnç gelişimi ve mekanizmasının belirlenmesine yönelik çalışmalar oldukça sınırlıdır.

Bu çalışmada önemli bir predatör akar olan *N. californicus*'da seleksiyon baskısı sonucunda tebufenpyrad direnç gelişimi araştırılmıştır. Ayrıca direncin önemli detoksifikasyon enzimleri olan esteraz ve monoksijenaz enzimleri ile olan ilişkisi kinetik olarak belirlenmiştir. Bununla birlikte tebufenpyrad direncinin detoksifikasyon enzimleri ile olan bağlantısını daha iyi açıklayabilmek adına sinerjist çalışmaları da yapılmıştır.

## MATERYAL VE METOT

### Predatör akarların orijini ve yetiştirilmesi

*Neoseiulus californicus*'un Türkiye orijini 2008 yılında organik elma yetiştiriciliği yapılan bahçeden toplanmıştır (Salman ve Recep 2013) ve günümüze kadar iklim kabinlerinde herhangi bir pestisite maruz kalmadan yetiştirilmiştir. *N. californicus* ve ona besin olarak verilen *T. urticae* popülasyonunun üretimi 26±2°C sıcaklık, %60±5 orantılı nem ve 16 saat aydınlatma koşulları sağlanan iklim odalarında ve fasulye (*Phaseolus vulgaris* L. var. Barbunia) bitkisi üzerinde yapılmıştır.

## **İnsektisit/Akarisit**

Çalışmada tebufenpyrad etkili maddeye sahip Croshe 20 WP (Hektaş) ticari preparat kullanılmıştır. Bu ticari preparat elma bahçelerinde Tetranychidae familyasına ait zararlı kırmızıörümcek türleri için yaygın olarak kullanılmaktadır.

### **Seleksiyon çalışmaları**

*N. californicus*'un 2008 yılından bu yana iklim odasında yetiştirilen popülasyonu seleksiyon için başlangıç popülasyonu olarak kullanılmıştır. Ancak seleksiyon işlemlerine başlamadan önce *N. californicus* popülasyonunun tebufenpyrad için hassasiyet kontrolleri yapılmıştır. Bu amaçla etken maddede *T. urticae* için de önerilen tarla uygulama dozu kullanılarak *N. californicus* popülasyonunda LC<sub>50</sub> denemeleri kurulmuştur. Tebufenpyrad için predatör akarda LC<sub>50</sub> denemeleri şu şekilde yapılmıştır: Denemeler 1 kontrol+7 doz, her doz için 3 tekerrür olacak şekilde kurulmuştur. Tebufenpyrad uygulama dozları belirlenirken ilk dozda %90'dan az, kontrol grubunda ise %10'dan fazla ölüm olmaması dikkate alınmıştır (Van Leeuwen ve ark., 2010). 9 cm petri içerisine yaprağın nem ihtiyacını karşılayabilmesi amacıyla su agarı dökülerek soğutulmuştur. 3 cm barbunya yaprak disklerin etrafı Tangle Trap yapışkanı ile çevrelenerek predatör akarların kaçması önlenmiştir ve bu yaprak diskler agar ortamına konulmuştur. Her tekerrür için petri içerisine 25±2 adet predatör akar ergini dişi eklenmiştir. Her doz için %50 seyreltilerek hazırlanan insektisit konsantrasyonları ile petri spraytower yardımıyla yaprak yüzeyine 1 bar basınçta 2 mL ilaç gelecek şekilde ilaçlama yapılmıştır. Ölü-canlı sayımları 24 saat sonunda yapılarak LC<sub>50</sub> değerleri POLO (probit analizi) bilgisayar programı ile belirlenmiştir. LC<sub>50</sub> denemesi yapıldıktan ve tebufenpyrad için *N. californicus*'un hassasiyet düzeyi yüksek olarak belirlendikten sonra seleksiyon işlemlerine başlanmıştır. Predatör akar popülasyonu için seleksiyon dozu olarak POLO programından belirlenen LC<sub>60</sub> değerleri kullanılarak başlanılmıştır.

Seleksiyon işlemi, tabanında agar ortamı bulunan 9 cm çapındaki petri üzerinde etrafı Tangle Trap yapışkanı ile çevrilmiş olan 3 cm barbunya yaprak diskleri üzerine 50±2 adet predatör akar ergin dişi aktarılmıştır. Seleksiyon çalışmaları 15 tekerrür olarak yapılmıştır. LC<sub>60</sub> dozu petrilere ilaçlama kulesinde 1 bar basınç altında yaprak üzerine 2 mL olacak şekilde uygulanmıştır. Petri 26±1°C sıcaklıkta %60-65 nem ve 16:8 (A/K) fotoperiyot koşullarında 24 saat bırakılmıştır. Bu süre içerisinde *N. californicus* bireylerinin besinsizlikten ölmelerini engellemek amacıyla petri içerisine her avcı akar için yaklaşık 3 adet ergin dişi *T. urticae* (petri içerisine yaklaşık 150 tane olacak şekilde) bireyleri aktarılmıştır. Seleksiyon uygulamasından 24 saat sonra petri içerisinde canlı kalan *N. californicus* bireyleri (kendi boyu kadar hareket edebilen birey canlı olarak sayılacaktır) temiz barbunya bitkisi üzerine aktarılmıştır. Ayrıca bu bitki üzerine seleksiyon sonrası canlı kalan *N. californicus* bireylerinin beslenebilmesi amacıyla yeteri kadar (her predatör akar için yaklaşık olarak 3 adet ergin *T. urticae* bireyi) aktarılmıştır.

### **Sinerjist + tebufenpyrad çalışmaları**

Seleksiyon aşamalarından sonra tebufenpyrad dirençli *N. californicus*'da monooksijenaz enzim inhibitörü piperonyl butoxide (PBO) (2000µl/l) ve esteraz enzim inhibitörü S-Benzyl-O,O-diisopropyl phosphorothioate (IBP) (200 µl/l) kullanılmıştır (Stumpf ve Nauen 2002; Kim ve ark., 2004; Van Leeuwen ve ark., 2004). Sinerjist çalışmalarında *N. californicus*'un ergin dişi bireyleri kullanılmıştır. Denemeler 1 kontrol+7 doz, 3 tekerrür olacak şekilde kurulmuştur. Sinerjistler 1:1 oranında aseton: saf su içerisinde çözdürülmüştür. Hazırlanan sinerjist çözeltileri ilaçlama kulesinde tabanında ıslatılmış pamuk bulunan petri üzerine yerleştirilen yapraklar üzerine 1 bar basınç altında 1 ml olarak püskürtülerek petri 24 saat boyunca 26±1 °C sıcaklıkta %60-65 nem ve 16:8 fotoperiyot koşullarında tutulmuştur. Sinerjist uygulamasından 24 saat sonra her doz için %50 seyreltilerek hazırlanan tebufenpyrad konsantrasyonları ile petri spray tower yardımıyla yaprak yüzeyine 2 ml ilaç gelecek şekilde ilaçlanmıştır. Ölü-canlı sayımları 24 saat sonunda yapılmıştır. Bireylerin besinsizlikten ölmelerini engellemek amacıyla her gün petri içerisine av aktarılmıştır. Kontrolde ise sadece sinerjist kullanılmıştır.

Sinerjistik etki oranı= Sinerjistsiz LC<sub>50</sub> değeri/ Sinerjistli LC<sub>50</sub> değeri formülü ile hesaplanmıştır (Kim ve ark., 2004).

### **Esteraz ve P450 Monoksijenaz Enzim Aktiviteleri**

Esteraz aktivitesinin kinetik olarak belirlenmesinde substrat olarak α-naphtylacetate ve (Stumpf ve Nauen 2002)'in geliştirdikleri yöntem kullanılmıştır. 20 adet ergin dişi 100 µl sodyum fosfat buffer (0.1M, pH 7.5) (%0.1 Triton X-100 içeren) içinde homojenize edilmiştir. Bu homojenat 10000 g, +4 ° C'de ve 5 dk santrifüj edildikten sonra enzim kaynağı olarak kullanılmıştır. Enzim kaynağı olarak kullanılan supernatant 10 kat seyreltilmiştir. Mikroplakanın hücrelerine 25 µl supernatant + 25 µl fosfat buffer (0.2 M, pH:6) konulmuştur. Çalışma hücrelere 200 µl substrat solüsyonunun eklenmesiyle başlatılmıştır. Substrat solüsyonu 30 mg fastblue RR tuzunun 50 ml 0.2 M sodyum fosfat buffer'da çözülmesi ve bu karışıma 500 µl 100 Mm α -naphtylacetate'm eklenmesiyle elde edilmiştir. Enzim aktivitesi 23 ° C, 450 nm'de 10 dk süreyle okunmuştur.

Sitokrom P450 monooksijenaz enziminin belirlenmesinde substrat olarak *p*-nitroanisole (PNOD) ve (RosE ve ark., 1995) yöntemi uyarlanarak kullanılmıştır. 50 adet dişi birey 100 µl homojenizasyon buffer'da (0.05 M Tris-HCl + %1.15KCl + 1mM EDTA pH (7.7)) plastik ezici ile ezilerek +4 °C 10000 g'de 20 dk santrifüj edilmiştir. Mikroplaka hücrelerine 45 µL homojenizasyon buffer + 45 µL supernatant+100 µL 2mM PNOD eklenerek karışım 30 °C'de 5 dk inkübe edilmiştir. Reaksiyon mikroplaka hücrelerine 10 µL 9.6 mM NADPH eklenerek başlatılmıştır. P450 enzim aktivitesi Versamax kinetic microplate reader'da (Molecular Devices) 405 nm 30 °C'de 15 dk süreyle ölçülmüştür.

Biyokimyasal çalışmalarda, kontrol hücreleri ise homojenatsız olarak okunmuştur. Enzim okumaları dört tekerrürlü olarak yapılmıştır. Tüm enzim aktiviteleri Softmax PRO software programında analiz edilerek sonuçlar mOD min-1 mg-1 protein olarak verilmiştir. Örneklerin toplam protein miktarlarının belirlenmesinde Bradford (1976)'un total protein tayin yöntemi kullanılarak ve Bovine Serum Albumine (BSA) standart olarak alınmıştır. Enzim sonuçlarından elde edilen veriler tek yönlü varyans analizi tekniği ile (One-Way ANOVA) analiz edilmiş ve popülasyonlar arasındaki farklılıkların belirlenmesinde Tukey testi kullanılmıştır.

## BULGULAR

Tebufenpyrad ile seleksiyon sonrası elde edilen popülasyonların LC<sub>50, 60</sub> değerleri ve direnç oranları tablo 1'de verilmiştir.

## TARTIŞMA

Zararlı akarlar ile mücadelede özellikle Phytoseiidae familyasının önemli bir yer aldığı uzun zamandır bilinmektedir (Solomon ve ark., 2000; Duso ve ark., 2009). Phytoseiidae familyasında yer alan *Neoseiulus californicus* (McGregor) (Acari: Phytoseiidae), fitofag akar mücadelesinde etkinliği ve alternatif besinlerle beslenebilmesi ile bilinen bir akardır (Rhodes ve Liburd, 2006; Sato ve ark., 2007; El Taj ve Jung, 2012). Zararlıların kontrolünde tek bir mücadele yönteminin yeterli olmaması sebebiyle entegre mücadele genellikle tercih edilmektedir. Bu kapsamda pestisitlerin doğal düşmanlar üzerindeki etkinliği oldukça önemlidir. Yapılan çalışmada, *N. californicus*'da tebufenpyrad direnç oranı, 9 seleksiyon sonrası 53.9 kata kadar çıkmıştır. Ülkemizde 1990'lı yıllarda ruhsat alan ve günümüze kadar yoğun bir şekilde kullanılan tebufenpyradın da içerisinde yer aldığı METI I akarisitlerinde fitofag akarlarda belirlenen çok sayıda direnç çalışması yayınlanmıştır (Croft ve Van de Baan, 1988; Van Leeuwen ve ark., 2009, 2010; Kwon ve ark., 2010a, b, c,

2012; Osakabe ve ark., 2010; Bajda ve ark., 2017). Ancak phytoseiid akarlarda METI I akarisit direnci üzerine yapılan çalışma sayısı oldukça sınırlıdır. Yakın zamanda yapılan bir çalışmada, laboratuvar koşullarında 7 kez pyridaben ile selekte edilen *N. californicus*'da direnç 270,0 kat olarak belirlenmiştir (Özkan ve Yorulmaz, 2022). Albayrak ve ark., 2022, in vitro koşullarda 5 seleksiyon ile *N. californicus*'da 69 kat pirimicarb direnci elde etmişlerdir. Salman ve Keskin (2019), laboratuvar şartlarında *Phytoseiulus persimilis* Athias-Henriot (Acari: Phytoseiidae)'de milbemectine karşı beş seleksiyon sonrasında 31 kat, spirodiclofene karşı ise 108 kat direnç geliştiğini belirlemişlerdir. Assis ve ark., 2018'de, yaptıkları çalışmada *N. californicus*'da METI I akaristi olan fenpyroximate karşı 113,96 kat direnç belirlemişlerdir. Yorulmaz-Salman ve Ay (2014), *N. californicus*'ta on üç seleksiyon sonrasında 52 kat spiromesifen direnci belirtmişlerdir. Salman ve Recep (2013), 14 defa hexythiazox uygulaması yapılan *N. californicus* popülasyonunda 64,04 kat direnç geliştiğini tespit etmişlerdir. Poletti ve Omoto (2012), Brezilya'da yaptıkları bir çalışmada 3500 kat deltamethrin dirençli *Phytoseiulus macropilis* Banks (Acari: Phytoseiidae) popülasyonu belirlemişlerdir. Auger ve ark., 2005'de, mancozeb ile 10 kere seleksiyon yaptıkları *Typhlodromus pyri* Scheuten (Acari: Phytoseiidae)'in popülasyonunda hassas popülasyona göre direncin 73 kat arttığını belirlemişlerdir. Sato ve ark., 2000, *Amblyseius womersleyi* Schicha (Acari: Phytoseiidae)'de methidathion ile 4 seleksiyon sonrası 311 kat dirençli popülasyon elde etmişlerdir. Görüldüğü üzere, başlangıç popülasyonunun genetik çeşitliliği, zararlı türü, başlangıç popülasyonunun direnç durumu gibi biyolojik etmenler ve ayrıca pestisitlerin bulunduğu sınıf veya pestisit türü laboratuvar seleksiyonlarında elde edilen direnç oranını etkilemektedir. Yapılan çalışmada ve literatürde de phytoseiidae familyası içerisinde yer alan predatör akarların, hem tarla hem de laboratuvar koşullarında seleksiyon baskısı sonucunda kimyasallara karşı direnç geliştirebilmektedir.

Tebufenpyrad seleksiyonu sonucu elde edilen dirençli ve hassas popülasyonlarda sinerjistlerin akarisit üzerindeki etkinliğini anlamak ve yapılan biyokimyasal çalışmalar sonucu enzimlerle olan ilişkilerini ortaya koymak amacıyla PBO ve IBP sinerjistleri ile çalışmalar yapılmıştır. S9 popülasyonlarında PBO ve IBP sinerjistlerinin etki oranları sırasıyla 2.61 ve 1,17 kat olarak belirlenmiştir. Popülasyonlarda esteraz ve monooksijenaz enzimlerinin aktiviteleri de uygun metotlarla belirlenmiştir. Esteraz enzim seviyesinde tebufenpyrad dirençli S9 popülasyonu ile başlangıç popülasyonu arasında önemli bir fark bulunmazken, monooksijenaz enzim aktivitesi için istatistiksel olarak fark önemli bulunmuştur. Literatür incelendiğinde, *T. urticae*'deki METI Kompleks I akarisitlerine direnç mekanizmalarını araştıran birçok çalışmada, genellikle P450 monooksijenaz aracılı metabolizmanın ana direnç sağlayan faktör olduğunu ve muhtemelen farklı METI-Is bileşikleri arasında gözlemlenen geniş çapraz direnç modelinden de sorumlu olduğu konusunda fikir birliğine varılmıştır (Hollingworth ve Ahammadsahib, 1995; Y. Kim ve ark., 2006; Y.-J. Kim ve ark., 2004; Motoba ve ark., 2000; Stumpf ve Nauen, 2001; Sugimoto ve Osakabe, 2014; Van Pottelberge ve ark., 2008, 2009). Fenpyroximate direncinde hem esteraz hem de P450 enzimlerinin (Ay ve Kara, 2011; Khanjani ve ark., 2020) rol aldığını belirten çalışmalar da yer almaktadır. Literatürde diğer predatör akarlar üzerine farklı pestisitlerle ilişkili enzimler ve sinerjistleri ile ilgili çalışmalar şu şekilde yer almaktadır; Fournier ve ark., 1987, *P. persimilis*'te methidathion direncinin gelişmesinde GST enziminin etkili olduğunu ileri sürmüşlerdir. Sato ve ark., 2001, 2006 methidathion dirençli *A. womersleyi* popülasyonu üzerinde monooksijenaz aktivitesinin oldukça sinerjistik bir etkiye sahip olduğunu belirlemişlerdir. Detoksifikasyon sürecinde yer alan farklı enzim gruplarının akar türüne ve sinerjiste göre etkilerinin değiştiği görülmektedir. Çalışma sonuçlarına göre, *N. californicus*'un tebufenpyrad direncinde monooksijenaz enziminin rol oynama potansiyeli olduğu düşünülmektedir.

## SONUÇ

Predatör akarları pestisitlerden korumanın yöntemlerinden biri, IPM topluluğunun sürekli ilgisini çeken, pestisitlere dirençli predatör popülasyonların meydana getirilmesidir. Literatürde ve yapılan çalışmada da görüldüğü üzere seleksiyonlar ile fitofag akarlar gibi hızlı direnç gelişimi predatör akarlarda da gerçekleşmektedir. Seleksiyon çalışmaları ile pestisitlerin phytoseiid akarlar üzerindeki etkilerini anlamak, çoğaltma veya koruma programlarına başarılı bir şekilde entegre olmaları için oldukça önemlidir ayrıca bir pestisit kalıcılığı ve sinerjistler ile etkileşimleri bir IPM programındaki yerlerinin belirlenmesine yardımcı olacaktır. Kimyasallara karşı direnç geliştiren doğal düşmanlar, pestisitlerin yoğun olarak kullanıldığı alanlarda daha uzun süre canlı kalabilmektedir. Bu nedenle entegre zararlı yönetim programlarına dahil edilebilirler. Ancak dayanıklı doğal düşmanlar saha şartlarında test edilmeli ve adaptasyon çalışmaları da yapılmalıdır.

## TEŞEKKÜR

Çalışmayı maddi yönden destekleyen TÜBİTAK 2209-A Üniversite Öğrencileri Yurt İçi Araştırma Projeleri Destek Programı'na teşekkür ederiz.

#### Abstract

Banana peels are the most waste products of fruits in the world and represent a rich source of cellulose. Cellulose could be used as a valuable material for various therapeutic and medical applications. Cellulose is a polymer could be applied as scaffold for growing human stem cells in 3-dimensional cell culture (3DCC) to collect their secretions for further therapeutic applications instead of MSC secretions collected of human stem cells (hSCs) in traditional 2-dimensional cell culture (2DCC). Therefore, this study has developed cellulose scaffold (CS) from banana peels. Banana peels were collected and dried using heating and cooling rounds and used as a source for cellulose using standard protocols. The collected cellulose was defatted, purified from proteins and bleached by hydrogen peroxide solutions, then dried and powdered. Previously isolated and characterized human mesenchymal stem cells (MSCs) (N=4) were grown in tissue culture plates in traditional 2DCC as well as growing on CS to from MSC 3D culture. MSC sections from both cultures were collected after 24 h and 48 h and analyzed using ELISA kits. MSC secretions collected from both 2DCC and 3DCC contained stromal derived factor-1 (SDF-1) and interleukin 1 (IL-1). Concentrations of biomolecules secreted by MSCs in 3DCC were significantly higher than in 2DCC. It could be concluded that CS could be used as 3D culture scaffold to grow MSCs and collect their secretions for medical and therapeutic applications.

**Keywords:** banana peels, cellulose, 3D scaffold, 3D cell culture, MSC secretions.

#### INTRODUCTION

One of the most widely consumed fruits in the world, bananas account for 40% of all fruit trade globally. The peel, which accounts for between 30% and 40% of the weight of the entire fruit is the primary by-product of the banana processing industry. This banana peel waste is an issue for the environment because it has high levels of nitrogen and phosphate as well as a lot of water, which is conducive to the growth of microorganism. Making wheat into a more valuable commodity is one method to lessen the issue. cellulose and other polymers can be found in banana peel (Hariyani et al., 2016). Making cellulose from banana peels, a more valuable product that may be utilized more widely in the food sector (Irvani and Varma., 2022). The primary structural element of plants, cellulose, is a glucose polymer linked in a -1, 4 linkage arrangement. The cellulose polymer's high intermolecular hydrogen bonding and ability to crystallize in a linear structure due to the -1, 4 linkage give it significant shear and tensile strength. cellulose can be refined for usage as a food ingredient due to its chemical make-up. The least soluble of all the fiber components, cellulose is insoluble in both hot and cold water as well as hot dilute acids and alkalis (Singanusong et al., 2013). Pharmaceutical derivatives such as microcrystalline cellulose and powdered cellulose, which are utilized as inert fillers and thickening agents in the reinforcing of drugs, are examples of the many uses for cellulose drugs (Cherian et al., 2008). Additionally, cellulose can be employed as a potential biopolymer to construct three-dimensional (3D) scaffolds instead of using non-renewable polymers for tissue culture and tissue engineering (Firmanda et al., 2022). Utilization of 3D scaffold is a promising technique to grow cells and collect their secretions for further uses in therapeutic applications (Al-Shaibani 2022). Human mesenchymal stem cells (MSCs) are the pivotal player for coordinating the development and regeneration of all body organs by differentiation and secreting biologically active substances (Zahorec et al., 2015). According to Teixeira and Salgado (2013), the secretome of MSCs is described as a complex mixture of soluble products made up of a vesicular fraction made up of microvesicles and exosomes that are involved in the transference of proteins and genetic material (such as microRNAs) to other cells. Due to its homing abilities, the MSCs secretome is now being recognized as a potential active

pharmaceutical component, and its vesicular portion has been demonstrating promising characteristics to be used as a drug delivery system. This creates an ideal opportunity for the release of specific and targeted substances (drugs, proteins, etc.) into damaged lesions. For instance, MSCs modulate the immune response (Blaber et al., 2012) by enhancing the synthesis of anti-inflammatory cytokines including IL-10 and IL-4 (Aggarwal and Pittenger, 2005). Moreover, MSCs produce bioactive substances to act as inhibitors for fibrosis and apoptosis and to act as inducers for angiogenesis, mitosis and / or differentiation of progenitor cells, activating target cells or neighbouring cells to release biologically active substances (Caplan and Dennis, 2006). All in all, MSCs impact the various events during regeneration such as, cell migration, inflammation, proliferation and tissue remodelling (Hocking and Gibrán, 2012). Many recent studies suggest that MSCs are the main candidates for cell mediated therapies and tissue regeneration (Sasaki et al., 2008) not only for their differentiation ability but also for their ability to produce active biomolecules (Caplan and Dennis, 2006). To avoid ethical issues related to applying animal material to human therapies, this study aimed to collect and analyze proteomic content of MSC secretions on 3D scaffold prepared from plant cellulose for further applications for human therapies.

## **MATERIALS AND METHODS**

### **Extraction of Cellulose**

This process was achieved as described by Singanusong et al., (2013). Briefly, fresh banana yellow peels were obtained and immediately cut into pieces 0.3×2.5 cm in size and dried at 55°C for 10 h to reach a moisture content of 7.5% (dry basis) using a hot air convection oven. After cooling to room temperature, the peel was weighed, ground, and passed through a 35 mesh testing to obtain banana peel powder (BPP) and kept in a polyethylene plastic bag then placed in a refrigerator at 4°C until analysis. Extraction of fat was achieved by soaking BPP in gradual ethanol concentrations i.e., 90%, 95%, and 99% for 8h, 16h, and 24 h. Twenty grams of BPP were mixed with 200 ml of ethanol 10% (w/v) in a water bath at 50°C and incubated in a shaker at a shaking speed of 150 rpm. Then it was washed 3 times with distilled water and filtered with Whatman paper No. 4 and the defatted banana peel powder was dried in a hot air oven at 80°C for 7 h at a velocity 304.8 mm/h. The sample soaked in distilled water served as a control. Extraction of protein was done by soaking BPP in sodium hydroxide (1:10 w/v) at 3 pH levels of 11.6, 11.8, and 12.0 for 8, 16, and 24 h and that soaked in distilled water served as a control. The experiment was conducted in a water bath at 50°C with a shaking speed of 150 rpm. The samples were washed 3 times with distilled water, filtered with Whatman paper No. 4, and dried in the hot air oven at 80±2°C for 7 h. The defatted and protein-removed BPP was soaked in hydrogen peroxide solutions of 10, 15, 20, and 30% for 1.5, 3.0, 4.5, 6.0, and 7.5 h. The bleached samples were washed 3 times with distilled water, filtered with Whatman paper No. 4, and dried in the hot air oven at 60±2°C for 10 h.

### **Preparation and Evaluation of the 3D Cellulose Scaffold**

A circular pieces of thin polystyrene paper of a diameter of 2 cm was coated with 0.01 mg/ml collagen followed by spreading BPP to prepare 3D cellulose scaffold and left overnight at 37°C to settle the kept at 4°C until use. The cellulose scaffold was characterized by scanning electronic microscope (SEM) to assess thickness and porosity. Upon use, cellulose scaffold was fixed between two circular rubbers with a diameter of 1 cm in a sandwich panel. The cells are grown on the upper surface of the scaffold and culture will be exposed to media from top and bottom.

### **Cell Culture**

All cell culture was performed in class II cabinets to reduce the risk of infection and contamination. Then, all the cells and 3D-BEM models were incubated at standard culture conditions (SCC) which were provided by humidified incubator adjusted to 37°C, ≈20% O<sub>2</sub> and 5% CO<sub>2</sub>. Unless otherwise stated, all culture conditions set out in this study for cell culture and cell experiments were SCC. MSCs were previously isolated from adipose tissue from donors undergone plastic surgery and grown in StemMACS MSC Expansion Media, human (UK) supplemented with foetal calf serum and L-Glutamine. Before use, it was supplemented with 5 ml of 100IU/ml penicillin - 100 µg/ml streptomycin (MSC Media) as described by Al-Shaibani (2022). To split cells, old media was aspirated, and cells were rinsed with phosphate buffered saline (PBS), trypsinised

with trypsin 1X and incubated for 10 minutes. A quantity of 10 ml of MSC Media was added to prepare the cell suspension and centrifuged at 1500 rpm for 5 minutes. The supernatant was discarded, and cells were counted and a cell number of  $5 \times 10^4$  was seeded into a T175 flask. A volume of 15-20 ml of fresh MSC Media were added to the flask and incubated under SCC. Trypan blue stain was used to assess viability of cells. A volume of 10  $\mu$ l trypan blue was mixed with 10  $\mu$ l of cell suspension. A quantity of 10  $\mu$ l of this mixture was transferred to a Neubauer chamber and covered with a cover slip prior to counting under the microscope (Sandell and Sakai, 2008). (Equation 1) and (Equation 2) were used to calculate cell count and cell viability.

$$\text{Total Cell Count} = \text{No of cells in 25 small square} \times \text{Dilution Fcator} \times 10^4 \quad \text{Equation 1}$$

$$\text{Cell Viability} = \frac{\text{No of viable cells in 25 small square}}{\text{Total cell count (Live + dead cells)}} \times 100 \% \quad \text{Equation 2}$$

### Construction and Evaluation of MSC 3D culture

Prior seeding cells, the cellulose scaffold (CS) was activated with 70% ethanol for 30 seconds, treated with MSC media for one minute, fixed in Petri dish (30 $\times$ 15 mm) and incubated under SCC until required. To establish MSC 3D-culture,  $3 \times 10^6$  cells were suspended in 200  $\mu$ l MSC media, seeded onto the CS and incubated at SCC for 90 minutes. Then, 20 ml of MSC media was added to the Petri dish and covered the entire scaffold, and the culture was incubated at SCC for 7 days, with regular feeding of the cells with MSC media every two days. Feeding the culture included withdrawal of old medium from the well using a micropipette and then 20 ml of fresh MSC medium was gently added on the inside wall of the petri dish without disturbing the cells on the CS. Sections of MSC 3D-culture were stained with haematoxylin-eosin (HE) to evaluate the formation of 3D structure of MSCs and to assess cell penetration through the CS. Briefly, paraffin embedded sections of MSC 3D-culture were always kept on ice during sectioning to ensure effective sectioning. The microtome was adjusted to 4  $\mu$ m and sections were kept in a water bath adjusted at 40 $^\circ$ C for 2-3 minutes before transferring to slides. The slides were then heated in an oven at 60 $^\circ$ C overnight and the next day, dehydrated by washing for 5 minutes in each xylene, 100% ethanol, 95% ethanol, 70% ethanol and distilled water. Slides were then stained with hematoxylin- eosin (HE) to evaluate the formation of 3D-tissue of MSC 3D-culture. Sections were then washed four times in TBS for 2 minutes, covered with DPX, left in the dark at room temperature overnight, and analysed the next day using fluorescent microscope (Leica).

### Collection of MSC Secretome and Analysing Its Content

The MSC secretome (MSC-CM) from MSC 3D-culture was collected in standard DMEM serum free supplemented with 4% of 200 mM L-Glutamine, 1% of 100 IU/ml penicillin, and 100 lg/ml streptomycin (PS) (Sigma/UK). In the case of 2D culture, when cells reached 80% confluence, it was considered day zero time point, old media was discarded, and a confluent monolayer of MSC culture was washed three times with PBS and fresh DMEM serum free was added to the culture. MSC secretions were collected from three samples (N = 3) seeded in 2DCC on day one and day two and are referred to as 24-2D and 48-2D. On the other hand, in 3D culture, MSCs formed a tissue like structure within 7 days, which is considered the day zero time point. On day zero, the old media was discarded and 3D MSC model was washed three times with PBS and fresh DMEM serum free was added to the culture. Following days, MSC secretome was collected from three samples (N = 3) of MSC 3D culture at day one, and day two, and were referred to as 24-3D and 48-3D. The MSC-secretions from 2DCC and 3D MSC model were collected and filtered using a 0.2  $\mu$ m filter unit before being analyzed by ELISA for growth factors and cytokines such as stromal derived factor-1 (SDF-1: Cat No. EHCXCL12A) and interleukin 1 (IL-1: Cat No. EH254RB). ELSA kits were purchased from (Life Technologies Thermo Fisher Scientific/US) and assays were performed according to protocols stated by the manufacturer company.

## Results

MSC 3D culture generated in this study was prepared by seeding MSCs on the CS for 7 days. As shown in figure (1a), the structure of MSC 3D culture is composed MSCs grown on the CS which was fixed by a plastic holder (orange part) and fed with MSC medium for 7 days. The scaffold now bearing MSCs and formed cellular layer of MSCs could be used to generate MSC secretions. The MSC 3D cellular layer upon staining with hematoxylin– eosin revealed that MSCs distributed within the CS and formed a tissue-like structure in which cells are distributed in a 3D environment that mimics an *in vivo* niche as illustrated in figure (1b).

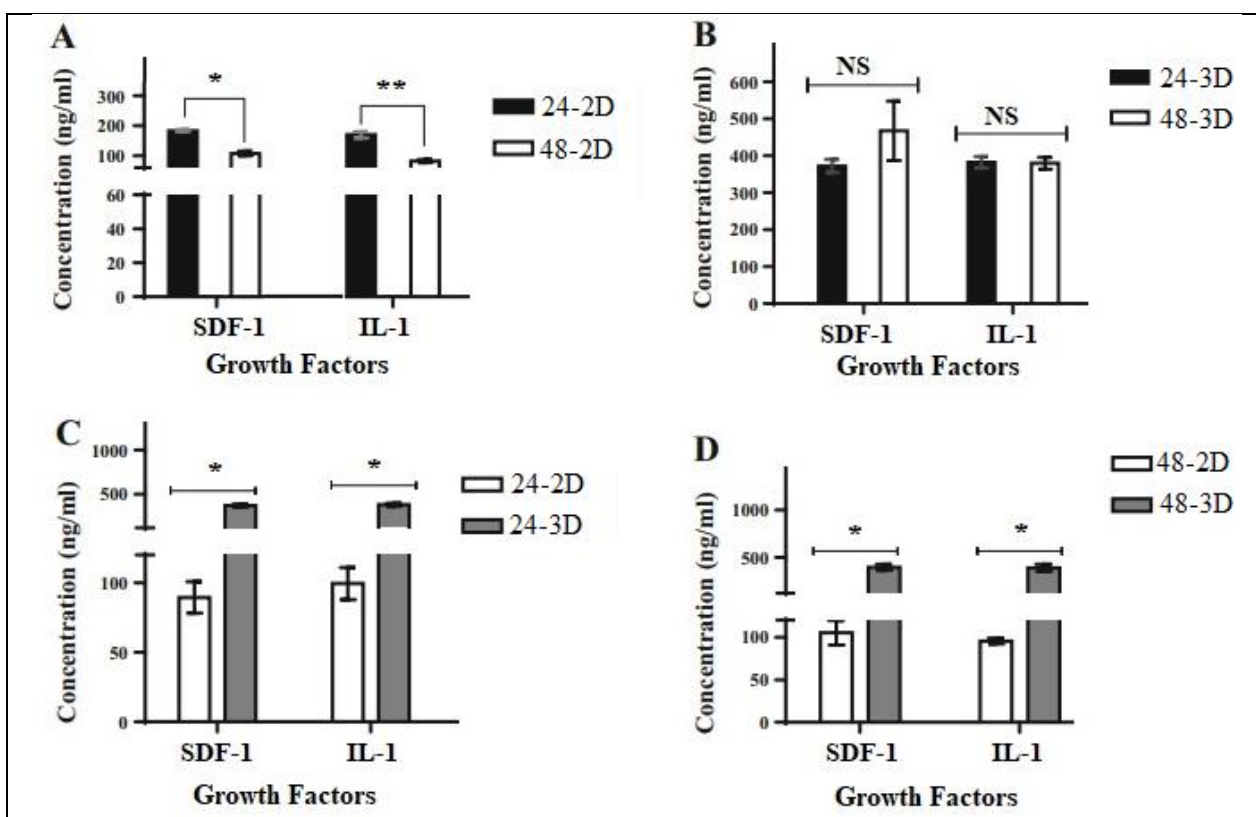

**Figure 1. Three-dimensional structure of MSCs on CS.**

(a) MSCs grown on CS in tissue culture plate and fed with MSC medium for 7 days. (b) Hematoxylin–eosin (HE) staining shows 3D culture of MSCs at day 7 after seeding the MSCs over the CS, revealing the formation of a cellular layer of MSCs that mimics an *in vivo* niche. Cells spread and deeply penetrated the scaffold and formed 3D tissue-like structure of MSC dressing. Yellow arrows are pointing out to MSCs, red arrows are pointing out to cytoplasm.

MSCs secreted detectable levels of SDF-1 and IL-1. Multiple comparisons were investigated between MSC secretions using Tukey's multiple comparisons test. The first one compared concentrations of SDF-1 and IL-1 collected from 2DCC at different time points i.e., 24 h and 48 h. MSC secretions contained different concentrations of SDF-1 and IL-1 collected from their culture at 24 h, with consistent secretion of these growth factors within this time until 48 h. Interestingly, there was a decrease in growth factor concentrations at time point 48 h. Two-way ANOVA revealed significant differences in concentrations of SDF-1 and IL-1 at time points of 24 h and 48 h. As shown in (Figure 2A), SDF-1 level decreased from  $188 \pm 6$  ng/ml to  $109 \pm 6$  ng/ml ( $P = 0.02$ ), IL-1 concentration depleted from  $173 \pm 13$  ng/ml to  $85 \pm 7$  ng/ml ( $P = 0.01$ ). The second compared between SDF-1 and IL-1 collected from 3DCC at different time points. MSC secretions collected from 3DCC contained consistent levels of SDF-1 and IL-1 within time change. Two-way ANOVA revealed no significant differences ( $P > 0.05$ ) in concentrations of SDF-1 and IL-1 at time points 24 and 48 as shown in (Figure 2B). The third comparison investigated differences between concentrations of SDF-1 and IL-1 collected from 2DCC and 3DCC at the same time points. Two-way ANOVA showed significant variations between concentrations of MSC secretions collected from both 2DCC and 3DCC. As shown in (Figure 3C), at time point 24 h concentrations of SDF-1 and IL-1 collected from 3DCC were significantly higher than those collected from 2DCC. Additionally, at time point 48 h, concentrations of SDF-1 and IL-1 collected from 3DCC were also significantly higher than those collected from 2DCC as shown in and (Figure 2D).

**Figure 2. Analysis of MSC secretions by ELISA. Concentrations of SDF-1 and IL-1 secreted by MSCs in both 2DCC and 3DCC at 24 h and 48 h.**

A- Concentrations of SDF-1 and IL-1 collected from 2DCC at different time points show a significant decrease in concentrations of SDF-1 and IL-1 at 48 h compared to 24h. B- Concentrations of SDF-1 and IL-1 collected from 3DCC at different time points show no significant differences in concentrations of all target growth factors and cytokines at the different time points (24h and 48h). (C and D) Statistical comparisons show that concentrations of SDF-1 and IL-1 collected from 3DCC are significantly higher than their counterparts collected from 2DCC at 24h and 48h, respectively. The data is represented as a mean of the concentration of SDF-1 and IL-1. N = 4, error bars = standard error of the mean (SEM).

## Discussion

It has been reported that MSC secretions could be applied for various therapeutic applications (James *et al.*, 2006). Therefore, this study has investigated the ability of MSCs to secrete two important cytokines which are SDF-1 and IL-1. It has been previously reported that MSCs in 3D cell culture secrete many growth factors and cytokines including platelet derived growth factor (PDGF-AB), transforming growth factor-1 (TGF-1), hepatocyte growth factor (HGF), stromal derived factor-1 (SDF-1), interleukin 1 (IL-1), and interleukin 6 (IL-6) (Al-Shaibani, 2022). Therefore, MSCs has been used in this study to establish MSC culture in 3DCC and further collect and analyse their secretions using CS prepared from banana peels. MSCs has formed 3D tissue like structure in 3D cell culture and secreted SDF-1 and IL-1 which are collectively or separately play vital roles in regeneration and development (Alfaro *et al.*, 2013). SDF-1 plays a role in regulating skin homeostasis and tissue remodelling (Werner, 2011). It also promotes wound closure by inducing cell migration. Many of which play an integral role in inflammation, proliferation, migration, differentiation, collagen regulation, angiogenesis and the remodelling phases of the healing process (Cowin *et al.*, 2001). The 3D microenvironment of the living organism is primarily responsible for the biological behavior of cells in vivo, which differs dramatically from their behavior in vitro (Edmondson *et al.*, 2014). According to research by Qiu *et al.* (2018), MSCs that are grown on scaffolds made of extracellular matrix (ECM) promote tissue regeneration. In contrast to 2DCC cells, which lack the proper ECM and hence are unable to exercise their normal behavior as in vivo and further impact their secretome, ECM play a crucial part in the successful proliferation of cells in vivo and allow the

cells to connect with one another. As a result, the 3D scaffold might be employed instead of the ECM to depict a region that offers mechanical support for cells to establish their proper niche for further cell-cell or cell-ECM communication, in order to establish the appropriate spatial spreading (Lv et al. 2017). Consequently, regular growth factor and cytokine secretions. Since the 3D architecture is later supported by the secretion of ECM representing glycosaminoglycan secreted by MSCs, it is possible to credit the consistent secretions of growth factors and cytokines gathered from 3DCC culture to the 3D architecture. Additionally, the ECM released by MSCs serves as a link between cells, allowing cells to communicate with one another, allowing MSCs to remain stationary and function without becoming immobile while conserving energy and improving performance (Qiu et al. 2018). However, selecting the right scaffold is one of the most important aspects that affects cell biology and behavior. Collectively, the 3D culture of MSCs on CS enhance them to secrete high concentrations of these bioactive molecules that guide and judge the healing process in acute and chronic wounds by coordinating numerous cellular responses of different cell types resulting in the re-establishment of the damaged barrier (Barrientos et al., 2008).

## CONCLUSION

The created 3D-MSM model secretes more growth factors and cytokines than those obtained using conventional 2DCC, indicating that banana peels is a good source for extraction cellulose for further using in 3D cell culture to grow cells of various types and collect their secretions.

## ORAL PRESENTATION

### Effect of temperature on rheologic properties of pasteurized cow's milk

Anisa Dhroso<sup>1\*</sup>, Hasime Manaj<sup>2</sup>, Laura Shabani<sup>3</sup>, Ilirjan Malollari<sup>4</sup>

<sup>\*1, 2, 3, 4</sup> University of Tirana, Faculty of Natural Sciences, Department of Industrial Chemistry, Tirana, Albania.

#### Abstract

The physico-chemical and rheological properties of pasteurized cow's milk available in Albania market depend on temperature and time storage were determined, which can evaluate the quality of food product. In the first phase, fat, solid non-fat (SNF) and density were determined by Lactoscan apparatus with different temperature. In the second phase of the study, dynamic viscosity was measured using the Falling Ball Viscosimeter, temperature range -20°C to 150°C, viscosity range 0.5 mPas to 10<sup>5</sup> mPas, reproducibly <0.5%. All the samples were measured in temperature range 5-30°C. The density and dynamic viscosity value of milk are used to calculate kinematic viscosity. Dependence of density, dynamic viscosity, kinematic viscosity and fluidity related to temperature were described by exponential functions. It was found that, viscosity of milk decreases non-linearly with increasing temperature. Therefore, temperature is one of the most important factors, which determine quality of milk.

**Keywords:** rheological properties, temperature, pasteurized milk

#### INTRODUCTION

Albania is a small European country located in the south-eastern part of the continent, with population amounts to 2.9 M inhabitants. The total land size of Albania is 2,875,000 ha, from which 24% is agriculture land, 36% forestry, 15% pastures and meadows, and 25% is classed as "others". (INSTAT, 2019) Milk production activities have a long tradition in Albania due to the favourable natural resources and is one of the most developed agricultural sub-sectors in the country. Over the past five years, the dairy processing industry has undergone important changes. The milk and dairy industry are second largest industry in terms of number of enterprises (12.8% of total), after flour and bakery industry. The region with the largest milk production is Fier, contributing to 19.4% of total milk production, and together with the regions of Elbasan, Korçë and Tirane make together up to 52.5% of the total milk production of the country. The same regions are the largest producers of cow's milk (54.7%). (Eurostat, 2019) Liquid milk category includes semi-pasteurised milk (a semi-processed product), pasteurised milk in bulk and retail packaging and UHT milk. Pasteurized milk is raw milk that has been heated to a specified temperature and time to kill pathogens without the product being damaged. Pathogens are microorganism such as bacteria that make us sick. Raw milk can contain pathogens such as Campylobacter, E. coli, Salmonella, Listeria and other bacteria. (Janzen, J. J., et al., 1982) Raw milk includes milk from cows, goats, sheep and other dairy animals. An optimum mixture of carbohydrates, proteins, and fats in these products dictates the rheological properties. Interactions of three basic ingredients (carbohydrates, proteins and fats) along with water and other minor additives during shearing, mixing and heating interfere in product formulations. (Ahmed, J., et al., 2006) Milk is a complex fluid consisting of seven main components: water, fat, protein, sugar (lactose), minerals, vitamins and enzymes. For the quality evaluation of food materials, it is important to know their physical properties particularly, mechanical, rheological, and thermo physical. (Manzocco L., et al, 1998) In this article, the results of measurement of physicochemical and rheological parameters are presented for a sample of pasteurised cow's milk. The dynamic viscosity of milk was experimentally determined as a function of temperature (5 to 30°C). The variation of the viscosity of cow's milk with the temperature is analyzed applying the two and multi constant equations.

## MATERIALS AND METHODS

The physico-chemical and rheological properties of pasteurized cow's milk available in Albania market depend on temperature and time storage were determined. The milk sample during experimental part was storage at the temperature 4C. All the measurement were made in Chemical Process Engineering laboratory in collaboration with Food Chemistry laboratory. The measurement were performed in temperature range 5-30C, at the beginning of storage (first day of bottle opening) and after one week of storing (last day of bottle expiration). In the first phase, physicochemical properties (fat, solid non fat (SNF), lactosa, add water, freezing point, salts and density) were determined by Lactoscan apparatus in different temperature. The device is electronic and quite simple to use. After placing the milk sample in the device, in a certain amount the button is pressed to start the analysis and after a short period of time the physico-chemical data appear on the screen. The function of the milk analyzer Lactoscan is to make quick analysis of milk. All measurements were performed in three repetitions. The density of milk is used to calculate kinematic viscosity. The dynamic viscosity measurement can be done by various types of viscometers: falling ball viscometers, rotational viscometers, capillary flow viscometers and orifice type viscometers. (Sahin and Sumnu, 2006) Cow's milk dynamic viscosity was measured using the Falling Ball Viscosimeter, temperature range -20°C to 150°C, viscosity range 0.5 mPa.s to 10<sup>5</sup> mPa.s, reproducibly <0.5%. Viscosity of cow's milk is important in determining the flow conditions in dairy processes. (Kessler, H.G., 2002) Kinematic viscosity and fluidity were determined according to the definitions. Office Excel software was used to carry out the effect of temperature on dynamic viscosity of milks by different mathematical models. Where, the dynamic viscosity of milk was represented as a function of temperature by using two and multiconstant proposed mathematical models. Equation 1, include the Arrhenius model that is commonly used to model temperature dependence of a property (Clements L. D. et al., 1982):

$$\mu = \mu_{\infty, T} \exp\left(\frac{E_a}{RT}\right) \quad (1)$$

Where  $\mu$  is the dynamic viscosity in mPa.s,  $\mu_{\infty, T}$  is the viscosity at infinite-temperature in mPa.s,  $E_a$  is the exponential constant that is known as activation energy (J/mol); R is the gas constant (J/mol.K) and T is the absolute temperature Kelvin. (Munson, B. R., et al, 1994) Multi-constant formula known as Andrade (three constant) and Clements (four constant) models that are represented in the following equations (Abramovic H., Klofutar G. 1998) (Clements L. D., Nouredini H. and Teoh B. C. 1982):

$$\ln\mu = A + \frac{B}{T} + \frac{C}{T^2} \quad \text{and} \quad \ln\mu = A + \frac{B}{T} + \frac{C}{T^2} + \frac{C}{T^3} \quad (2)$$

Where  $\mu$  is the dynamic viscosity in mPa.s, T is the temperature in Kelvin. A, B and C are constants. Kinematic viscosity ( $\text{m}^2 \cdot \text{s}^{-1}$ ) is defined as a ratio of dynamic viscosity to density of fluid  $\rho$  ( $\text{kg} \cdot \text{m}^{-3}$ ) at the same temperature.

$$\eta = \frac{\mu}{\rho} \quad (3)$$

Reciprocal value of dynamic viscosity is called fluidity and unit of fluidity is  $\text{mPa}^{-1} \cdot \text{s}^{-1}$  (Hlaváč P., et. al 2016).

$$\varphi = \frac{1}{\mu} \quad (4)$$

The mean absolute percentage error (MAPE), which indicates the deviance of the observed values from the calculated, was calculated using the following formula:

$$MAPE^a = \frac{\sum_{i=1}^n \left( \frac{A_0 - A_c}{A_0} \right)}{n} \cdot 100 \quad (5)$$

Where  $A_0$  is the observed value,  $AC$  is the calculated value, and  $n$  represents the number of pairs of samples.

## RESULTS AND DISCUSSION

The physico-chemical and rheological properties of pasteurized cow's milk available in Albania market depend on temperature were determined. Measured values of physicochemical properties (fat %, non fat solid %, protein %, lactosa %, add water %, freezing point %, salts %, density %) at the first and last day of storage are presented on Figure 1 (a) and (b). By comparing our experimental data with standard value, we can see that they are roughly the same.

**Figure 1 (a)** Physicochemical properties of pasteurized cow's milk on the first day of bottle opening

**Figure 1 (b)** Physicochemical properties of pasteurized cow's milk on the last day of bottle expiration

Milk fat is one of the most important parts of milk and depends on the type of dairy animal, breed and feeding of the animal. We see from the results obtained that the fat content in the samples taken for analysis ranges from 3.12 - 3.24% for samples before the expiration date and 3.15-3.26% for the samples after the expiration date. The determination of milk fat is of great importance to evaluate the stability and quality of milk during the storage period. Today, these analyses are useful, because on the basis of their results, the control of the milk fat of individual cows is ensured. Total milk solid (fat + SNF) contains all the constituent parts of milk such as: proteins, fats, lactose, mineral salts, vitamins with the exception of water. Total milk solid is within standard value 11-13%. Milk proteins are of great importance in the nutritional value and in the technological process. The protein value on the last day of storage is lower due to the hydrolysis of heat-resistant enzymes of bacterial origin (psychrophilic bacteria). The sample gives lower values ranging from 3.13-3.25% before expiration and 3.17-3.21% after expiration. Density of milks is also influenced by amount of fat content. The highest fat content had caused the lowest density. (Hlaváč P. and Božiková M., 2016) In milk, the main ingredient is lactose. Lactose is a combination of glucose and galactose and has a light sweet taste. Lactose loses its quantity through fermentation. Before and after the expiration date, we see that the values of added water are higher. The increase in the values of added water reflects the decrease in density and SNF. Regarding the amount of salts, we see that there are no big differences between the samples.

Figure 2 (a) Effect of temperature on dynamic viscosity

Figure 2 (b) Effect of temperature on dynamic viscosity

Figure 2. (c) Effect of temperature on dynamic viscosity

The experimental data of cow's milk before and after expiring date, for dynamic viscosity (mPa.s) versus temperature is shown in Figure 2 (a). The dynamic viscosity is decreasing with increasing of temperature. The values of dynamic viscosities are a bit higher after one week of storing, because of water loosening.

The kinematic viscosity can be calculated from the dynamic viscosity and the density (equation 3). On Figure 2 (b) is presented kinematic viscosity decreasing versus temperature range 5 – 30°C. The values at the beginning of storing are a bit higher than after.

While fluidity is increasing with increasing of the temperature, is presented in Figure 2 (c). The values of the estimated constants and correlation coefficients are shown in each equation, set in the graphs.

The experimental data, for dynamic viscosity fitting by Arrhenius, Andrade and Clements models are presented in Fig. 3 (a-c), by using Equation 1 and 2 respectively.

**Figure 3. (a)** Effect of temperature on Arrhenius model

**Figure 3. (b)** Effect of temperature on Andrade model

**Figure 3. (c)** Effect of temperature on Clements model

The values of the estimated constants are shown in each equation, set in the graphs. In all cases the determination coefficient ( $R^2$ ) exceeded values  $>0.99$ . The mean absolute percentage errors (MAPEa) were below 10%: 7.3% Arrhenius model, 2.1% Andrade model and 0.38% Clements model. All of the mean absolute percentage errors were low, which means that the viscosity values obtained were very stable. However, comparisons of the calculated data indicate that the temperature-dependence of viscosity for the sample was best described by the Clements model. An equation with lower MAPE values gives a better fit to experimental data compared to an equation with higher MAPE values.

## CONCLUSIONS

The article is focused in physicochemical parameters determination and on influence of temperature on rheological parameters of cow's milk made in Albania. The physicochemical parameters results depend on milk nature and can be used as a way of characterizing. The limit values of physicochemical and rheological parameters in milk were within the Albanian and European standard values. The dynamic viscosity versus temperature was measured and described by different mathematical models. The value of correlation coefficient and mean absolute percentage error indicates that the models fit satisfactorily to experimental data. However, comparisons of the results obtained indicate that the temperature dependence of viscosity was best described by the Clements model.

## Özet

Bu çalışma maviyemiş bitkisinin vejetatif çoğaltma yöntemlerinden biri olan odun çelikleriyle çoğaltılması kapsamında, dinlenme döneminde yıllık sürgünlerden alınan odun çeliklerine 4 farklı Indole-3-Butyric Asit hormon dozlarının köklenme üzerine etkilerini araştırmak amacıyla yapılmıştır. Bu amaçla Rize ilinin Fındıklı ilçesinde bulunan kapama maviyemiş bahçesinde yetiştirilen Bluecrop maviyemiş çeşidinden alınan odun çelikleri kullanılmıştır. Odun çeliklerine Indole-3-Butyric Asit'in dört farklı dozu (Kontrol, 2500, 3500, 4500, 5500 ppm) uygulanmıştır. Çalışma alt ısıtmasız perlit ortamlı beton yastıkların bulunduğu polycarbon serada yürütülmüştür. Çalışma tesadüf parsellerinde faktöriyel deneme desenine göre 4 tekerrürlü olarak planlanmıştır. Odun çeliklerinde en yüksek köklenme oranı % 45 ile 3500 ppm dozundaki Indole-3-Butyric Asit uygulamasından elde edilmiştir. En düşük köklenme oranı ise % 10 ile kontrol grubu çeliklerinden elde edilmiştir. Köklenme oranı bakımından en iyi sonucu veren 3500 ppm dozundaki Indole-3-Butyric Asit uygulamasındaki canlı çelik sayısı oranı % 60, ortalama kök sayısı 2,22 adet ve ortalama kök uzunluğu ise 27,51 mm olarak tespit edilmiştir.

Tüm sonuçlar dikkate alındığında Bluecrop maviyemiş çeşidinin odun çeliklerinin köklenme ve kök gelişimi üzerine, 3500 ppm dozundaki Indole-3-Butyric Asit hormonu uygulamasının en iyi sonucu verdiği ve bu uygulamanın üreticilere önerilebileceği kanaatine varılmıştır.

**Anahtar Kelimeler:** Maviyemiş, çoğaltma, Indole-3-Butyric Asit

## Abstract

This study was carried out to investigate the effects of 4 different Indole-3-Butyric Acid hormone doses of hardwood cuttings taken from annual shoots on rooting during the resting period, within the scope of propagation of blueberry plant with hardwood cuttings, which is one of the vegetative propagation methods. For this purpose, hardwood cuttings taken from Bluecrop blueberry variety grown in the orchard blueberry garden in Fındıklı district of Rize province were used. Four different doses of Indole-3-Butyric Acid (Control, 2500, 3500, 4500, 5500 ppm) were applied to hardwood cuttings. The study was carried out in a polycarbon greenhouse with perlite environment concrete pads without bottom heating. The study was planned according to the factorial experimental design in randomized with 4 replications. The highest rooting rate in hardwood cuttings was obtained from the application of Indole-3-Butyric Acid at a dose of 45% to 3500 ppm. The lowest rooting rate was obtained from the control group cuttings with 10%. The rate of viable cuttings in the application of 3500 ppm Indole-3-Butyric Acid, which gave the best results in terms of rooting was 60%, the average root number was 2.22 and the average root length was 27.51 mm.

Considering all the results, it was concluded that 3500 ppm dose of Indole-3-Butyric Acid hormone application gives the best results on rooting and root development of hardwood cuttings of Bluecrop blueberry variety and this application can be recommended to producers.

**Keywords:** Blueberry, propagation, Indole-3-Butyric Acid

## 1.GİRİŞ

Dünya üzerinde ılıman iklim kuşağında yetiştiriciliği yapılan maviyemiş ilk olarak 1900'lü yılların başında anavatanı olan ABD'de kültüre alınmıştır. Asitli topraklarda yetişen maviyemiş Fundagiller (*Ericaceae*) familyasının *Vaccinium* cinsi içerisinde yer almaktadır. Maviyemiş bitkisinin 450' ye yakın türünün olduğu bildirilmektedir. Maviyemiş bitkisinin kültüre alınmış türleri *Vaccinium corymbosum* L. (yüksek boylu), *Vaccinium angustifolium* (Alçak boylu), *Vaccinium myrtilloides* (Alçak boylu), *Vaccinium ashei* Reade (Tavşangözü) olarak adlandırılmaktadır. (Strik ve ark., 1993; Gough, 1994; Çelik, 2012). Son yılların popüler bir meyvesi olan maviyemiş sağlık açısından oldukça yararlı olmasının yanında birim alandan alınan verim oldukça yüksektir (Strik ve ark., 1993; Gough, 1994; Himelrick ve ark., 2002; Çelik, 2009a, 2009b ve 2009c; Çelik, 2012a).

Maviyemiş meyvesinin kullanım alanı oldukça fazladır. Taze meyve olarak, meyve suyu sanayisinde, ilaç sanayisinde, süt ve süt ürünlerinde, kuru meyve, meyveli ekmek, çörek, kek, puding, pasta, baharat sanayisinde, meyve salatalarında, reçel, marmelat, konserve sanayisinde, çay, diyet menüleri ile şarap gibi birçok alanda değerlendirilmektedir (Çelik, 2005).

FAO istatistiklerine göre 2020 yılı dünya maviyemiş üretiminde 294 bin ton ile ABD ilk sırada, 146 bin ton ile Kanada 2. sırada, 180 bin ton ile Peru üçüncü sırada yer almaktadır. Dünya maviyemiş üretimi 1961 yılında 26.091 ton iken, son 60 yılda 32 kata yakın üretim artışı gerçekleşmiştir (FAO,2020).

Türkiye'de maviyemiş (*Vaccinium corymbosum* L.) bitkisinin üretimi her geçen gün artmaktadır. Ege ve Akdeniz bölgelerinde ağırlıklı olarak topraksız tarım ile yetiştirilmekle birlikte, Karadeniz ve Marmara bölgelerinde kapama bahçelerde de yetiştirilmektedir (Çelik, 2004; Çelik, 2006; Çelik ve Ağaoğlu, 2013).

Maviyemiş bitkisi vejetatif çoğaltma yöntemlerinden en yaygın olarak yapraklı yeşil çelik, odun çeliği, daldırma, dip sürgünü, ayırma ve doku kültürü (in vitro) yöntemleri ile çoğaltılabilmektedir (Abolins ve ark., 2003; Çelik, 2006; Çelik, 2007; Krewer ve Cline, 2006; Çelik ve Ateş, 2009; Çelik, 2012a; Çelik, 2012b; Çelik ve Ağaoğlu, 2013; Ruter, 2015; Çelik, 2016; Çelik, 2017; Colombo ve ark., 2018; Karabulut ve Çelik, 2019). Vejetatif çoğaltma yöntemlerinden biri olan aşı yöntemi ile; makineli hasat sırasındaki meyve kayıplarını önlemek için yüksek toplama tablası oluşturmak üzere çoğaltma çalışmaları da yapılmaktadır (Wei, 2011; Wei ve ark., 2013; Marino ve ark., 2014).

Türkiye'de ilk maviyemiş çoğaltma çalışmaları Çelik tarafından 2004 yılında başlatılmıştır. Çelik,2006 Temmuz ayında bazı maviyemiş çeşitlerinden aldığı yapraklı yeşil çeliklere 1000 ppm IBA uyguladıktan sonra sera ortamında alttan ısıtılmalı (25°C) olarak Rekord çeliklerin de % 100.00 köklenme sağlamış, ısıtmasız Bluejay çeliklerindeki köklenmenin % 38,89 ile en düşük düzeyde kaldığını tespit etmiştir. Yapılan başka bir çalışmada Akbulut ve ark. 10 farklı maviyemiş çeşidinden kış döneminde aldıkları odun çeliklerine IBA, NAA ve GA3 'in 4 farklı dozunu (0, 250, 500, 750 ve 1000 ppm) uygulamışlardır. Maviyemiş odun çeliklerinde en yüksek köklenme oranını Nortland çeşidinde (% 52,5), en düşük köklenme oranını ise Golden Traube (% 2,5) ve Chandler (% 3,2) çeşitlerinden elde etmişlerdir.

Çeliğin alıdınığı sürgünün odunlaşma durumu da önemli olup odun çelikleri için yıllık sürgünler tercih edilmektedir. Yeteri kadar odunlaşmış ya da ikinci yıl sürgünleri, dinlenme döneminden sonra uyanan gözlerden çıkan sürgünler kadar iyi köklenmemektedir (Çelik, 2007; Çelik, 2012b, Pacholczak ve Nowakowska, 2015; Çelik, 2016). Çelik (2006), yaz ayında aldığı yapraklı yarı odun çeliklerinden alttan ısıtma (25°) uygulaması ile % 100 (Rekord) başarı sağlarken, alttan ısıtma uygulanmayan Bluejay yarı odun çeliklerinden ise % 39 başarı sağlayabilmiştir.

Doku kültürü tekniği, kısa sürede kitlesel üretim imkânı sağlandığı için son yıllarda tercih edilmektedir. Ancak, bu yöntem diğer yöntemlere kıyasla pahalıdır. Özel cihazlar ve ekipmanlar, laboratuvar ve bu alanda bilgili elemana ihtiyaç olmaktadır (Orlikowska, 1986; Brissette ve ark., 1990, Austin, 1994). Maviyemiş doku kültürü ve çelikle çoğaltım metodlarını karşılaştıran Smolarz ve Chebelebowska (1998); büyüme, gelişme ve olgunlaşmada herhangi bir farklılık göstermez iken, dördüncü ve beşinci yıllardaki verimlerinin ise doku kültürü ile elde edilenlerde daha düşük olduğunu saptamışlardır.

## 2. Materyal ve Metod

### 2.1. Materyal

Bu araştırma; 2021-2022 dinlenme döneminde Recep Tayyip Erdoğan Üniversitesi Ziraat Fakültesinin deneme ve uygulama seralarında yürütülmüştür. Araştırmada Rize ilinin Fındıklı ilçesinde bulunan kapama maviyemiş bahçelerinden alınan odun çelikleri kullanılmıştır. Çalışmada Karadeniz bölgesinde oldukça yaygın yetiştiriciliği yapılan Bluecrop maviyemiş çeşidinin odun çelikleri kullanılmıştır. Odun çelikleri dinlenme döneminde bir yıllık dallardan 20-25 cm uzunluğunda ve 2-3 göz bulunduracak şekilde hazırlanmıştır. Odun çeliklerine dört farklı IBA (Indole-3-Butyric Asit) dozu (Kontrol-0, 2500, 3500, 4500, 5500 ppm) uygulaması yapılmıştır. Çalışma alt ısıtmasız beton yastıkların bulunduğu polycarbon serada yürütülmüştür. Köklendirme ortamı olarak perlit kullanılmıştır. Sera içi sisleme süresinin uzunluğu ile aralığı hava sıcaklığı ve oransal neme göre ayarlanmıştır. Çalışma tesadüf parsellerinde faktöriyel deneme desenine göre 4 tekerrürlü olarak planlanmıştır (Resim 1).

Şekil 1. Serada bulunan galvanize sac yastıklı perlit köklendirme ortamındaki odun çelikleri

### 2.2. Metod

Odun çeliklerinin, perlit ortamına dikim tarihinden itibaren 120 gün sonra sökülerek canlı çelik sayısı (adet) belirlenmiş, köklenmiş odun çeliği sayıları belirlenerek oranları (%) tespit edilmiş, ayrıca kök sayıları (adet) belirlenmiş ve kök uzunlukları cetvel yardımıyla ölçülerek tespit edilmiştir. Çalışma, 4 tekerrürlü ve her tekerrürde 10 çelik olacak şekilde tesadüf parselleri deneme desenine göre planlanmıştır. İstatistiki analizler JMP 13 paket programı kullanılarak yapılmıştır. F testine göre önemli bulunan ortalamalar arasındaki farklar, LSD testine göre farklı harfler kullanılarak ifade edilmiştir.

## 3. Bulgular ve Tartışma

Maviyemiş çeliklerinin köklenmesi ile ilgili elde edilen sonuçlar Tablo 1'de sunulmuştur. Yapılan hormon uygulamaları sonucunda en yüksek canlı çelik sayısı ve köklenme oranı Indole-3-Butyric Asidin 3500 ppm dozundan elde edilmiştir (Resim 2). Elde edilen sonuçlar değerlendirildiğinde en yüksek köklenme oranı % 45 ile 3500 ppm dozunda gerçekleşmiştir. Çelik ve Ateş (2009) ise maviyemiş mini çeliklerinde 2000 ppm IBA'nın köklenmeyi artırdığını saptamışlardır.

Araştırma kapsamındaki maviyemiş çeliklerinin ortalama kök sayıları üzerine farklı hormon uygulamalarının etkisi incelendiğinde, en yüksek değer yine IBA 3500 ppm dozu uygulamasında (2,22 adet), en düşük değer ise kontrol grubunda (0,30 adet) saptanmış olup, diğer uygulamalar arasındaki fark istatistiksel olarak önemli bulunmuştur. Benzer konuda yapılan çalışmalarda Turna ve ark. (2013) hormon uygulanan çeliklerin hormon

uygulanmayan çeliklere göre daha iyi köklenme meydana getirdiklerini tespit etmiştir. IBA hormonunun 1000 ppm ve 5000 ppm dozlarındaki köklenme oranı diğer hormon ve dozlarına göre en yüksek bulunmuştur. Braha ve ark., 2015 maviyemiş (*V. Corymbosum* L.) odun çeliklerine çeşitli konsantrasyonlarda (1500, 3000, 4500 mg/l) uygulamalar yapmışlar ve 3000 mg/l dozunda IBA uygulamasının NAA ile karşılaştırıldığında en yüksek köklenme yüzdesine sahip olduğunu belirlemişlerdir.

Şekil 2. Köklenmiş maviyemiş çeliklerinin görünüşü

Odun çeliklerinde en yüksek ortalama kök uzunluğu 3500 ppm IBA uygulamasında 27,51 mm, en düşük ortalama kök uzunluğu ise 3,63 mm ile kontrol grubunda saptanmış olup istatistiksel fark önemli bulunmuştur.

Odun çeliklerinde en yüksek canlı çelik sayısı da yine % 60 ile 3500 ppm dozundaki IBA uygulamasından, en düşük canlı kök sayısı ise % 17,5 ile kontrol grubundan elde edilmiştir. Martinussen ve ark. (2006) Maviyemiş gibi *Vaccinium* cinsi içinde yer alan kekreyemişin sert veya yumuşak odun çelikleri ile çoğaltılabileceğini saptamışlar ve 6000 ppm IBA ile % 85 başarı elde etmişlerdir.

**Tablo 1. Maviyemiş odun çeliklerinde köklenme değerleri**

UYGULAMA	Canlı Çelik Oranı (%)	Köklenme oranı %	Çelik başına ortalama Kök Sayısı	Çelik başına ortalama Kök Uzunluğu
<b>Kontrol</b>	17,5	10 b	0,30 c	3,63 c
<b>2500 ppm</b>	47,5	37,5 ab	1,47 ab	26,81 ab
<b>3500 ppm</b>	60	45 a	2,22 a	27,51 a
<b>4500 ppm</b>	25	15 b	0,65 bc	13,01 c
<b>5500 ppm</b>	35	17,5 ab	0,75 bc	13,83 bc

Aynı harfle gösterilen ortalamalar arasında fark yoktur ( $p<0.05$ ).

## SONUÇ

Anavatanı ABD olan maviyemiş ülkemizde Akdeniz ve Ege bölgesi ağırlıklı olmakla birlikte, Karadeniz bölgesinde yetiştirilmektedir. 1996 yılında ilk defa Türkiye’de başlayan maviyemiş yetiştiriciliği, Rize ilinin Güneysu ilçesinde yabancı olarak yetişen ve maviyemiş ile aynı cins içinde yer alan çayüzümü (*Vaccinium arctostaphylos* L.) tiplerinin selekte edilerek kültüre alınması ile olmuştur. Sağlık açısından da oldukça faydalı bir meyve olan maviyemiş; kan şekerini düşürür, lifli yapısından dolayı bağırsak metabolizmasını düzenler ve kan kolesterolünü düşürür. Gece görüş kabiliyetini artıran maviyemiş, göz yorgunluğunu giderir, miyopluk ve şeker hastalığından kaynaklanan görme bozukluklarını gidermesi gibi insan sağlığına birçok fayda sağlamaktadır. Bu sebeplerden ötürü Karadeniz bölgesinde çaydan sonra en çok tercih edilen meyvelerden biri olan maviyemiş oldukça farklı alanlarda değerlendirilmektedir. Karadeniz bölgesindeki kapama bahçelerde Bluecrop maviyemiş çeşidi oldukça yaygın olarak yetiştirilmektedir. Bölge de bahçe tesisinde kullanılmak üzere fidan temininde sorunlar ortaya çıkmakta gerekli olan fidan temininde zorluklarla karşılaşmaktadır. Bluecrop çeşidinin çelikle hızlı bir şekilde çoğaltılması ile ilgili yeterli çalışma olmaması nedeniyle bu çalışma Bluecrop çeşidinde kitlesel üretimde geliştirilecek tekniklere ışık tutacaktır. Rize ili Recep Tayyip Erdoğan Üniversitesi’nde gerçekleştirilen bu çalışmada dinlenme döneminde yetiştiricilik yapılan bahçelerden alınan yıllık odun çelikleri kullanılmıştır. Dinlenme döneminde alınan çelikler alt ısıtmasız perlit ortamına dikilmiştir.

Araştırma sonucunda IBA uygulamasının maviyemiş odun çeliklerinin köklenmesi üzerine etkisi olduğu saptanmıştır. Dinlenme döneminde alınan odun çeliklerinde en yüksek canlı çelik sayısı %60 ile 3500 ppm dozunda IBA uygulamasından, en düşük canlı çelik sayısı ise % 17,5 ile kontrol grubunda meydana geldiği saptanmıştır.

Köklenme oranı kontrole kıyasla en yüksek 3500 ppm dozundaki IBA uygulamasında % 45 olarak; en düşük köklenme oranı ise %10 ile kontrol grubunda odun çeliklerinden elde edilmiştir. Köklenme oranında belirli doza kadar artan IBA dozlarına paralel olarak genelde bir artış gözlenmiştir. 4500 ppm IBA uygulamasının odun çeliklerinin köklenmesi üzerine daha düşük oranda etki gösterdiği tespit edilmiştir. Odun çeliklerinde en yüksek ortalama kök sayısı 2.22 adet olarak 3500 ppm dozundaki IBA uygulamasında, en düşük ortama kök sayısı ise 0,30 adet ile kontrol grubundaki odun çeliklerinde saptanmış olup oluşan farklılık istatistiksel olarak önemli bulunmuştur. Odun çeliklerinin ortalama kök uzunlukları ise en yüksek 27,51 mm olarak 3500 ppm dozundaki IBA uygulamasından elde edilmiş olup bu uygulamanın diğer uygulamalara göre daha önerilebilir olduğu tespit edilmiştir.

Elde edilen sonuçlara göre Bluecrop maviyemiş çeşidinin çelikle çoğaltılmasında, dinlenme döneminde alınan odun çeliklerinin köklenme yüzdesi ve kök sayısı bakımından en yüksek değerlerin elde edildiği 3500 ppm dozundaki IBA uygulaması önerilebilir bulunmuştur.

#### Özet

İmidazol, yapısında iki azot bulunduran, oda sıcaklığında genellikle beyaz kristal formda bulunan aromatik heterosiklik yapıda organik bir bileşiktir. Aynı zamanda, bilinen çeşitli farmakolojik etkilerinden kaynaklı ilaç kimyası ve tıp biliminin vazgeçilmez bileşiklerinden biridir. Klimbazol ise, antifungal imidazol türevidir. Kepek, sedef, egzama ve bazı fungal enfeksiyonların tedavisinde ayrıca benzer dezenfeksiyon işlemlerinde kullanılır. Kuvvetli çözünürlüğe, uygun maliyete ve düşük genotoksisiteye sahip olduğu için, ilaç sanayiide kullanımının yaygınlaşması ön görülebilir. Bu çalışmada, çeşitli alkil ve benzilhalojenürlerin klimbazol etkileştirilerek farklı yapıda klimbazolyum tuzları elde edilmiştir. Ayrıca tuzların PEPPSI tipi paladyum kompleksi sentezlenmiştir. Sentezlenen tuzların ve komplekslerin yapı karakterizasyonları spektroskopik yöntemlerle aydınlatılmıştır. Tuzların ve paladyum kompleksleri farklı patojenik mikroorganizmalara karşı *in vitro* antimikrobiyal testleri yapılmıştır. Bu zamana dek yapılan çalışmalar, klimbazolün çözünürlüğü, ekotoksik ve genotoksik etkisi, hali hazırda kullanımı ve potansiyel kullanım alanları gibi konuları inceleme üzerine yapılmıştır. Çalışma sayesinde, klimbazolyum tuzları ve metal kompleksleri karakterize edilmiş, aynı zamanda fizyolojik ve farmakolojik etkileri incelenmiştir. Ayrıca çalışma, literatürdeki klimbazol türevleri eksikliğini gidermek ve literatüre yeni klimbazol türevleri kazandırmak, tıp ve ilaç kimyası alanında birtakım potansiyel yara iyileştirme ürünleri geliştirmek, aynı zamanda akademiye yeni ve geliştirilmesi gereken bir konu kazandırmayı amaçlamaktadır.

#### Synthesis of klimbazolium salts and their palladium complexes: Antimicrobial activity studies

#### Abstract

Imidazole is an organic compound with an aromatic heterocyclic structure containing two nitrogen compounds in its structure, which is usually found in white crystalline form at room temperature. At the same time, it is one of the indispensable compounds of pharmaceutical chemistry and medical science due to its various known pharmacological effects. Climbazole, on the other hand, is a derivative of the antifungal imidazole. It is also used in the treatment of dandruff, psoriasis, eczema and some fungal infections, as well as in similar

disinfection processes. Since it has strong solubility, affordable cost and low genotoxicity, its widespread use in the pharmaceutical industry can be predicted. In this study, climbazole salts of various alkyl and benzyl halides were obtained by activating climbazole in different structures. In addition, palladium complexes of the PEPPSI type of salts were synthesized. The structure characterizations of the synthesized salts and complexes have been elucidated by spectroscopic methods. Antimicrobial tests of salts and palladium complexes against different pathogenic microorganisms have been performed *in vitro*. Studies conducted so far have been conducted on the solubility of climbazole, its ecotoxic and genotoxic effects, its current use and potential uses. Thanks to the study, climbazolium salts and metal complexes were characterized, at the same time, their physiological and pharmacological effects were studied. In addition, the study aims to eliminate the lack of climbazole derivatives in the literature and introduce new climbazole derivatives into the literature, develop a number of potential wound healing products in the field of medicine and pharmaceutical chemistry, as well as introduce a new and necessary topic to the academy.

## GİRİŞ

İyonik sıvılar, 100°C'nin altında sıvı olabilen tuzlardır (Tavanaie, 2013). İyonik sıvılar, tıpkı NaCl gibi anyon ve katyon çiftlerinden oluşsa da, buradaki iyonlar atomik değil asimetrik moleküler iyonlardır. Bu nedenle iyonlar daha hızlı bir araya gelip kristal ayrımı oluşturamazlar, bu nedenle daha düşük erime sıcaklıklarına sahiptirler (Aslanov, 2011). İyonik sıvıların en önemli özelliklerinden birinin ihmal edilebilir bir buhar basıncı seviyesine sahip olmaları ve bu nedenle atmosfere karışmalarının oldukça düşük olması ve yeşil kimya için bir çözüm olarak kabul edilmeleri olduğu söylenebilir (Postleb ve ark., 2013). Aynı zamanda iyonik sıvıların birçok kullanımı vardır. Son zamanlarda, iyi bilinen güçlü farmasötik etkileri nedeniyle tıpta kullanım alanlarından biri haline gelmiştir (Ferraz ve ark., 2015). İyonik sıvıların sitotoksik özellikleri ve antimikrobisideri, ilaç sentezindeki olası uygulamalar açısından tıp bilimcilerinden büyük ilgi görmüştür. Climbazol, egzama ve kepek gibi insan derisi enfeksiyonlarının tedavisinde ve dezenfeksiyon işlemlerinde kullanılan antifungal imidazolün bir türevidir. Kimyasal yapısı ve özellikleri incelendiğinde climbazol, ketokonazol ve mikonazol gibi diğer mantar öldürücülere benzer denebilir (Couteau ve ark., 2000). Diklorometan, aseton, kloroform, alkoller gibi çözücülerde oldukça yüksek çözünürlüğe sahip iken suda az çözünürlük gösterir. Alkollerde zincir uzunluğu arttıkça, climbazolün hidrojen bağı yapmasından kaynaklı çözünürlük azalır fakat buna rağmen yine de iyi çözünürlük göstermektedir. Toksisitesine bakacak olursak, yapılan denemeler sonucu sucul canlılarda ve bitkilerde oldukça toksik olduğu gözlemlenmiştir (Richter ve ark., 2013). Ancak, fareler üzerinde yapılan genotoksisite çalışmalarında tam tersi sonuç saptanmıştır. 4 saatlik maruziyet sonucu farelerde mutasyon saptanmazken, 24 saatlik maruziyet sonucunda oldukça hafif bir artış göstermiştir (Pérez-Rivera ve ark., 2009).

## MATERYAL VE METOT

### Klimbazolyum Tuzları Sentezi Genel Prosedür:

1:1 oranda klimbazol, alkil-benzil halojenür önceden argonla doldurulmuş bir reaksiyon balonunda karıştırılır. İnce tabaka kromatografisi ile kontrol edilerek reaksiyon takip edilir ve gerektiğinde sonlandırılır. Ardından DCM/Eter difüzyonunda 1 gün boyunca bekletilir. Saf ürün filtre edilerek ayrılır.

### Paladyum Kompleksleri Sentezi Genel Prosedür:

1:1 oranda **1a-h** ve PdCl<sub>2</sub>, 1:5 oranda K<sub>2</sub>CO<sub>3</sub> ve 1-2 damla piridin 100°C sıcaklıkta 3 saat boyunca karıştırılır. Reaksiyon sonlandırıldıktan sonra vakumlu destilasyon ile piridin ortamdan uzaklaştırılır. Kalan turuncu katı, DCM ile çözülüp filtre edilir ve tuz ortamdan uzaklaştırılır. Kalan süzöntü, DCM ile yapılan kolon kromatografisi ile saflandırılır. Sarı kristal ürün elde edilir.

**Tablo 1.** Tuz ve Komplekslerin Karakter Analizi Sonuçları

Örnek	Verim (%)	Tuz piki (ppm)	Piridin piki (ppm)	C=O piki (cm <sup>-1</sup> )

<b>2c</b>	35	-	8.98	1731
<b>2d</b>	36	-	8.99	1729
<b>2e</b>	21	-	9.03	1732
<b>2f</b>	23	-	9.05	1730
<b>2g</b>	15	-	8.92	1729
<b>2h</b>	27	-	8.92	1724

## SONUÇ

Elde ettiğimiz tuzların <sup>1</sup>H ve <sup>13</sup>C-NMR analizlerine baktığımız zaman, en asidik protonun tuz pikine ait olan proton olduğu görülmektedir. Tuzlarda, **1b** ve **1c**'den yola çıkılarak zincir uzunluğu arttıkça bileşiğin iyonik sıvı olma meyilinin arttığı yorumu yapılabilir. Ancak, benzilik gruplarda böyle bir şey söz konusu değildir. Hepsisi beyaz katı madde olarak elde edilmiştir. Ayrıca, **1e** ve **1f**'deki verimin diğer tuzlara nazaran düşüklüğünün sebebi benzil gruplarındaki süstitüe grubun artması ile maddenin daha kararsız hale gelmesi olarak değerlendirilebilir. Kompleksleşmelerde ise, düşük verimde bileşik eldesi, klimbazolün rasemik yapısından kaynaklı yan ürün oluşma ihtimalinin olmasından kaynaklandığı düşünülmektedir.

## TEŞEKKÜR

Çalışmam boyunca bana her zaman öncülük eden ve manevi desteklerini esirgemeyen sayın hocam Prof. Dr. Hayati TÜRKMEN'e, ihtiyacım olduğu her zaman bilgilerini benimle paylaşan ve yol gösteren değerli hocam Arş. Gör. Serdar Batıkan KAVUKÇU'ya ve laboratuvarında bulunduğum süreçte kendi deneyimlerini ve bilgilerini benimle paylaşan ve yardımcı olan sevgili meslektaşlarım Aslıhan KARAER TUNÇAY, Sinem ÇAKIR ve Vedat Tolga ÖZDEMİR'e teşekkürlerimi sunarım.

#### Abstract

Pesticides have become very preferred in organic farming systems in order to make agricultural products more productive and with longer storage life. However, due to the increase in population and urbanization, pesticide use is increasing day by day. The main cause of pollution of the environment and crops stems from the excessive and uncontrolled use of pesticides. This situation disrupts both human health and ecosystem balance. Therefore, strict regulations have been developed and regulated for the pursuit of these compounds. Especially in the last decade, various techniques, from traditional detection techniques to advanced detection techniques, have been investigated for the detection, extraction and recovery of pesticides. Thanks to these techniques, time and economic savings can be achieved in the management of pesticide pollution. In this study, different techniques used in the analysis of pesticide residues were investigated by devices such as pretreatment with polymer-coated magnetic nanoparticles, gas chromatography combined with various detectors, and high-performance liquid chromatography. As a result of such studies, the measures to be taken in areas where pesticides are used heavily will be easily determined, and the control of pesticide pollution will become easier.

**Keywords:** Pesticides, organic farming, different techniques, pollution management

#### INTRODUCTION

Pesticides are very important chemical compounds in in farming, horticulture forestry, parks industrial vegetation control, sport fields, grass management ,educational facilities, etc due to many advantages (Marican and Durán-Lara 2018). These compounds have strong and rapid impacts for repulsion, prevention, mitigation, or destruction of weeds or pests. Thus, various active ingredients have been used as pesticides to protect agricultural products (Saleh, Zouari, and Al-Ghouti 2020) Depending on the target, pesticides can be classified as insecticides, herbicides, bactericides, fungicides, miticides and molluscicides, and some as nematicides, wood preservatives and rodenticides.

Depending on the chemical structure, pesticides are divided into the following classes: organophosphate group pesticides (compounds containing fenitrothion, chlorpyrifos, malathion, diclofenthion and diazinon), organochlorine pesticides (chlorothalonil, dichloro-diphenyltrichloroethane, lindane and endosulfan), carbamate pesticides (formethanate, carbetamide, carbofuran; chlorophenol). pesticides), chlorophenol pesticides (2-,3-,4-chlorophenols, 2,5-,2,6-dichlorophenols and 2,3,5-trichlorophenol; and synthetic pyrethroids).(Foo and Hameed 2010)(Marican and Durán-Lara 2018)(Aktar, Sengupta, and Chowdhury 2009). It has been observed that pesticide residues in agricultural products have increased with the increased use of these chemicals. These residues have been reported to cause various short- or long-term adverse health effects such as carcinogenicity in humans. (Wallace and Buha Djordjevic 2020), teratogenic (Sharma et al. 2020), hepatotoxic (Alarcan et al. 2020) and several other effects. For this reason, decreasing pesticide residues from extensively soil or consumed food materials is crucial. (Hassaan and El Nemr 2020) (Tang et al. 2021)

Pollutants enter the environment directly from disposal sites, landfills, spills during transportation, or as a result of accidents such as leaching from industrial facilities. Pesticides can reach plants in different ways, such as through soil, rain, wind and irrigation water. They then mix with soil, groundwater, surface waterways and surface runoff from wastewater treatment plants. Different techniques are being developed to separate pesticides from liquid streams and purify mixtures of substances.(Iorhemen, Hamza, and Tay 2016) (Jariyal et al. 2015). And these techniques have been efficiently applied to different matrices. (Cengiz et al.

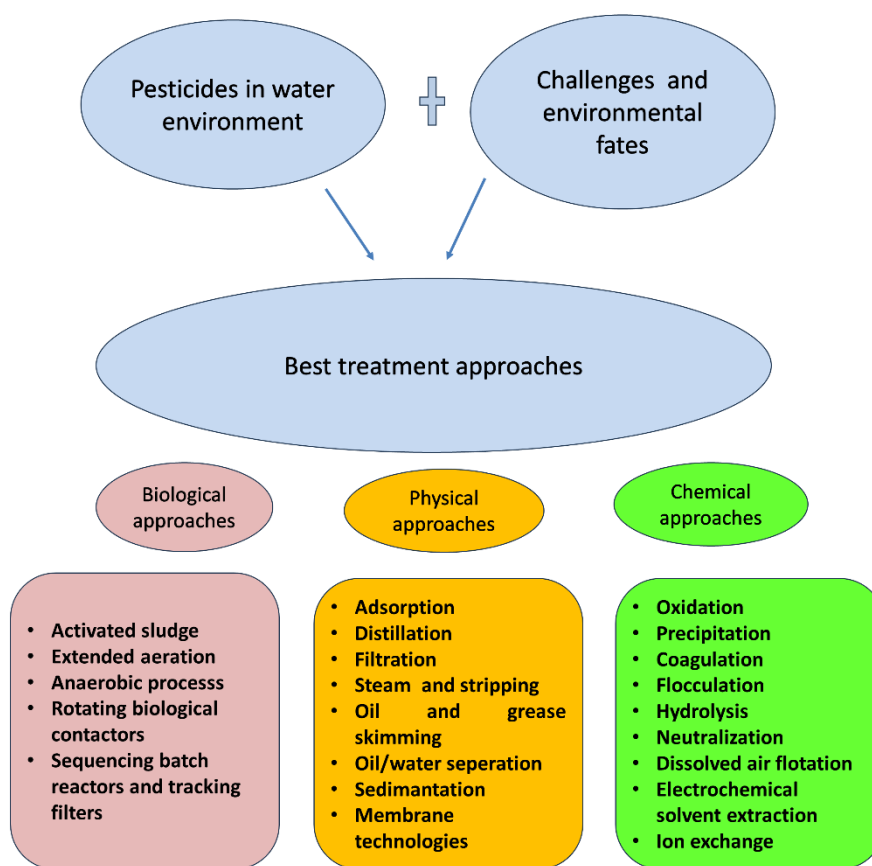

2021)(Marican and Durán-Lara 2018) Different techniques used for the recovery of pesticides as shown in Table 1.

**Table 1.** Recovery of pesticides, using different technique

Pesticide	Technique used in recovery	Matrix	Reference
tricyclic antidepressants (TCAs)	Extraction	in biological fluids	(Mofazzeli, Asaadi Shirvan, and Mohammadi 2018)
fungicides, insecticides and herbicide residues in hops	liquid chromatography–mass spectrometry/mass spectrometry (LC-MS/MS).	various adsorbent mixtures for dispersion solid-phase extraction	(Dušek, Jandovská, and Olšovská 2018)
Triazine (atrazine), chloroacetamide (alachlor), and phenoxy (2,4-dichlorophenoxyacetic acid)	a method for herbicide quantification	in environmental aqueous samples	(Suárez et al. 2018)
polycyclic aromatic hydrocarbons (PAHs)	high-performance liquid chromatography-tandem mass spectrometry (HPLC-MS/MS)	in environmental aqueous samples	(Feng et al. 2018)
organochlorine species	dielectric barrier discharge ionization (DBDI) as LC-MS ionization interface and electrospray ionization (ESI) method		(Lara-Ortega et al. 2018)
organophosphorus pesticides	zero valent Fe-reduced graphene oxide quantum dots (rGOQDs@Fe) as a new sorbent for magnetic dispersive solid-phase microextraction (MDSPME) coupled with gas chromatography–mass spectrometry method (GC-MS)	in water and fruit juice	(Akbarzade et al. 2018)
alachlor, atrazine, metolachlor, and simazine	dispersive pipette extraction and gas chromatography-mass spectrometry method (GC-MS)	in surface water	(Guan et al. 2018)
Cardiac troponin	an anti-passivation electrode (rGO/IL/Chi) by writing a graphene–ionic liquid–chitosan composite directly on a	in environmental aqueous samples	(Zheng et al. 2018)

	single-sided conductive gold strip		
phenoxy acid herbicides (fenoprop, mecoprop, dichlorprop, 2-(4-chlorophenopropionic acid (4-CPPA), 2-(3-chlorophenoxy) propionic acid (3-CPPA), and 2-phenoxypropionic acid (2-PPA))	reverse-phase/strong anionic exchange mixed-mode or strong anionic exchange retention mechanism	in river samples and effluents from wastewater treatment plants	(Valimaña-Traverso et al. 2018)
carcinogenic pesticides in milk	a cloud point methodology and spectrophotometry	in environmental aqueous samples (or milk)	(Mohd et al. 2018)
organophosphorus (OP) pesticides	Biochemical Assays	a plasmon resonance immunosensor for development of a broad-specific monoclonal antibody (mAb) for	(Jiao et al. 2018)
3- phenoxybenzoic acid (3-PBA) based on nanobody (Nb)-alkaline phosphatase (AP) fusion protein	a test method using direct competitive fluorescence enzyme immunoassay	3-phenoxybenzoic acid in urine	(Jiska Cohen-Mansfield, Maha Dakheel-Ali, MD, Marcia S. Marx, PhD, Khin Thein, MD, and Natalie G. Regier and Waage et al. 2017)

Pesticides have disadvantages such as high levels of contaminants in water and soil and their natural breakdown. There are various treatment techniques discussed in detail in this review to remove pesticides from different matrices such as soil and water. This review article gives general information about the adsorption and recovery capacities of different adsorbent methods for the recovery of pesticides harmful to human health in matrices such as water and soil, and each technique is tried to be explained by taking into account the advantage and disadvantage of each technique. Due to these disadvantages, it has led to the development of different techniques for the recovery of pesticides from water and soil by biological, physical and chemical methods, as shown in Figure 1. (Marican and Durán-Lara 2018)

**Figure 1.** Best treatment approaches as chemical, physical, and biological wastewater treatment methods (Singh et al. 2018)(Saleh et al. 2020) (L et al. 2018a).

The aim of this review is to compare different analyses that can lead to future scientific research on the techniques and materials with the most promising and successful results for the removal of pesticides.

### Biological processes of recovery

Biological recovery is an attractive technology achieved by completely converting organic compounds into products such as  $\text{CO}_2$  and  $\text{H}_2\text{O}$  that may be less harmful to nature and human health. It is considered low-cost and environmentally friendly in removing pollutants compared to other methods. (Nwankwegu and Onwosi 2017). There are three methods in biological recovery with microorganisms. The first is improvement through enhanced natural attenuation, achieved by utilizing the natural capacities of the microorganisms present in the matrix. The second method is bioaugmentation, which is achieved by taking advantage of the natural capacities of the microorganisms present in the matrix. The other is biological processes achieved by adding non-native or genetically modified microorganisms and electroreceptors or nutrients. (Javaid, Ashiq, and Tahir 2016) There are two different techniques in biological recovery: aerobic and anaerobic recovery. Pesticides containing dichlor are digested through an aerobic process. This aerobic process involves oxidation and cleavage of the ether bond and hydroxylation of chlorophenol to form chloro-catechol. Additionally, when the aromatic ring in the compound is opened, water and carbon dioxide can be easily digested through bacterial metabolism. (Musbah et al. 2018) Via reductive dehalogenation, dichlorinated pesticides can also be digested anaerobically. When the ratio of chlorine atoms in the compound is less, it will decompose into  $\text{CH}_4$  and  $\text{CO}_2$ .

Pesticides are difficult to biodegrade. However, once the biodegradation system is established, it can be easily maintained. In addition, some pretreatments may be necessary to accelerate enzymatic reactions, degradation of some pesticides by photochemical degradation, or biological digestion reactions. (Huang et al. 2018). In another study, they stated that the degradation of norfloxacin, as an antibacterial agent, from wastewater through the enzymatic reaction via chloroperoxidase was facilitated by the addition of  $\text{H}_2\text{O}_2$ . (Zhao et al. 2017). There is no need for a large land area in the treatment method using biologically enriched activated sludge.

Lower cost is required compared to the advanced oxidation process. It is also more eco-friendly than chlorination. The disadvantage of this technique is that it requires a disposal area for the sludge and manual operation is required for this. (Luo et al. 2014) Degradation of pesticides by adding ligninolytic fungi that secrete ligninolytic enzymes to the targeted biomixture is one of the preferred techniques. Ligninolytic fungi added to this mixture depolymerize and mineralize lignin. (Castillo Mdel et al., 2008).

Hexachlorocyclohexane (HCH) is an organochlorine pesticide made from a mixture of more than eight stereoisomers with an environmental half-life of up to ten years. The HCH compound is difficult to remove from water and soil. In recent years, there has been research on developing a bacterial consortium that can digest HCH. Actively used bacterial consortia include strains of *Pseudomonas*, *Burkholderia*, *Flavobacterium*, and *Vibrio*. (Murthy and Manonmani 2007)

### Physical processes of recovery

Physical recovery is the technique of correcting the problem by physical means. One of these techniques is membrane filtration techniques, which are widely used especially in wastewater. (Chiam and Sarbatly 2011)

Karimi et al. (2016) obtained a thin film composite poly (piperazine amide) nanofiltration membrane using the interfacial polymerization technique and triethylamine as an accelerator. They reported that nanofiltration membranes containing poly (piperazine amide) provided a significant improvement in the removal of pesticides. (Karimi, Rahimpour, and Shirzad Kebria 2016).

Qin et al. (2020) reported that  $ZrO_2$  nanoparticles were efficiently produced by reverse micelle-mediated sol-gel process to prepare the nanofiltration membrane for the removal of carbofuran pesticides from wastewater. (Qin et al. 2020)

In another study, Musbah et al. (2018) reported that polypiperazine amide nanofiltration and OPMN-K membrane achieved successful results in the removal of different pesticides such as atrazine, simazine and diuron in the presence of humic acid. (Musbah et al. 2018).

### Chemical processes of recovery

Recovery of pesticides through chemical techniques consists of various chemical reactions that help hydrolyse contaminants in water or soil. Some of the most commonly used chemical techniques are: Fenton treatment is an advanced oxidation process that also includes coagulation and ozonation. Many of these are used in conjunction with photocatalysis and membrane techniques. (Saleh et al. 2020) (Meghwal et al. 2019)

Vela et al. (2019) in their study with free radical have studied the removal of sodium persulfate ( $Na_2S_2O_8$ ) from the matrix to which different pesticides such as pemetozine, heksythiazox, spiromesifen, folpet, akrinatrininlonikamid, imidacloprid, acetamiprid, cymoxanil, tiacpropride, spinosad, tebukazol, difokazol, difokazol, difokiliprid are bound.

Persulphate photolysis converts pesticides into less harmful substances by producing free radicals capable of oxidizing ( $SO_4^{\bullet-}$ ). Because the pesticide causes mineralization into  $CO_2$  and  $H_2O$ . With this study, it was observed that initially dissolved organic carbon was reduced by 87%. Therefore, it is thought that oxidation with sulphate radicals may be a promising method for the recovery of pesticides. (Vela et al. 2019)

One of the chemical techniques used is photochemical degradation. Ultraviolet (UV) light is used as electromagnetic radiation used for the photodegradation of pollutants in soil and wastewater. This UV light used includes UV-A (315–400 nm), UV-B (280–315 nm), UV-C (180–280 nm), and vacuum UV light (10–180 nm). However, since UV light alone is generally not sufficient to degrade pollutants, it is also used in combination with different photochemical degradation techniques. (L et al. 2018b) (Rani and Sud 2015)

In their ozonation technique studies, Meijers et al. (1995) investigated the recovery rates of nearly 30 pesticides using this technique. As a result, it was concluded that different pesticides such as isoproturon, methoxuron, dimethoate, chlortoluron, diuron, and vinclozolin were removed. (Meijers et al. 1995)

Fenton reaction is the oxidation process of  $\text{Fe}^{2+}$  and  $\text{H}_2\text{O}_2$  compounds with organic substrates. This oxidation process is one of the most effective chemical techniques in the recovery of pesticides. (Barbusiński 2009). With the Fenton reaction, a result was obtained in the recovery of an organophosphate insecticide known as fenitrothion at a rate of 98.5%, another organophosphorus pesticide such as orfenvinphos at a rate of 97.1%, and a rate of 90% of organochlorine pesticides from wastewater contaminated with pesticides (Barbusiński and Filipek). 2001). (Barbusiński and Filipek 2001) (Barbusiński 2009).

Saritha et al. (2007) showed advanced oxidation process as the best result in the recovery of 4-chloro-2-nitrophenol (4C-2-NP), which is known as a pollutant. It showed that a concentration much lower than the initial concentration was reached. (Saritha et al. 2007)

Adsorption technique is one of the processes that gives very effective results in the recovery of pollutants as a low-cost water purification method. The success of the adsorbent technique depends on the surface area of the contaminant, its porosity, and its interaction with the target substance. (Al-Ghouti and Da'ana 2020)

Ultrasound waves are waves created by obtaining high vibration using very high frequency sound waves. In the ultrasound technique, aviation bubbles are formed in the matrix to which they are attached, and these bubbles burst and particles are formed with micro turbulence. Then, these particles are disrupted and the chemical reaction is accelerated. These ultrasound waves used for the recovery of pesticides are the degradation of the diazinon compound in water. (Kadam et al. 2015) (Zhang et al. 2010)

## CONCLUSION

This review article evaluates biological, physical, and chemical techniques for removing specific pesticides from water and soil, describing alternatives for pesticide recovery based on the unique characteristics of each technique. Each pesticide has different biological, physical and chemical properties. In other words, it supports the revision of appropriate techniques and materials for the removal of certain pesticides from water and soil. Choosing an inappropriate recovery technique may result in more toxic by-products. Therefore, comprehensive scientific analysis and laboratory studies are required to purify the pesticide.

The biological recovery technique of pesticides involves biological processes using fungal and bacterial species that enable the degradation of pesticides. Although this technique is widely used due to its low cost and high efficiency, it depends on many factors such as pH, temperature and oxygen level of water and soil, moisture content and nutrient availability. Within the physical remediation, there are good adsorption materials for pesticides with low cost of production that can be used effectively to treat wastewater containing pesticides. The common feature of pesticides is their poor water solubility. This feature turns them into complex compounds at the point of recovery. Therefore, the solubility of pesticides in water must be increased for subsequent removal.

As a result, choosing the best technique and material for the recovery of some pesticides is extremely important for subsequent research. amount of water and soil, investment cost, pH, matrix type, temperature, solubility of pesticides, etc. all variables such as are taken into account.

#### Abstract

Drought and salinity stresses limit agricultural production worldwide. Stress mitigation by external biostimulator molecules has been an active research topic in recent years. In this study, the effect of the steroidal hormone progesterone, present in both animal and plant tissues, was investigated in terms of morphological (tissue length and weights), physiological (relative water content, ion leakage, MDA and proline levels) and enzymatic (ACS2, P5CS, FeSOD, CAT2, GR1 and APX1) stress indicators under both drought and salinity stresses. Both stresses were alleviated to some extent by progesterone treatment in tomato seedlings.

**Keywords:** *Solanum lycopersicum* L., abiotic stress, progesterone

#### INTRODUCTION

Drought and salinity are the most common abiotic stresses restricting current agricultural production worldwide. Both stresses are associated with low osmotic potential, which results in stomatal closure to prevent further water loss at the expense of reduced photosynthetic efficiency. Both stresses usually result in reduced growth and negatively affect physiological processes by triggering ROS production (Gupta et al., 2017). Salinity stress exerts further destructive effects by causing ion toxicity and nutritional imbalances (Haj-Amor et al., 2022). Various molecules that regulate growth and development in plants are being investigated for their ameliorative potential under various stresses (Zulfiqar and Ashraf, 2020). One of the molecules is progesterone, a well-known animal steroidal hormone essential for ovulation, luteinization and the continuation of pregnancy in mammals.

Progesterone was detected in plants in the 1960s and its presence has been demonstrated in a wide variety of plant species and in various plant tissues (Lino et al., 2007). Similar to animals, its roles in flowering and generative development have been characterized (Janeczko and Filek, 2002; Janeczko et al., 2003). Lino et al. (2007) proposed that progesterone acts as a growth hormone in plant tissues and that its role and function is different from those of brassinosteroids, which are another group of plant steroidal hormones.

Progesterone was also shown to decrease necrosis and ion leakage and improve photosystem II efficiency in *Arabidopsis* under a biotic stress, *Pseudomonas syringae* infection (Janeczko et al., 2013a). Progesterone was also shown to play a role in various abiotic stresses. Erdal (2012a) showed that progesterone protects germinating maize seeds under salt stress. The molecule also protected wheat and chickpea seedlings from salt stress by both enzymatic and non-enzymatic antioxidative defense mechanisms and by increasing the anabolism of carbon compounds (Erdal, 2012b; Erdal and Dumlupınar, 2011). Progesterone mitigates drought, heat and light stress in wheat by enhancing antioxidant defense and photosystem II activity (Janeczko et al., 2013b; Su et al., 2014; Xue et al., 2017). Progesterone was also shown to protect chickpea and maize seedlings from chilling damage and to enter the lipid bilayer and similar to other sterols, it plays a role in membrane fluidity and frost tolerance in winter wheat (Genisel et al., 2013; Erdal and Genisel, 2016; Filek et al., 2017; Janeczko et al., 2019).

Tomato (*Solanum lycopersicum* L.) is a model plant for the study of fruits. It is also an economically important crop exhibiting many health benefits due to its high vitamin and lycopene content. In this study, the effects of progesterone were investigated through observation of common physiological stress indicators such as growth parameters, membrane damage status and osmoprotectant proline production as well as transcript levels of the

enzymatic antioxidative defense system including superoxide dismutase (FeSOD), catalase (CAT2), glutathione reductase (GR1), ascorbate peroxidase (APX1), 1-aminocyclopropane-1-carboxylic acid synthase (ACS2) and delta 1-pyrroline-5-carboxylate synthase (P5CS).

## MATERIALS AND METHODS

### Plant growth and treatment

Tomato seeds (Kayra F1 tomato variety from Anamas Tohum Ltd. Şti., Antalya) were placed in polypropylene containers with a volume of 400 ml containing sterile perlite as one seed in each container. Germination was achieved in all pots at the end of a week by irrigation with sterile Hoagland solution (Hoagland and Arnon, 1950) every other day. Plant growth was continued for 21 days in a 16-hour light/8-hour dark cycle, at 24°C in a plant growth cabinet containing 50% humidity. Drought stress started at the end of the 21st day, 0 water potential was reached on the 3rd day, and at the end of the 5th day, the tissue samples were collected for analysis. Salt stress was initiated with Hoagland solution containing 200 mM NaCl at the end of the 21st day and applied for 5 days as in drought stress.

Progesterone was applied by adding 1 µM progesterone (Progestan, Koçak Farma, İstanbul) into Hoagland solution starting from seed sowing and the application continued throughout stress applications. Progesterone concentration was determined by pre-testing with 10 plants that received treatments at three different concentrations for each hormone. Root and stem lengths of the plants and ion leakage measurements were evaluated and the concentration with the best anatomical and physiological response was used throughout the study. Salt stress was applied at a concentration of 200 mM NaCl based on the observation that it induced a severe stress response for the same tomato variety within a week in previous laboratory studies.

### Determination of physiological plant stress indicators

In the presence or absence of progesterone application and stress, after 21 days of development and 5 days of stress application, all plants were removed from perlite and washed under tap water, and root/stem lengths were determined as cm. Root and stem tissues were separated and weighed, and after drying at 60 °C for 48 h, they were weighed again and their dry weight (g) was determined.

Relative water contents (BSU) were determined according to the formula;  $BSU (\%) = \frac{\text{Wet weight} - \text{Dry weight}}{\text{Turgid weight} - \text{Dry weight}} \times 100$ , as was specified in Smart and Bingham (1974). Turgid weight was determined by keeping the leaves in distilled water at room temperature for 24 h.

The levels of osmoprotectant amino acid proline were determined by the method of Bates et al. (1973) without any modifications.

Cellular membrane damage was determined by measuring the phospholipid peroxidation product malondialdehyde (MDA) level according to Ohkawa et al. (1979) without any modifications.

Another indicator of cell wall and membrane damage, ion leakage levels, were determined according to Nanjo et al. (1999) without any modifications.

### Determination of gene expression

Total RNA isolation was performed according to the instructions of Thermo GeneJET plant mini kit (Thermo, USA), followed by treatment with Thermo RNase-free DNase I (Thermo, USA) in accordance with the instructions for quantitative RT-PCR. The amounts of total RNA obtained were determined spectrophotometrically using Nanodrop 2000. The quality of total RNAs was also determined by separation and imaging with 1% agarose gel electrophoresis followed by cDNA synthesis, which was performed according to Thermo RevertAid FirstStrand cDNA synthesis kit instructions (Thermo, USA).

In this study, *ACS2*, *P5CS*, *FeSOD*, *CAT2*, *GR1*, and *APX1* gene expressions in tomato leaves were normalized using the EF-1 reference gene, and the relative quantification of genes was compared with the control group using a Biorad CFX Connect Real-Time PCR device and CFX Maestro software (Biorad, USA). All amplification reactions were performed using Biorad iTaq Universal SYBR Green Supermix as specified in the user manual. The primers used in the study were optimized with PrimerPremier 5.0 software (Premier Biosoft International, USA) to provide optimum amplification conditions. PCR conditions included initial denaturation of 30 s at 95°C, followed by amplification for 5 seconds at 95°C and 30 seconds at 54°C, repeating

40 cycles. RT-PCR reactions included two biological and two technical replicates. Relative expression of genes was determined according to the  $2^{-\Delta\Delta C_T}$  method.  $\Delta\Delta C_T$  values were calculated by subtracting the mean  $\Delta C_T$  values of the samples from the mean  $\Delta C_T$  values of the controls, and these values were used to determine the  $2^{-\Delta\Delta C_T}$  differences.

#### Statistical Analysis

The study was conducted in triplicate and each replicate included 20 plants. The data obtained in the research were evaluated using the SPSS 16.0 program. The differences between the means were determined by the one-way ANOVA and Tukey's test.

## RESULTS

Neither stress nor progesterone treatment had no significant effect on shoot and root lengths. Drought stress and sole progesterone application slightly reduced shoot dry weights, whereas salinity stress significantly reduced both shoot and root dry weights. Although not significant, progesterone treatment increased shoot dry weights under drought and both shoot and root dry weights under salinity stress. Both stress slightly reduced the water content, and progesterone did not show any significant effect.

**Table 1.** Effect of different stress and hormone treatments on plant morphological parameters. C, T, K, P, P+T and P+K indicate control, salt, drought, progesterone, progesterone+salt and progesterone+drought applications, respectively.

Treatment	Tissue Length (cm)	Dry Weight (gr)	Water Content (%)

Relative water content also decreased upon stress application and no significant effect of progesterone was observed on the parameter. Stress applications did not change ion leakages significantly; however, the value was significantly lower than every other treatment, including control, upon progesterone treatment under salt stress. Unlike ion leakage, both stress increased MDA contents, whereas progesterone treatment reduced the level back to the control level under salinity stress. The proline content was the most reactive parameter to both drought and salt stresses, with 7- and 20-fold increases, respectively. The presence of progesterone resulted in 9% and 38% decrease in proline content under salinity and drought stresses, respectively.

**Table 2.** Effect of different stress and hormone treatments on physiological stress indicators. C, T, K, P, P+T and P+K indicate control, salt, drought, progesterone, progesterone+salt and progesterone+drought applications, respectively.

Treatment	Relative Water Content (%)	Ion Leakage (%)	MDA Content (nmol/g)	Proline Content (nmol/g)

The antioxidative defense system genes *FeSOD* and *CAT2* were upregulated under salinity and drought stresses as well as stress-related *ACS2* and *P5CS* genes. *APX1* and *GRI* gene expressions did not significantly change under stress treatments. Progesterone treatment alone usually did not change gene expression except for *FeSOD* and *CAT2*, which increased with progesterone treatment. Progesterone treatment under drought stress increased *FeSOD*, *CAT2*, *GRI* and *P5CS* gene expressions significantly, compared to drought stress treatments alone. *GRI* and *P5CS* gene expressions also increased with progesterone treatment under salinity stress in addition to *ACS2* gene expressions, while *FeSOD*, *CAT2* and *APX1* expressions were unaffected.

## DISCUSSION

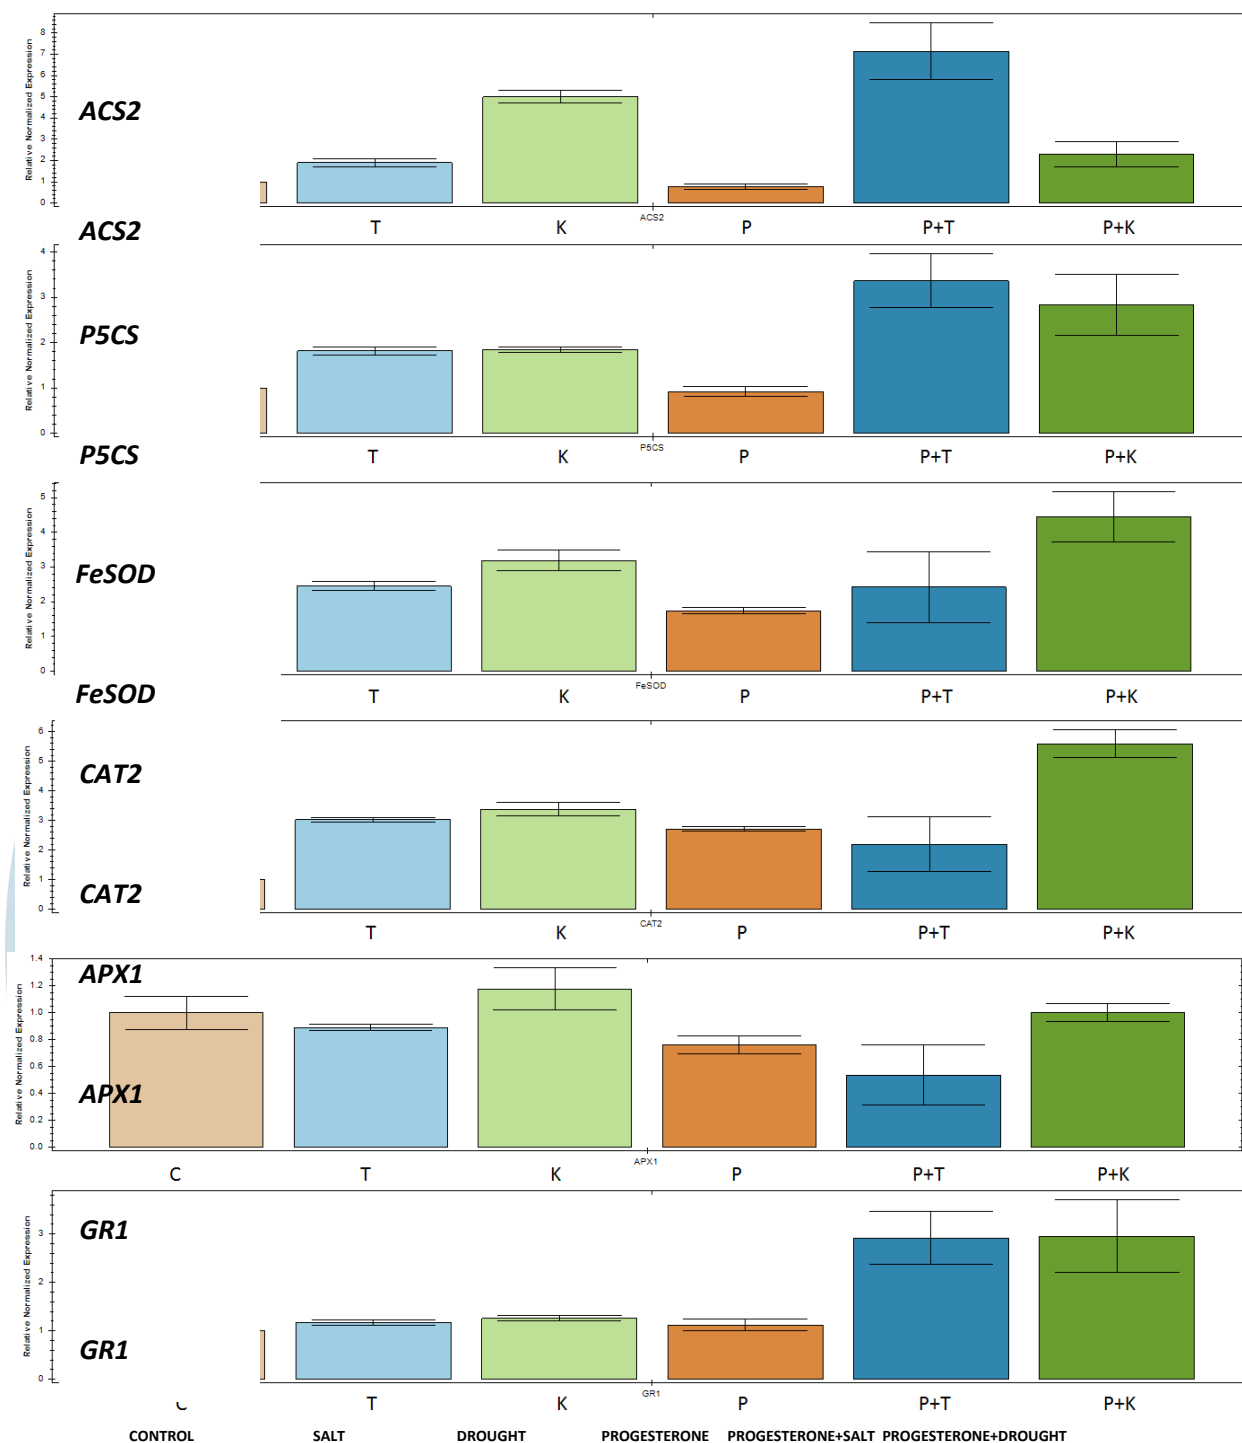

Although limited in number, previous studies have reported oxidative stress mitigation under exogenous progesterone treatment. Our study showed enhancements in root length and dry weight upon progesterone application under salinity stress. The same observation was also performed for maize seedlings under salt stress (Erdal, 2011). The results of our study also showed that the level of MDA and ion leakage was reduced with progesterone treatment under salinity stress. Similar effects were also reported by other researchers for wheat, chickpea, and maize under heat, drought, salt, and cold stresses (Erdal, 2011; Genisel et al., 2013; Su et al., 2014; Erdal and Genisel, 2016; Xue et al., 2017). Our results showed that the effects of progesterone were more prominent under salt stress compared with drought stress in terms of morphological and physiological stress parameters.

In chickpea plants, progesterone application alone increased SOD and CAT enzyme activities and decreased lipid peroxidation levels, which is also in agreement with our findings (Erdal and Dumlupınar, 2011). The abovementioned literature also reported increments in antioxidative enzyme activities, which were supported by gene expressions investigated in this study. *P5CS*, *FeSOD*, *CAT2* and *GRI* expressions were significantly higher in progesterone-treated plants under drought stress, whereas only *P5CS* and *GRI* expressions were higher under salt-stressed plants. Because plant morphology and physiological indicators show better protection under salinity stress, some other parameters not investigated in this study might explain the better protection status of salt-stressed plants upon progesterone treatment. According to Su et al. (2014) and Xue et al. (2017), the main reason for plant tolerance in progesterone-treated plants under stress is the facilitation of D1 protein phosphorylation, which plays a role in photosystem II and therefore increases photosynthetic efficiency, which was not investigated in our study.

## CONCLUSION

Although we have observed stress mitigation effects of progesterone under drought and salinity stresses, our results are not sufficient to explain the molecular mechanisms of protection and better protection of tomato seedlings under salt stress conditions. Further studies including transcriptomics technologies are necessary to decipher the mechanism of action of progesterone under oxidative stress conditions.

**Figure 1.** Graph of relative normalized gene expressions for different treatment groups. C, T, K, P, P+T and P+K indicates control, salt, drought, progesterone, progesterone+salt and progesterone+drought applications, respectively.

#### Abstract

Gentamicin, an antibiotic, is commonly used in many infectious diseases and has lots of advantages although it has some complications. It is determined that gentamicin's side effects on the liver could impair the process of the disease. *Chenopodium Album* L. containing flavonoids and protecting the liver is a plant. Current studies presented that *Chenopodium Album* L. extract ameliorates liver toxication occurred from different reasons. In light of this information, the aim of the study was that present the effects of the extract on alanine and aspartate aminotransferase (ALT and AST) in acute gentamicin toxicity. A total of 32 mature 223-250 g Wistar albino rats were divided into four groups: Control, Toxication, Extract, and Treatment. The toxication model was realized with one dose of 80 mg/kg gentamicin intraperitoneally. 7 days later, the extract was applied subcutaneously at 0.45 mg/kg. On the eighth day of the study, animals were sacrificed, and blood tissues were collected. Obtained serums were used for the determination of ALT and AST levels via the UV- P5P method. As a result of the examinations, it was found that ALT and AST levels were not changed significantly ( $p < 0.05$ ). Low damage from acute toxication or insensitivity to ALT and AST values could be the possible reason for the results. Thus, to establish the *Chenopodium album* L. effects on acute gentamicin, there is needed to comprehensive approaches.

**Keywords:** Gentamicin, *Chenopodium album*, Alanine Aminotransferase, Aspartate Aminotransferase

#### INTRODUCTION

Gentamicin commonly used in infections originates from gram-negative bacteria and is an antibiotic structured the aminoglycoside. Given patients' ages, symptoms, and vitals, it could be applied and be treat local microbial resistance including bacterial septicemia, meningitis, urinary system infections, and soft tissue infections (Chaves and Tadi, 2020). Despite the clinical advantages of gentamicin like the other aminoglycoside, it has critical complications. The most seen complication is nephrotoxicity, and it could be seen in approximately %30 of patients following the 7 days of the gentamicin treatment. Current studies indicated that gentamicin could cause acute kidney injury even if used in only one dose. Although kidney toxicity due to gentamicin comes to the forefront, it is more important that side effects on the liver have a role detoxification of medication and toxins (Babaenezhad et al., 2021; Galaly et al., 2014). According to some researchers, it results from long-distance organ injury following acute kidney damage (Babaenezhad et al., 2021). On the other hand, gentamicin directly increases superoxide anion, hydrogen peroxide, and hydroxyl radicals produced by mitochondria. The free radicals start some cellular activity including phospholipid membrane peroxidation, breaking of DNA chain, and protein denaturation. Therefore, it can result in cellular damage (Najaran et al., 2014). So, the process causes oxidative stress and increases alanine aminotransferase (ALT), aspartate aminotransferase (AST), and alkaline phosphatase (ALP). Additionally, an increase in reactive oxygen species triggers inflammation and suppresses the endogenous antioxidant system (Babaenezhad et al., 2021; Najaran et al., 2014). With all, studies should be focused on the antioxidant and anti-inflammatory agents to prevent gentamicin-related toxicity.

*Chenopodium album* L., is a fast-growing and annual plant called *sirken* in our country (Atalay and Kamalak, 2019). This plant also grows on different continents containing different contents like fatty acids, flavonoids, and  $\beta$ -carotene. So that it has antibacterial, anti-fungal, anti-nociceptin, anti-inflammatory, anti-diabetic, and

anti-hyperlipidemic properties (Chamkhi et al., 2022) exhibiting also hepatoprotective effects (Ata et al., 2015; Baldi and Choudhary, 2013; Jain & Singhai, 2012; Nayak et al., 2012; Parkash & Patel, 2015). Nayan et al. (2012) reported that *Chenopodium album* L. protected the liver against CCl<sub>4</sub>-induced hepatotoxicity decreasing serum glutamate oxaloacetate transaminase (SGOT), serum glutamate pyruvate transaminase (SGPT) levels (Nayak et al., 2012). Jain and Singhai (2012) experimented with *Chenopodium album* L. effects in vivo and in vitro on CCl<sub>4</sub>-induced hepatotoxicity. The in vitro and in vivo results indicated that AST, ALT, and lactate dehydrogenase (LDH) levels were decreased. (Jain & Singhai, 2012). Considering, *Chenopodium album* L. extract has alleviating effects on the liver. Moreover, there is a lack of the effects of *Chenopodium album* L. extract on gentamicin-related hepatotoxicity. Therefore, in this study, we aimed to investigate the effects of *Chenopodium album* L. extract on gentamicin-related acute hepatotoxicity, ALT, and AST levels.

## MATERIALS AND METHODS

### 2.1. Animals

Male Wistar albino rats (32 animals, 225-250 g) were obtained from Kafkas University Experimental Research Centre. Rats were housed at 40-60% humidity, 22±2 °C temperature, and 12 h/12 h light/dark cycle. During the experiment, rats were fed with standard food pellets and water *ad libitum*. All rats were examined in terms of behavioural, respiratory, and cardiovascular conditions. Distressed rats were not counted in the study. The whole protocol was proper with the 1964 Helsinki Declaration.

Rats were randomly divided equally into 4 experimental groups as represented below:

- **Group 1 (Control, n=8):** A vehicle of extract was applied to rats orally by gavage.
- **Group 2 (Toxicity, n=8):** Acute toxicity was established by Gentamicin.
- **Group 3 (Extract, n=8):** Only extract was applied to rats orally by gavage.
- **Group 4 (Treatment, n=8):** Acute toxicity was established by Gentamicin after the extract was applied to rats orally by gavage.

### 2.2. Establishment of Gentamicin Toxicity

Toxicity was established according to the previous model of Sule and Arhoghro (2016). Briefly, only one dose of 80 mg/kg gentamicin was injected intraperitoneally (i.p.) (Sule and Arhoghro, 2016).

### 2.3. Application of *Chenopodium album* L. Extract

*Chenopodium Album* L. was given orally at a dose of 0,45 mg/kg by gavage after 7 days of acute toxicity.

### 2.4. Euthanasia and Harvesting

Animals were sacrificed under general anaesthesia (ketamine hydrochloride (75mg/kg) and xylazine (15 mg/kg) i.m.) on the 8<sup>th</sup> day of the study. Blood samples were harvested, and serum ALT-AST levels were evaluated by the UV - P5P method.

### 2.6. Statistics

Data was determined with IBM SPSS (Version 26). Normality was performed by the Shaphiro-Wilk test. Statistical differences were examined by one-way ANOVA and post-hoc Tukey test. The significance is represented as  $p < 0.05$ .

## RESULTS

Our results indicated that there were differences between experimental groups in ALT and AST levels, but results were statistically insignificant ( $p < 0.05$ , Figure 1).

**Figure 1:** Serum ALT and AST levels of experimental groups.

## DISCUSSION

In the present study, we aimed to investigate the effects of *Chenopodium album* L. extract on ALT and AST levels of gentamicin with one dose-induced hepatotoxicity in rats. To do that Sule and Arhoghro's (2016) acute toxicity model was established in rats.

ALT is an enzyme composed of 496 amino acids with a half-life life  $47 \pm 10$  h. ALT has three isoforms called ALT1, ALT2 and ALT2\_2. Among them, ALT2\_2 is enzymatically inactive. ALT is mainly located in the cytosol of hepatocytes but is also placed minimally in muscle, adipose tissue, colon, prostate, and brain. ALT located in hepatocytes is 3000 times more active than in serum ALT. (Åberg et al., 2021; Ndrepepa and Kastrati, 2019). At clinical practice, serum ALT levels are cheap and reachable tests for the measurement of liver function. The release of ALT following tissue injuries could be able to diagnose a range of pathologies like viral and toxic hepatitis, muscular dystrophy, and other muscular atrophy diseases. Specifically, serum ALT levels increase following liver injury (Liu et al., 2014). In our study, serum ALT levels of rats were examined. According to the biochemistry results, there was not a significant difference between groups in ALT levels. It was suggested that there could be a variety of reasons for this result. Previous studies indicated that serum ALT levels might not always increase in all liver injury cases (Liu et al., 2014). Thus, our outcomes indicated differences in serum ALT levels but were statistically insignificant. Additionally, ALT levels in circulation have many origins. Due to a lack of knowledge about underlying mechanisms, ALT crosses to the intracellular space and circulation by cytoplasmic budding or blow-ups (Lindblom et al., 2007). Therefore, in our study gentamicin was applied in only one dose, so it is possible that this application wouldn't have as much damage to the hepatocytes. Also, ALT does not show up in the diurnal rhythm. Serum ALT levels are 45% higher during daytime while between different days the serum ALT levels differ from 10% to 30% (Cordoba et al., 1998; Fraser and Harris, 1989).

AST has a key role in amino acid metabolism and there are cytoplasmic and mitochondrial isoforms. AST is expressed in almost every tissue. Initially, the heart and liver then skeletal muscle, kidneys, pancreas, spleen, lung, and erythrocytes. AST is wiped out from circulation by hepatic sinusoidal cells. The total serum AST half-life is 17 h. From the early 1950s serum AST levels were commonly used for diagnosis and prognosis of liver diseases. Serum ALT levels increase was reported after inflammatory liver disease, alcoholic liver disease, cirrhosis, and drug toxicity (Åberg et al., 2021; Ndrepepa, 2021). So, in this study, we examined serum AST levels in addition to ALT levels. There was no significant difference between groups in serum AST levels. We suggested that the severity of gentamicin toxicity might be minimal. Previous studies reported that median injuries exhibit lower enzymatic fraction (Wieme and Demeulenaere, 1970). In addition, hepatocyte injury and plasma aminotransferase correlation are also weakened (Pratt and Kaplan, 2000).

## CONCLUSION

*Chenopodium album* L. did not show any effects on serum ALT and AST levels. So, we could declare that *Chenopodium album* L. does not have hepatotoxic effects.

In this study, histopathological and genetic analyses were not performed. The powerful side of our study is to examine the effects of *Chenopodium album* L on ALT and AST levels which are routine tests. Further studies are required to investigate the effects of *Chenopodium album* L on gentamicin cytotoxicity.

#### Abstract

Exercise is a drug that provides a healthy and quality lifestyle, prevents pathologies, and is a treatment method. Exercise is the most common application with its benefits and has no side effects. Considering the beneficial effects of exercise, studies about exercise gained attention in recent years. The underlying molecular mechanisms of exercise are still lacking. Therefore, animal models established on exercise are required. Several exercise models exerting advantages and disadvantages have been used in experimental studies. With all, this study aimed to determine the experimental models in exercise. To that, professional experimental studies in this field have been examined which were published in Pubmed and Google Scholar databases between the years 2003-2023. Results have indicated that experimental models in exercise studies are classified as volunteered, non-volunteered, compulsory, and specific models. It has been pointed out in those studies that all classified exercise models both have positive and negative effects and were not ideal types of exercise. It was also suggested that the options for exercise models should have been established according to the main hypothesis. Additionally, the target population should have been considered during exercise model selection.

**Keywords:** exercise, exercise therapy, experimental animal models

#### INTRODUCTION

Exercise is a type of drug that provides a healthy quality of life for individuals and prevents diseases. The importance of exercise elevating day by day due to its mental and physical enhancing properties. Therefore, the studies based on exercise effects gained attract recently (Ruegsegger and Booth, 2018; Thompson et al., 2020). Due to the systemic effects of exercise, studies mostly were established in vivo not in vitro. So exercise studies are generally established on humans or animals (Feng et al., 2019). Human studies are mostly comprised of epidemiological research. In addition, tissue harvesting for underlying molecular mechanisms of exercise effects from humans is not ethically approved. Thus, animal models are used extensively in exercise studies (Chu-Tan et al., 2022).

In animal models for exercise studies, generally, dogs, cats, and rabbits are used (Feng et al., 2019). But rats and mice are the most common types of animals that are used in exercise animal models with a 95 % rate (Hickman et al., 2017; Seo et al., 2014). Here we summarized in this review the exercise models that are established on mice/rats and, the advantages and disadvantages of these models.

#### MATERIALS AND METHODS

The present study is based on the studies which were published between the years 2003-2023 by professionals of the field with the keywords; exercise, experimental models, exercise physiology, and experimental exercise models. The related studies were analyzed and most related of the research were contributed to the review.

## RESULTS and DISCUSSION

Experimental exercise models can be categorized as volunteered exercise, non-volunteered exercise, forced exercise, and specified exercise (Seo et al., 2014).

The voluntary exercises are a type of exercise that does not activate a systemic response. So that general parameters do not generally change (Naderi et al., 2015). This type of exercise is commonly performed on wheels set up inside a cage. The animals are allowed to the mechanism ad-libitum for 24 hours. Therefore, a force is not applied to the animals. The mechanism can be customized with additive equipment if required. For example, the laps can be increased by the addition of extra wheels. Also, the distance that the animal made can be evaluated. The mechanism also can be standardized by locking some of the wheels (Leasure and Jones, 2008). Further, volunteer exercise also has some disadvantages. Although this type of exercise is an aerobic exercise, it is limited in exhaustive experiments. Considering that, it is more appropriate for senescence, behavioral research, ischemia, cancer, diabetes, emotional conditions, muscle physiology, neuromuscular diseases, and stroke cases. Additionally, because the animals are on their own during the whole exercise process, their paws may stuck to the mechanism (Seo et al., 2014).

One of the other exercise animal models is involuntary exercise. The muscle contraction and exercise process are applied to the animal by an electrical force from outside. The common method in this process is functional electrical stimulation (FES). To achieve this method, the electrodes should have been implanted under general anesthesia in the muscles of the animals. Following implantation, the stimulation threshold is determined with the application of different voltages. The exercise begins with this electrical threshold voltage application. The most attractive advantage of this method is that animal motivation and coordination are not required. That means this method is quantitative and repeatable. Differing from conscious exercise, all motor units can be activated with electrical stimulation (Ke et al., 2011). The disadvantages of this method involve anesthesia requirements and implantation can cause neuropathy. Under higher frequency conditions, the muscle fibers may be exposed to transmission. Besides, the muscle contraction is not physiological (Seo et al., 2014).

In forced exercise models, animals are forced to get on the exercise platform. The treadmill, lifting weights, squads, swimming, and stairs up are subtypes of forced exercise. The treadmill is a common exercise model which is used for measuring time and speed. The treadmill is nearly the same as a human treadmill, so the slope and speed of the tool can be changed as required. The treadmill has a school grille behind it. The animals are forced to run on the treadmill with the effect of the shock grill. Running exercise also consists of an adaptation process. Additionally, rats are nocturnal animals so this type of exercise can be applied under red light in the dark (Burghardt et al., 2004; Seo et al., 2014; Shankarappa et al., 2011; Yoo et al., 2000; Zhang et al., 2013).

The mechanism of weightlifting exercise was developed by Klitgaard in 1988, and it has been used since then with different modified models. The animals were forced to reach the food above them with load bearing on their shoulders. During the exercise, the plantar flexors and knee and ankle extensor muscles work. This type of exercise is similar to human progressive resistance exercise and quantitative. In addition, the exercise forces to work bilateral extremities, so multi-muscle comparison can be available. Further, the exercise requires an adaptation process for two weeks and fasting. The fasting procedure provides minimal muscle hypertrophy (Klitgaard, 1988; Krutki et al., 2017; Legerlotz et al., 2007; Seo et al., 2014).

Squad with pulling weight is a forced exercise, differing from weightlifting exercise with making the exercise at the horizontal plane. An award and punishment system is applied. Food is award and miliamper electrical disturbance is used as punishment. So, the movement is provided (Seo et al., 2014).

Stairs up exercise is one of the forced exercise types and also a resistance exercise. The mechanism consists of a start point, stairs, and arrival cage. At the start point, the animal is forced to start the route with electrical stimulation at a milliamper level. The food is placed in the arrival cage and the animal is forced to climb up stairs. According to the selected protocol, a weight can be loaded on animal tails or backs. The exercise procedure requires an adaptation process. The time of adaptation decreases animal stress (Kelty et al., 2019; Krutki et al., 2017; Zhai et al., 2020).

Swimming is known as aerobic and anaerobic forced and resistance exercise. The required equipment for this exercise is cheaper than a water tank. During the procedure, a different weighed lifting was loaded on animals'

tails such as 5-10% of animal weights (adapting load- performance test load). Moreover, it is suggested that animals are taken after the exercise for the body and water temperature (Campos-Ferraz et al., 2013; Falavigna et al., 2012; Seo et al., 2014).

The specified exercises are the specifically aimed models which are used in experimental exercise models. The legs of animals are lifted and elevated to establish muscle atrophy in space and flight physiology studies. Tounge exercises are required for dysphagia pathologies. Bipedalled downstream running (eccentric) exercises are proper for Achille's tendinosis, muscle damage, or musculoskeletal pain models (Hinks et al., 2022; Seo et al., 2014; Williamson et al., 2021). It is clear from that, there are specific exercise models for specific patterns.

## CONCLUSION

There are a bunch of exercise models for investigating the prevention and treatment effects of exercise. These models include aerobic, anaerobic, and resistance exercises. In addition, it is possible to select different exercise times and speeds. Specified exercises are also appropriate for specialized types of exercise models. Considering that, it can be suggested that every exercise model can be modified according to the selected study topic and the main object of the study.

#### Abstract

The term 'postbiotics' refers to soluble factors secreted by live bacteria, or released after bacterial lysis, such as enzymes, peptides, teichoic acids, peptidoglycan-derived muropeptides, polysaccharides, cell surface proteins, and organic acids that give a health advantage to the host. Postbiotics take attention for their clear chemical structure, safety dose parameters, long shelf life and ingredient of various signaling molecules which may have anti-inflammatory, immunomodulatory, anti-obesogenic, antihypertensive, hypocholesterolemic, anti-proliferative, and antioxidant activities. Postbiotics imitate the evidenced health benefits of probiotics without the safety risks of probiotics, which include microbial translocation, infection or reducing enhanced inflammatory responses. Additionally, postbiotics do not be necessary tight manufacturing or storage conditions, and also to being more stable than the living bacteria and having a longer shelf life, which these new concept may be a good alternative to probiotics.

**Keywords:** Postbiotics, Probiotics, Health benefits

#### INTRODUCTION

In the early XX century, Metchnikoff observed that fermented dairy products such as yoghurt were associated with better health and longevity among people living in Bulgarian villages and caused to the development of the probiotic concept (Metchnikoff, 1907). According to FAO/WHO (2001) defined that probiotics are “live microorganisms that, when administered in adequate amounts, confer a health benefit on the host”. Probiotics mainly comprise of *Lactobacillus* species, *Bifidobacterium* species, and *Streptococcus* species, and also *Lactococcus lactis* and some *Enterococcus* species. Probiotics are reported many beneficial health effects such as increasing nutrients bioavailability, enhancement of intestinal health, improvement of immune response, lowering serum cholesterol levels, prevention of cancer, reduce lactose intolerance, prevention or reduction of allergies in sensitive individuals, reduction of the risk of gastrointestinal diseases (Argyri et al., 2013, Kechagia et al., 2013). The beneficial effect of probiotics depends on the able to survive passage through the GIT and colonise the GIT. Thus, viability of probiotics are important property to ensure the beneficial effects to the host's health and this complicate use of probiotics in some foods. The many factors such as the composition of the food matrix, the processing and storage conditions can reduce the probiotic cell viability (Russell et al., 2011). On the other hand, a new approach such as paraprobiotic and postbiotic were constituted which imply bacterial viability is not an essential requirement for health benefits, supplying a broad dimension to the probiotic concept (Barros et al., 2020).

The term postbiotics, also known as either metabiotics, biogenics, or simply metabolites/CFS (cell-free supernatants); refers to soluble factors (products or metabolic byproducts) secreted by live bacteria or released after bacterial lysis that give a health advantage to the host. On the other hand, paraprobiotics, also known as “non-viable probiotics”, “inactivated probiotics” or “ghost probiotics”, is defined inactivated (non-viable) microbial cells, which, when administered in sufficient amounts confer benefits to consumers (Cuevas-González et al., 2020). Postbiotics and paraprobiotics are more stable and safer for industrial uses when compared to the viable microorganisms because of their viability is not necessary either during consumption or large-scale production thus, its applications in food products may offer several technological advantages for the food manufacturers (Barros et al., 2020). In addition to, nonviable microbial cells can have safety benefit over probiotics by decreasing the risk of microbial translocation, infection or rised inflammatory responses (Taverniti and Guglielmetti, 2011).

## Postbiotics

The word postbiotic is derived from the Greek for 'post', meaning after, and 'bios', meaning life. (Vinderola, 2022). Postbiotics is a recently arised concept that states to a broad range of bioactive molecules including non-viable/inactivated microbial cells, cell compounds, and any soluble products or metabolic by products resulting from probiotics, which, when applied to consumers, directly or indirectly mediate positive biological activity (Bourebaba et al., 2022). Currently used definition of this concept was "preparation of inanimate microorganisms and/or their components that administer a health benefit to the host" (Salminen et al., 2021). Therefore, postbiotics have been accepted to imitate probiotics functions and activities, and do not be necessary tight manufacturing or storage conditions (Patel and Denning, 2013). Postbiotics have several alluring properties that including clear chemical structures, safety dose parameters, and longer shelf life. The use of postbiotics can be a current and safer alternative to avoids risk related to viable probiotic bacteria (Aguilar-Toalá et al., 2018)

*Lactobacillus* species (*L. rhamnosus*, *L. bulgaricus*, *L. acidophilus*, *L. reuteri*, *L. casei*, *L. fermentum*, *L. paracasei*, *L. helveticus*, *L. johnsonni*, and *L. gasseri*) and *Bifidobacterium* species (*B. bifidum*, *B. longum* subspecies *infantum*, *B. breve*, and *B. longum*) have been reported the most common source of postbiotics. High effective postbiotics which include cytoplasmic extracts and cell wall components were detected in several species relating to *Lactobacillus*, *Bifidobacterium*, *Saccharomyces*, *Bacillus*, *Streptococcus*, or *Faecalibacterium* genera (Bourebaba et al., 2022). The majority of postbiotics have been acquired by using cell disruption techniques, such as heat and enzymatic treatment, solvent extraction, as well as sonication (Aguilar-Toalá et al., 2018).

### Classification of postbiotics and its therapeutic benefits

There are various types of postbiotics molecules resulting from extracellular and intracellular probiotic cells. The postbiotics molecules contain peptidoglycans-derived muropeptides, exopolysaccharide (EPS), teichoic acids, and surface protruding molecules like fimbriae, pili or flagella that constitute cell wall components, secreted proteins/peptides, bacteriocins such as acidophilin, reuterin, and bifidin, cell-free supernatant, organic acids such as lactic acid and acetic acid, vitamins, short-chain fatty acids like butyric acid and propionate, neurotransmitters, biosurfactants, etc. (Bourebaba et al., 2022).

Because of their established chemical structures and long storage stability, postbiotics have been found to have health benefits by demonstrating local effects on specific tissues of the gut epithelium and by influencing multiple others organs and tissues. Postbiotics objective to prevent the risk of live microorganisms application to altered intestinal barriers or compromised immune defenses by imitate the therapeutic effect of probiotics and also to being more stable and having a longer shelf life (Patel and Denning, 2013; Sharma and Shukla, 2016).

Many potential activities of postbiotics which include anti-inflammatory and antibacterial properties, immunomodulatory, anti-obesogenic, anticarcinogenic, antihypertensive, hypocholesterolemic, antiproliferative, and antioxidant activities, boosting the immune system and strengthening the function of the gut barrier have been reported (Aguilar-Toalá et al., 2018; Sharma and Shukla, 2016). In addition to, postbiotics have been detected having antiproliferative specific activity to colon cancer cells (Tiptiri-Kourpeti et al., 2016). Studies support that beneficial effects of postbiotic may depend on secreted-derived factors (Compare et al., 2017).

In vitro and in vivo anti-cancer, anti-inflammatory, anti-proliferative, and immunomodulatory effect of peptidoglycan obtained from probiotic bacteria have been reported (Bourebaba et al., 2022). Effecty of Cell-free supernatants (CFS) such as oxidative stress reduction, anti-inflammatory, anti-tumoral, antibacterial effects as well as biofilms formation suppression have been detected (De Marcoet al., 2018; Escamilla et al., 2012). It has been found that cell-free extracts produced from *B. longum* and *L. acidophilus* indicated a significant antioxidative activity (Lin and Chang, 2000).

Posbiotics was identified as pathogenic bacteria inhibitors towards pathogens which include *Listeria monocytogenes* L-MS, *Salmonella enterica* S-1000, *Escherichia coli* E-30 and vancomycin resistant *Enterococci*, when using cell-free supernatants culture got from *L. plantarum* strains RG11, RG14, RI11, UL4, TL1 and RS5 strains. (Kareem et al., 2014). Specific SCFAs have been demonstrated to conduce to plasma cholesterol homeostasis in rodents and humans (den Besten et al., 2013). In addition, another producers of postbiotics are yeast. Canocini et al. (2011) detected that culture supernatants, when get from *Saccharomyces*

*boulardii*, developed wound healing capacity and epithelial cells migration via the activation of  $\alpha 2\beta 1$  integrin collagen receptors in vitro models.

It has been showed that the culture supernatant obtained from *Lactobacillus paracasei* B21060 may preserve healthy tissue towards the inflammatory properties of invasive *Salmonella* in a human mucosa explant of colon (Tsilingiri et al., 2012), and also culture supernatant when got from *Lactobacillus casei* DG, may alleviate the inflammatory response in ileac and colonic mucosa cultures from post-infectious bowel syndrome patients (Compare et al., 2017). Xu et al. (2011) reported that exopolysaccharides (EPS) from *Bifidobacterium animalis* indicated in vitro inhibition of lipid peroxidation and radical scavenging activity (hydroxyl and superoxide radicals).

### Applications of postbiotics

Postbiotics is more stable than the living bacteria they are derived from (Venema, 2013) and also their positive safety profile as there is no require for the uptake of billions of living microbes (Shigwedha et al., 2014). Another major advantage of postbiotics may be applied in a controlled and standardized way (Gabriele, 2016).

Individual postbiotic has many food safety functions such as in food biopreservation and packaging, control and eradication of foodborne pathogen's biofilm, biodegradation of harmful chemicals contaminants. The effectiveness of postbiotics in the food systems is attached to many factors include the LAB strain from which the postbiotics is prepared, the type of target microorganism or contaminant, concentration and form of application, and the food matrix features. Postbiotics indicate many antimicrobial activities both against pathogenic microorganisms and on spoilage microorganisms in vitro conditions (Moradi et al., 2020).

Cell-free preparations devired from the metabolic products of different beneficial bacteria have been offered with potential pharmaceutical applications in the prevention or treatment of diseases (Klein et al., 2013). For example, Colibiogen® (Laves-Arzneimittel GmbH, Schötz, Switzerland) a commercially protein-free filtrate from cultures of *Escherichia coli* (strain Laves 1931), including amino acids, peptides, polysaccharides and fatty acids, has been indicated to be effective in inhibiting in vitro both antibiotic resistant and susceptible *Salmonella* isolates (Zihler et al., 2009).

Some postbiotics have been deliberately implemented certain foods. For instance, cell free supernatant from probiotic *L. plantarum* YML 007 strain having biopreservative effect on soybeans obtained that developed shel life of unshelled soybeans until 2 months (Rather et al., 2013). Another study observed that the direct addition of bifidin bacteriocin from *Bifidobacterium lactis* Bb-12 advanced the shelf life of ground meat until 3 months at 4 °C (Mokhtar et al., 2016). It has been observed that postbiotics from *Lactobacillus rhamnosus* EMCC 1105 at 100 mg/g concentration annihilated the *Clostridium perfringens* on chicken mince on the 4th day of storage at 6 °C (Hamad et al., 2020), and also lyophilized postbiotics obtained from *Leuconostoc* spp. reduced the growth of background microorganisms, and *E coli* O157:H7 on the ground meat (Koo et al., 2015). Exopolysaccharide got from *L. rhamnosus* indicated that 8.2% raise in Cheddar cheese yield with *L. lactis* (Torino et al., 2015). Postbiotics can be helpful as microbial-free food supplements, fermented functional foods, and prophylactic drugs, as complementary treatment for several diseases (Chaluvadi et al., 2016).

### CONCLUSION

The postbiotics concept refers to non-viable microorganisms and bacterial-free extracts that can ensure advantages to the host by offering additional bioactivities to probiotics. The results from studies indicate that postbiotics exhibit several bioactivities such as anti-inflammatory, immunomodulatory, anti-proliferative, antioxidant, and antimicrobial. In this regard, adding of postbiotics in foods can be a well alternative with high therapeutic value and rised shelf-life of food products. Despite the scientific evidence present, the mechanisms of action and the signaling pathways involved have not yet been fully explained, therefore supplementary in-depth investigations are requested.

#### Özet

On cins ve 44 türden oluşan Belonidae familyası üyeleri hem amatör hem de ticari balıkçılık faaliyetlerinde talep gören ekonomik değere sahip türler barındırır. Türkiye deniz balıkları listesinin verildiği son çalışmada ise Türkiye kıyılarında *Belone belone* (Linnaeus, 1761), *Belone svetovidovi* (Collette ve Parin, 1970) ve *Tylosurus acus* (Lacepède, 1803) olmak üzere 3 türün varlığından söz edilmektedir. *B. svetovidovi* türünün ise Türkiye'nin Ege ve Marmara Denizi Kıyıları'nda dağılım gösterdiği bilinmektedir. Ege ve Marmara Denizi'nde toplamda 7 farklı istasyonda gerçekleştirilen örnekleme çalışmalarında Ege Denizi'nden 145, Marmara Denizi'nden 19 birey temin edilmiştir. Vücut bütünlüğünde herhangi bir deformasyon bulunmayan toplam 114 adet *B. svetovidovi* bireyi morfolojik analizlere tabii tutulmuş ve toplamda 32 farklı karakter kullanılarak morfolojik analizler gerçekleştirilmiştir. *B. svetovidovi* bireylerinin 26.1-41.5 cm (ortalama 32.67 cm) standart boya sahip oldukları tespit edilmiştir. Kafa boyu 5.7-12.5 cm (ortalama 10.02 cm) arasında değişirken, göz çapının 0.76-1.12 cm (ortalama 0.93 cm) arasında değiştiği saptanmıştır. Bireylerin meristik karakterlerinde ise, dorsal yüzgeç ışın sayısının 14-19 (ortalama 16.86) arasında değiştiği, anal yüzgeç ışın sayısının 18-25 (ortalama 21.18) arası değişkenlik gösterdiği, pektoral yüzgeç ışın sayısının 11-15 (ortalama 12.48) arasında değiştiği gözlemlenmiştir. Solungaç diken sayısı 31-50 (ortalama 41.42) arası değişirken, maksil diş sayısının 106-312 (ortalama 189.28) ve mandibul diş sayısının ise 105-440 (ortalama 286.68) arasında değişkenlik gösterdiği saptanmıştır. Hesaplanan Bray Curtis benzerlik değerlerine göre en yüksek benzerlik Orta Ege (OE) ve Güney Ege (GE) (%99.4), en düşük benzerlik oranının ise Kuzey Ege (KE) ve Marmara (MD) popülasyonları (%98.6) arasında olduğu hesaplanmıştır. Yapılan SIMPER analizine göre popülasyonlar arasındaki en yüksek farklılık Marmara Denizi ve Kuzey Ege Denizi popülasyonları arasında (%1.40) en düşük farklılık değerinin ise Orta Ege ve Güney Ege Denizi popülasyonları arasında (%0.52) bulunmuştur. Buna ek olarak popülasyonlar arasında farklılığa sebep olan karakterlerin başında "İnterorbital/HL; alt çene diş sayısı/mandibul uzunluğu; kafa derinliği/HL" gibi genelde baş ile ilgili oranların yer aldığı tespit edilmiştir.

**Anahtar Kelimeler:** Belonidae, Morphology, *Belone svetovidovi*, Akdeniz, Ege Denizi, Marmara Denizi.

#### Abstract

Members of the Belonidae family, consisting of ten genera and 44 species, contain species of economic value that are in demand in both amateur and commercial fishing activities. In the last study, which lists the marine fishes of Turkey, it is mentioned that there are three species distributed in Türkiye coasts: *Belone belone* (Linnaeus, 1761), *Belone svetovidovi* (Collette and Parin, 1970) and *Tylosurus acus* (Lacepède, 1803). It is known that *B. svetovidovi* is distributed in the Aegean and Marmara Sea coasts of Türkiye. Sampling studies carried out in 7 different stations in the Aegean and Marmara Seas, 145 individuals from the Aegean Sea and 19 individuals from the Marmara Sea were obtained. A total of 114 *B. svetovidovi* individuals without any deformation in their body integrity were subjected to morphological analysis, and morphological analyses were carried out using a total of 32 different characters. *B. svetovidovi* individuals were found to have a standard length of 26.1-41.5 cm (average 32.67 cm). While head length varied between 5.7-12.5 cm (average 10.02 cm), eye diameter varied between 0.76-1.12 cm (average 0.93 cm). In the meristic characters of individuals, the number of dorsal fin rays varied between 14-19 (average 16.86), the number of anal fin rays varied between 18-25 (average 21.18), the number of pectoral fin rays varied between 11-15 (average 12.48). Gill rakers varied

between 31-50 (average 41.42), while the number of maxillary teeth varied between 106-312 (average 189.28) and the number of mandibular teeth varied between 105-440 (average 286.68). According to Bray Curtis similarity values, the highest similarity rate is between the Central Aegean (OE) and Southern Aegean (GE) (99.4%), and the lowest similarity rate is between the Northern Aegean (KE) and Marmara (M) populations (98.6%). According to the SIMPER analysis, the highest difference between populations was found between the Marmara Sea and North Aegean Sea populations (1.40%), and the lowest difference value was found between the Central Aegean and South Aegean Sea populations (0.52%). In addition, the characters that cause differences between populations are “Interorbital/HL; number of mandibular teeth/mandible length; It has been determined that there are generally head-related ratios such as “head depth/HL”.

## GİRİŞ

On cins ve 44 türden oluşan Belonidae familyası üyeleri (Fricke ve ark., 2023) hem amatör hem de ticari balıkçılık faaliyetlerinde talep gören ekonomik değere sahip türler barındırır. Tropikal ve subtropikal denizlerin genellikle sahil bölgelerinde epipelajik ve neritik olarak yaşamlarına devam eden *Belone* cinsine ait türlerin hepsinde ovipar üreme görülür ve yumurtaları demersaldir (Akşıray, 1987; Collette, 2016). Yumurtalarının üzerinde bulunan ipliksi ve yapışkan uzantılar yumurtanın bitkilere ve sert yapılara tutunmasını sağlar (Yüce, 1975; Collette, 2016) Zarganalar uzun mesafe göçleri yapmazlar ancak kışın derin sularda geçirdikleri, ilkbahar aylarından itibaren ise yüzey sularına çıktıkları bilinmektedir (Akşıray, 1987).

Ülkemiz sularında “Zargana balığı–Sargana” olarak bilinen ve yayılış gösterdiği denizlerin kıyılarındaki ülkeler için ekonomik değere sahip olan bu türler ülkemizde de balıkçılık ekonomisi açısından oldukça önemlidir. Türkiye deniz balıkları listesinin verildiği son çalışmada ülkemiz kıyılarında *Belone belone* (Linnaeus, 1761), *Belone svetovidovi* (Collette ve Parin, 1970) ve *Tylosurus acus* (Lacepède, 1803) olmak üzere 3 türün varlığından söz edilmektedir (Bilecenoğlu ve ark.,2014). *Belone belone* türünün tüm kıyılarımızda dağılım gösterdiği bilinmekle beraber, *Belone svetovidovi* ve *Tylosurus acus* türlerinin Ege ve Akdeniz kıyılarımızda dağılım gösterdiği bildirilmiştir (Bilecenoğlu ve ark.,2014; Dalyan ve Eryılmaz, 2006) Ancak güncel çalışmalar *Belone svetovidovi* türünün Marmara Denizi’nde de yerleşik popülasyonlara sahip olduğunu göstermektedir (Sevhan Öztürk, 2023).

Collette ve Parin (1970) tarafından Galiçya/Vigo/İspanya kıyılarından örneklenmiş müze örnekleri üzerinden tanımlanan *B. svetovidovi* daha sonrasında Akdeniz’in çeşitli noktalarından rapor edilmiştir (Dorman, 1984; Collette ve Parin, 1986; Golani, 1996; Meriç ve Altun, 1999; Dalyan ve Eryılmaz, 2006). Gerek dış morfolojileri, gerek iç içe geçmiş meristik karakterleri ile sıklıkla *B. belone* ile karıştırılan *B. svetovidovi* hakkında Akdeniz havzasında yapılan çalışmalar daha çok sınırlı morfolojik analizlerin yer aldığı yeni dağılım alanlarını işaret eden çalışmalar olmuştur (Dorman, 1984; Collette ve Parin, 1986; Golani, 1996; Meriç ve Altun, 1999; Dalyan ve Eryılmaz, 2006).

Bu çalışma ile Ege Denizi ve Marmara Denizi’nden örneklenen *B. svetovidovi* popülasyonlarının detaylı morfolojik analizlerinin yapılması amaçlanmış ve hakkında oldukça sınırlı çalışma bulunan bu tür ile ilgili literatüre katkı sağlanması hedeflenmiştir.

## MATERYAL VE METOT

### Örnekleme Çalışmaları

Örnekleme çalışmaları Türkiye’nin Ege ve Marmara Denizi kıyılarında toplamda 7 farklı istasyonda gerçekleştirilmiştir. (Tablo 1). Örneklerin temini istasyon doğrulamasına mahal bırakmayacak şekilde, küçük ölçekli kıyı balıkçılığı faaliyetlerinin gerçekleştirildiği balıkçı barınaklarından ve kooperatiflerden doğrudan (aracı olmaksızın) satın alma yoluyla yapılmıştır

### Morfolojik Analizler

Bireylerinin morfoloji analizlerinde Zorica ve Čikeš Keč (2011)’ den yararlanılmış olup morfolojik incelemelerin detaylandırılması adına ilave karakter kullanılmıştır. Morfometrik ölçümler ve meristik sayımlar için 32 farklı karakter kullanılmış olup vücut bütünlüğünde herhangi bir deformasyon bulunmayan örnekler çalışılmıştır.

Popülasyonlar arasında benzerlik ve farklılığa neden olan karakterler Primer7 ile belirlenmiştir (Clarke ve Gorley, 2015). Bray-Curtis Benzerlik matrisi uygulanan verilerde MDS (non-Metric Multidimensional Scaling

– Metrik Olmayan Çok Yönlü Ölçümleme) ve SIMPER (Similarity Percentages –Benzerlik Yüzdesi) yöntemleri kullanılmıştır. Popülasyonları gruplandırmak içinse bir kümeleme yöntemi olan UPGMA (Aritmetik Ortalamalı Ağırlıksız Çift Grup Yöntemi) uygulanmıştır

**Tablo 1.** *Belone svetovidovi* bireylerinin örneklediği istasyonlar:

Örnekleme Bölgesi	İstasyonlar	Örnek sayısı
Marmara Denizi	Boğaz/BGZ – Gemlik/GML	19
Kuzey Ege	Çanakkale/CNK – Altınoluk/ALT	35
Orta Ege	İzmir/IZM	73
Güney Ege	Bodrum/BDR – Didim/DM	37

## BULGULAR ve TARTIŞMA

Türkiye'nin Ege ve Marmara kıyılarında ki 7 farklı istasyondan örneklenen toplam 114 adet *B. svetovidovi* bireyi morfolojik analizlere tabii tutulmuştur. Toplamda 32 farklı karakter kullanılarak gerçekleştirilen morfolojik analizlerde *B. svetovidovi* bireylerinin 26.1-41.5 cm (ortalama 32.67 cm) standart boya sahip oldukları tespit edilmiştir. Kafa boyu 5.7-12.5 cm (ortalama 10.02 cm) arasında değişirken, göz çapının 0.76-1.12 cm (ortalama 0.93 cm) arasında değiştiği saptanmıştır.

Bireylerin meristik karakterlerinde ise, dorsal yüzgeç ışın sayısının 14-19 (ortalama 16.86) arasında değiştiği, anal yüzgeç ışın sayısının 18-25 (ortalama 21.18) arası değişkenlik gösterdiği, pektoral yüzgeç ışın sayısının 11-15 (ortalama 12.48) arasında değiştiği gözlemlenmiştir. Solungaç diken sayısı 31-50 (ortalama 41.42) arası değişirken, maksil diş sayısı 106-312 (ortalama 189.28) ve mandibul diş sayısının ise 105- 440 (ortalama 286.68) arasında değişkenlik gösterdiği saptanmıştır. Tüm meristik karakterlerin istasyonlarımıza göre dağılımı ise Tablo 2'de verilmiştir. Detaylı morfometrik değerler ise Tablo 3de sunulmuştur.

Tablo 2. Meristik karakterlerin istasyonlara göre dağılımı

**Şekil 2.** Popülasyonlar arasında morfolojik farklılığa neden olan karakterler

Tür ile ilgili gerçekleştirilen morfoloji çalışmaları incelendiğinde sadece 2 çalışma dikkat çekmekte ve bu çalışmaların özellikle 5 adet meristik karakter üzerine yoğunlaştığı görülmüştür (Meriç ve Altun, 1999; Dorman, 1987). Kullanılan birey sayısının az olduğu çalışmalardan elde edilen sonuçlar ile bu çalışmadan elde edilen sonuçlarla benzerlik göstermekle beraber maksimum ve minimum sınırlarda farklılıklar saptanmıştır (Tablo 5). Çalışmada incelenen popülasyonların Bray Curtis benzerlik değerleri Kuzey Ege- Marmara popülasyonu hariç popülasyonların %99 üzeri benzerlik gösterdiğini ortaya koymuştur. Dolayısıyla morfolojik olarak farklı bir popülasyon yapısı gözlenmemiştir. SIMPER analizine göre ise saptanan en yüksek farklılık ise Marmara Denizi ve Kuzey Ege Denizi popülasyonları arasında (%1.40) tespit edilmiştir. Buna ek olarak, popülasyonlar arasında farklılığa sebep olan karakterlerin başında “İterorbital/HL; Alt çene diş sayısı/mandibul uzunluğu; Head depth/HL” gibi genelde baş ile ilgili oranların yer aldığı tespit edilmiştir. Tekerrürlü gerçekleştirilen örnekleme çalışmalarında *B. svetovidovi* türünün popülasyon yoğunluğunun Orta Ege Denizi’nde diğer örnekleme bölgelerine göre daha yoğun olduğu, bu yoğunluğun ise güneye doğru azaldığı gözlenmiştir. Güney Ege ve Levantin kıyılarımızda yapılan tekrarlı örnekleme çalışmalarında *B. svetovidovi* türüne sadece Didim’de ulaşılabilmektedir.

**Tablo 5.** *Belone svetovidovi* ile gerçekleştirilen morfoloji çalışmaları

Pektoral Yüzgeç Işın Sayısı	11-13 (Ort. 12) N=30	11-13 (Ort. 12.11) N=54	11-15 (Ort. 12.48) N=114

Collette ve Parin (1970) tarafından Galiçya/Vigo/İspanya kıyılarından örneklenmiş müze örnekleri üzerinden tanımlanan *B. svetovidovi* türünün Doğu Akdeniz'in kuzey enlemlerindeki soğuk sularda daha yoğun dağılım gösterdiği dikkat çekmektedir (Froese ve Pauly, 2023). Levantin kıyılarımızdaki su sıcaklığının diğer denizlerimize nazaran daha fazla olmasının, bu türün güneydeki dağılımını sınırlayan faktör olabileceğini düşündürmektedir. Bununla beraber, besin tuzları bakımından oldukça oligotrof yapıda olan Levantin Denizi'ndeki yüksek sıcaklık değerleri (Salihoğlu ve ark., 1990) demersal yumurtlayan bu türlerin yumurtlama substratları olabilen deniz çayırlarının da dağılımını sınırlamaktadır (Çelebi, 2007). İstilacı türlerin bölgedeki varlığı ve yerli türlerle olan rekabet ilişkileri gibi uzun dönemli ekolojik değişikliklerin türün güneydeki dağılımını sınırlandıran diğer faktörler olabileceği değerlendirilmektedir.

## SONUÇ

Gerçekleştirilen çalışmada *B. svetovidovi* türünün kıyılarımızdaki popülasyon yoğunluğunun Orta Ege Denizi'nde diğer örnekleme bölgelerine göre daha yoğun olduğu, bu yoğunluğun ise güneye doğru azaldığı gözlenmiştir. Levantin kıyılarımızdaki su sıcaklığının diğer denizlerimize nazaran daha fazla olmasının, bu türün güneydeki dağılımını etkileyen faktör olabileceği ve Levantin Denizi'ndeki yüksek sıcaklık değerlerinin demersal yumurtlayan bu türlerin yumurtlama substratları olabilen deniz çayırlarının da dağılımını da etkileyerek türün güneydeki dağılımını sınırladığı kantine varılmıştır.

Balıkçılık kaynaklarının sürdürülebilirliğinin ekosistem temelli yaklaşımlarla sağlanabileceği, yalnızca biyolojik çeşitliliğin korunmasının yeterli olmadığına anlaşıldığı, mevcut tür ve popülasyonların genetik varyasyon düzeyinin ve popülasyonların değişim süreçlerinin bilinmesinin önemli olduğunun farkına varılmıştır.

Gerçekleştirilen bu çalışmada, Ege ve Marmara denizlerindeki *Belone svetovidovi* türüne ait popülasyonların detaylı morfometrik ve meristik analizleri yapılmış ve literatüre katkıda bulunulmuştur.

## ORAL PRESENTATION

### Effect of dopamine on the physiological and molecular responses of tomato seedlings under drought and salt stress

#### Abstract

Drought, heat and salt stresses are the most common abiotic stresses resulting in yield reduction or complete loss of agricultural production in recent years. This study investigated the effects of the biostimulator molecule dopamine in tomato seedlings under drought and salt stress, by examining various morphological and physiological parameters, as well as various enzymes that play a role in the antioxidative defense system. The results showed that dopamine alleviated drought stress mainly by increasing superoxide dismutase and catalase antioxidative enzyme gene expression, decreasing ethylene production and improving cell membrane and tissue integrity in tomato seedlings. Although responses of the seedlings were mostly similar, unlike drought stress, the defense mechanisms excluded antioxidative defense enzyme gene expression under salt stress.

**Keywords:** *Solanum lycopersicum* L., abiotic stress, dopamine

#### INTRODUCTION

According to the latest FAO agricultural production statistics (2020), tomato (*Solanum lycopersicum* L.) is the most widely produced vegetable crop worldwide. In addition to its high economic value and health benefits, tomato is a model plant for fleshy fruit research. The high water requirement of tomato makes it very vulnerable to both drought and soil salinity (Battilani et al., 2012).

In recent years, unexpected droughts and extreme heat conditions have become very common throughout the world due to climate change (Zomer et al., 2017). High salt concentrations in the soil also restrict agricultural production due to intensive usage of synthetic fertilizers and use of irrigation systems depending on groundwater, which contains high amounts of dissolved salts (Haj-Amor et al., 2022). The common denominators of both stresses are osmotic and oxidative stress resulting from stomatal closure, decreased photosynthesis efficiency and accumulation of reactive oxygen and nitrogen species (Abdelaal et al., 2022).

In recent years, the stress mitigation potential of various biostimulator compounds has been investigated. Among them, a promising substance is a biogenic amine or catecholamine dopamine. It is biosynthesized from tyrosine and is a very common active molecule in both plants and animals. Although the roles of dopamine in animals as a neurotransmitter regulating metabolism, hormone secretion, and control of movement, reward and addiction processes are widely studied, its roles in plant tissues are largely unknown (Howe and Dombeck, 2016). The recognition of the stress-mitigating effects of dopamine is a promising new field of study. A recent study reported increased levels of dopamine in apple leaves under drought and salt stress (Zhang et al., 2022). It has also been shown that, exogenous dopamine application alleviated stress symptoms in plants under drought, salt, nutrient deficiency and pathogen infection. Commonly observed effects of dopamine under stress conditions include increased photosynthetic rates, higher water use efficiencies and improved antioxidant capacity (Li et al., 2015; Yogendra et al., 2016; Liang et al., 2017; Gao et al., 2020; Lan et al., 2020). Dopamine and its oxidation product melanin also show strong antioxidant capacities similar to those of ascorbic acid or catechin and play a direct role in the scavenging of reactive oxygen species (Rosel et al., 1994; Kanazawa, 2000). This study was performed to investigate the effect of dopamine under drought and salt stress by observing common physiological stress indicators such as morphological responses, membrane damage and osmoprotectants as well as components of the enzymatic antioxidative defense system, including superoxide dismutase (FeSOD), catalase (CAT2), glutathione reductase (GR1), ascorbate peroxidase (APX1), 1-aminocyclopropane-1-carboxylic acid synthase (ACS2) and delta 1-pyrroline-5-carboxylate synthase (P5CS).

## MATERIALS AND METHODS

In this study, the Kayra F1 tomato variety (Anamas Tohum Ltd. Şti., Antalya) was used as plant material.

### Plant growth and treatments

Tomato seeds were placed in polypropylene containers with a volume of 400 ml containing sterile perlite, as one seed in each container. Germination was achieved in all pots at the end of a week by irrigation with sterile Hoagland solution (Hoagland and Arnon, 1950) every other day. Plant growth was continued for 21 days, in a 16-hour light/8-hour dark cycle, at 24°C in a plant growth cabinet containing 50% humidity. Drought stress was started at the end of the 21st day, 0 water potential was reached on the 3rd day, and at the end of the 5th day the tissue samples were collected for analysis. Salt stress was initiated with Hoagland solution containing 200 mM NaCl at the end of the 21st day and applied for 5 days as in drought stress.

Dopamine was applied by adding 100 µM dopamine hydrochloride (Dopasel, Haver Farma, Istanbul) into Hoagland solution starting from seed sowing and the application continued throughout stress applications. Dopamine concentration was determined by pre-testing with 10 plants that, received treatments at three different concentrations for each hormone. Root and stem lengths of the plants and ion leakage measurements were evaluated and the concentration with the best anatomical and physiological response was used throughout the study. Salt stress was applied at a concentration of 200 mM NaCl based on the observation that it induced a severe stress response for the same tomato variety within a week in previous laboratory studies.

### Determination of physiological plant stress indicators

In the presence or absence of dopamine application and stress, after 21 days of development and 5 days of stress application, all plants were removed from perlite and washed under tap water, and root/stem lengths were determined as cm. Root and stem tissues were separated and weighed, and after drying at 60°C for 48 h, they were weighed again and their dry weight (g) was determined.

Relative water contents (BSU) were determined according to the formula;  $BSU (\%) = (\text{Wet weight} - \text{Dry weight}) / (\text{Turgid weight} - \text{Dry weight}) \times 100$  as specified in Smart and Bingham (1974). Turgid weight was determined by keeping the leaves in distilled water at room temperature for 24 h.

The levels of osmoprotectant amino acid proline were determined by the method of Bates et al. (1973) without any modifications.

Cellular membrane damage was determined by measuring the phospholipid peroxidation product malondialdehyde (MDA) level according to Ohkawa et al. (1979) without any modifications.

Another indicator of cell wall and membrane damage, ion leakage levels were determined according to Nanjo et al. (1999) without any modifications.

### Determination of gene expression

Total RNA isolation was performed according to the instructions of Thermo GeneJET plant mini kit (Thermo, USA), followed by treatment with Thermo RNase-free DNase I (Thermo, USA) in accordance with the instructions for quantitative RT-PCR. The amounts of total RNA obtained were determined spectrophotometrically using Nanodrop 2000. The quality of total RNAs was also determined by separation and imaging with 1% agarose gel electrophoresis followed by cDNA synthesis, which was performed according to Thermo RevertAid FirstStrand cDNA synthesis kit instructions (Thermo, USA).

In this study, *ACS2*, *P5CS*, *FeSOD*, *CAT2*, *GRI* and *APX1* gene expressions in tomato leaves were normalized using the *EF-1* reference gene and the relative quantification of genes was compared with the control group using a Biorad CFX Connect Real-Time PCR device and CFX Maestro software (Biorad, USA). All amplification reactions were performed using Biorad iTaq Universal SYBR Green Supermix as specified in the user manual. The primers used in the study were optimized with PrimerPremier 5.0 software (Premier Biosoft International, USA) to provide optimum amplification conditions. PCR conditions included initial denaturation of 30 s at 95°C, followed by amplification for 5 seconds at 95°C and 30 s at 54°C, repeating 40 cycles. RT-PCR reactions included two biological and two technical replicates. Relative expression of genes was determined according to the  $2^{-\Delta\Delta C_T}$  method.  $\Delta\Delta C_T$  values were calculated by subtracting the mean  $\Delta C_T$  values of the samples from the mean  $\Delta C_T$  values of the controls, and then these values were used to determine the  $2^{-\Delta\Delta C_T}$  differences.

## Statistical Analysis

The study was conducted in triplicate and each replicate included 20 plants. The data obtained in the research were evaluated using the SPSS 16.0 program. The differences between the means were determined by the one-way Anova and Tukey's test.

## RESULTS

Salt and drought stress significantly reduced the length, dry weight and water contents of shoot tissues, whereas dopamine application did not have any significant effect on the morphological parameters except for slight improvements in dry weights (Table 1). Salt and drought stress did not have any significant effect on root length, dry weight or water content, except for 50% reduction in root dry weight under salt stress. Dopamine application improved dry weights under both salt and drought stresses. Dopamine application also significantly increased the root length by 26% under salt treatment.

**Table 1.** Effect of different stress and hormone treatments on plant morphological parameters. C, T, K, D, D+T and D+K indicate control, salt, drought, dopamine, dopamine+salt and dopamine+drought applications, respectively.

All physiological stress indicators were measured using tomato leaf tissues (Table 2). Under both abiotic stress, leaf relative water contents decreased and dopamine had no improvement effect. Although stress treatments did not significantly change leaf ion leakage levels, the value was at its minimum under drought stress/dopamine co-treatment, which was significantly lower than the control treatment. MDA contents also increased under abiotic stresses; however, dopamine treatment effectively reduced it back to control levels under salt treatment. The proline contents showed 1925% and 628% increments under salt and drought stresses, respectively. However, dopamine treatments slightly reduced proline levels under both stresses.

**Table 2.** Effect of different stress and hormone treatments on physiological stress indicators. C, T, K, D, D+T and D+K indicate control, salt, drought, dopamine, dopamine+salt and dopamine+drought applications, respectively.

Transcript levels of ACS2, which is the key enzyme in stress hormone ethylene synthesis and P5CS, which is the rate-limiting enzyme in proline synthesis, increased significantly under drought stress and reduced back to control levels upon dopamine application (Figure 1). Both drought and salt stress treatments, as well as dopamine application alone increased *FeSOD* and *CAT2* gene expressions significantly compared to control treatment. However, under drought stress, dopamine application significantly increased *FeSOD* and *CAT2* expressions compared with drought treatments alone. The only treatment that significantly changed *APX1* and *GRI* gene expression was drought. Unlike *FeSOD* and *CAT2* gene expressions, both expressions were reduced back to control levels under dopamine treatment.

## DISCUSSION

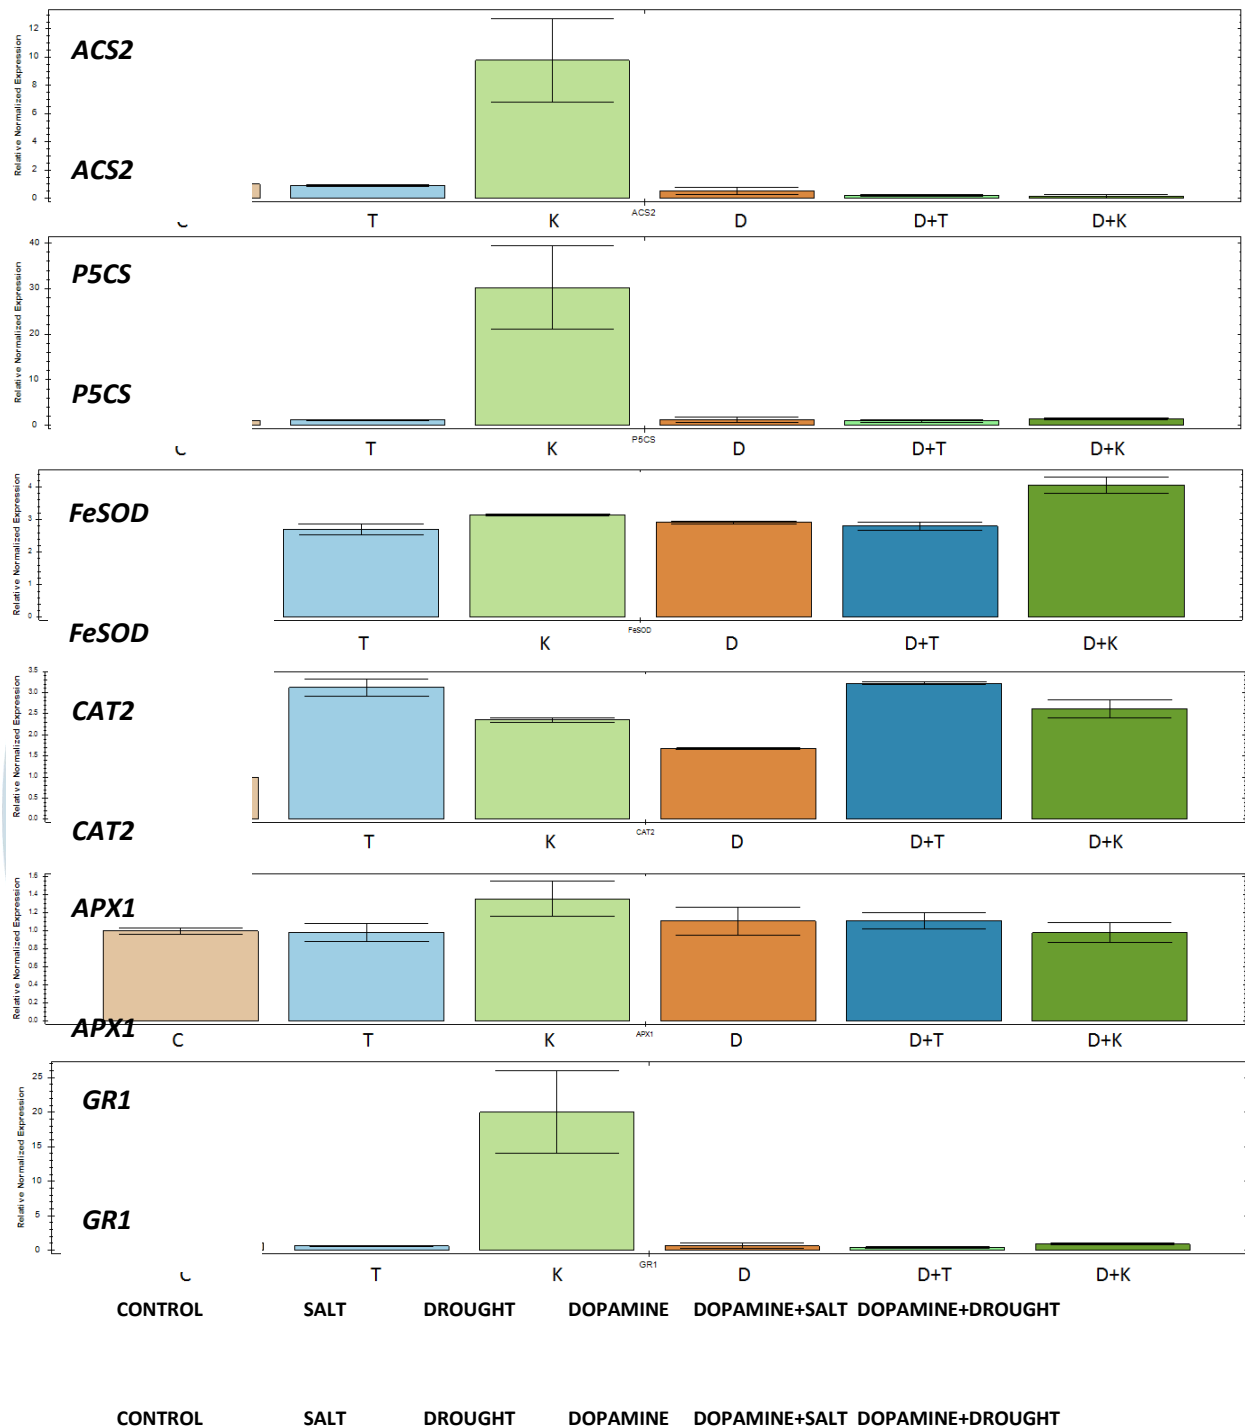

In this study, no significant effect of dopamine was reported on the morphological parameters of tomato plants, as also supported by the related literature. There are two contradictory studies which have reported root growth inhibition in soybean seedlings and root growth promotion in *Acmella oppositifolia* and *Nicotiana tabacum* by dopamine treatment, indicating plant-specific responses that cannot be generalized (Protacio et al., 1992; Guidotti et al., 2013). Both drought and salt stresses reduced tissue lengths, weights and water contents and shoot tissue was more sensitive to stress treatments than root tissues as also supported by the literature (Li, 2009). In this study, dopamine application slightly improved the morphological parameters under stress treatments. The application also reduced ion leakage and MDA levels as well as proline levels. Limited literature data also support these observations. Wang et al. (2020) reported that overexpression of the tyrosine decarboxylase gene (*MdTyDC*), which is responsible for the synthesis of dopamine derivatives, resulted in higher dopamine levels, increased fresh weight and reduced MDA levels in apple callus under salt stress. Apple *MdTyDC* overexpression lines also exhibited lower ion leakage levels and water loss rates in addition to enhanced photosynthetic performance under drought stress (Gao et al., 2021).

In this study, *ACS2* and *P5CS* gene expressions increased significantly with drought stress and decreased with presence of dopamine under stress. *ACS2* is the rate-limiting enzyme in ethylene synthesis and its expression results in the production of ethylene hormone, which plays a role in aging and senescence followed by necrosis. To the best of our knowledge, there is no report on dopamine application/*ACS2* expression interaction in the literature. The findings of this study showed potential low levels of ethylene under drought stress in the presence of dopamine. *P5CS*, which is responsible for proline production, also exhibited a similar expression pattern and the transcript levels were also in agreement with tissue proline levels, which showed reduction under stress upon dopamine application. Proline levels and *P5SC* expression results of this study contradict those of Wang et al. (2020, 2021) who reported increased levels with dopamine presence, which possibly shows plant, tissue and/or dose-dependent effects of dopamine.

The results of this study also showed that the transcript levels of *FeSOD* and *CAT2* increased with the presence of dopamine, whereas *APX1* and *GRI* gene expressions decreased with the presence of dopamine under drought stress. SOD and CAT are the two main antioxidative defense enzymes that detoxify superoxide radicals and hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>), respectively. Catalase enzymes function independently from reducing equivalents, whereas APX1, which is also an H<sub>2</sub>O<sub>2</sub> scavenging enzyme, requires a steady supply of NADPH. This requirement may result in the sensitivity of APX1 to severe stress and decreased transcript levels. Similar to our study, Guidotti et al. (2013) and Gomes et al. (2014) also reported increased SOD and decreased or unaffected POD activity upon dopamine application. Although salt stress upregulated *FeSOD* and *CAT2* gene

expressions, dopamine presence did not change the expressions under salt stress. Unlike drought, salt stress also has an ion toxicity component in addition to osmotic stress. Ion toxicity is destructive to antioxidative defense enzymes and the antioxidative potential of dopamine might be insufficient under this additional stress component.

**Figure 1.** Graph of relative normalized gene expressions for different treatment groups. C, T, K, D, D+T and D+K indicates control, salt, drought, dopamine, dopamine+salt and dopamine+drought applications, respectively.

## CONCLUSION

External dopamine applications improve the morphological and physiological responses of tomato plants to drought and salt stress. Dopamine also boosts *FeSOD* and *CAT2* gene expression under drought stress. Reduced tissue ethylene levels and decreased levels of reactive oxygen species, superoxide and H<sub>2</sub>O<sub>2</sub> in turn result in cell membrane integrity and improved tissue lengths and weights in tomato plants. The results showed that external application or seed treatment with dopamine has a promising effect on abiotic stress mitigation for agricultural production.

#### Abstract

According to the report published by IQVIA, the world pharmaceutical market reached 1.5 trillion USD in 2022. For this reason, domestic pharmaceutical production, which has both economic and strategic importance, is a priority area. In addition, when world prescription drug sales in 2022 are examined, it is seen that the highest share is in oncology drugs. 193 billion USD were spent in 2022 for the treatment of cancer, which is the second cause of death in the world. Therefore, more effective, more economical treatments need to be developed. The most commonly used methods in cancer treatment are surgery, radiotherapy and chemotherapy. But, new cancer treatment methods are being developed as an alternative to traditional methods for more effective treatment with fewer side effects. When we look at cancer treatment methods, it is seen that the therapeutic effectiveness of combined treatments is greater than a single method. For example, hyperthermia alone is rarely used. It is usually used together with chemotherapy or radiation to increase the effectiveness of the treatment. Magnetic hyperthermia, one of the methods frequently used in dual treatments, uses the heat generating abilities of magnetic nanoparticles (MNP) under the alternating magnetic field (AMF). Thus, it is possible to increase the temperature only in the tumor area. Many studies show that the therapeutic effect is greater in dual treatments applied together with MHT. The use of these dual therapies by creating personalized treatment combinations for a more effective treatment is the new goal of scientists.

**Keywords:** cancer treatment, magnetic hyperthermia, dual therapy

#### INTRODUCTION

Cancer, which is expected to become the first cause of death in the world in the near future, is a major threat to human health today. According to the report published by IQVIA, in 2022, the world pharmaceutical market reached 1.5 trillion USD (IQVIA, 2023). This number is increasing day by day due to the rapidly increasing number of cases. When world prescription drug sales in 2022 are examined, it is seen that the highest share is in oncology drugs. According to WHO (World Health Organization) 2020 data, breast cancer, lung cancer and colorectum cancer are the most common cancer types. When it comes to death rates, lung and colorectum cancer come first, with rates of 18% and 9.4%. The incidence of cancer types is shown in the Figure (World Health Organization, 2020).

**Figure 1.** Estimated number of new cases in 2020, World, both sexes, all ages

The most commonly used methods in cancer treatment are surgery, radiotherapy and chemotherapy. Surgical treatment is the most effective treatment method, but many patients do not prefer surgical treatment. While other methods kill cancer cells, they also kill healthy cells and have severe side effects (Yaghoubi et al., 2020). According to the current data of the National Cancer Institute, new cancer treatment methods used as an alternative to traditional methods; hormone therapy, immunotherapy, photodynamic therapy, photothermal therapy, stem cell transplantation, targeted therapy and hyperthermia (National Cancer Institute, 2015). Considering cancer treatment methods, the therapeutic effectiveness of a single method is less than combined treatments (Gurunathan et al., 2018). Therefore, two or more methods are used together for a more effective treatment with less side effects (Table).

For example, hyperthermia, a treatment method to kill cancer cells by increasing the environment temperature, is rarely used alone (Behrouzki et al., 2016). Hyperthermia is often used in combination with chemotherapy and radiation, thus providing a more effective treatment. Hyperthermia increases the sensitivity of cells to radiation and drugs. Hyperthermia, when used together with radiation, may make some of the tumor cells more prone to radiations. Additionally, free radicals generated from radiotherapy damage the DNA of tumor cells, and hyperthermia prevents repair (Jha et al., 2016). When used together with chemotherapy, it may increase the effects of anticancer agents. Thus, it provides a chemo-sensitizing and radio-sensitizing effect (Behrouzki et al., 2016). Hyperthermia can also be commonly applied with other different forms of cancer therapy (Jha et al., 2016). However, if the tumor area cannot be targeted in hyperthermia applications, heating also occurs in healthy tissues (Rajan & Sahu, 2020). This is an undesirable situation in cancer treatments. Because while destroying the tumor area, it is desired to minimize the side effects by not damaging the healthy cells. In order to overcome this situation, another hyperthermia strategy called 'magnetic hyperthermia' has been developed.

Magnetic nanoparticles (MNPs) are used as heat mediators in magnetic hyperthermia. With an externally applied AC magnetic field (AMF), magnetic energy is converted into thermal energy only in the region of MNPs. Thus, it is possible to specifically increase the temperature of only the tumor area (Peiravi vd., 2022). By exposing cancer cells to a temperature higher (41-46 °C) than normal body temperature for a certain period of time, an effective cellular heat shock damage is induced (Acar et al., 2022). This heat shock alters cellular processes, protein structure and function, eventually leading to cellular death called apoptosis (Kumar & Mohammad, 2011). Biocompatible and biodegradable MNPs are pertinent materials for MHT applications. Metals such as iron, cobalt, nickel, manganese, zinc, gadolinium, magnesium, their alloys, and oxides are some of the explored MNPs for MHT. Iron oxide nanoparticles (IONPs) possessing excellent self-heating ability is the most used MNPs (Rajan & Sahu, 2020). The selection of MNP exhibiting a sufficient heating capacity (specific absorption rate) to achieve satisfactory temperatures is important. The specific absorption rate (SAR) is the measure of heat diffuse per unit mass of MNPs (Gupta & Sharma, 2021). To determine the SAR value, MNPs are exposed to AMF. Depending on the amount of iron content of the sample, heat production is determined (Ludwig et al., 2014). Then, SAR values are calculated using the specific formulation (Acar et al., 2022; Albarqi et al., 2019).

In addition, surface functionalization of MNPs enables selective targeting of cancer cells (Bañobre-López et al., 2013). For example, folic acid receptors are overexpressed on the surface of breast cancer cells. Due to their specificity to these receptors, folic acid conjugated nanocarriers are used for targeting purposes. In this way, the accumulation of the carrier in non-target organs is reduced (Tagde et al., 2020). Therefore, it is important to functionalize MNPs to specifically target different types of cancer.

**Table 1.** Combinatorial approaches for cancer

Combinatorial approaches	Type of cancer	Reference
Chemotherapy and Magnetic Hyperthermia	Breast cancer	(Petryk et al., 2013)
Chemotherapy and Photothermal Therapy	Cervix cancer	(T. Liu et al., 2014)
	Brain cancer	(Dash et al., 2021)
Chemotherapy, Hyperthermia and Ultrasound	Liver cancer	(Misra et al., 2015)
Hyperthermia and Radiation Therapy	Breast cancer	(Datta et al., 2016)
Gene Therapy and Magnetic Hyperthermia	Ovarian cancer	(Yin et al., 2016)
Gene Therapy and Photothermal Therapy	HeLa tumor	Liu vd. (2018)
		(Zhao et al., 2021)
Chemotherapy and Hyperthermia	Colon cancer	(Zheng et al., 2019)
Magnetic Hyperthermia and Immune Therapy	Breast cancer	(Pan et al., 2020)
Chemotherapy, Radiotherapy and Photothermal Therapy	Colon cancer	(Mirrahimi et al., 2020)
Magnetic Hyperthermia, Photothermal Therapy and Chemotherapy	Breast cancer	(Sharifi et al., 2020)
Chemotherapy and Photodynamic Therapy	Prostate cancer	(Ghosh et al., 2022)
Gene therapy and Chemotherapy	Breast cancer	(Jia et al., 2022)

Looking at the studies, it seems that MHT is more effective when used together with other therapies. In a study in which cisplatin (chemotherapy) and MHT were used together for breast cancer treatment, it was observed that dual therapy was 1.7 times more effective than MHT alone and 1.4 times more effective than cisplatin alone (Petryk et al., 2013). In another study, they used gene therapy and MHT together for the treatment of ovarian cancer. They controlled TRAIL expression by hyperthermia by adding the TRAIL gene, which is associated with the apoptotic pathway, behind the hsp70 promoter (a heat-induced promoter) sequence. Thus, tumor size was observed to decrease significantly in dual therapy (Yin et al., 2016). In a study where MHT was used together with immunotherapy, superparamagnetic  $\text{CoFe}_2\text{O}_4@ \text{MnFe}_2\text{O}_4$  nanoparticles were synthesized for MHT. Combined MHT and  $\alpha$ -PD-L1 treatment was applied to breast cancer model mice. An effective anticancer activity was achieved by MHT-induced immunotherapy as a result of the formation of abundant tumor-associated antigens (Pan et al., 2020).

## CONCLUSION

From past to present, efforts have been made to develop methods for cancer treatment that are both more effective and have fewer side effects. When we look at the studies, it is seen that the use of two or more therapies together is more effective than single therapies. For this reason, finding the most effective method by applying different combinations for different types of cancer is considered the best strategy. Creating personalized treatment combinations for even more effective treatment is the new target for cancer treatment.

#### Abstract

In this study, jasmonic acid (JA) and methyl jasmonate (MeJA) elicitation and LC-HRMS analyses were performed in *Hypericum perforatum in vitro* plantlets and callus. The highest shoot regeneration was obtained from LS (Linsmaier&Skoog)/B5 medium containing 1 mg/L benzylaminopurine (BAP). Callus was produced in LS/B5 media which contain 0.5 mg/L Thidiazuron (TDZ) and 0.5 mg/L Indole Butyric Acid (IBA). Elicitation was applied 0.01 mg/L JA callus, 0.01 mg/L JA *in vitro* plantlets, and 0.01 mg/L MeJA *in vitro* plantlets. Epicatechin, acacetin, fumaric acid, hispidulin, naringenin, naringin, chicoric, hyperoside, rhamnocitrin, chlorogenic acid, chrysin, isosakuranetin, apigenin-7-glucoside compounds were identified by Liquid chromatography-high-resolution mass spectrometry (LC-HRMS). While there was no production in calli; a five-fold increase in epicatechin compound in 0.01 mg/L JA *in vitro* plantlets and a significant decrease in 0.01 mg/L MeJA, compared to the control group. Acacetin was not detected in the control group, but it was detected in the same amount in all groups. Chicoric, fumaric acid, chlorogenic acid and hyperoside compounds were detected highest in plantlets containing 0.01 mg/L JA. Fumaric acid was detected in 0.01 mg/L JA calli, 2.4 times more than the control group. Fumaric acid and hyperoside were produced in both plantlets and calli, however, hispidulin was produced only in calli. Chlorogenic acid was not produced in calli but was produced in the highest amounts in other groups. Naringin, chrysin, isosakuranetin, and apigenin-7-glucoside compounds could not be detected in any of the groups.

**Keywords:** *H.perforatum*, LC-HRMS, *In vitro* plantlet, Callus, Jasmonic acid, Methyl Jasmonate

#### INTRODUCTION

*H.perforatum* L. (Clusiaceae) is a common species and there are around 482 species in the world. Due to its traditional usage, it has been widely studied by researchers (Crockett and Robson 2011). It has important medical effects such as antimicrobial, antioxidant, antiviral, antifungal, cell regenerative and antidepressant because of contains naphthodiantrone, phlorogucinol and other phenolic compounds which have been synthesized by the aerial parts of the plant (Gadzovska et al. 2007, Çırak et al. 2016). *In vitro* production of compounds with these medicinal effects is encouraged through plant tissue culture techniques. While the flowering period of plants in nature takes a whole year, this period is shortened with *in vitro* techniques; additionally, the production of desired metabolites can be achieved under biotic and abiotic stress conditions (Wang et al 2015). Many studies conducted on *Hypericum* have revealed variations in metabolite amounts with various elicitors such as-jasmonic acid, salicylic acid, and methyl jasmonate-under *in vitro* conditions. In addition, the content of compounds was analyzed with various analytical (HPLC, HPLC-MS, LC-MS, LCMS-MS, etc.) devices (Jeyasri et al. 2023).

Today, many exogenous elicitors create a stress response within plant cells and thus increase secondary metabolite production through plant tissue culture techniques. Jasmonic acid and methyl jasmonate, which are jasmonate derivatives obtained from jasmine, are elicitors used in *in vitro* techniques. Jasmonic acid is a hormone used biotically to stimulate the accumulation of alkaloids, terpenoids, and phenolic compounds in plants (Zhao et al. 2005, Jirakiattikul et al. 2021). In previous studies, it was stated that jasmonic acid increased the amount of total phenolic and flavonoids in plants such as *H. perforatum* (Wang et al. 2015), *Artemisia absinthium* (Ali et al. 2014), *Phyllanthus pulcher* (Danaee et al. 2015).

Methyl jasmonate is a volatile methyl ester of jasmonic acid and an important signaling molecule in biotic and abiotic stresses. It is considered an important plant hormone that regulates internal and external transmission in plants due to its volatility and easy passage through biological membranes (Wang et al. 2021, Jeyasri et al 2023). It has been reported that externally applied methyl jasmonate in *in vitro* culture activates the antioxidant system and increases the expression of defense-related genes (Murthy et al. 2014; Ho et al. 2020). In this study, *H.perforatum* plantlets and callus were obtained, then jasmonic acid and methyl jasmonate were added to separately the nutrient medium (0.01 mg/L) under *in vitro* conditions. Moreover; epicatechin, acacetin, fumaric acid, hispidulin, naringenin, naringin, chicoric, hyperoside, rhamnocitrin, chlorogenic acid, chrysin, isosakuranetin, apigenin-7-glucoside compounds were detected with the LC-HRMS devices.

## MATERIALS AND METHODS

### Plant Material and Seeds Surface Sterilization

*Hypericum perforatum* L. seeds were collected from Samsun-Balıca, (41°27'97"01' and 36°33'60"67') Turkey. Seeds were washed for 15 minutes under tap water, surface sterilized with 70 % ethanol for 1 min, then NaOCl 15 % for 5 min, and rinsed 3 times in sterile deionized water. Seeds were cultured LS /B5 medium supplemented with 3 % sucrose and 0.7 % agar without plant growth regulators (Önlü 2019).

### *In vitro* Plantlets and Callus Formation

For *in vitro* multiplication, 1 mg/L BAP was used and rooted 1 mg/L IBA at LS/B5 media. Callus cultures were started with axillary buds of sterile seedlings. The media contained LS/B5 including 3 % sucrose, and 0.7 % agar. Five different TDZ (0.1, 0.25, 0.5, 0.75, 1 mg/L) and IBA (1,0.75, 0.5, 0.25, 0.1 mg/L) concentrations were used for callus culture.

### Elicitation of Elicitors

After 2 months of callus induction, the friable and green callus as equal fragments were transferred to new LS/B5 media containing jasmonic acid (0.01 mg/L) elicitor for 15 days. *In vitro* plantlets also were transferred to jasmonic acid (0.01 mg/L) and methyl jasmonate (0.01 mg/L) media, separately. Jasmonic acid (Duchefa, Netherland) and methyl jasmonate (Duchefa, Netherland) were dissolved in pure ethanol and filtered using a microfilter of 0.22  $\mu$  pore size. All treatments were incubated in the 16 h light/8 h dark photoperiod at  $24 \pm 2^\circ\text{C}$  and photon flux of  $90 \mu\text{mol m}^{-2} \text{s}^{-1}$  in the culture chamber.

### Extraction and Quantification of Secondary Metabolites

The calli and plantlets which treatments with JA and MeJa were freeze-dried lyophilized and powdered. Plant materials were extracted with 80 % (v/v) methanol in an ultrasonic bath for 30 min at  $4^\circ\text{C}$  as previously reported (Gadzovska et al. 2007, Gadzovska et al. 2013).

### Statistical Analyses

All the experiments were conducted using three biological replicates and all measurements were analyzed in triplicate. Significant differences in the amount of compounds between different plant extracts were evaluated with the Anova and Kruskal Wallis test. IBM SPSS Statistics 26.0 (IBM Corp. Released 2019. IBM SPSS Statistics for Windows, Version 26.0. Armonk, NY: IBM Corp.) and OriginPro 2018 (OriginLab Corporation, Northampton, MA, USA) were used for statistical analyses and calculations. The statistical significance level was accepted as  $p < 0.05$ .

### LC-HRMS and Chromatographic Conditions

The analyses of the extracts were made with LC-HRMS. Epicatechin, acacetin, fumaric acid, hispidulin, naringenin, naringin, chicoric acid, hyperoside, rhamnocitrine, chlorogenic acid, chrysin, isosakuranetin, apigenin 7-glucoside compounds were determined. LC-HRMS measurements were carried out on a Thermo ORBITRAP Q-EXACTIVE (Bremen, Germany) mass spectrometry-equipped ESI ion source and with a Dionex LC system. Identification of compounds was performed previously reported (İnal et al. 2022) by comparison of retention time of standard compounds in the range of purity 95-99% see section chemicals and HRMS data of Bezmialem Vakıf University, Drug Application and Research Center Library-ILMER.

## RESULTS and DISCUSSION

It was determined that the amount of chlorogenic acid was higher in plantlets containing 0.01 mg/L JA than in both control and methyl jasmonate. The hispidulin compound only was produced in calli containing 0.01 mg/L JA. While fumaric acid was produced highest in calli 0.01 mg/L JA, its amount decreased in 0.01 mg/L MeJa. For hyperoside, methyl jasmonate and callus groups were decreased. Epicatechin was detected at the highest rate in *in vitro* plantlets of 0.01 mg/L JA, while it could not be detected in callus. Acacetin was determined at the same rate in all groups, except of the control. While naringenin was produced in small amounts in 0.01 mg/L MeJA plantlets, it could not be detected in other groups. Considering the overall composition of the compounds, jasmonic acid increased the amounts compared to methyl jasmonate (Table 1).

**Table 1.** Amounts of compounds analyzed by LC-HRMS in *in vitro* plantlets and calli of *H. perforatum* L.

	Compounds	Retention Time	Quantification(mg/L)				Mother Ion (m/z)	Ion mode	LOD/LOQ (mg/L)
			<i>in vitro</i> seedling control	<i>in vitro</i> seedling 0.01 mg/L JA	<i>in vitro</i> seedling 0.01 mg/L MeJA	Callus_0.01 mg/L JA

n.d.: Not detected

The metabolites desired to be produced may sometimes be at low levels in plant tissue culture samples. Since LC-HRMS has high resonance in liquid chromatograms, it can detect molecules of low mass. According to our LC-HRMS analysis results, also it can be compared either methyl jasmonate or jasmonic acid is more effective as an external elicitor (Figure 1). Although there are many studies on the effect of methyl jasmonate on metabolite production cell suspension culture of *H.perforatum* (Wang et al 2015), *Isatis tinctoria* (Gai et al. 2019); in our study, it had little effect on phenolic compounds. The elicitor of JA made a significant increase in the amount of epicatechin and chlorogenic acid, which also provided hispidulin production in calli. Franklin and Dias (2011) reported that the amount of chlorogenic acid was higher in *in vitro* plantlets of *H.perforatum*. It has been reported that chlorogenic acid, which has an important role in plant functions, accumulates in tissues after plant injuries and triggers organ formation (Ramamurthy et al. 1992; Campos-Vargas and Saltveit 2002).

Zhang et al (2014) reported that hyperoside, a flavonoid group, inhibits the proliferation of osteosarcoma cells by inducing G0/G1 arrest in the cell cycle without causing significant cell death. Catechin group phytochemicals are some of the alternative chemotherapeutics that have been extensively tested for their anti-tumor and anti-inflammatory properties (Kurbitz et al. 2011). Epicatechin is one of these derivatives and its production should be supported *in vitro* plant culture.

**Figure 1.** Comparison of total compounds from *in vitro* examples from *H. perforatum* L. Respectively; *In vitro* plantlets control, *In vitro* plantlets 0.01 mg/L JA, *In vitro* plantlets 0.01 mg/L MeJA, Callus 0.01 mg/L JA. Each bar represents the percentage  $\pm$  standard deviation (SD) for indicated total compounds. Different letters show significant  $p < 0.05$  from ANOVA and KW.

## CONCLUSION

This study demonstrated the role of stress in the stimulated production of phenolic compounds and the effect of JA in callus cultures of stimulated hispidulin. The productivity of phenolic compounds was found to be dependent on the elicitation period and elicitors. The results of the present study indicate that JA is the most effective elicitor for phenolic compounds in *in vitro* plantlets, especially for chlorogenic acid. The medical importance of phytochemicals induced by jasmonic acid in *H. perforatum* plantlets has been emphasized by the mentioned studies. It is important to produce, purify, and bring these valuable chemicals into the economy under *in vitro* conditions.

## ACKNOWLEDGEMENTS

This research received financial support from Muş Alparslan University Research Foundation (Project No: BAP-18-FEF-4901-02).

#### Abstract

In this paper, we offer a unique method for improving the electrochemical performance of supercapacitors by fabricating nanocomposites from a conductive polymer, polyaniline (PANI), and CZTS material. The paper describes the hydrothermal synthesis of CZTS and the subsequent formation of PANI: CZTS nanocomposites using in situ chemical oxidative polymerization. To create nanocomposites, 30% mass ratios of CZTS to aniline were used, and the results were characterized using methods such as X-ray diffraction (XRD), scanning electron microscopy (SEM), elemental mapping (EDX), FT-IR, and electron impedance spectroscopy and cyclic voltammetry. The addition of PANI with CZTS considerably improved the electrochemical characteristics of nanocomposites. PANI has specific capacitance, energy density, and power density values of 36 F/g, 5.1 Wh/kg, and  $0.83 \times 10^5$  W/kg in a symmetric supercapacitor design, respectively. Among of synthesized sample, the PANI: CZTS30 symmetric supercapacitor design displayed significant gains, with specific capacitance, energy density, and power density values of 168 F/g, 23.4 Wh/kg, and  $1 \times 10^5$  W/kg, respectively. The use of low-cost, readily manufactured materials such as PANI and PANI: CZTS nanocomposites offers promise for a variety of energy storage and conversion devices.

**Keyword:** CZTS, PANI, specific capacitance, energy storage, nanocomposite

#### INTRODUCTION

Polyaniline (PANI) and copper zinc tin sulfide (CZTS) are two fascinating materials in the field of energy storage, each having specific features and possible uses. PANI, a conducting polymer, has received substantial interest owing to its extraordinary electrical conductivity, as well as its capacity to undergo chemical and physical tuning, all of which make it appropriate for a broad variety of applications, especially in the area of energy storage. (Kumar, Sahoo and Panda, 2018) It belongs to the family of conducting polymers, distinguished by their propensity to conduct electricity after doping or oxidation. PANI contains many oxidation states, enabling diversity in its characteristics that make it well-suited for diverse applications, notably in the construction of batteries and supercapacitors. Its high electrode capacity and redox characteristics make it a good alternative for electrode materials, adding to its popularity in energy storage systems. (Wu *et al.*, 2021) However, PANI also confronts significant limitations, such as low cycle stability, particularly in battery applications, resulting to a steady loss in storage capacity with repeated charge and discharge cycles (Li *et al.*, 2008). This downside is linked to structural modifications that PANI suffers during cycling, resulting in mechanical strain and decreased performance. Additionally, PANI's inherent electrical conductivity is rather poor, needing doping to produce acceptable levels of conductivity, with the choice of dopant considerably impacting its electrochemical performance.

To overcome the difficulties associated with PANI in energy storage applications, current research has investigated numerous novel solutions. One of these ways is the integration of PANI with conductive materials to boost its conductivity and structural integrity while minimizing ion diffusion lengths. This coupling of PANI with other sophisticated materials, such as metal oxides or sulfides (Jadhav, Mane and Shinde, 2020; Lokhande, Chavan and Pandey, 2020), has led to the creation of hybrid systems, seeking to boost energy storage performance and stability. These hybrid systems use the unique features of both PANI and the selected additive material to achieve synergistic effects that result in increased overall performance. Transition metal chalcogenides, for instance, have attracted great interest in recent decades for their remarkable performance as electrodes in supercapacitors. These materials offer advantages such as enhanced redox chemistry, extended cycle lifespans, increased electronic conductivity, and a range of structural benefits, including flexibility, larger surface area, and denser active sites, all contributing to higher specific capacitance compared to their oxide and nitride counterparts (Wu and Ma, 2018).

Copper zinc tin sulfide (CZTS), among the main chalcogenides within the category of metal sulfide materials, has gained great interest owing to its exceptional features, notably in the context of thin film solar cells. CZTS boasts various positive qualities, including low toxicity, plentiful component elements, and attractive optoelectronic characteristics, giving it a very promising material for solar energy conversion. Its direct bandgap of roughly 1.5 eV places it as an effective absorber of light in the visible spectrum, making it a promising contender for solar energy absorption (Roy *et al.*, 2018). Furthermore, CZTS has a high absorption coefficient, significant light scattering, and prolonged carrier lifetime, all of which contribute to the possibility for high device efficiency. However, obstacles exist in the manufacture of high-quality CZTS films with regulated composition and shape, as well as in the construction of acceptable device topologies. Therefore, continuing research attempts concentrate on increasing CZTS synthesis and processing techniques while extending our grasp of its core optoelectronic features and the subtleties of device physics (Guo *et al.*, 2014).

Beyond its use in solar cells, CZTS has proven tremendous promise in the realm of energy storage, spanning batteries, capacitors, and supercapacitors. In the world of rechargeable batteries, CZTS may operate as both an anode and a cathode material, delivering a high theoretical capacity and outstanding cycle stability, which are key features for long-term energy storage solutions (Zhou *et al.*, 2013). Furthermore, CZTS-based capacitors and supercapacitors display high energy and power densities, respectively, due to their vast surface area and the ability to store charge efficiently at the interface between the electrode and the electrolyte. Importantly, CZTS materials have the potential to overcome difficulties related with the toxicity and restricted availability of certain metals often employed in conventional electrode materials, such as cobalt and lithium (Ito, 2013).

Despite these promising qualities, the performance of CZTS-based energy storage devices remains hampered by issues linked to the synthesis of high-quality CZTS materials and the design of acceptable device topologies. To increase the electrochemical properties of CZTS, researchers have investigated numerous approaches. Surface modification using conductive materials, such as carbon nanotubes or graphene, has proved beneficial in enhancing electrical conductivity (Permatasari *et al.*, 2021). Doping CZTS with materials, particularly iron, has been examined to increase its inherent electrical characteristics. Modifying synthesis parameters, such as temperature and precursor ratios, has shown promise in modifying the composition, crystallinity, and morphology of CZTS materials, consequently boosting their electrochemical capabilities. Nanostructuring techniques, including the use of nanoparticles or nanowires, have enlarged the surface area, giving extra active sites for electrochemical reactions.

Copolymerization of CZTS with conductive polymers has emerged as a viable technique to increase the electrochemical properties of CZTS-based products (Chen *et al.*, 2013). The incorporation of conductive polymers, such as polypyrrole or polythiophene, into CZTS matrices has the potential to boost electronic conductivity, hence increasing the electrochemical activity of the resultant nanocomposite material. Additionally, copolymerization of CZTS with conductive polymers may lead to greater mechanical stability and flexibility, making these materials appropriate for use in flexible and wearable energy storage devices. However, the synthesis of CZTS-conductive polymer composites demands careful control of reaction conditions to enable the uniform distribution of the conductive polymer inside the CZTS matrix while keeping the optimum electrochemical properties of both components. Therefore, more research efforts are necessary to completely understand the fundamental principles of copolymerization and to develop feasible synthesis procedures for CZTS conductive polymer composites that display superior electrochemical performance. In a pioneering investigation, the current research analyses the impacts of integrating CZTS into the conductive organic polymer PANI within the context of energy storage applications, examining its possibilities beyond the world of solar cells. Specifically, the research examines the electrochemical performance of nanocomposite

materials generated by altering the mass ratios of CZTS and PANI. To completely examine their performance and appropriateness for energy storage, symmetrical supercapacitors were fabricated and evaluated. In conclusion, this scholarly discourse underlines the varied potential of PANI and CZTS in energy storage applications, illuminating their particular advantages, present obstacles, and options for development. It underlines the continuous research initiatives aimed at leveraging the unique features of these materials and creating novel solutions for the creation of enhanced energy storage systems capable of addressing the expectations of future energy storage technologies.

## MATERIALS AND METHODS

All chemicals used in the materials' production were utilized without being purified. Commercial supplies included  $\text{CuCl}_2$  (Sigma Aldrich),  $\text{ZnCl}_2$  (Across Organics),  $\text{SnCl}_2$  (TCI Chemical), and Thiourea ( $\text{CS}(\text{NH}_2)_2$ ) (Across Organics). The monomer was aniline hydrochloride (Thermo-scientific 99% purity, molecular weight- $M_w$ -129.59 g/mol), while the initiator was ammonium persulfate (Thermo-scientific APS, 98% purity, molecular weight 228.19 g/mol). Sigma Aldrich supplied sulfuric acid (95-98 wt%,  $M_w$ =98.074 g/mol) as a solvent. A Millipore Milli-Q system (Millipore Inc., = 18 M cm) was utilized to purify the water used throughout the synthesis.

CZTS was generated utilizing a well-known solution-based traditional synthesis process. To make the initial solution, sufficient quantities (molar ratio=2:1:1:8) of copper chloride ( $\text{CuCl}_2$ ), zinc chloride ( $\text{ZnCl}_2$ ), tin chloride ( $\text{SnCl}_2$ ), and thiourea ( $\text{CS}(\text{NH}_2)_2$ ) were added in the combination DMSO solution with a solvent. The solution was then heated in a controlled environment ( $200^\circ\text{C}$ ) to generate the necessary kesterite phase. After that, the substance was purified by washing it several times with ethanol and water, resulting in a black solid powder. In the production of PANI and PANI: CZTS 30 nanocomposite, a conventional in situ chemical oxidative copolymerization process was utilized (Figure 1). Firstly, aniline monomer (2.8 mmol) was dissolved in 10 mL of 1 M  $\text{H}_2\text{SO}_4$  solution for 10 minutes. In another beaker, APS (1.85 mmol) is put in 5 mL of 1M  $\text{H}_2\text{SO}_4$  and dissolved by stirring for 10 minutes. The APS solution was carefully added dropwise to the prepared aniline solution and stirred at room temperature for 10 minutes at a steady pace. With the addition of APS, the polymerization process commenced, PANI was produced, and the solution colour became dark green. The solution is maintained at  $4^\circ\text{C}$  for 24 hours to get pure PANI. The products were collected by centrifugation and rinsed with ethanol and deionized water. The finished product was dried at  $70^\circ\text{C}$  for one day. The same procedure was used to make PANI: CZTS 30 nanocomposite, where the ratio of aniline to CZTS was 30:1 (mass%). CZTS powder is added to a beaker containing 10 mL of 1 M  $\text{H}_2\text{SO}_4$  and swirled in a magnetic stirrer for 30 minutes. The aniline solution made in another beaker is then added to the beaker holding the CZTS solution, and the ensuing stages are done in the same way as in the synthesis of pure PANI. The synthesized substance was designated PANI: CZTS30.

## RESULTS and DISCUSSION

In the present research, a variety of sophisticated analytical methods was employed to fully analyze the structural, chemical, and electrochemical properties of materials under investigation, primarily focusing on PANI (Polyaniline) and its composites with CZTS (Copper Zinc Tin Sulfide) with potential implications for supercapacitor applications. X-ray Diffraction (XRD) investigation was undertaken utilizing a high-resolution PANalytical EMPYREAN model equipped with Cu K $\alpha$  radiation source ( $\lambda = 1.5406 \text{ \AA}$ ) to reveal the crystallographic characteristics and phase composition of CZTS. Raman spectroscopy, employing a Renishaw InVia Qontor apparatus with an excitation wavelength of 532 nm at room temperature, aided the examination of molecular vibrations, revealing insights into the structural features of the materials. Fourier Transform Infrared (FTIR) spectroscopy carried out using a Thermo Scientific iS50 equipment in the spectral region of 400-4000  $\text{cm}^{-1}$ , permitted the recognition of surface functional groups and transmittance measurements. Scanning Electron Microscopy (SEM) examination, done using an FEI Quanta 650 model with gold-plated samples, was useful in visualizing the morphology and surface characteristics of PANI, CZTS, and PANI: CZTS composites. The electrochemical investigation, done utilizing BioLogic VMP 300 electrochemical devices with 6M KOH as the electrolyte and Whatman glass microfibers as dielectric separators, investigated the electrochemical performance of supercapacitors built using PANI and PANI: CZTS nanocomposites. Methods such as the use of cyclic voltammetry (CV), potentiostatic electrochemical impedance spectra (PEIS), were applied within a voltage range of 0 to +1 V at varying scan rate. Overall, this multimodal methodology allowed for a full assessment of the materials' feasibility for electrochemical energy storage applications.

Furthermore, we undertook a meticulous synthesis of PANI: CZTS (Polyaniline: Copper Zinc Tin Sulfide) nanocomposites utilizing a low-temperature oxidation-based polymerization method. CZTS was introduced into the polymer matrix at varying mass ratios, comprising 30% of the resulting composite. The overarching objective of this research endeavor was to facilitate the intercalation of CZTS within the PANI matrix, with the anticipated outcome of enhancing the electrochemical performance of the resultant composite material. This intercalation mechanism was based on the postulate of electrostatic and Van der Waals interactions occurring between PANI and CZTS constituents. The structural characterization of the synthesized materials was meticulously conducted through X-ray diffraction (XRD) analysis, a robust technique for extracting vital crystallographic information. We present below our findings from this analysis pertaining to PANI, CZTS, and the PANI: CZTS nanocomposites.

**Figure 2.** FTIR (a) and XRD (b) analysis graph of synthesized materials

Primarily, the XRD pattern for pure PANI revealed the presence of two distinctive, well-defined peaks at specific diffraction angles, unambiguously attributed to the predominant 113 and 322 hkl miller indices crystallographic planes. The sharpness of these peaks alluded to a substantial degree of polymer chain alignment within these crystallographic planes, while peak intensity correlated with the population of crystalline domains within these planes. Subsequently, the XRD pattern for CZTS exhibited a series of discernibly sharp and well-aligned kesterite peaks at specific  $2\theta$  values, corresponding precisely to the (112), (200), (220), and (312) lattice planes (Chen *et al.*, 2013). This unequivocal alignment confirmed the tetragonal

crystal phase of CZTS, aligning precisely with the JCPDS card reference, thereby attesting to the high purity of the synthesized material. Lastly, upon analyzing the XRD patterns of the PANI: CZTS nanocomposites, wherein CZTS constituted 30% of the composite mass, it was apparent that the characteristic peaks of both PANI and CZTS were distinctly present within the synthesized composite materials. This observation strongly indicates that the PANI and CZTS constituents retained their inherent crystal structures even within the composite framework. It is crucial to underscore that the synthesis methodology and subsequent structural characterizations presented herein adhere rigorously to established protocols. They collectively provide a solid foundation for further inquiries into the electrochemical properties and potential applications of PANI: CZTS nanocomposites, thus contributing to the burgeoning field of advanced materials science.

The Fourier-transform infrared (FTIR) spectroscopy analysis undertaken in this work has shown to be significant in clarifying the composition and structural properties of the synthesized materials. Notably, the FTIR spectrum of the raw PANI material displayed five conspicuous distinctive peaks. Specifically, the peaks at around  $1556$  and  $1461\text{cm}^{-1}$  were linked to the C=C stretching vibrations associated with quinonoid and benzenoid rings, respectively. Furthermore, the appearance of a distinct peak at  $1292\text{cm}^{-1}$  showed the production of the PANI emeraldine salt phase. In addition, the peaks detected at  $1049$  and  $800\text{cm}^{-1}$  were suggestive of the presence of sulfonate groups connected to aromatic rings, leading to an increased proton conductivity, and C-H out-of-plane bending vibrations inside the PANI structure, respectively. The observation of C-C bond stretching vibrations within the spectrum region of  $1550\text{cm}^{-1}$  to  $1875\text{cm}^{-1}$  further validated the presence of benzoid and quinoid units indicative of the emeraldine form inside the synthesized PANI material. Moreover, the FTIR analysis showed discrete infrared bands covering the range of  $1150\text{cm}^{-1}$  to  $1490\text{cm}^{-1}$ , corresponding to C-N and C-H bending vibrations occurring at the C1 and C4 locations of the benzene ring. Additionally, a faint band at  $500\text{cm}^{-1}$  was found, confirming the existence of C double bonds and the Zn-S bond, so conclusively proving the effective integration of CZTS nanoparticles into the FTIR spectrum of the nanocomposites. Notably, a faint vibration band at around  $2900\text{cm}^{-1}$ , due to the S-H vibration in CZTS nanoparticles, emphasized the presence of surface hydroxyl groups, possibly coming from ambient moisture adsorption (Dongyun *et al.*, 2014). In summation, the application of FTIR spectroscopy in this study has provided comprehensive insights into the molecular vibrations and functional groups within both PANI and CZTS constituents, thereby corroborating the effective synthesis of PANI: CZTS nanocomposites and affording valuable revelations concerning their structural composition.

Figure 3. SEM image and EDX analysis all synthesized samples

Moreover, the morphological characteristics of several materials, including pure CZTS, PANI (Polyaniline), and PANI: CZTS nanocomposites at different mass ratios (referred to as PANI: CZTS 30) were comprehensively examined using scanning electron microscopy (SEM) and energy-dispersive X-ray (EDX) spectroscopy. These investigations gave useful insights into the composition, structural characteristics, and elemental distribution within the synthesized materials. The SEM images, as represented in Figure 3, were collected at a scale of 1  $\mu\text{m}$ . A remarkable and constant finding across all samples was the uniform dispersion of particles, reflecting a good synthesis process. The photos verified the production of CZTS, PANI, and their nanocomposite structures with various PANI to CZTS ratios. This homogeneity in particle dispersion emphasized the efficiency of the synthesis approach applied in creating well-dispersed nanocomposites. In addition to SEM examination, EDX spectroscopy was performed to confirm the composition and production of the nanocomposite materials. This approach enabled for exact elemental analysis by measuring atomic percentages. Notably, the EDX spectra for the PANI: CZTS nanocomposites indicated the existence of PANI and CZTS ingredients in the samples. Specifically, the EDX examination indicated the following atomic percentages for the different materials: For pure PANI, carbon (C) was the dominating element, totaling 61.3% of the substance. In the instance of CZTS, the composition comprised of carbon (C: 44.46%), copper (Cu: 17.31%), zinc (Zn: 5.73%), tin (Sn: 4.33%), and sulfur (S: 11.66%). Turning to the PANI: CZTS nanocomposites, the EDX analysis characterised their compositions as follows: PANI: CZTS 30: Carbon (C: 46.63%), copper (Cu: 0.94%), zinc (Zn: 0.40%), tin (Sn: 1.25%), and sulfur (S: 6.07%). The EDX study therefore gave convincing evidence of CZTS incorporation into the conductive PANI matrix inside the nanocomposites. Furthermore, the presence of transition metals such as copper, zinc, and tin indicated the effective creation of the PANI: CZTS nanocomposite material.

In order to investigate the electrochemical properties of PANI, CZTS, and PANI: CZTS:30 composite materials, electrochemical impedance spectroscopy (EIS) and cyclic voltammetry (CV) analyses of different materials were conducted using a two-electrode system. PANI, CZTS, and PANI: CZTS30 samples were utilized as electrode materials in the electrochemical analyses. A 6M KOH solution was employed as the electrolyte. CV analysis was conducted in the range of 0-1 V. The designed supercapacitors were characterized through potentiostatic electrochemical impedance spectroscopy (PEIS) analyses and cyclic voltammetry (CV) measurements, employing a symmetric design, and the prepared designs are presented in Table X.

**Table 1.** The specific supercapacitor designs based on these synthesized nanocomposites.

Electrode 1	Electrode 2	Electrolyte	Separator	Type
PANI	PANI	6M KOH	Glass fiber	Symmetric
CZTS	CZTS	6M KOH	Glass fiber	Symmetric
PANI: CZTS30	PANI: CZTS30	6M KOH	Glass fiber	Symmetric

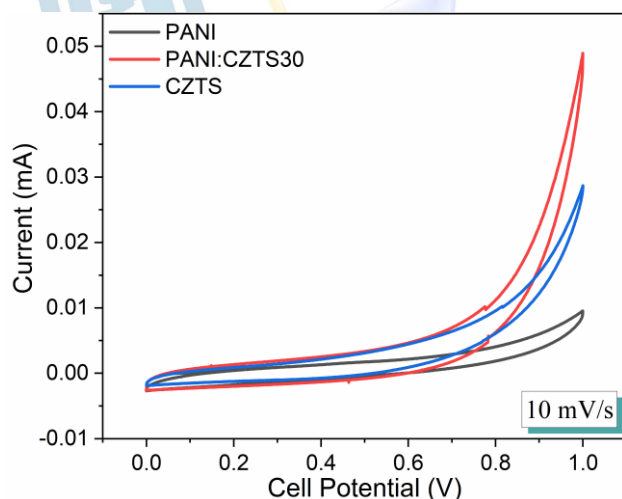

In energy storage systems, one of the most critical factors in evaluating the processes occurring at the electrode/electrolyte interface is the characterization of capacitive behavior. To examine the charge/discharge processes taking place at the electrode/electrolyte interface, electrochemical impedance spectroscopy (EIS) analysis is commonly employed. Through PEIS analysis, the impedance of the energy storage system is determined at different frequency values, allowing for the characterization of capacitive behavior.

As a result of the PEIS analysis conducted on PANI, CZTS, and PANI: CZTS:30 composite materials, Nyquist plots were obtained, as shown in Figure 4. The semi-circular shape of the Nyquist plots in the high-frequency region provides insights into the ion transfer rate of the electrode used and the charge transfer resistance occurring at the electrode/electrolyte interface. It is noteworthy that in the high-frequency region, a semi-circular shape is not observed in all three plots. Therefore, this result implies an increase in the ion transfer rate at the electrodes used during the measurements and a decrease in the charge transfer resistance at the electrode/electrolyte interface.

**Figure 4.** Nyquist plots of each design

Cyclic voltammetry (CV) analysis is another important method for determining the capacitive behavior of the electrodes used. Additionally, CV can be used to characterize the material's redox behavior. CV analysis provides information about the events occurring at the electrode/electrolyte interface during charge/discharge cycles. Figure 5 presents the CV curves of all synthesized samples at a scan rate of 10 mV/s. The reason for selecting a scan rate of 10 mV/s is that as the scan rate decreases, the area under the CV curve increases, resulting in a more consistent specific capacitance value. Therefore, CV analysis was conducted at a scan rate of 10 mV/s. Upon examining the CV curves of PANI, CZTS, and PANI: CZTS30 composites, it is apparent that all the curves are approximately rectangular in shape. This indicates that the process of charge storage in the electrode materials used in the designed supercapacitor primarily involves the formation of electrical double layers at the interface. Hence, it can be stated that the designed supercapacitor exhibits Electric Double-Layer Capacitor (EDLC) behavior based on the CV curves. Furthermore, the specific capacitance values calculated with the area under the CV curves for PANI, CZTS, and PANI: CZTS30 are 36, 135.8, and 168.1 F/g, respectively. This demonstrates a significant increase in specific capacitance as a result of the contribution of PANI to CZTS. Predictably, the synergistic interactions between PANI and CZTS lead to increased ion transfer rates, decreased interfacial charge transfer resistance, and enhanced electron diffusion rates.

**Figure 5.** CV curves of PANI, CZTS and PANI: CZTS30 composites at 10 mV/s scan rate.

## CONCLUSION

This study presents a novel approach for the synthesis of nanocomposites using the conductive polymer polyaniline (PANI) and CZTS material, aiming to enhance the electrochemical performance of supercapacitors. CZTS was synthesized via a hydrothermal method, while PANI: CZTS 30 nanocomposites were produced by in situ chemical oxidative polymerization with varying mass ratios of CZTS to aniline. The materials were

extensively characterized through X-ray diffraction, SEM, elemental mapping, FT-IR, and CV spectroscopic analyses, confirming the presence of CZTS in the synthesized PANI/CZTS nanocomposites. CV spectroscopy revealed the incorporation of CZTS particles, but significant changes in spectral intensity were observed. The electrochemical properties demonstrated substantial improvements when PANI was combined with CZTS. Specifically, PANI: CZTS 30 exhibited significantly enhanced specific capacitance value compared to pure PANI. In summary, this research offers valuable insights into the electrochemical performance of PANI and PANI: CZTS nanocomposites, highlighting their potential as cost-effective and efficient materials for energy storage applications. These materials hold promise for various energy-related devices, including high-performance supercapacitors, contributing to advancements in energy storage and harvesting technologies.

#### Özet

Sitokin salınım sendromu (SSS) veya sitokin fırtınası, SARS-CoV-2 tarafından başlatılabilen, bağışıklık sisteminin orantısız tepkisinden kaynaklanan proinflatuar sitokinlerin aşırı üretiminin bir sonucudur. SARS-CoV-2'nin neden olduğu COVID-19, sitokinlerle korelasyon göstermektedir. SARS-CoV-2, yaygın dağılım gösteren makrofajlar ve mast hücreleri sayesinde IL-1 üretimini tetiklemektedir. IL-1 ise, IL-6 ve TNF- $\alpha$  üretimlerini etkileme eğilimindedir. COVID-19 şiddetinin ilerlemesi, IL-6 gibi bazı sitokin düzeylerini etkiler. IL-6, SSS oluşumundan başlıca sorumlu olan sitokindir. SSS, COVID-19 ile ilgili komplikasyonların ve COVID-19 ile ilişkili ölümlerin ana nedenidir. Bu zamana kadar literatürde bildirilmiş verilere rağmen, SARS-CoV-2 ve sitokinler arasındaki ilişki tam olarak aydınlatılmış değildir. Bu çalışma ile söz konusu ilişkinin irdelenmesi amaçlanmıştır. COVID-19 tedavisi sırasında sitokinlerin hedeflenmesi, hastaların hayatta kalma oranlarını artırma ve COVID-19 ile ilişkili ölümleri azaltma potansiyelini taşımaktadır. COVID-19 hastalığında, sitokin salınım mekanizmalarına ve salınan sitokinlerin etkilerine odaklanılmasının, özellikle T lenfositler üzerindeki etkilerinin ve IFN- $\gamma$  üretiminin irdelenmesinin, hastalığın ölümcül etkilerini azaltmaya yardımcı olabileceği düşünülmektedir.

#### Roles of Some Cytokines in Covid-19 Disease

#### Abstract

Cytokine release syndrome (CNS), or cytokine storm, is the result of overproduction of pro-inflammatory cytokines resulting from a disproportionate response of the immune system, which can be initiated by SARS-CoV-2. COVID-19 caused by SARS-CoV-2 correlates with cytokines. SARS-CoV-2 triggers IL-1 production by widely distributed macrophages and mast cells. IL-1, on the other hand, tends to affect the production of IL-6 and TNF- $\alpha$ . The progression of COVID-19 severity affects the levels of some cytokines, such as IL-6. IL-6 is the cytokine primarily responsible for CNS formation. CNS is the leading cause of COVID-19-related complications and COVID-19-related deaths. Despite the data reported in the literature to date, the relationship between SARS-CoV-2 and cytokines has not been fully elucidated. This review aims to examine this relationship. Targeting cytokines during COVID-19 treatment holds the potential to increase patient survival rates and reduce COVID-19-related deaths. It is thought that focusing on the mechanisms of cytokine release and the effects of released cytokines in COVID-19 disease, especially examining their effects on T lymphocytes and IFN- $\gamma$  production, may help reduce the fatal effects of the disease.

**Keywords:** COVID-19, Cytokines, Cytokine Release Syndrome, Cytokine Storm

## GİRİŞ

Coronavirüs hastalığı 2019 (COVID-19), yeni insan koronavirüsü Şiddetli Akut Solunum Sendromu Coronavirüs 2'den (SARS-CoV-2) kaynaklanır. SARS-CoV-2, zarflı tek sarmallı bir RNA genomu olan Coronaviridae familyasına aittir (Li ve ark., 2020). Aralık 2019'da Wuhan-Çin'de ortaya çıkmasının ardından hızla 196'dan fazla ülkeye yayılarak Dünya Sağlık Örgütü (WHO) tarafından küresel sağlık acil durumu olarak ilan edilmiştir (Darif ve ark., 2020, Kunnumakkara ve ark., 2021). Araştırmalar SARS-CoV-2'nin zoonotik bir kökene sahip olduğunu ve yarasaların SARS-CoV-2'ye benzer şekilde önemli koronavirüs rezervuarları olduğunu öne sürmüşlerdir. SARS-CoV-2'nin insandan insana bulaşması, enfekte bir insandan öksürme ve hapşırma sırasındaki aerosol damlacıklarının doğrudan temas yoluyla olabilir. Kontamine yüzeyler de virüsün dolaylı olarak bulaşmasına katkıda bulunmaktadır (Karabacak ve Kırdemir, 2021). SARS-CoV-2 üst ve alt solunum yollarına saldırarak çoğalmaktadır. Enfekte kişilerde 2 hafta içinde semptomların görüldüğü kuluçka süresi bulunmaktadır (Chan ve ark., 2020). Enfekte kişilerin bağışıklık durumlarına bağlı olarak, hafiften, orta dereceye kadar değişen semptomlar bulunmaktadır. Bununla birlikte, yaşlı bireyler ve diyabet, kronik solunum yolu hastalığı, kanser ve kardiyovasküler hastalık gibi kronik hastalıkları olan hastalarda, zayıf bağışıklık sistemlerinin bulunmasından dolayı, ciddi semptomlar ortaya çıkabilmektedir. Bu hastalarda gelişen enfeksiyon, pnömoni ve akut solunum sıkıntısı sendromuna (ARDS) yol açarak organ yetmezliği ve ölümle sonuçlanabilmektedir (Karabacak ve Kırdemir, 2021).

Eskiden kaynak hücre ile ilişkilerini tanımlamak için lenfokinler ve monokinler olarak adlandırılan sitokinlerin, neredeyse tüm nükleuslu hücrelerce sentezlenebildikleri kesinleşince günümüzde 'sitokinler' olarak adlandırılmışlardır (Dinarello, 2000). Sitokin terimi sito (hücre) ve kinos (hareket) olan iki Yunanca kelimeden köken almaktadır (dos Santos ve ark., 2020). İmmün hücreler, endotelial hücreler, fibroblastlar ve diğer stromal hücreler (Fares ve ark., 2020) tarafından salgılanan, pleiotropik ve hücreye özgü fonksiyonlara sahip düşük molekül ağırlıklı protein olan sitokinler, hücreler arası iletişim ve hücreler arası yanıtların koordinasyonunda görev almaktadır (Chauhan ve ark., 2021, Devrim ve ark., 2020). Ayrıca sitokinler ilgili hücrelere büyüme, farklılaşma, inflammatuar veya antiinflammatuar sinyaller de sağlamaktadır ve çoğu zaman uyarılara yanıt olarak belirli periyotlarda salgılanırlar (Berraondo ve ark., 2019, Devrim ve ark., 2020). Sitokinlerin dolaşımdaki yarı ömürleri sınırlı olduğundan etki süreleri kısadır. Tipik olarak sitokinler otokrin veya parakrin etki gösterir (Berraondo ve ark., 2019, Simpson ve ark., 2020). Bununla birlikte uzak hücrelere de sinyal göndererek endokrin aktivite sergileyebilirler (Katze, 2012). Sitokin geninin ekspresyonu, bazal homeostatik koşullar altında sıkı bir şekilde düzenlenmekte olup çoğu zaman sürekli değildir. Sitokin geninin transkripsiyon ve translasyon oranları, büyüme faktörleri, yabancı uyaranlar ve/veya sitokinler (Fares ve ark., 2020) gibi çeşitli uyaranlardan (Chauhan ve ark., 2021) etkilenebilir. Sitokinler bağışıklık hücrelerinin aktivasyonunda esastır, yani bağışıklığa çok büyük katkı sağlarlar. Bununla birlikte salınımları düzenlenmediğinde birçok inflammatuar hastalığın (Fares ve ark., 2020) ve sitokin salınım sendromunun (CRS) veya sitokin fırtınasının (Shimabukuro-Vornhagen ve ark., 2018) ortaya çıkmasını etkilerler. CRS, SARS-CoV-2 tarafından tetiklenebilen bağışıklık sisteminin orantısız tepkisinden kaynaklanan proinflammatuar sitokinlerin aşırı üretiminin bir sonucudur. CRS'nin bazı hastalarda COVID-19'un ciddiyeti ve zararlı etkilerinin ortaya çıkmasında rol oynadığı gösterilmiştir (Darif ve ark., 2020, Tang ve ark., 2020, Ye ve ark., 2020). Bu çalışma ile SARS-CoV-2 ile sitokinler arasındaki ilişkinin değerlendirilmesi amaçlanmıştır.

## SARS-COV-2 TARAFINDAN SİTOKİN SALINIMININ BAŞLATILMASI

Anjiyotensin dönüştürücü enzim 2 reseptörü (ACE 2), solunum yolu epitel hücrelerinin hücre zarlarının yüzeyinde eksprese edilir. SARS-CoV-2'nin bu reseptöre bağlanması, proinflammatuar sitokinlerin salınmasını tetikler. Anjiyotensin II (Ang II) hormonu, vazokonstriktör olmasının yanı sıra pro-inflamatuar yanıtları da uyarır, böylece NF- $\kappa$ B'yı yukarı düzenleyerek IL-6, IL-8 ve TNF- $\alpha$  dahil sitokinlerin salınmasını sağlar. Ang 1-7, renin-anjiyotensin sisteminin (RAS) ana modülatörü olan ACE 2'nin modülatör etkisi altında Ang II'den meydana gelen bir vazodilatördür. Bu nedenle, ACE2'nin inhibisyonu veya eliminasyonu sonucunda Ang 1-7 üretiminin bloke edilmesi, AngII seviyelerinde bir artışa yol açar ve bu da proinflammatuar sitokinlerin abartılmasına neden olur. Ayrıca Ang 1-7 hormonu hücreler tarafından antiinflammatuar sitokinlerin salınımını tetikleyerek akciğer hasarını önler (Mahmud-Al-Rafat ve ark., 2020). SARS-CoV-2 enfeksiyonu, ADAM Metallopeptidaz Alanı 17 (ADAM 18) aracılığıyla ACE 2 aktivitelerini inhibe eder. Bu sonuçta membrana bağlı ACE2'nin çözünür bir formda (sACE2) serbest bırakılmasıyla sonuçlanır. ADAM 17'nin aracılık ettiği SARS-CoV-2 tarafından ACE 2 üretiminin veya salınımının azaltılması, Ang II'den Ang 1-7 sentezini engeller. Bu nedenle, COVID-19 hastalarında Ang II seviyesi artar ve bu da vücuttaki pro-inflamatuar yanıtı artırma veya şiddetlendirme eğilimindedir. Dolayısıyla, COVID-19 hastalarında Ang II düzeyinin artması,

hastalardaki pro-inflamatuar yanıtı artırma veya şiddetlendirme eğiliminde olup, sonuçta COVID-19 hastalarında organ veya çoklu organ yetmezliğinin ortaya çıkmasına neden olmaktadır (Mahmud-Al-Rafat ve ark., 2020). Virüsün kendisinin yanı sıra bozunmuş ürünleri de CRS'nin ortaya çıkmasını tetikleyebilir. SARS-CoV-2'nin germline tarafından kodlanan konak sensörleri ve pattern tanıma reseptörleri (PRR'ler) tarafından tanınması, hem doğal hem de adaptif bağışıklık tepkilerini uyarmak için sitokinlerin salınmasında hayati bir rol oynar (Sallenave ve ark., 2020). CRS, COVID-19 hastalarında sık görülen bir durum olup IL-1 tarafından başlatılmaktadır. SARS-CoV-2, makrofajlar ve mast hücreleri (MC'ler) (Conti ve ark., 2020) tarafından IL-1 salgılanmasını indükler ve SARS-CoV-2 tarafından indüklenen IL-1 salgılanması, hem şiddetli hem de şiddetli olmayan hastalarda yüksek olarak bulunmaktadır (Huang ve ark., 2020). IL-1 salgılanmasını takiben TNF- $\alpha$  ve IL-6'nın salgılanmasını da tetikler (Conti ve ark., 2020). IL-6 büyük ölçüde CRS'nin nedenidir. IL-6'nın iki ana reseptörü vardır; IL-6R ve çözünür form olan SIL-6R. Aynı zamanda klasik ve trans-sinyalizasyon yolu olmak üzere iki ana sinyal yoluna sahiptir. COVID-19 hastalarında IL-6, SIL-6R'ye (trans-sinyal yolu) bağlanarak IL-6/SIL-6R kompleksini oluşturur ve bu da gp130'un aktivasyonu ile sonuçlanır. GP130'un aktivasyonu, Janus kinaz (JAK)/sinyal transdüserleri, transkripsiyon aktivasyonu (STAT) ve fosfatidilinositol-3 kinaz yolu gibi birçok hücre içi yolun tetiklenmesine yol açarak tüm hücreler tarafından proinflamatuar sitokinlerin salınmasına neden olur (Darif ve ark., 2020, Ebihara ve ark., 2011). IL-6 aynı zamanda sitokinlerin (CRS) aşırı ekspresyonunu tetikleyebilen serum amiloid A (SAA) gibi pozitif akut faz reaktanlarının sentezini ve üretimini de indükler ve bu da diyabet gibi kronik hastalıkları olan bireylerin COVID-19 şiddetiyle karşılaşma riski daha fazla olduğunu açıklamaktadır. IL-6 tarafından indüklenen SAA üretimi daha sonra eritrosit (RBC) aglütinasyonu yoluyla pulmoner ve doku gaz değişiminin azalması, fibrinojene bağlanma yoluyla atipik koagülopati ve yüksek yoğunluklu lipoprotein (HDL) fonksiyon bozukluğu veya lipoproteinlere bağlanarak ateroskleroz gibi komplikasyonlara neden olur (Chatterjee ve ark., 2020).

IL-6'nın pozitif akut faz reaktanları üzerindeki etkisine ek olarak, hepatositlerde C-reaktif protein (CRP) geninin transkripsiyonunu da tetiklemektedir. COVID-19'un erken evresinde CRP'deki yüksek seviyelerin akciğer hasarını ve hastalığın ciddiyetini göstermektedir. CRP aynı zamanda birkaç organ sisteminin etkilenen ciddi COVID-19 olan hastalarda ve ölen kişilerde de yüksek seviyelerde bulunmuştur. CRP, aktivasyon komplemanı, pro-inflamatuar sitokin üretiminin indüksiyonu ve apoptoz yoluyla COVID-19'un ciddi sonuçlarının ortaya çıkmasına katkıda bulunabilir (Mosquera-Sulbaran ve ark., 2021).

## COVID-19'da SİTOKİN FIRTINASI

Yeni insan koronavirüsü SARS-CoV-2 de dahil olmak üzere enfeksiyonlar, CRS'ye veya sitokin fırtınasına neden olan bağışıklık tepkisinin hiperaktivitesini tetiklemektedir. CRS, B hücreleri, T hücreleri, nötrofiller, makrofajlar, monositler, dendritik hücreler, NK hücreleri gibi birçok beyaz kan hücresinin ve proinflamatuar sitokinlerin aşırı miktarda bulunması olarak tanımlanmaktadır (Azkur ve ark., 2020, Behrens ve ark., 2017). Bu anormallik, kemokinlerin, koloni uyarıcı faktörlerin (CSF'ler), interlökinlerin (IL'ler), interferonların (IFN'ler) ve tümör nekroz faktörü-alfa'nın (TNF-a) aşırı ekspresyonunu içerir. Sitokin fırtınasının ARDS'nin ana nedeni olarak kabul edilmektedir. Ayrıca sitokin fırtınası ve buna bağlı komplikasyonlar, COVID-19'a bağlı ölümlerin ana nedeni olarak tanımlanmaktadır (Karabacak ve ark., 2021, Ye ve ark., 2020). İmmün yanıt ile COVID-19 şiddeti arasında bir korelasyon bulunmaktadır. T lenfositlerin; CD4+ T hücreleri ve CD8+ T hücreleri hafif, orta ve şiddetli tüm COVID-19 hastalarında azalmakta olup bu durum ciddi hastalarda daha belirgin bir azalma şeklindedir. Bu durum bu hücreler ile hastalığın şiddeti arasında negatif bir korelasyon olduğu anlamına gelmektedir. Buna IL-6, IL10, IL-2R ve TNF- $\alpha$  düzeylerinde belirgin bir yükselme eşlik etmektedir. Aksine, IFN-y'nin (Chen ve ark., 2019) daha düşük bir ifadesi bulunmaktadır ve bu muhtemelen CD4+ T hücre sayısındaki azalmanın bir sonucudur. Yine şiddetli ve aşırı şiddetli COVID-19 hastalarında T lenfositlerin (CD4+ ve CD8+ T hücreleri) ve B hücrelerinin mutlak sayısının kademeli olarak azaldığı, ağır hastaların sayılarının aşırı ağır hastalara göre daha yüksek olduğu bildirildi. Buna rağmen, IFN-y üreten CD8+ T hücrelerinin yüzdesi hem şiddetli hem de aşırı şiddetli hastalarda hafif hastalara göre artmaktadır. Ayrıca aşırı şiddetli hastalarda IFN-y üreten CD4+ T hücrelerinin yüzdesi de artmaktadır. Sonuç olarak, COVID-19 hastalarında IFN- $\gamma$  üretimini de içeren T lenfositlerin sayısı ve işlevi tutarsızlık bulunmaktadır. Ayrıca aşırı şiddetli hastalarda IL6, IL-10 ve IL-2R'nin ekspresyonu arttığı tespit edilmiştir (Wang ve ark., 2020). Yapılan bir çalışmada 50 hem ağır hem de kritik COVID-19 hastasında IFN- $\alpha$  üretimi ve aktivitesinin düşük olduğu, IFN- $\beta$  üretiminin ise olmadığı bildirilmiştir. Bu varyasyonlar kalıcı kan viral yükü ve aşırı eksprese edilen inflammatuar yanıt ile ilişkilendirilmektedir (Hadjadj ve ark., 2020). COVID-19 hastalarında daha yüksek serum IL-6, IL-10, IL-2, IL-4, TNF- $\alpha$  ve IFN- $\gamma$  seviyeleri gözlenmiştir. Ancak çalışmanın kritik hasta grubunda serum IL-6 ve IL-10 düzeyleri anlamlı derecede yüksek bulunmuştur. Ayrıca serum IL-10 düzeyleri C-reaktif protein (CRP) miktarı ile pozitif korelasyon göstermiştir (Han ve ark., 2020). 43 yetişkin COVID-19 hastası

(28 hafif ve 15 ağır hasta) üzerinde yapılan bir araştırma, IL-6'nın 2 grup arasında önemli ölçüde farklılık gösterdiğini ve en yüksek IL-6 düzeyine şiddetli grubun sahip olduğunu bildirilmiştir. Ayrıca IL-6, yetişkin hastalarda COVID-19 şiddetinin ortaya çıkmasıyla yakından ilişkili olarak gösterilmektedir (Gao ve ark., 2020). Başlangıçta COVID-19 testi pozitif çıkan bir ölen hasta grubu ve taburcu edilmiş olan hasta grubu üzerinde yapılan bir çalışmada, ölüm grubunun IL-6 düzeyinin, ölen grupta önemli ölçüde daha yüksek olduğunu gösterilmiştir. Otopsi yapılarak sonuçların doğrulanmasının ardından SARS-CoV-2 ile aktive olan CRS'nin, COVID-19 ölümlerinin nedeni olabileceği öne sürülmüştür (Ruan ve ark., 2020). Liu ve ark. (2020), 12 COVID-19 hastasında ölçülen toplam plazma sitokinlerinden 38 sitokinin anlamlı düzeyde yükseldiğini bildirmiştir. Ayrıca SARS-CoV-2 yüküyle ilişkili 17 sitokin ve sitokinlerin 15'inin akciğer hasarıyla güçlü bir korelasyonu vardı. Buna M-CSF, IL-10, IFN- $\alpha$ 2, IL-4, IP-10, IL-7, IL-1ra, G-CSF, IL-12, IFN- $\gamma$ , IL-1 $\alpha$ , IL-2 dahildir. HGF, PDGF-BB ve IL-17. TH17 hücreleri, kendini kopyalamayı da içeren virüslere yanıt olarak akciğerlerde IL-17 üretir. Ayrıca sinerjizmleri de CD8+ T hücresi aracılı hedef yıkımını teşvik eder (Hou ve ark., 2014).

Nötrofil-lenfosit oranı (NLR), trombosit-lenfosit oranı (PLR) ve lenfosit-monosit oranı (LMR) gibi dolaşımdaki biyobelirteçler, COVID-19 hastalarının inflamatuvar ve bağışıklık durumunu temsil edebilmektedir. NLR, PLR ve LMR; sistemik inflamasyonun prognozunda kullanılan yararlı belirteçler olup, viral pnömoninin prognozunda yaygın olarak kullanılmaktadır. NLR, ciddi hastalığı olan COVID-19 hastalarında yükselir. Dolayısıyla NLR; COVID-19 şiddetiyle ilişkili olup, kötü klinik seyir için bağımsız bir prognostik biyobelirteç olarak kullanılabilir (Yang ve ark., 2020). Ayrıca 29 çalışma üzerinde yapılan bir meta-analizde ağır hastalarda NLR düzeylerinin arttığı rapor edilmiştir (Feng ve ark., 2020). PLR seviyesinin, COVID-19 şiddeti için uygun maliyetli ve kolay ulaşılabilen bir prognostik biyobelirteç olduğu söylenebilir. Düzeyi, COVID-19'un ciddiyetine yanıt olarak artar ve bu, şiddetli grubun, şiddetli olmayan gruba göre daha yüksek PLR düzeyleri sunduğu bir meta-analizde gösterilmiştir (Simadibrata ve ark., 2020). LMR düzeyinin ise COVID-19'un ciddiyeti ile negatif bir korelasyon sergilediği düşünülmektedir. Şiddetli COVID-19 hastalarında daha yüksek NLR seviyeleri ve daha düşük LMR seviyeleri bildirilmiştir. Tersine, hafif veya orta şiddette COVID-19 vakası olan hastalarda daha yüksek LMR seviyeleri raporlanmıştır. Her ne kadar NLR, PLR ve LMR seviyeleri COVID-19'un prognozunda yararlı olsa da NLR, PLR ve LMR için normal referans aralıkları hala belirsizliğini korumaktadır (Kong ve ark., 2020). Yukarıdakilerden yola çıkarak, tedavi sırasında sitokinlerin hedeflenmesi, COVID-19 hastalarında COVID-19 hastalığının ilerleme hızını azaltabilir ve COVID-19'un neden olduğu ölümleri azaltabilir. Örneğin Tocilizumab, IL-6'nın reseptörüne bağlanmasını engelleyebilen rekombinant hümanize IL-6 reseptör antagonistidir. Tocilizumab esas olarak romatoid artrit tedavisinde kullanılmaktadır ancak KRS'nin büyük oranda IL-6'dan kaynaklanması nedeniyle COVID-19 tedavisi sırasında da kullanılabilir (Xu ve ark., 2020). Tocilizumab'ın ağır ve kritik 21 hastayı tedavi etmek için kullanıldığında cesaret verici sonuçlar elde edildiği bildirmiştir. Bunun dışında kortikosteroid tedavisi gibi başka alternatifler de COVID-19 tedavisinde benimsenebilir. Kortikosteroidler, anti-inflamatuvar etkileri olan steroid hormonlardır ve yaygın olarak inflamasyonu baskılamak için kullanılır. Şiddetli SARS hastalarına glukokortikoidlerin uygun şekilde uygulanması, ateşin düşmesi, akciğerlere sızan radyasyonun hafifletilmesi ve oksijenasyonun iyileştirilmesi yoluyla durumlarını iyileştirdi. Ancak glukokortikoidlerin uygulanmasının zamanlaması doğru yapılmalı ve dozajı dikkatli bir şekilde alınmalıdır. Glukokortikoidlerin çok erken uygulanması vücudun savunma mekanizmasını engelleyerek viral yükün artmasına neden olur. Bu nedenle, glukokortikoidler esas olarak sitokin fırtınasından muzdarip, kritik durumdaki COVID-19 hastalarının tedavisinde kullanılmaktadır. Kritik durumdaki COVID-19 hastalarına doğru zamanda kortikosteroid uygulanması ARDS oluşumunu azaltmış ve etkilenen organları korumuştur (Ye ve ark., 2020). İntravenöz immüno globulin tedavisi aynı zamanda immün ikame ve immün modülasyon açısından ikili bir potansiyele sahiptir. Ancak COVID-19 hastalarında uygulanmasının önemi doğrulanmamıştır (Chen ve ark. 2020). Klorokin'in TNF ve IL-6'nın üretimini ve salınımını inhibe ettiği, dolayısıyla klorokin'in COVID-19 hastalarında sitokin fırtınasını baskılayabildiği bildirilmiştir. Yine kök hücre tedavisi de hastalarda sitokin fırtınasını önleyebilmektedir. Mezenkimal kök hücreler (MSC) kendini yenileme potansiyellerinin yanı sıra güçlü bir anti-inflamatuvar ve immün düzenleyici fonksiyona sahiptirler. MSC, T lenfositlerin ve makrofajların anormal aktivasyonunu inhibe edebilir ve ayrıca bunların sırasıyla düzenleyici T hücrelerine ve anti-inflamatuvar makrofajlara farklılaşmasını da aktive edebilir. MSC ayrıca TNF- $\alpha$ , IL-1, IL-6, IL-12 ve IFN- $\gamma$  gibi proinflamatuvar sitokinlerin üretimini de inhibe edebilir (Ye ve ark., 2020).

## SONUÇ

Tüm enfeksiyonlarda olduğu gibi COVID-19 enfeksiyonu da sitokin salınımını uyarmaktadır ancak bazı hasta grupları aşırı sitokin tepkisi göstererek sitokin fırtınasının oluşmasına neden olmaktadır. Ayrıca, COVID-19 şiddetinin artması, başta IL-6 olmak üzere bazı sitokin düzeyleri üzerinde etkiye sahiptir. Bu nedenle sitokinler, COVID-19'un teşhisinde önemlidir ve bunların tedavi sırasında doğru zamanda doğru hastada kullanılması daha olumlu sonuçlar verebilmektedir. Sitokin fırtınası, COVID-19'a bağlı komplikasyonlara neden olur ve COVID-19'a bağlı ölümlerin ana nedenidir. Literatürde COVID-19 enfeksiyonunun neden olduğu sitokin salınımına ilişkin bildirilen veriler dikkate alındığında, bu enfeksiyonun T lenfositler ve bunların ürettiği IFN- $\gamma$  düzeyleri üzerindeki etkisine odaklanan çalışmaların önemli bulgular sağlayacağı sonucuna varılmıştır.

#### Özet

Dünya genelinde önemli bir sağlık sorunu olan ve vücutta aşırı yağ birikmesiyle karakterize edilen obezite tip 2 diyabet, kardiyovasküler hastalıklar ve alkolsüz yağlı karaciğer hastalığı gibi bir dizi kronik hastalıkların riskini keskin bir şekilde artırır. Diyet ve egzersiz gibi yaşam tarzı müdahalelerinin obezite ile mücadelede kayda değer etkileri olmasına rağmen, kilo vermede uzun vadeli başarıya ulaşmak son derece zordur ve obezite prevalansı dünya çapında artmaya devam etmektedir. Geçtiğimiz birkaç on yılda, obezitenin patofizyolojisi kapsamlı bir şekilde araştırılmış ve artan sayıda sinyal yolu obezite ile ilişkilendirilmiş, obeziteyle daha etkili ve kesin bir şekilde mücadele etmek için sinyal yollarına odaklanılmıştır. Bu makalede, obezitenin patogenezi ve tedavisi üzerine odaklanılan iki ana sinyal yolunun rolü incelenmiştir: mitojenle aktifleşen protein kinaz (MAPK) ve fosfatidilinositol 3-kinaz (PI3K)/AKT sinyal yolları. MAPK sinyal yolu, iştah kontrolü, glukoz seviyelerinin düzenlenmesi ve yağ hücresi oluşumuna katkıda bulunurken, aynı zamanda insülin direncinin gelişimine de yol açabilir. Özellikle hipotalamusta ve yağ dokusunda MAPK'nin rolü vurgulanmıştır. PI3K/AKT sinyal yolu ise hücre büyümesi ve çoğalmasının düzenlenmesinde kritik bir rol oynar. Bu yolun anormal aktivasyonu, obezitenin gelişimini destekleyebilir ve insülin direncine katkıda bulunabilir. Ayrıca, iştah düzenlemesi ve enerji dengesi üzerinde de etkilidir. Obezitenin toplumsal maliyeti yüksektir ve sağlık sorunlarını artırır. Bu nedenle obezitenin önlenmesi ve tedavisi büyük önem taşır. Araştırmalar, sinyal yollarının iştah düzenlemesi, yağ dokusunun metabolizması ve enerji dengesi arasındaki ilişkilerin daha iyi anlaşılması gerektiğini göstermektedir. Sonuç olarak, obezitenin yönetimi için yenilikçi ve güvenli önlemlerin araştırılması gerekmektedir. Sinyal yolları, obezitenin patogenezinde önemli bir rol oynar ve gelecekteki çalışmalar bu konuya daha fazla odaklanmalıdır.

**Anahtar Kelimeler:** Obezite, Sinyal yolu, MAPK sinyal yolu, PI3K/AKT sinyal yolu

#### MAPK and PI3K/AKT signaling pathways in the pathogenesis of obesity

#### Abstract

Obesity, a major health problem worldwide and characterized by excess fat accumulation in the body, sharply increases the risk of a number of chronic diseases, such as type 2 diabetes, cardiovascular diseases and non-alcoholic fatty liver disease. Although lifestyle interventions such as diet and exercise have significant effects in combating obesity, long-term success in weight loss is extremely difficult to achieve and the prevalence of obesity continues to increase worldwide. Over the past few decades, the pathophysiology of obesity has been extensively investigated and an increasing number of signaling pathways have been associated with obesity, focusing on signaling pathways to combat obesity more effectively and precisely. This article focuses on the pathogenesis and treatment of obesity by examining the role of two major signaling pathways: mitogen-activated protein kinase (MAPK) and phosphatidylinositol 3-kinase (PI3K)/AKT signaling pathways. While the MAPK signaling pathway contributes to appetite control, regulation of glucose levels and fat cell formation, it may also lead to the development of insulin resistance. The role of MAPK has been particularly emphasized in the hypothalamus and adipose tissue. The PI3K/AKT signaling pathway plays a critical role in regulating cell growth and proliferation. Abnormal activation of this pathway may promote the development of obesity and contribute to insulin resistance. It is also effective on appetite regulation and energy balance. The social cost of obesity is high and increases health problems. Therefore, prevention and treatment of obesity is of great importance. Research shows that there is a need for a better understanding of the relationships between signaling pathways, adipose tissue metabolism, and energy balance in the regulation of appetite. As a result, innovative and safe measures for obesity management need to be investigated. Signaling pathways play an important role in the pathogenesis of obesity, and future studies need to focus more on this issue.

**Keywords:** Obesity, Signaling pathway, MAPK signaling pathway, PI3K/AKT signaling pathway

## GİRİŞ

Yağ dokusundaki aşırı artış, hem anormal yağ hücresi lipid birikiminin (adiposit hipertrofisi) hem de hiperplazi olarak bilinen öncüllerinin katılımıyla yeni adipositlerin gelişmesinin bir sonucudur. Yağ dokusundaki bu artış sonucu ortaya çıkan obezite, tip 2 diyabetes mellitus, kardiyovasküler hastalıklar, metabolik sendrom, alkolsüz yağlı karaciğer hastalığı gibi bulaşıcı olmayan hastalıklarla sıklıkla birlikte görülen, gün geçtikçe kötüleşen bir sağlık sorunudur (Gustafson ve ark., 2019), (Shen ve ark., 2022). Obeziteye eşlik eden komorbiditeler, hastaların yaşam kalitesini kötüleştirir (Kivimäki ve ark., 2022). Bu da vücut kitle indeksi ile orantılı olarak sağlık bakım maliyetlerinde artışa karşılık gelir (Kent ve ark., 2019). Yakın zamanda obezite ve aşırı kilo prevalansındaki mevcut eğilim değişmezse, yaklaşık ekonomik maliyetlerin küresel gayri safi yurt içi hasılanın %3,29'una yükseleceği rapor edilmiştir (Okunogbe ve ark., 2021). Toplu olarak, obezitenin geç ve geri döndürülemez sonuçlarının tedavisiyle ilişkili olarak dünya nüfusuna gelen bu önemli sosyo-ekonomik yükler, dikkatleri obezitenin yönetiminde yenilikçi ve güvenli önleme ve erken müdahalelerin araştırılmasına çekmiştir (Müller ve ark., 2022).

Tüm canlı sistemler çevreleri hakkında bilgi edinir. Hücresel düzeyde bunu sinyal yolları aracılığıyla yaparlar. Bu tür yollar, hücre dışı bir işaretin veya sinyalin varlığını algılayan ve hücrenin iç kısmına ileten moleküller arasındaki tersine çevrilebilir bağlanma etkileşimlerine dayanır (Azpeitia ve ark., 2020). Bu etkileşimlerin oluşturduğu sinyal yollarının modüle edilmesinde yer alan eylemlerin anlaşılması, hastalıkların önlenmesi ve tedavisi için yararlı bilgiler sağlamaktadır (Keskin, 2023). Sinyal iletimine ilişkin gelişen bilgi, kişiselleştirilmiş tıpta yeni bir çağa girerken obezite araştırmalarının gelecekteki yönüne ışık tutabilmektedir. Sinyal iletim yolları ile obezite arasındaki ilişkiye ilişkin giderek artan sayıda kanıt bulunmaktadır; Obezitenin patofizyolojisi kapsamlı bir şekilde araştırılmıştır ve bu da obeziteyle daha etkili ve kesin bir şekilde mücadele edilmesini mümkün kılmaktadır (Müller ve ark., 2022).

Bilim ve teknolojideki gelişmelerin yanı sıra ilaç sektörünün de hızla büyümesiyle obeziteyle mücadelede büyük başarılar elde edilmiş; kalori kısıtlaması, yaşam tarzı yönetimi, farmakoterapi ve bariatrik cerrahi gibi çeşitli stratejiler obeziteye karşıtı çareler olarak önerilmiştir (Trepanowski ve ark., 2017), (Wolfe ve ark., 2016). Bununla birlikte, bu müdahaleler küresel boyuttaki tıbbi ihtiyaçları karşılama kapasitesine sahip değildir. Son zamanlarda iştahın düzenlenmesi ve periferik enerji emilimi, depolanması ve tüketimi ile ilgili çok sayıda faktör/sinyal ortaya çıkarılmıştır (Huang ve ark., 2019), (Xu ve ark., 2021). Bu ilerlemeler obezitenin ortaya çıkışının anlaşılmasına ışık tutmaktadır. Bu sinyal yollarının modüle edilmesinde polifenollerin rolü, yakın zamanda yapılan birçok çalışmanın konusu olmuştur (Keskin, 2023). Buna ek olarak, bu sinyalleri hedef alan bazı bileşikler klinik kullanıma dönüştürülmüştür. Örneğin, obeziteye karşıtı araştırmaların sıcak noktası olan iştah düzenlemesi, hem merkezi melanokortin yolu hem de leptin ve bağırsak hormonları gibi periferik sinyaller tarafından düzenlenir. Kan şekeri düzeylerini düşürebilen ve siklik adenosin monofosfat'a (cAMP) bağımlı sinyal yollarıyla insülin salgılanmasını teşvik ederek glikoz toleransını geliştirebilen bağırsaktan türetilen bir hormon olan glukagon benzeri peptid 1 (GLP-1), aynı zamanda anoreksijenik nöronları doğrudan uyarak iştahı da azaltabilir. Öte yandan oreksijenik nöronları γaminobütirik asit (GABA) bağımlı sinyal yoluyla baskılayabilir (Huang ve ark., 2019).

Obezitenin patofizyolojisi hala tam olarak anlaşılmamış olmasına rağmen, birçok yolla kontrol edilen heterojen bir sağlık sorunu olduğu yaygın olarak kabul edilmektedir. Obezitenin ortaya çıkması ve gelişmesinde yer alan sinyal yollarının giderek daha iyi anlaşılması, obeziteyle daha kesin bir şekilde mücadele etmemizi sağlar. Bu derlemede, obezitenin patogenezinde, özellikle iştahın düzenlenmesinde, yağ dokusu metabolizmasında ve fonksiyonunda, glikoz hemostazında ve enerji harcamasında yer alan bazı sinyal yollarının incelenmesi amaçlandı.

## MATERYAL VE METOT

Obezite sağlık sorununun patogenezinde sinyal yollarının öneminin daha iyi anlaşılmasını sağlamak amacıyla PubMed, Scopus, Web of Science ve Google Scholar veritabanlarını kullanarak literatür taraması yapıldı. Anahtar kelime olarak, obezite, sinyal yolu, mitojenle aktifleşen protein kinaz (MAPK) sinyal yolu ve fosfatidilinositol 3-kinaz (PI3K)/AKT sinyal yolu, kelimeleri kullanıldı. Alıntılama sayıları ve yayın tarihleri dikkate alınarak 35 makale seçildi. Ayrıca bu seçim, obezite patogenezine esasına dayalı olarak yapıldı.

Literatür taramasında en çok çalışma yapılan iki sinyal yolu, ana başlıklar altında kategorize edildi. Referans olarak değerlendirmeye alınan çalışmalarda ilgili sinyal yolu ile iştahın düzenlenmesi, yağ dokusu metabolizması ve fonksiyonu, glukoz hemostazı ve enerji harcaması arasındaki ilişkiye odaklanıldı.

## MEMELİ HÜCRELERİNDE SİNYAL İLETİMİNİN KRİTİK ARACI: MAPK SİNYAL YOLU

MAPK sinyali, hücre dışı uyarıları hücre içi sinyallere bağlayan bir kinaz kademesi içerir (Pudewell ve ark., 2021). MAPK tarafından gerçekleştirilen fosforilasyon ile, gen ekspresyonuna aracılık etmek ve proliferasyon, inflamasyon, farklılaşma ve apoptoz gibi hücrel olayları başlatmak için aşağı yöndeki transkripsiyon faktörleri aktive edilir (Sun ve ark., 2015). Hücre dışı sinyalle düzenlenen kinaz (ERK) 1/2, c-Jun N-terminal kinaz (JNK) ve p38 MAPK dahil olmak üzere MAPK sinyal yolu üyeleri iştah, adipogenez, glukoz homeostazisi ve termojenezin düzenlenmesinde önemli bir rol oynar (Kassouf ve Sumara, 2020).

MAPK aracılı iştah düzenlemesinin yanı sıra merkezi sinir sistemindeki diğer MAPK fonksiyonları da obezitenin patogeneze katkıda bulunur. ERK1/2, hipotalamik nöronlarda glukozla uyarılan proopiomelanokortin ekspresyonunu artırır ve anoreksijenik etkiye katılır (Zhang ve ark., 2015). Buna ek olarak MAPK sinyal yolu merkezi sinir sistemindeki JNK1 nakavtı, hipotalamik-hipofiz-tiroid ekseninin negatif geri bildirimini bloke ederek gıda alımını azaltır ve enerji harcamasını artırır (Sabio ve ark., 2010). p38 MAPK alt birimi nakavt veya inhibisyonu olan embriyonik farelerden alınan primer embriyonik fibroblastlarda ve yetişkin farelerden alınan preadipositlerde, PPAR $\gamma$  ekspresyonu artar, bu da p38 MAPK'nin adipogenez baskıladığını gösterir (Aouadi ve ark., 2006). Tersine, in vitro insan preadiposit farklılaşması sırasında p38 MAPK aktivitesinde artış gözlenir ve bu hücrelerde p38 MAPK'nin farmakolojik inhibisyonu, trigliseritlerin birikimini ve diğer adipogenez belirteçleriyle birlikte PPAR $\gamma$  ekspresyonunu azaltır (Aouadi ve ark., 2007). İnsan beyaz yağ dokusunda, artan hipertrofik adiposit sayısı aynı zamanda yukarı regüle edilmiş p38 MAPK sinyalleriyle de ilişkilidir ve fosforile edilmiş p38 MARK, açlık trigliserid, insülin ve glukoz düzeyleriyle bağlantılıdır (Bashan ve ark., 2007). Bu bulgular p38 MAPK'nın adiposit farklılaşması ve adipogenez üzerinde iki işlevli etkileri olduğunu göstermektedir.

MAPK sinyal yolu, insülin direncinin gelişiminde yakından rol oynar. MAPK sinyal yolunun birden fazla noktadan defosforilasyonu ve deaktivasyonu, insülin reseptör substrat-1'in tirozin fosforilasyon seviyesini ve insülin sinyal transdüksiyonuna aracılık etme kapasitesini eski haline getirir (Khoubai ve Grosset, 2021). Benzer şekilde, MAPK sinyal yolunun endojen bir aktivatörü olan kaspaz 9'un eksikliği, yüksek yağlı diyetin neden olduğu insülin direncini ve adiposit büyümesini azaltır (Zeng ve ark., 2018). Yüksek yağlı diyet ile beslenen farelerden alınan yağ dokularında, entegre multiomik analiz, makrofajlardaki MAPK sinyal yollarında inflamatuvar genlerin zenginleştiğini göstermektedir (Wang ve ark., 2021).

## HÜCRE BÜYÜMESİ VE ÇOĞALMASININ ÖNEMLİ BİR DÜZENLEYİCİSİ: PI3K/AKT SİNYAL YOLU

Hücre büyümesi ve çoğalmasının önemli bir düzenleyicisi olan PI3K/AKT sinyal yolunun anormal aktivasyonu, obezitenin gelişimini teşvik etmektedir (Sun ve ark. 2019). PI3K ve AKT, bu yoldaki hormonlar ve büyüme faktörleri gibi yukarı yönlü sinyaller tarafından etkinleştirilen iki ana düğümdür. PI3K aktivasyonu, fosfatidilinositol 4,5-bifosfatı fosfatidilinositol 3,4,5-trisfosfata dönüştürür, fosfoinositid bağımlı kinazları ve AKT'yi aktive eder ve ardından glikojen sentaz kinaz3, sırasıyla glikojen sentezini, glukoz alımını ve adipogenez düzenleyen forkhead box protein (Fox) ailesini aktive eder (Hemmings ve Restuccia, 2015).

PI3K/AKT sinyal yolunda katalitik bir alt birim olarak bulunan rapamisininin memeli hedefi (mTOR) çok çeşitli önemli hücrel süreçleri kontrol etme konusundaki olağanüstü yeteneğinden dolayı hücrel yaşlanmada önemlidir (Keskin ve ark., 2023). mTOR, mTORC1 ve mTORC2 olmak üzere iki farklı kompleks oluşturur. mTORC1 ve mTORC2 PI3K/AKT/mTOR sinyal yolunda farklı hareket eder ve her ikisi de obezitenin patogeneziyle yakından ilişkilidir. mTOR ayrıca merkezi ve periferik sistemlerde iştahın düzenlenmesine de katkıda bulunur. Hipotalamusta mTOR'un uyarılması, proopiomelanokortin nöronlarını aktive ederek gıda alımını azaltır ve hayvan çalışmalarında yaşa bağlı obeziteyi iyileştirir. PI3K/AKT yolu, merkezi sinir sistemi ve periferik dokular yoluyla iştahı düzenler. Leptinin hipotalamusun mediobazal kısmına etki ederek kısmen PI3K-AKT-FoxO1 yoluyla gıda alımını baskılamaktadır (Kwon ve ark., 2016). PI3K'nın seçici inhibisyonunun leptinin etkisini ortadan kaldırdığı rapor edilmiştir (Hill ve ark., 2008).

PI3K/AKT yolu, insülin sinyal yolu için vazgeçilmezdir. Bu sinyalin düzensizliği obezitenin ciddiyeti ve insülin direnciyle ilişkilidir (Li ve ark., 2017). AKT aktivitesi ile vücut yağ yüzdesi arasında negatif korelasyon hem hayvan modellerinde hem de insanlarda bulunmuştur ve obez popülasyondaki insülin direncinden AKT sorumlu olabilir (Friedrichsen ve ark., 2010), (Mackenzie ve Elliot., 2014). PI3K/AKT sinyalleşmesinin inhibisyonu, glikoz taşıyıcı 4 (GLUT4) depolama keseciklerinin bir elemanı olan Sort1'in bozulmasına yol açar ve insülin duyarlılığını azaltır (Li ve ark., 2017).

## SONUÇ

Sonuç olarak MAPK sinyal yolu, iştah kontrolü, glukoz seviyelerinin dengelemesi ve vücut ısısının ayarlanması gibi işlevlerin yanı sıra yağ hücrelerinin oluşumu ve gelişimi üzerinde önemli etkilere sahiptir. Aynı zamanda insülin direncinin gelişiminde de rol oynar, bu da obezitenin patogeneziyle yakından ilişkilidir. PI3K/AKT sinyal yolu da, anormal aktivasyonunda obezitenin gelişimini teşvik etmesinin yanı sıra obez popülasyondaki insülin direncinden AKT sorumlu olabilmektedir. Aynı zamanda merkezi sinir sistemi ve periferik dokular yoluyla iştahı düzenlemesine ve leptin salınımına etki ederek gıda alımını baskılamasına katkıda bulunarak obezitenin patogeneziinde önemli rolü olan diğer sinyal yoludur. Obezitenin ve neden olduğu birçok sağlık sorununun tedavi maliyetini en düşük düzeylere indirmek ve toplumdaki sağlıklı birey oranlarını en yüksek düzeylere yükseltmek amacıyla obezitenin önlenmesine yönelik çalışmalar artarak devam edecektir. Bu çalışmalarda, sinyal yollarının iştah düzenlemesi, yağ dokusunun metabolizması ve fonksiyonu, glukoz dengelemesi ve enerji harcaması arasındaki ilişkiler öncelikli bir öneme sahip olacaktır.

#### Abstract

Monocrotaline (MCT) is a pyrrolizidine alkaloid that causes hepatotoxicity in animals and humans. Humans are exposed to toxic PAs through consumption of PA-containing plants, PA-contaminated foods, herbal medicines, tea, and honey. The aim of this study is to examine biochemical changes in mice administered intragastric MCT. For this purpose, 30 male BALB/c mice were divided into three groups: control, acute toxicity and subacute toxicity. The control group received 0.9% saline three times in total, with an interval of 5 days. While a single dose of MCT was administered at a dose of 120 mg/kg to the acute toxicity group, MCT at a dose of 120 mg/kg was administered to the subacute toxicity group three times in total with an interval of 5 days. At the end of the trial, plasma AST, ALT, GGT, TBIL, TCHO and TPro levels were determined. Among the biochemical parameters evaluated within the scope of the study, AST, ALT, GGT, TBIL and TCHO levels were found to be higher in the trial groups. However, while there was no statistical difference between the groups in AST enzymatic activity, one of the hepatocellular damage markers, ALT enzymatic activity was found to be significantly higher in the acute toxicity group than in the control group. When GGT and TBIL levels, which are hepatobiliary damage markers, were examined, they were found to be higher and more significant in the acute toxicity group than in the control and subacute toxicity groups. Unlike other parameters, it was found that there was a decrease in TPro levels in the trial groups receiving MCT compared to the control group, and this decrease was statistically significant in all groups. As a result, it was observed that MCT administered intragastrically to mice played a role in the formation of hepatocellular and hepatobiliary damage.

**Keywords:** Monocrotaline, hepatotoxicity, biochemical parameter, mouse

#### INTRODUCTION

At the meeting of the joint expert committee (JECFA) formed by the World Health Organization (WHO) and the Food and Agriculture Organization (FAO), held in 2020, the toxicity of pyrrolizidine alkaloids (PA) was emphasized and of critical importance for health (WHO, 2020).

Pyrrolizidine alkaloids (PAs) are toxins of plant origin, produced by approximately 6000 plant species, consisting of a nesine base combined with one or two nescic acids via ester bonds (Xu et al., 2019; WHO, 2020). It is known that more than 600 unsaturated PAs and a large portion of their nitrogen oxides (N-oxides) produced by some plant species are hepatotoxic (Fu et al., 2004; Edgar et al., 2015).

People are exposed to toxic PAs through consumption of PA-containing plants, PA-contaminated foods, herbal medicines, tea and honey (Mulder et al., 2015; Zhu et al., 2018; He et al., 2020). Various plant products are frequently contaminated with PAs during mechanical harvesting processes. This is a possible source of exposure not only for humans but also for animals (Edgar et al., 2011; Dusemund et al., 2018; He et al., 2020). In particular, the exposure of farm animals such as cattle, sheep and goats to PA causes the presence of PA in animal products such as meat, milk or dairy products and increases the PA exposure of humans (EFSA, 2011; Mulder et al., 2016)

Hepatic sinusoidal obstruction syndrome (HSOS), liver damage, liver cirrhosis, pneumotoxicity and pulmonary hypertension have been reported to occur when exposed to PA due to various reasons (Ward et al., 2008; Rubbia-Brandt, 2010; Agostini et al., 2012). When the animals used in the experimental studies were examined, it was stated that hepatocellular necrosis was detected as a major and consistent finding, and similar findings were observed in humans after the consumption of wild herbs contaminated with seeds containing PA (Stewart and Steenkamp, 2001).

Numerous cases of human and animal poisoning by pyrrolizidine alkaloids were reported around the world (Karagöz et al., 2013). More than 4000 people were hospitalized in Tajikistan in 1992 due to consumption of grain contaminated with pyrrolizidine alkaloids (Chauvin et al., 1993; Mayer and Luthy, 1993; He et al., 2021a), and in Ethiopia, as of 2011, a total of 1033 people were reported to be affected, including 314 deaths (CDC, 2012; Robinson et al., 2014; Chiu et al., 2016). In China, where traditional herbal medicine is extensively practiced, a total of 2214 PA-induced liver injuries, including more than 200 deaths, have been reported due to the consumption of a PA-containing plant (*Gynura japonica*) (Zhu et al., 2021).

The liver, located in the metabolic center of the living body, is a very important organ for removing toxic substances from the body. Starting from this point, the main purpose of the study is to determine the effect of unintentionally exposed MCT, one of the pyrrolizidine alkaloids, on some biochemical parameters that play a critical role in the hepatic damage process. In this context, alanine aminotransferase (ALT), aspartate aminotransferase (AST), gamma-glutamyl transferase (GGT), total bilirubin (TBIL), total cholesterol (TCHO) and total protein (TPro) values will be examined. In this way, differences between control and experimental (acute and subacute toxicity) groups can be determined.

## MATERIALS AND METHODS

### Research and Publication Ethics:

The study design was approved by the Animal Experiments Local Ethics Committee of the University of Kırıkkale (Decision no. 2023/01).

### Material:

Study material: 30 male BALB/c mice, 6-8 weeks old, weighing 20-25 g were created. The animals were housed in plastic cages at a controlled room temperature (22-25 °C) and 55-60 % humidity with 12:12-h light-dark cycle in Kırıkkale University Hüseyin AYTEMİZ Experimental Research and Application Center.

### Experimental design:

They were fed with commercial standard dry pellet rat food and water ad libitum during the study and acclimated for two weeks before the experiment. Afterwards, they were randomly divided into three groups, including control, acute toxicity and subacute toxicity and the practices given in Table 1 were performed.

**Table 1.** Experimental Groups and Practices

Group name	Practices	Number of mice (n)
<b>Control Group (Group 1)</b>	Only intragastric saline was administered to the mice. The application started on day 0 of the experiment and continued 3 times in total, with 5-day intervals. The experiment was terminated at the 48th hour following the last application.	10
<b>Acute Toxicity Group (Group 2)</b>	MCT was administered intragastrically to mice at a dose of 120 mg/kg. The application was made once and on the 0th day of the experiment. The experiment was terminated at the 48th hour following the application.	10
<b>Subacute Toxicity Group (Group 3)</b>	MCT was administered intragastrically to mice at a dose of 120 mg/kg. The application started on day 0 of the experiment and continued 3 times in total, with 5-day intervals. The experiment was terminated at the 48th hour following the last application.	10

At the end of the experimental periods specified in Table 1, the animals were anesthetized and sample collection was carried out. For this purpose, xylazine (Rompun®) was administered intraperitoneally at a dose of 10 mg/kg as preanesthetic (Özden et al., 2020), and ketamine (Ketasol®) was administered intraperitoneally at a dose of 90 mg/kg to ensure deep anesthesia (Akbulak et al., 2021).

Then, the abdominal and chest cavities of all mice were opened, blood samples were collected into the heparinized test tubes for biochemical analysis, via cardiac puncture and plasma was removed after centrifugation at 3000 rpm for 10 minutes (Çınar et al., 2021). Blood plasma samples were aliquoted into eppendorf tubes and stored in the deep freezer (-80 °C) until analysis.

#### Biochemical analysis:

The plasma samples were analyzed for AST, ALT, GGT, total bilirubin, total protein and total cholesterol with biochemistry autoanalyzer for biochemical evaluation. Measurements were carried out on the Mindray BS-400 Biochemistry autoanalyzer and with commercially purchased test kits.

#### Statistical analyses:

Descriptive analysis and normality tests of all data obtained from each group were performed with SPSS 20.0 package program. Results were presented as mean ± standard error mean (Mean±SE'). One-way analysis of variance (ANOVA) was applied to show the difference between groups. The lower P value than 0.05 was considered as statistically significant. When the P value was significant, Duncan's Multiple Range test was performed.

## RESULTS

The levels of some serum biochemical parameters of the control and experimental groups are given in Table 2.

**Table 2.** Some Biochemical Parameters of Control and Experimental Groups ( $\bar{x} \pm SH$ ) (n=10)

Parameters	Control	Acute Toxicity	Subacute Toxicity	P
AST (U/L)	90,60±7,36	137,72±19,04	112,33±9,76	>0,05
ALT (U/L)	90,96±4,96 <sup>b</sup>	124,20±12,60 <sup>a</sup>	106,08±7,45 <sup>ab</sup>	≤0.05
GGT (U/L)	2,46±0,37 <sup>b</sup>	6,22±0,70 <sup>a</sup>	2,65±0,28 <sup>b</sup>	<0.001
Total bilirubin (mg/dl)	1,31±0,32 <sup>b</sup>	3,69±0,27 <sup>a</sup>	1,75±0,40 <sup>b</sup>	<0.001
Total cholesterol (mg/dl)	36,80±2,40	40,40±1,57	39,90±1,62	>0,05
Total protein (mg/dl)	5,87±0,10 <sup>a</sup>	4,93±0,14 <sup>c</sup>	5,48±0,07 <sup>b</sup>	<0.001

Among the biochemical parameters evaluated within the scope of the study, AST, ALT, GGT, total bilirubin and total cholesterol levels were observed to be higher in the trial groups. However, while there was no statistical difference between the groups in AST enzymatic activity, one of the hepatocellular damage markers, ALT enzymatic activity was found to be significantly higher in the acute toxicity group than in the control group. When GGT and total bilirubin levels, which are hepatobiliary damage markers, were examined, they were found to be higher and more significant in the acute toxicity group than in the control and subacute toxicity groups. There was no statistical difference in total cholesterol levels, which were similar in all groups. Unlike other parameters, decreased total protein levels were found to be statistically significant among all groups.

## DISCUSSION

Determination of biochemical parameters provides important information in terms of reflecting the functions of organs and metabolic events (Etim, 2014). In this way, it is possible to confirm clinical diagnoses, evaluate the course of the disease, evaluate the results, and apply the appropriate treatment (Karagül et al., 2000). In the presented study, the effects of monocrotaline, one of the pyrrolizidine alkaloids (PA) that can be heavily exposed to many types of plant and animal foods, on some biochemical parameters were evaluated. In particular, AST, ALT, GGT, total bilirubin, total protein and total cholesterol levels were examined because PAs, which pose a risk to public health, have protoxin properties and develop toxicity after metabolic activation in the liver.

In a study conducted by Ren et al (2023), at a dose of 90 mg/kg given MCT intragastrically, statistically significant higher serum AST, ALT, and total bilirubin levels, lower serum Alb levels were observed in the MCT-treated group than those in the control group. Similarly, when Yamashita et al (2002) administered MCT intragastrically at a dose of 100 mg/kg, they demonstrated the hepatic damage caused by MCT with high serum AST, ALT and total bilirubin levels. Srinivasan and Liu (2012), who investigated acute monocrotaline poisoning, they reported that AST and ALT activity and hepatic injury had peaked 24 hours after acute monocrotaline poisoning.

In the study in question, it was observed that AST, ALT, GGT enzymatic activities and total bilirubin levels, which are the criteria for determining hepatocellular and hepatobiliary, were increased in the experimental groups compared to the control group.

However, it was determined that AST was not statistically significant, while ALT, GGT enzymatic activities and total bilirubin levels were statistically significant in the acute toxicity group that was euthanized at the 48th hour. Additionally, lower serum total protein levels were observed in the MCT-treated groups than those in the control group. Looking at the total protein levels in Table 2, it can be seen that there is a statistically significant difference between both the control group and the MCT-administered trial groups. No statistically significant difference was found in total cholesterol levels, one of the biochemical parameters evaluated within the scope of the study.

It was observed that the data obtained were compatible with the literature and that MCT application at a dose of 120 mg/kg caused changes in hepatocellular and hepatobiliary system parameters, which are criteria for demonstrating liver damage. When a comparison was made between the experimental groups included in the study, it was observed that the biochemical values of the acute toxicity and subacute toxicity groups showed a similar increase or decrease compared to the control group. While there was no difference in AST, ALT and Total cholesterol levels between the two groups in which MCT was applied, GGT, total bilirubin and total protein levels were found to be statistically significant.

## CONCLUSION

As a result, it was determined that MCT administration at a dose of 120 mg/kg to BALB/c mice affected the levels of AST, ALT, GGT, total bilirubin and total protein, which are the criteria for detecting hepatic damage. It was concluded that presenting new studies in which advanced techniques will be used and different doses and administration routes will be experienced will contribute to the literature in order to examine the damage caused by pyrrolizidine alkaloids exposed to various food contaminations from a broad perspective.

## ACKNOWLEDGEMENT

This study was funded by the Scientific and Technological Research Council of Turkey (TUBITAK 1002-A Project No. 2220862) and was produced from a part of the first author's doctoral thesis.

#### Abstract

Anthropogenic disturbances, dating back millennia and increasingly intensifying, have caused the devastating increase in greenhouse gases and the Earth's climate to deviate from its natural cycle. Climate change has been an ongoing fact since the Swedish scientist Svante Arrhenius first articulated in 1896 that the amount of carbon dioxide released into the atmosphere due to human activities could lead to global warming. The literature defines climate change as a long-term change in the statistical properties of the climate system. It is demonstrated by an unusual distribution around the recorded mean over an average period of 30 years. The Intergovernmental Panel on Climate Change "Special Report on the Impacts of Global Warming of 1,5 °C" warned that "climate-related risks to health, livelihoods, food security, water supply, human security, and economic growth will escalate at 1,5°C and worsen beyond 2°C. Climate change exerts its influence not solely on crop production and food security but also extends its impact on food safety and the incidence and prevalence of food-borne diseases.

Climate change's influence on microorganisms is in alterations in metabolic activity, shifts in mortality rates, fluctuations in biomass, heightened biodiversity, and adverse or favourable effects on their physiological functions. Within the context of Sustainable Food Biosecurity, alterations in climatic factors are poised to exert significant impacts on (i) sources and modes of transmission, (ii) growth and survival, and (iii) the ecological dynamics of pathogens within the food supply chain. In the most optimistic scenario, it has been proposed that coupled with climate change, pathogenic microorganisms could potentially lead to food contamination at any stage of the production process, spanning from the farm to the consumer's table. Climate change has been posited to influence the prevalence of climate-sensitive infectious diseases categorised as water-borne, food-borne, and vector-borne.

**Keywords:** Climate Change, Sustainable Food Biosecurity, Pathogenic Microorganisms

#### Introduction

In the current discourse, we may say that climate change has gained increased prominence, standing out as one of the foremost threats confronting both Earth's ecosystems and human societies. The United Nations 1994 formally delineated climate change as "a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is, in addition to natural climate variability, observed over comparable periods." (United Nations, 1994). This phenomenon was initially articulated in 1896 by the Swedish scientist Svante Arrhenius, who posited that carbon dioxide emissions to the atmosphere by human activity could precipitate global warming (Arrhenius, 1896). From the point of literature perspective, climate change is characterised as a long-term change in statistical properties of the climate system and is demonstrated by an unusual distribution around the recorded mean over an average period of 30 years (Delcour et al., 2015). By the onset of the Industrial Revolution at the end of the eighteenth, anthropogenic destructions, such as agricultural activities, burning of fossil fuel, and deforestation have culminated in global climate change (Grace et al., 2019). These anthropogenic endeavours significantly contribute to the release of greenhouse gases (GHG), notably carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and nitrous oxide (N<sub>2</sub>O), which serve as the primary agents responsible for instigating climate change (Filho et al.,

2022). The nomenclature 'greenhouse' originated from the capability to retain these gases' solar heat, thereby making the atmosphere warmer (IPCC, 2007).

Let us delve into the historical context and the ominous trajectory of climate change. Throughout the last 650 millennia, there has been a pronounced escalation in the atmospheric concentration of carbon dioxide (Bergot et al., 2004). Notably, within the preceding two decades, the expansion rate in greenhouse gas concentrations, particularly encompassing carbon dioxide, methane, and nitrous oxide, have accelerated compared to prior decades (Boland et al., 2004; Grace et al., 2019). Furthermore, it is noteworthy that the average global surface temperature has demonstrated an ominous increase, registering a rise of 0.2°C per decade over the past three decades (Boland et al., 2004; Grace et al., 2019). The climatic factors subject to influence encompass temperature, relative humidity, precipitation, and ultraviolet (UV) radiation. These influences give rise to climate variability or alterations in climate conditions, thereby impacting ecosystems. These alterations are discernible through persistent temperature increments, shifts in precipitation quantity and patterns, elevated levels of carbon dioxide and ozone, modifications in the water cycle, and instances of drought. Notably, these transformations are anticipated to persist, even in the event of greenhouse gas concentrations reaching a state of stabilisation. This continued impact can be attributed to the thermal inertia of the system and the protracted timeframe required for the system to return to a lower equilibrium state (Boland et al., 2004; Grace et al., 2019).

When we direct our attention toward apprehensive future scenarios about climate change, the Intergovernmental Panel on Climate Change (IPCC) (driven by four methods for population, economic growth and carbon use, global climate models) have predicted global warming ranging from 1.7 to 4.8 °C and a rise in the mean global precipitation of 5 to 15% by the end of the century. (IPCC, 2014). The researchers have suggested that a significant shift in the variables may induce meteorological hazards (extreme weather events, with weather variables and frequency below or above the fixed mean threshold) as well as natural calamities, which are sudden localised extreme hydrological, geophysical, meteorological, or climatological events (Duchenne-moutien and Hudaa Neetoo 2021).

Amid the array of climate change-related hazards, it is discerned that (i) mycotoxin and marine biotoxin contamination, (ii) environmental residues stemming from diverse anthropogenic activities, and (iii) zoonotic diseases stand out as emergent risks to human life influenced by climatic factors. This paper aims to provide a comprehensive overview of the prospective ramifications of climate change on both the food industry and food safety, particularly concerning microbial spoilage throughout various stages of the food supply chain.

## **Climate Change and Food Industry**

### **Food Production and Climate Change**

It is advantageous to approach the ramifications of climate change on the food industry from diverse perspectives because climate change does not only mean an increase in average global temperature. The domino effect of climate change includes extreme weather events and natural disasters such as floods, droughts, hurricanes, tsunamis, etc., increased frequency of heavy rainfall events, prolonged dry periods, water acidification and potential rise in sea level. FAO (2008) states that these climate change-related disasters may primarily affect agriculture, fisheries and animal husbandry (FAO, 2008). It is inescapable that the food industry, which relies heavily on agricultural, livestock, and fisheries inputs, will experience direct and/or indirect impacts attributable to climate change on a global scale. Researchers anticipate that the agricultural sector will be most vulnerable to climate change when compared to livestock production or fisheries, as noted by Misiou and Koutmanis (2022). The impact of climate change will manifest prominently for both biotic populations and abiotic factors that play a role in agriculture. Climate changes will influence microbial populations, including insects, pests, vectors, and soil microorganisms, subsequently impacting the prevalence of microorganisms like fungi and viruses. In addition, abiotic factors, such as air pollution, nutrient deficiencies, and extreme temperatures, will affect soil quality, plant health, and crop productivity, as indicated by the Food and Agriculture Organization (FAO, 2008). Nelson et al. (2009) briefly encapsulate the impact of climate change on agriculture as follows:

- (i) Climate change is anticipated to diminish yields for critical crops in developing nations.
- (ii) The effects of climate change on irrigated yields will exhibit variability.
- (iii) Climate change will trigger price escalations for essential agricultural staples, including rice, wheat, maize, and soybeans.

(iv) Elevated feed costs are likely to translate into higher meat prices, resulting in a modest slowdown in meat consumption growth and a more substantial decline in cereal consumption.

(v) Relative to 2000 levels, the availability of food energy in 2050 is projected to decrease.

Soil properties are vulnerable to the effects of climate change. Nevertheless, due to the intricate and uncertain interplay among minerals, chemicals, soil microbial communities, and meteorological phenomena, assessing the consequences of climate change on soil quality and plant growth remains challenging. A more comprehensive comprehension of these interactions, necessitating a multidisciplinary approach, is imperative to enable a pragmatic assessment of climate change on soil quality (Misiou and Koutmanis, 2022).

Soil microbes play a pivotal role in facilitating various essential processes in crop production, including biological nitrogen fixation, nutrient accumulation and utilisation, root and shoot development, disease regulation, and soil quality improvement. The forecasted implications of climate change include alterations in soil microbial composition, given that temperature is one of the pivotal determinants influencing the growth rate of organisms. Higher temperatures trigger consequential alterations in the lipid compositions of cell membranes as part of a physiological response. This temperature increase initiates a cascade of effects, including the loss of labile carbon in the soil, a reduction in the abundance of fungi and Actinobacteria, and an increase in the prevalence of Oligotrophic bacteria, leading to significant shifts within the ecosystem (Jansson et al., 2019). It is estimated that a vast microbiome comprising 40,000 to 50,000 species exists within a gram of soil. In response to climatic changes, bacterial, archaeal, and fungal hyphal communities within the soil undergo modifications, resulting in changes in community structure, a decline in their numbers, and a transition to a dormant state. These alterations also manifest in modifying the soil microbiome composition and reducing its quality, ultimately impacting soil fertility (Berhe et al. 2018). Anticipations suggest that changes in soil microbe composition will lead to modified functional profiles among soil microbes. One notable alteration involves the promotion of Oligotrophic Taxa, which are microbes with a slower growth rate and an ability to thrive in nutrient-poor conditions, over Copiotrophic Taxa, which are microbes adapted for nutrient-rich environments. This shift is attributed to soil warming.

Consequently, this change is expected to influence the cycling of essential elements such as phosphorus, sulphur, and nitrogen in the soil. As warming increases soil inorganic nitrogen levels and expands the plant nitrogen pool size, it concurrently suppresses microbial decomposition rates and alters nitrogen cycling dynamics (Naylor et al., 2020). Furthermore, climate change impacts the microbiome's respiration, affecting soil carbon and nitrogen levels.

Cultivated crops exhibit a heightened susceptibility to fluctuations in climatic conditions. While one might anticipate positive outcomes regarding enhanced CO<sub>2</sub> concentrations and elevated temperatures concerning crop yields, in the context of rice production, the fact that temperature extremes emerge as a significant constraining factor. Furthermore, the evidence underscores that the impact of CO<sub>2</sub> is more pronounced in C3 plants than C4 plants, owing to inherent physiological distinctions (Mirón et al., 2023).

Climate change may have deleterious impacts on food quality, particularly with regard to critical factors such as protein and starch concentrations, which can significantly influence taste and mineral concentrations that play a pivotal role in consumer nutrient intake. This phenomenon finds support in evidence indicating that heightened levels of CO<sub>2</sub> are associated with diminished protein content and reduced quantities of essential minerals, including calcium, sulphur, magnesium, iron, and other trace elements, within the grain (Mirón et al., 2023).

Conversely, factors impacting fodder production can exert profound effects on animal nutrition, thereby influencing the production of food products of animal origin. Empirical findings from studies examining the repercussions of climate change on husbandry reveal the following (Mirón et al., 2023)

(i) Genetically selected animals are more sensitive to environmental changes

(ii) Lower dairy production and greater heat-related mortality

(iii) Lower growth index

(iv) Changes in fertility, increases in mortality due to heat, and economic losses

Both fishing and aquaculture face significant vulnerability in the current climate change scenario, as global trends reveal a noteworthy elevation in ocean temperatures and widespread ocean acidification. Based on empirical findings from a study, the acidification of oceanic waters resulting from heightened atmospheric

CO<sub>2</sub> concentrations has been observed to have immediate and direct consequences on calcareous marine species, particularly molluscs such as oysters, clams, and sea snails (Kornder et al., 2018).

### Climate Change's Effect on Sustainable Food Biosecurity

Climate change has been recognised as a potential catalyst for the increased contamination of water and food by bacteria, viruses, and pathogens. Several climatic factors, including temperature, humidity, and extreme weather events, can alter the conditions affecting these agents' survival and transmission patterns. These encompass alterations in the occurrence, persistence, dominance, and toxicity of marine and freshwater algal blooms, bacteria, fungi, viruses, parasites, and vectors pathogenic to plants and animals. Within the context of Sustainable Food Biosecurity, alterations in climatic factors are poised to exert significant impacts on (i) sources and modes of transmission, (ii) growth and survival, and (iii) the ecological dynamics of pathogens within the food supply chain. For instance, shifts in temperature can potentially disrupt the reproductive cycles of pathogens, leading to changes in their distribution and proliferation. In certain regions, this may even give rise to the emergence of novel pathogens specifically adapted to particular hosts (Duchenne-moutien and Hudaa Neetoo 2021).

Consequently, more significant outbreaks caused by highly persistent pathogens in the environment, temperature or pH-resistant strains, or those with low infectious thresholds become more likely. Such pathogens include *Mycobacterium avium*, *Salmonella* spp., *Shigella* spp., enterohaemorrhagic *Escherichia coli* (*E. coli* O157:H7), enteric viruses, and parasitic protozoa. As a result, the risks associated with water and food-borne infectious diseases may escalate, potentially leading to the emergence of new risks (FAO, 2020; EFSA, 2020).

Temperature and precipitation are two pivotal climatic factors significantly impacting the incidence of food-borne diseases. In the most optimistic scenario, it has been postulated that temperature escalation may result in (i) Augmented prevalence of parasites in freshwater fish and aquatic plants, (ii) Identification of novel mycotoxin-producing fungal species in European maize crops, (iii) Elevated incidence of mastitis in cattle, (iv) Enhanced prevalence of *Salmonella* in poultry, and (v) A heightened abundance of *Vibrio* cells in seafood. In the event of a temperature decline, it is predicted that there will be an elevated risk of Norovirus and hepatitis A contamination in fruits.

In the event of Internalization of an increase in precipitation, it is predicted that there will be (i) internalisation of pathogenic *E. coli* and *Salmonella* in leafy green vegetables, (ii) increased contamination of seafood by faecal indicator organisms due to water runoffs, (iii) increase risk of splash dispersal and aerosolised *Salmonella* infecting tomatoes due to increased frequency of short period of heavy rainfall (Duchenne-moutien and Hudaa Neetoo 2021).

Mycotoxins represent secondary metabolites synthesised predominantly by filamentous fungi, primarily belonging to the genera *Aspergillus*, *Fusarium*, *Penicillium*, and *Alternaria*. Among these mycotoxins, the most profoundly toxic include aflatoxins, zearalenone, trichothecenes, fumonisins, and ochratoxins, which are notable for their carcinogenic and immunosuppressive properties, which have adverse effects on both humans and animals. Mycotoxigenic fungi have the potential to infect a diverse range of staple crops, dried fruits, feed crops, fruits, and vegetables and have the potential to pose threats to the safety of these food items. The primary climatic determinants influencing the occurrence and prevalence of mycotoxigenic fungi encompass temperature, humidity, and precipitation. Additionally, a subtle increase in carbon dioxide (CO<sub>2</sub>) levels has been recorded to exert an influence, particularly when interacting with temperature and water availability. Variations in these crucial factors may engender food safety apprehensions with regard to mycotoxigenic fungi (Duchenne-moutien and Hudaa Neetoo 2021).

## Conclusion

Climate change exerts its influence not solely on crop production and food security but also extends its impact on food safety and the incidence and prevalence of food-borne diseases. Global warming exerts an effect on all microorganisms, encompassing spoilage bacteria and fungi. Consequently, an augmented risk of microbial spoilage is anticipated for food items, including dried products and non-refrigerated processed foods. In the most optimistic scenario, it has been proposed that coupled with climate change, pathogenic microorganisms could potentially lead to food contamination at any stage of the production process, spanning from the farm to the consumer's table. Among the various facets of this complex issue, the most critical and overlooked aspect, the microbiological spoilage of foods, warrants a heightened level of preparedness from both the food industry and policymakers.

It is conspicuously necessary to grapple with the implications of climate change and adopt multidisciplinary approaches, fostering a comprehensive understanding and identification of latent emerging risks.

#### Abstract

The heavy metal pollution constitutes a pressing environmental problem. Even if heavy metals have entered the organism in trace amounts by respiratory or skin, they are slow to be removed from metabolism and therefore reach dangerous dose as a result of accumulation. The effects that this dangerous dose will create in the body vary depending on the accumulation concentration, chemical properties, ion status, redoxing ability, solubility and complexization of heavy metal. This problem has stimulated great efforts to develop treatment sustainable techniques for the heavy metal removal from wastewater including chemical oxidation, ion exchange, precipitation, adsorption, coagulation and flocculation, filtration, reverse osmosis, biosorption and membrane separation. This review focuses on experimental studies in the literature of using several biological materials for the biosorption of heavy metals from wastewater and we concluded that biosorption is successful techniques because of its high removal activity, economic effectiveness and environment friendly.

**Keywords:** Biosorption, wastewater, biomass, heavy metal.

#### INTRODUCTION

Heavy metals; It is defined as metallic elements with high specific gravity, which can have a toxic effect at low concentrations (Velarde et al., 2023). It is known that heavy metals with carcinogenic effects cause damage to DNA. Unprotected exposure in the same environment as some heavy metals accumulating in the brain and all other tissues causes serious poisoning. Different methods have been proposed for the removal of the mentioned pollution, including chemical precipitation, chemical oxidation or reduction, filtration, ion exchange, reverse osmosis, biosorption, electrochemical treatment, evaporation, advanced oxidation processes and membrane technologies (Fei and Hu, 2023). Although many methods have been used in the treatment of wastewater containing heavy metals, the use of biological materials has increased in the removal of heavy metals from wastewater due to their lower cost. The biosorption method, which provides the removal of heavy metals using biosorbents, can be given as an example. Live or non-living biological materials can be used as biosorbents and the reason why the method is preferred is that the biological materials used in biosorption are generally cheap and abundant (Beni and Esmaeili, 2020). In this study, the usability of the biosorption method was examined and studies in the literature were mentioned.

#### HEAVY METALS AND THEIR HARMFUL EFFECTS ON HUMAN HEALTH

“Heavy metals” refer to metal and metalloids that have an atomic density greater than 5 g/cm<sup>3</sup> and its pollution has become a global environmental problem (Aryal et al., 2022). Heavy metals with serious toxic hazards to human body include lead (Pb), mercury (Hg), cadmium (Cd), chromium (Cr), nickel (Ni) and arsenic (As) (Wang and Matsushita, 2021). Heavy metal accumulation in the human body can cause serious health issues such as cellular poisoning, brain damage, cancer, neurotoxicity, renal damage, genotoxic abnormalities, pulmonary diseases, birth defects, diabetes, intestinal irritation, allergic reaction on the skin, chronic anemia, asthma, diarrhea and cardiovascular diseases (Mishra et al., 2021) (Figure 1). Therefore it is a necessity to develop sustainable techniques for the removal of heavy metals from wastewater.

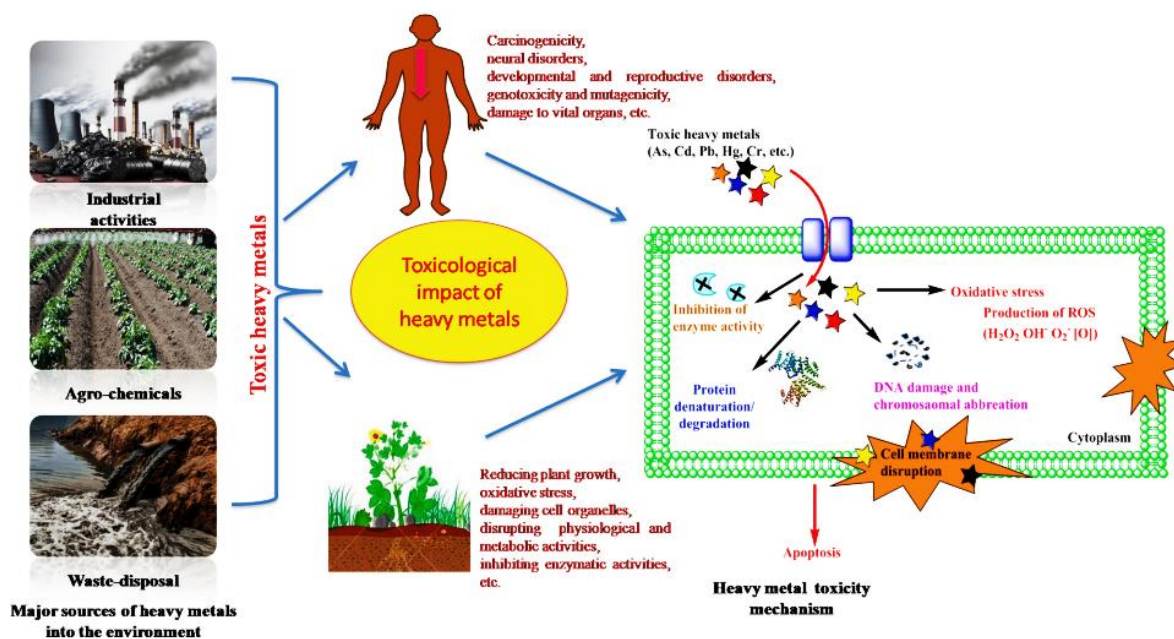

Figure 1. Toxicological impact of heavy metals (Mishra et al., 2021).

## CONVENTIONAL METHODS FOR HEAVY METAL REMOVAL FROM WASTEWATER

In the last decade, several processes treat water containing heavy metals including chemical oxidation, ion exchange, precipitation, adsorption, coagulation and flocculation, filtration, reverse osmosis, catalysis, biosorption and membrane separation (Jyoti et al., 2022). Performance comparison of these methods for heavy metal removal are given in Table 1.

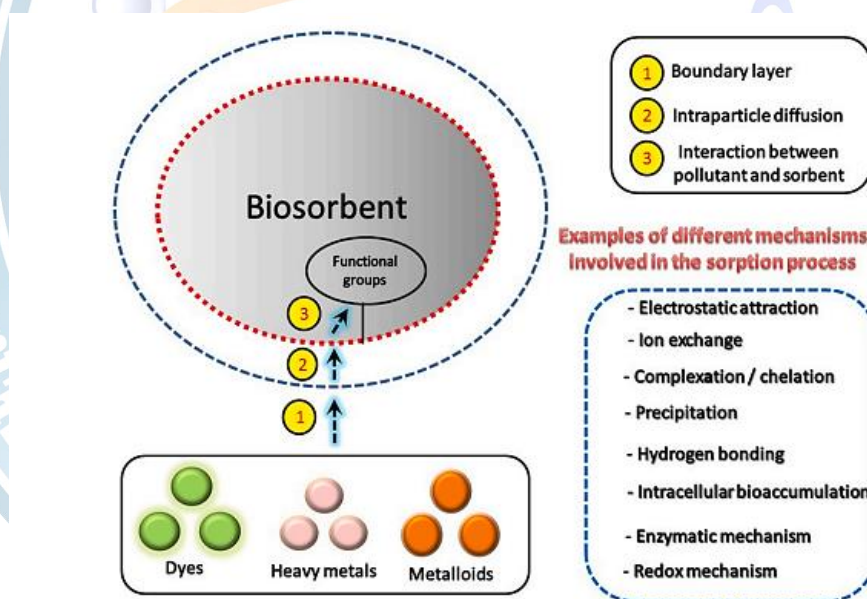

Table 1. Performance comparison of conventional methods for heavy metal removal (Fei et al., 2023; Jyoti et al., 2022).

Method	Advantage	Disadvantage
Reverse osmosis	Resistance to high temperatures	High pressure requirement
Ion exchange	High efficiency	Low capital cost, high maintenance cost
Membrane separation	Simple operation	Membrane fouling
Catalysis	High efficiency for chelating wastewater	High operation cost
Flotation	High efficiency and selectivity	High capital, operation, and maintenance cost

The flotation method is widely used in heavy metal removal due to its high metal selectivity. In this method, which is intended to be removed from the wastewater phase of heavy metal particles, high cost is undesirable. In the reverse osmosis method, it separates the dissolved salts of heavy metals from a semi-permeable membrane and wastewater and fresh water. In the method, a certain concentration of salt is added to the compartment where the wastewater is present and the formation of osmotic pressure is ensured. With a higher-pressure application than osmotic pressure, the passage through the membrane is ensured and heavy metal cations can be separated from the water in which they are located (Fei et al., 2023). Adsorption has been the most used method for removal of heavy metals from wastewater. Physical, exchange and chemical adsorption are carried out in the removal of pollution. It starts with the transfer of the heavy metal ions from the solution to the surface of the adsorbents, followed by the binding between the heavy metal ions and the surface through physical or chemical interactions. Activated carbon is an adsorbent commonly used in the removal of heavy metal ions (Jyoti et al., 2022). Common causes of use include a large surface area and porous structure. Due to the cost of activated carbon, biological materials have started to be preferred in heavy metal removal from wastewater.

## BIOSORPTION

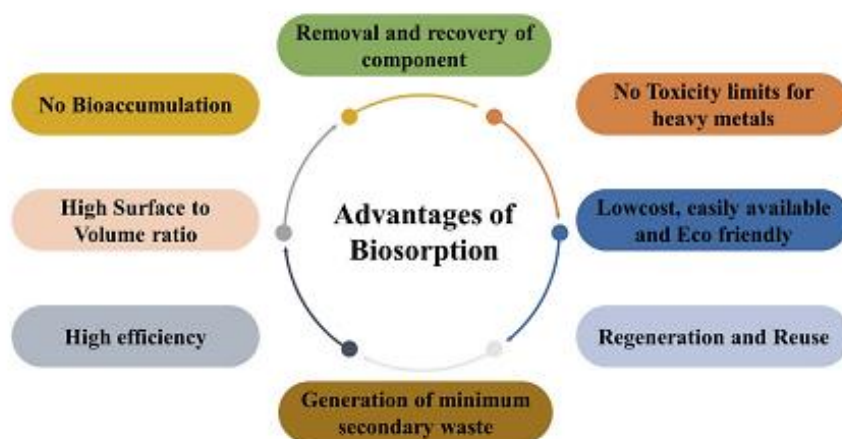

Biosorption is the method of removal of heavy metals using biosorbents. Heavy metal ions adsorb through surface precipitation, electrostatic and Van der Waals interactions or by variation of these processes through physical adsorption. Figure 2 shows the different mechanisms involved in the biosorption (Elgarahy et al., 2021). A range of biomass products, such as pepper seed, walnut leaf, tea pulp, apple peel, cranberry pulp, banana peel, lemon pulp, marine algae and bacterial cells are effective as metal biosorbent (Priya et al., 2022). This method is used not only for the removal of heavy metals by biosorption, but also for the removal of toxic dyes.

**Figure 2.** Examples of different mechanisms involved in the biosorption (Elgarahy et al., 2021).

In addition, the fact that biological materials to be used in biosorption are generally cheap and abundant is the reason for the method to be preferred. The advantages of the biosorption method are shown in Figure 3. Waste formation after biosorption is considerably less than after adsorption. The possibility of losing the characteristic of biological material or its rapid access to saturation and its inability to be easily controlled are the disadvantages of the biosorption method (Priya et al., 2022). However, these disadvantages started to be overcome by physical or chemical modifications.

**Figure 3.** The advantages of the biosorption method (Priya et al., 2022).

The biosorption method can proceed as an active process or passive process. Biological material that is alive in the active process is used and there is accumulation of metabolic activities and pollution on the living surface. In contrast, in the passive process, biosorption takes place before metabolic activities are engaged. In heavy metal biosorption, one or more of its interactions between heavy metal ion and biosorbent, such as ion exchange, micro-level precipitation, biosorption to the cell surface and cell membrane transport can be found in the same mechanism (Syeda et al., 2022). In the biosorption on the cell surface, interaction occurs between functional groups on the surface and heavy metal ions, and physical adsorption occurs. In the process of micro-level precipitation, heavy metal ion accumulates on the surface of the biosorbent cell in metal hydroxide, resulting in precipitation. Finally, in the process of ion exchange, cations ( $K^+$ ,  $Na^+$ ,  $Ca^{+2}$ ,  $Mg^{+2}$ ) naturally linked to functional groups on the biosorbent surface are replaced by metal cations in the solution (Elgarahy et al., 2021). Apart from these, it is necessary to look at the factors affecting the biosorption process. The first of the factors affecting the biosorption process is pH changes in solution and it affects the surface charge of biomass and the ionization degree of the functional group (aldehydes, carboxyl, amino, glycoproteins and polysaccharides) linked with it. In addition, the temperature of the solution with heavy metal ions affects the biosorption process. Finally, it is necessary to mention the biosorption isotherm equations. Freundlich and Langmuir are the two most used models to define the biosorption of heavy metal ions by biomass. Among these 2 models, the model that best describes the process of biosorption between the biosorbent and biosorbate system is the Langmuir isotherm model (Liu et al., 2023).

The Langmuir isotherm is presented in Eqs. (1) and (2).

$$\text{Eq. (1): } q_e = (q_{\max} b C_e) / (1 + b C_e)$$

$$\text{Eq. (2): } C_e / q_e = 1 / (b q_{\max}) + (C_e / q_{\max})$$

$q_{\max}$  (mg/g): Biosorption capacity

$b$  (L/mg): Langmuir constants related to the energy.

The Freundlich isotherm is presented in Eqs. (3) and (4).

$$\text{Eq. (3): } q_e = K_F C_e^{1/n}$$

$$\text{Eq. (4): } \log C_e / q_e = (1 - 1/n) \log C_e - \log k_f$$

$K_F$  (mg/g) and  $n$ : Freundlich constants related to the temperature and intensity of the biosorbent.

In addition to these summaries, biosorption thermodynamics also provides important information. Gibbs free energy change in the biosorption method ( $\Delta G^\circ$ ) that is, the degree of spontaneous occurrence of the method, the thermodynamic parameters such as enthalpy change ( $\Delta H^\circ$ ) and entropy change ( $\Delta S^\circ$ ) provide information about the thermodynamics of the biosorption (Liu et al., 2023).

The Gibbs free energy change is presented in Eqs. (5) and (6).

$$\text{Eq. (5): } \Delta G^0 = - RT \ln K_C$$

Eq. (6):  $\Delta G^0 = \Delta H^0 - T\Delta S^0$

$\Delta G^0$ : Gibbs free energy change

Kc: Equilibrium constant (unitless)

$\Delta H^0$ : Enthalpy change

$\Delta S^0$ : Entropy change

## STUDIES ON BIOSORPTION OF HEAVY METALS FROM WASTEWATER

In a study conducted by Atilgan, the biosorption potential of the biosorbent prepared with fish scales was examined for the removal of cadmium ( $\text{Cd}^{2+}$ ) from wastewater. The highest removal efficiency was recorded as 99.02% when fish scale biochar was 0.35 g (Atilgan M, 2021).

Ayob et al. modified pineapple waste using NaOH for the removal of  $\text{Pb}^{2+}$  from wastewater and biosorption capacity increased from 52.57% to 85.88% after modification (Ayob et al., 2020).

In another study Ozturk et al. conducted by the biosorption of  $\text{Ni}^{2+}$  ion was examined using waste tea. When using 0.025 g of waste tea in biosorption, the removal efficiency was calculated as 15.80%, while the yield increased to 48.40% when using 0.20 g of waste tea. This study shows that tea waste can be an alternative in the biosorption of heavy metals (Ozturk et al., 2020).

In a study conducted by Gurel et al., the biosorption of  $\text{Ni}^{2+}$  ions from the wastewater were investigated using the pepper seed. The maximum biosorption capacity was recorded as 4.2 mg/g under conditions determined as the most appropriate pH value of 5.5. It has been demonstrated by this study that raw pepper seeds have the potential to remove  $\text{Ni}^{2+}$  ions (Gurel et al., 2020).

In a study conducted by Mohamed et al., the authors modified banana peel for the removal of  $\text{Pb}^{2+}$  and  $\text{Fe}^{2+}$  ions. The results showed that the maximum biosorption capacity reached 100% and 64%, respectively (Mohamed et al., 2020).

In another study, Ozudogru conducted by the biosorption of thorium metal from wastewater using *Cystoseira barbata* an algae. It determined that the biosorption efficiency at optimum pH value increased by 95% and the maximum biosorption capacity was 36.45 mg/g in the experiments performed (Ozudogru et al., 2019).

## CONCLUSION

This review focuses on studies in the literature of using several biological materials for the biosorption of heavy metals from wastewater. Different methods have been proposed for the removal of the mentioned pollution, including chemical precipitation, chemical oxidation or reduction, filtration, ion exchange, reverse osmosis, biosorption, electrochemical treatment, evaporation, advanced oxidation processes and membrane technologies. Although many methods have been used in the treatment of wastewater containing heavy metals, the use of biological materials has increased in the removal of heavy metals from wastewater due to their lower cost. In addition, the fact that biological materials to be used in biosorption are generally abundant is the reason for the method to be preferred. Finally, we concluded that biosorption is successful techniques because of its high removal activity, economic effectiveness and environment friendly.

#### Abstract

Doping has proven to be an effective approach for enhancing the physicochemical properties of carbon dots (CDs) and has garnered increasing attention in recent years. The incorporation of metal ions into the CD structure is a straightforward strategy for imparting additional physicochemical properties to CDs. Metal ions possess more electrons, vacant orbitals, and larger atomic radius. When these ions are doped into CDs, they can modify the electron density distribution and energy gap, resulting in improvements in their optical, electronic, and magnetic properties. In this study, thermal synthesis was employed to refine the one-pot synthesis of CDs, including the preparation of metal-doped CDs. Fluorescence emission, FT-IR, and Zeta potential analyses were performed to examine the effects of different metals ( $\text{Sr}^{+2}$ ,  $\text{Cu}^+$ ,  $\text{Na}^{+2}$  and  $\text{Ca}^{+2}$ ) on the physical and chemical properties of CDs. Our observations revealed that metal doping influenced the fluorescence color and the maximum emission peak of CDs. Furthermore, metal-doped CDs exhibited a more positive surface charge compared to bare CDs. This suggests that  $\text{Sr}^{+2}$ ,  $\text{Cu}^+$ ,  $\text{Na}^{+2}$  and  $\text{Ca}^{+2}$  ions are predominantly located inside the carbon dots, particularly on or near the surface. These improved physicochemical properties make CDs promising and competitive materials for a wide range of applications, including detection, imaging, phototherapy, optoelectronics, and catalysis.

**Keywords:** carbon dots, metal doping, fluorescence, thermal synthesis

#### INTRODUCTION

Carbon dots (CDs) are emerging as competitive zero-dimensional nanomaterials with a hemispherical structure, featuring a crystalline  $\text{sp}^2$  carbon core and abundant amino, carboxyl, and hydroxyl groups on their surface (Mansuriya and Altintas, 2021.). CDs can exhibit excitation wavelength-dependent, and independent fluorescence emissions (Gallareta-Olivares *et al.*, 2023.). In comparison to other photoluminescent (PL) materials, such as organic dyes or conventional semiconductor quantum dots (QDs), these new CDs offer several advantages, including ease of preparation, surface modification capabilities, excellent biocompatibility, low cytotoxicity, good water dispersibility, and tunable fluorescence properties (Alaş *et al.*, 2022.). The unique physicochemical properties of CDs make them suitable for a wide range of applications, including energy storage and production, chemical sensing, biological imaging, phototherapy, and optoelectronic devices (Kandasamy, 2019). Recently, methods such as thermal, hydrothermal, and microwave/microwave-assisted synthesis, known for being faster, more cost-effective, and environmentally friendly, have gained preference (Simsek *et al.*, 2019.). In CD synthesis, natural resources like apples, coffee, honey, and molasses are utilized as carbon sources to minimize chemical usage and reduce process costs (Alaş and Genc, 2017.; Vinoth Kumar *et al.*, 2021.). Researchers are trying to produce higher-quality CDs for practical applications regarding quantum efficiencies, stability, and narrow or tuned emission wavelengths. Therefore, two effective approaches, surface passivation and chemical doping, have been developed recently to improve CDs' fluorescence properties and performance.

Doping is a valuable method for controlling the physicochemical properties of CDs, and it has garnered significant attention from researchers in recent years (Yan *et al.*, 2019.). The introduction of heteroatoms/metals into the nanostructure of CDs can induce substantial changes in their chemical composition, electronic structures, and nanostructure. This occurs due to the push/pull electron effect of heteroatoms/metals, resulting in the emergence of various intrinsic properties. Consequently, the

photoluminescent (PL) properties of CDs can undergo alterations owing to the varying HOMO-LUMO band gaps in heteroatom/metal-doped CDs. In comparison to non-metallic atoms, metal ions possess larger atomic radii, more electrons, and vacant orbitals. Therefore, when metal ions are doped, there is a shift in electron density distribution and energy levels, enabling the adjustment of the physical and chemical properties of CDs (Dang and Pham, 2022.; Li *et al.*, 2022.; Gallareta-Olivares *et al.*, 2023.). n heteroatom doping on the surface functional groups of carbon dots (CDs), researchers have employed heteroatoms such as nitrogen (N), fluorine (F), sulfur (S), phosphorus (P), silicon (Si), and boron (B) to fine-tune emission properties and enhance quantum yield (QY) (Zhao *et al.*, 2022.). Most of the studies conducted thus far have focused on nitrogen doping (N@CDs), which has consistently led to improved fluorescence in CDs (Yan *et al.*, 2019.). Additionally, recent reports have highlighted the ability to modulate the color emission, QY, and decay lifetime of CDs to some extent through the addition of metal elements (Yan *et al.*, 2019.; Li *et al.*, 2022.; Gallareta-Olivares *et al.*, 2023.). For instance, Liu *et al.* produced yellow fluorescent manganese-doped CDs (Mn-CDs). In comparison to pure CDs, Mn-CDs exhibited increased coverage of conjugated  $\pi$ -domains and surface states, resulting in a redshifted emission wavelength. The fluorescence QY and lifetime of Mn-CDs reached 46% and 8.11 ns, respectively, demonstrating higher QY (68.6%) and longer lifetime (8.75 ns) compared to pure CDs. These improvements were attributed to the development of passivated defects on the surface of Mn-CDs due to manganese doping (Liu *et al.*, 2018.). In another study, transition metal ion ( $Mn^{2+}$ ,  $Fe^{2+}$ ,  $Co^{2+}$  and  $Ni^{2+}$ ) doped CDs (TMCDs) were synthesized from lemon juice using a one-pot microwave method. TMCDs exhibited excitation wavelength-dependent emission with brighter photoluminescence at 460 nm. When compared to pure CDs with a 48.31% PL QY and 3.6 ns fluorescence lifetime, synthesized Mn/C, Fe/C, Co/C, and Ni/CDs exhibited QY values of 35.71%, 41.72%, 75.07%, and 50.84%, respectively, along with enhanced fluorescence lifetimes of 9.4, 8.6, 9.2, and 8.9 ns, respectively (Murugan *et al.*, 2018.).

In this current study, metal-doped CDs ( $Sr^{+2}$ ,  $Cu^+$ ,  $Na^{+2}$  and  $Ca^{+2}$ ) were synthesized from lemon salt using a one-pot thermal synthesis method to enhance the optical and physical properties of CDs. The characterization included fluorescence emission spectroscopy, Zeta Potential measurements, and Fourier Transform Infrared Spectroscopy (FTIR) to determine the physical properties of the particles and surface functional groups. Additionally, the metal-doped CDs emitted greenish-yellow or blue fluorescence under UV light, with photoluminescence quantum efficiency (QY) ranging from approximately 3% to 32%.

## MATERIALS AND METHODS

Lemon salt was procured from local supermarket. Urea and ethanol were purchased IsoLab. Ultrapure water used throughout all the experiments was purified by the Milli-Q system (Millipore Inc.,  $\Omega=18\text{ M}\Omega\text{ cm}$ ). All chemicals used in the synthesis of the materials were used without purification. Strontium nitrate, copper (I) chloride, sodium oxalate, calcium chloride dihydrate, and potassium chlorate ( $KClO_3$ ) were purchase Sigma-Aldrich.

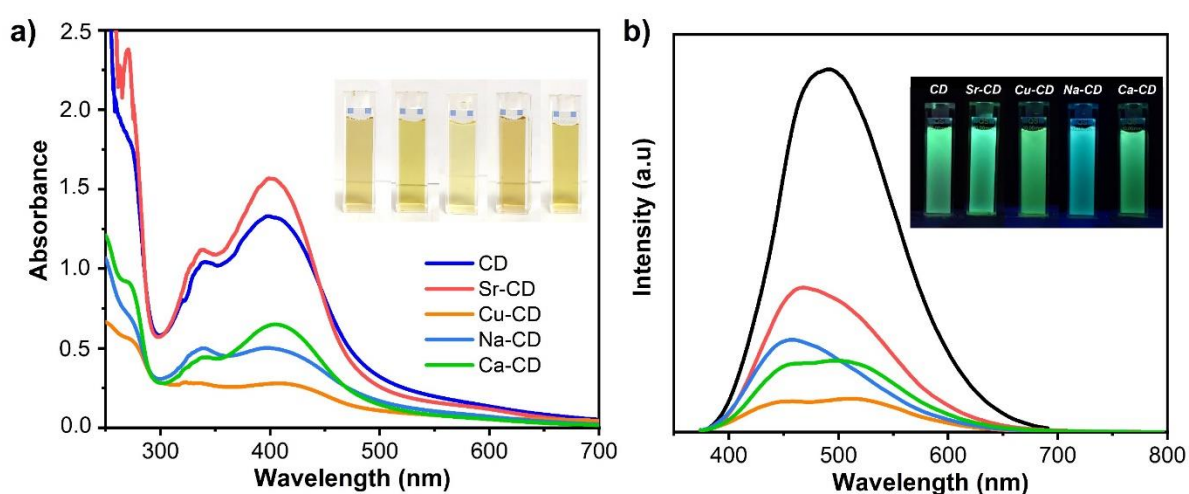

Metal doped CDs were synthesized using the same method we applied before (Alaş *et al.*, 2019., 2022.). In the synthesis, citric acid was used as a carbon source and urea was used as a nitrogen additive. First, citric acid, urea and metal ion precursor (2:2:1 w/w) were dissolved in water/ethanol (1:1 v/v). The resulting solution mixture was taken into a ceramic container and heat treated at 250 °C for 45 minutes. After the reaction, final material was dissolved in Milli-Q water and centrifuged at 8000 rpm for 20 minutes to precipitate aggregates. The supernatant was collected and the final product was dried at 90 °C overnight. In addition, metal-free CDs were synthesized by the same procedure without metal. The schematic representation of metal doped CD synthesis is shown in Figure 1.

**Figure 1.** The schematic representation of metal doped CD synthesis.

## RESULTS and DISCUSSION

Metal-doped carbon dots (CD) have been synthesized from lemon salt which nature carbon source by one-pot thermal synthesis (Figure 1). The UV-Vis spectrum is given in Figure 2a. CDs and metal-doped CDs exhibited peaks at 270 nm attributed to the  $\pi-\pi^*$  transition of the C=C bond (Alaş *et al.*, 2019.). Also, the peaks centered at 336 nm and 400 nm are due to the  $n-\pi^*$  electronic transition of the C=N and C=O bond (Cheng *et al.*, 2018.; Alaş *et al.*, 2019.). CD and metal-doped CDs dissolved in water display greenish yellow (CD, Sr-CD, Cu-CD, and Ca-CD) and blue (Na-CD) fluorescence under 365 nm UV light (Figure 2b inset). When the emission spectra ( $\lambda_{em}$ :365 nm) of each CD are examined, CD, Sr-CD, Cu-CD, Na-CD, and Ca-CD have maximum emission maxima of 490, 471, 500, 456, and 498 nm, respectively. The PL spectra of Cu-CD and Ca-CD showed two overlapping peaks attributed to the  $\pi-\pi^*$  transition of C-C over the  $sp^2$  domain of CDs (high electron transition) and the  $n-\pi^*$  transition as the edgeband transition of the surface or doped groups (low electron transition). Depending on the interaction of metal ions acting as additives with the CD surface, PL is increased or quenched. The fluorescent emission intensity of metal-doped CDs was slightly lower than that of pure CDs. The decrease in fluorescence intensity and the change in fluorescence colors are due to metal doping in CDs (Kumar *et al.*, 2019.). The PL quantum yield (PL QY) was calculated to be 32.26, 12.14, 2.79, 7.13, and 6.23% for CD, Sr-CD, Cu-CD, Na-CD, and Ca-CD, respectively.

**Figure 2.** UV/Vis and fluorescence emission spectrums of metal-doped CDs.

**Table 1.** Physical properties of synthesized CDs. Fluorescence emission maxima ( $\lambda_{em}$ ) and Quantum Yield (QY) measured at  $\lambda_{exc}$ :365 nm. Hydrodynamic radius ( $R_h$ ), and Zeta Potential ( $\zeta$ -Pot) of the samples measured in Milli-Q water.

Sample	$\lambda_{em}$ (nm)	QY (%)	$\zeta$ -Pot (mV)	Conductivity (mS/cm)
CD	490	32.26	$-13.57 \pm 1.57$	$0.05 \pm 0.003$
Sr-CD	471	12.14	$-11.70 \pm 1.07$	$0.11 \pm 0.004$
Cu-CD	500	2.79	$-5.45 \pm 0.86$	$0.49 \pm 0.018$
Na-CD	456	7.13	$-13.43 \pm 0.83$	$0.15 \pm 0.0005$
Ca-CD	498	6.23	$-11.87 \pm 0,40$	$0.17 \pm 0.009$

The surface net charges and conductivity values of the synthesized CDs were determined by dynamic light scattering method (DLS) using Zeta Sizer device. The surface charge of metal-doped CDs was analyzed through zeta potential measurements and compared to that of pure CDs. When Table 1 is examined, it is seen that all of the samples have negative zeta potentials. Metal doping into CDs showed increased positive zeta potentials ( $\zeta$ -Pot) of CDs. The positive shifting zeta potentials prove that metallic  $Sr^{+2}$ ,  $Cu^+$ ,  $Na^{+2}$  and  $Ca^{+2}$  ions are located inside the carbon dots, especially above or near the surface (Kumar *et al.*, 2019.).

**Figure 3.** FT-IR spectrums of CD and metal-doped CDs.

The functional groups on the surface of pure CDs and metal-doped CDs were examined using FT-IR spectroscopy and are given in Figure 3. In their spectra, all CDs showed broad absorption bands. Peaks, which is attributed to the OH/N-H stretching vibration show at between 3500-3100  $\text{cm}^{-1}$ . Peaks of aldehyde C-H stretching vibration at 2700-2760  $\text{cm}^{-1}$ , C=O stretching vibration indicating the formation of aromatic carbonyl bonds at 1715-1700  $\text{cm}^{-1}$ , and asymmetric and symmetrical C-O-C vibration peaks at 1000-1350  $\text{cm}^{-1}$  were observed. Also, the peaks at about 1600-1500  $\text{cm}^{-1}$  and 1200-1100  $\text{cm}^{-1}$  are attributed to vibrations of the C-NH-C bond of aromatic C=C and amine groups on the surface of CDs, respectively. The vibrations between 1460-1380  $\text{cm}^{-1}$  and 770-730  $\text{cm}^{-1}$  are attributed to the  $\text{sp}^3$  C-H and aromatic  $\text{sp}^2$  C-H bands, respectively (Alaş, 2022.; Alaş *et al.*, 2022.). Spectra of metal-doped CDs showed peaks not in the pristine CD spectrum at below 750  $\text{cm}^{-1}$ , confirming the formation of metal oxide traces on the CD surface (Murugan *et al.*, 2018.).

## CONCLUSION

In summary, one-pot thermal “green” synthesis of metal-doped CDs have been successfully demonstrated using lemon salt. Both Pure CD and metal-doped CDs revealed characteristic absorbance peaks due to  $\pi$ - $\pi^*$  electronic transition, excitation-wavelength dependent PL behavior and PL-QY values. The decreased PL emission intensity and the resulting QY for metal-doped CDs were attributed to non-radiative electronic transition caused by complex formation between metal ions and CDs surface functional groups. CDs exhibited negative  $\zeta$  potential due to the rich abundance of oxo-functional groups explaining the better colloidal stability of CDs in aqueous medium. With metal doping, the surface charge of CDs shifted to positive, indicating that metal ions were present in CDs. The chemical composition and surface functional groups of the CD samples and the presence of trace amounts of additive metal ions in the CD were determined by FT-IR analysis. The present study provides an easy strategy for the synthesis of fluorescent metal-doped CDs whose physicochemical properties can be improved for use in applications such as detection, imaging, phototherapy, optoelectronics, and catalysis.

#### Özet

Sinir sistemi gelişiminde nöron hücrelerinin sağlıklı şekilde farklılaşması oldukça önemlidir. Birçok nörolojik hastalığın temelinde de bu süreç yatmaktadır. Rett sendromu çoğunlukla kadınlarda görülen nörogelişimsel bir hastalık olup nadir görülen ve karmaşık bir yapıya sahip olduğu için klinik olarak çalışılması oldukça güçtür. Bu nedenle in silico gibi klinik öncesi çalışmalar oldukça önemlidir. Rett sendromunun nöronal hücre farklılaşmasındaki etkisini incelemek için sağlıklı ve MECP2 mutasyonlu tek hücre rna sekans verisi kullanılmıştır. Gerçekleştirilen transkriptomik analizler ile SOX11 ve SOX4 başta olmak üzere 10 gen belirlenmiştir. Bu genlerin gelecek çalışmalarda çok daha detaylı incelenmesi gerekmektedir.

**Anahtar Kelimeler:** Rett sendromu, nöronal farklılaşma, hücre gidişatı, ortak ekspresyon modül

#### In silico analysis of target genes that may affect neuronal cell differentiation in Rett syndrome

#### Abstract

Healthy differentiation of neuron cells is very important in the development of the nervous system. This process lies at the basis of many neurological diseases. Rett syndrome is a neurodevelopmental disease mostly seen in women, and it is very difficult to study clinically because it is rare and has a complex structure. Therefore, preclinical studies such as in silico are very important. To examine the effect of Rett syndrome on neuronal cell differentiation, single-cell-RNA-seq data from healthy and MECP2 mutations were used. With the transcriptomic analysis, 10 genes, especially SOX11 and SOX4, were identified. These genes need to be examined in more detail in future studies.

**Keywords:** Rett syndrome, neural differentiation, cell trajectory, co-expression module

#### GİRİŞ

Nörogelişimsel hastalıklar (NGH), karmaşık moleküler mekanizmaları nedeniyle anlaşılmasını ve tedavi edilmesini zor olan karmaşık bozukluklardır. Özellikle kesin bir tedavisi olmayan NGH'ler için klinik öncesi modeller oluşturarak genetik temellerini incelemek, hastalık mekanizması, hedef genlerin belirlenmesi ve potansiyel ilaç denemeleri için çok önemlidir (Christopher ve ark., 2021) Etkili terapötik hedefleri ortaya çıkarmak için genomik verileri kullanarak gen-hastalık ilişkilerinin analiz edildiği in silico sistem biyolojisi gibi klinik öncesi yaklaşımlar gereklidir (Finlay-Jones ve ark., 2019) X kromozomunda bulunan MECP2 geninde meydana gelen mutasyonların yol açtığı Rett sendromu (RTT) nadir bir NGH'dir ve kadınlarda daha sık görülür (Amir ve ark., 1999; Neul ve ark., 2010). Elektriksel ve kimyasal sinyalleri ileterek nöronlar arası iletişimin sağlandığı bölge olan sinapların RTT durumunda işlev bozukluğu meydana gelmektedir. Bu bozulma, nöronlar arasındaki iletişimin zayıflamasına neden olarak sinir ağlarında bilgi aktarımını etkilemenin yanında hastalarda gözlenen bilişsel ve motor eksikliklerine sebebiyet vermektedir (Boggio ve ark., 2010). Sinapslara ek olarak RTT durumunda, nöronlar üzerinde bulunan ve gelen sinyalleri algılayan dendritlerin gelişiminin ve dallanmasının azaldığı görülmektedir. Dendritlerde meydana gelen gelen bu gelişim bozukluğu sinir sistemini işlevsizleşmesine neden olmaktadır (Nerli ve ark., 2020). RTT'de sinaptik bağlantılar ve dendrit gelişiminde görülen bozulmalar direkt olarak nöronların olgunlaşma ve farklılaşma sürecini etkilemektedir (Kim ve ark., 2011) Sinir sisteminde bulunan nöronal olmayan ancak nöronların işlevini destekleyen ve düzenleyen glia hücrelerinde de RTT durumunda anormallikler gözlemlenmektedir. Glia hücrelerinin nöral fonksiyon bozukluğu üzerindeki etkileri ve mekanizmaları halen araştırılmaktadır (Kahanovitch ve ark., 2019).

Bu çalışmada, birleştirilmiş/kaynaştırılmış (fused) serebral korteks + ganglionik eminens organoidine ait tek hücre rna-sekans verileri kullanılarak RTT'nin nöral hücre farklılaşması üzerindeki etkisi in silico olarak incelenmektedir. Bu kapsamda hücre gidişatı (cell trajectory) ve ortak ekspresyon modül (co-expression module) analizleri gerçekleştirilerek gelecek çalışmalarda kullanılacak hedef genler belirlenmesi amaçlanmaktadır.

## MATERYAL VE METOT

### Veri Kaynağı ve Verinin Hazırlanması

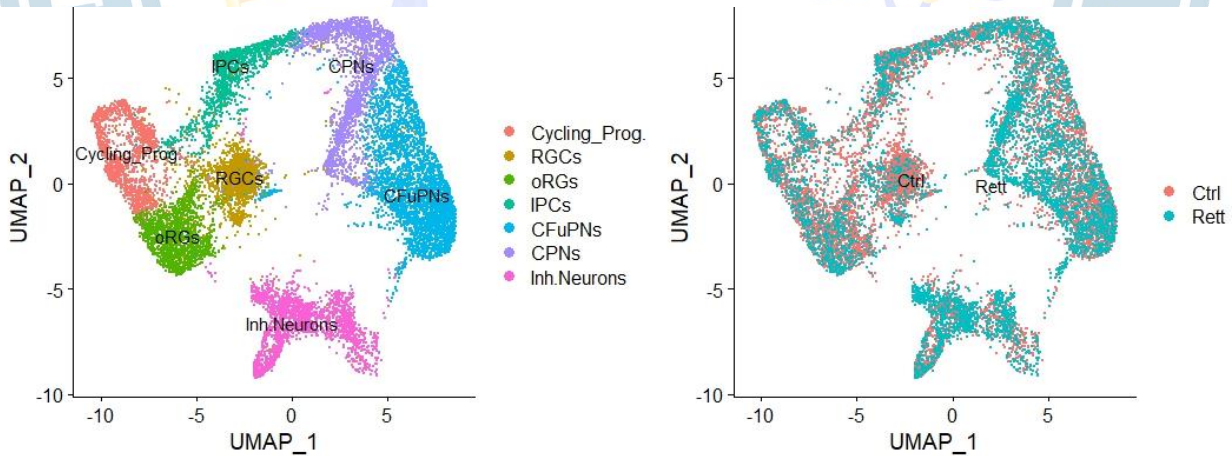

Daha önce yayınlanmış, birleştirilmiş/kaynaştırılmış serebral korteks ve medial ganglionik eminens organoidlerine ait tek hücre rna sekans verisi GSE165577 numarası ile Gene Expression Omnibus veritabanından indirilmiştir (Samarasinghe ve ark., 2021). R paketi 'Seurat' (Seurat v4.3.0.1) kullanılarak, toplam 10 hücre kümesinden oluşan 70. gün verilerden "Cycling Progenitor" (Cyc.Prog.), "Outer Glial Cells" (oRGs), "Radial Glial Cells" (RGCs), "Induced Pluripotent Stem Cells" (IPCs), "Callosal Projection Neurons" (CPNs), "Corticofugal Projection Neurons" (CFuPNs) ve "Inhibitory Interneurons" (Inh.Neurons) hücre kümeleri seçilip alt grup oluşturulmuş. Bu alt grup sağlıklı kontrol (Ctrl) ve 705delG MECP2 mutasyonu (Rett) olmak üzere ikiye ayrılmıştır (Şekil 1).

### Hücre Gidişatı Analizi

R paketi 'monocle3' (monocle3 v1.3.4) kullanılarak 'pseudotime cell trajectory' oluşturuldu. Boyutları azaltmak için 'UMAP' yöntemi seçilerek 'cluster\_cells' ve 'learn\_graph' fonksiyonları. Görselleştirme için 'plot\_cells' fonksiyonu kullanıldı. Hücre sıralamaları 'order\_cells' fonksiyonu kullanılarak oluşturuldu ve 'ggplot' fonksiyonu ile görselleştirildi. Rett alt grubu için bu analiz yapılmamış olup Ctrl alt kümesi için belirlenen hücre sıralaması referans alınarak Rett alt grubu incelenmiştir.

### Ortak Ekspresyon Modül Analizi

R paketi 'hdWGCNA' (hdWGCNA v0.2.23) ile Ctrl ve Rett verileri için ayrı ayrı ortak ekspresyon modülleri belirleyip oluşturulan hücre sıralaması gidişatlarının bu modüllerdeki değişimleri incelenmiştir. Ölçeksiz topoloji modeli uyumunun eşiği  $> 0,80$  olarak ayarlandıktan sonra en iyi bağlantı için yumuşak eşik (soft threshold) Ctrl için 5 Rett için 7 olarak seçilmiştir. Görselleştirmeler için 'plotDendrogram', 'DotPlot' ve 'PlotModuleTrajectory' fonksiyonları kullanılmıştır.

Şekil 1. Hücre kümeleri ve genotipe göre oluşturulan alt grupların UMAP grafikleri.

## BULGULAR ve TARTIŞMA

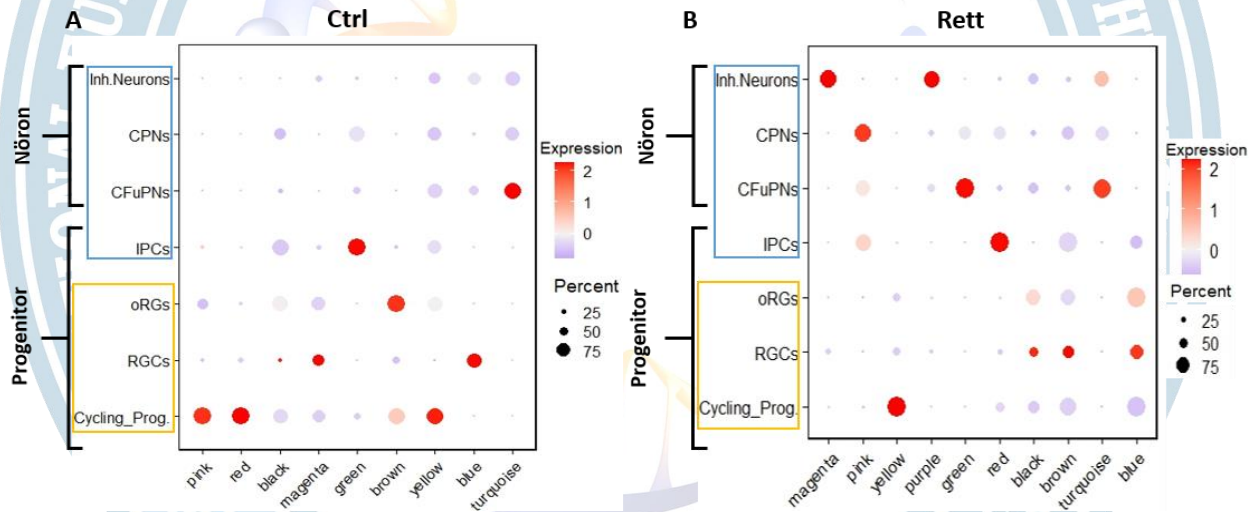

Ctrl ve Rett alt grupları için oluşturulan veriler 7 hücre tipinden oluşmaktadır. oRGs, RGCs, Cyc.Prog. ve IPCs hücre kümeleri 'progenitor' olarak tanımlanırken CPNs, CFuPNs ve Inh.Neurons hücre kümeleri 'nöron' olarak tanımlanmıştır. Rett verisinde nöron grubunun progenitor grubuna oranı Ctrl verisine göre yükseliş göstermektedir. Bu durum verilerin alındığı orijinal çalışmada da gösterilmiştir. Hücre gidişatı analizi sonucunda Ctrl alt grubu için iki hücre yol haritası elde edilmiştir (Şekil 2A). İlk hücre yol haritası (ipc\_pseudotime) nöron grubunun yanında IPCs'yi de barındırırken ikinci hücre yol haritası (cyc\_pseudotime) Cyc.Prog., oRGs ve RGCs hücre kümelerinden oluşmaktadır. İlk yol için IPCs, ikinci yol için ise Cyc.Prog. başlangıç noktası olarak seçilmiş ve hücre gidişatı oluşturulmuştur (Şekil 2B). Ctrl için oluşturulan bu yol haritaları referans alınarak Rett verileri içinde uygulanmış ve değişimler incelenmiştir.

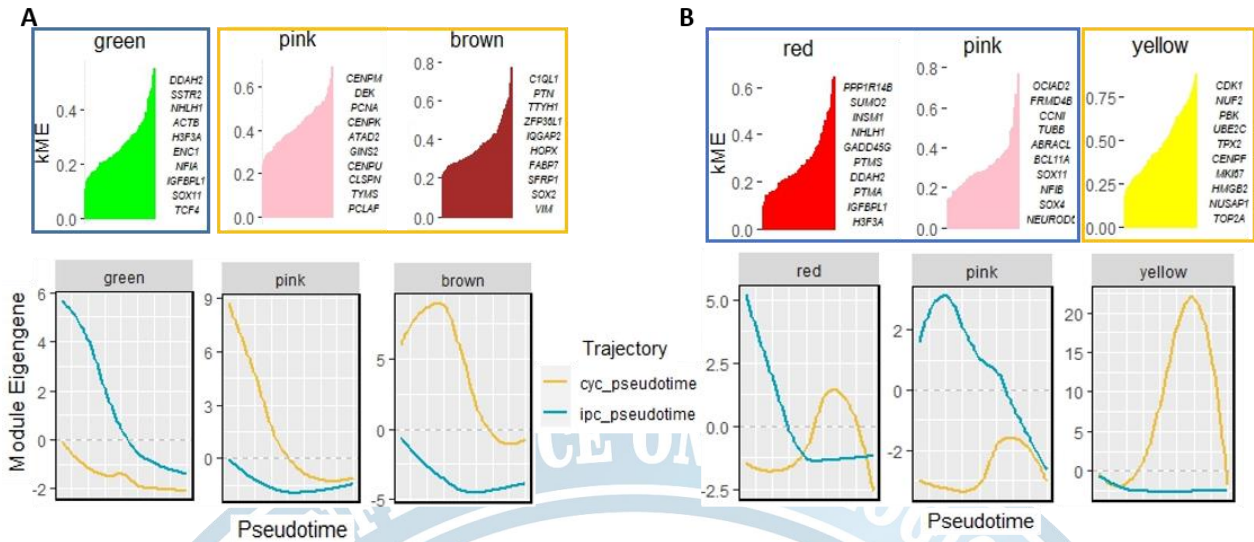

**Şekil 2. A)** Hücre gidişatı sonucunda ortaya çıkan yol haritasının UMAP grafikleri üzerindeki gösterimi. **B)** Elde edilen iki yol haritasına başlangıç noktaları belirtilerek gidişat yöneliminin gösterimleri.

Hücre yol haritaları belirlendikten sonra hücre kümelerine özel genlerin incelenmesi için Ctrl ve Rett alt gruplarına ayrı ayrı ortak ekspresyon analizi gerçekleştirilmiştir. Oluşturulan gen modüllerinin hangi hücre kümelerine ait oldukları ve ekspresyon seviyeleri nokta grafikleri ile gösterilmiştir. Ctrl alt grubunda ‘turquoise’ modülü harici diğer modüllerin progenitor hücre grubunda ekspresyon gösterdiği görülmektedir. Ayrıca, ‘green’ modülü ipc\_pseudotime’ye özel iken ‘pink’ ve ‘brown’ modülleri cyc\_pseudotime’ye ait olarak görülmektedir (Şekil 3A). Rett alt grubunda ise Ctrl grubuna göre daha fazla modül nöron grubunda ekspresyon göstermektedir. ‘pink’ ve ‘red’ modülleri ipc\_pseudotime’ye ait iken ‘yellow’ modülü cyc\_pseudotime’ye ait olduğu görülmüştür (Şekil 3B).

**Şekil 3. A)** Ctrl alt grubuna ait modül-hücre kümesi ortak ekspresyon nokta grafiği. **B)** Ctrl alt grubuna ait modül-hücre kümesi ortak ekspresyon nokta grafiği. x eksenini modülleri, y eksenini hücre kümelerini ifade etmektedir. Mavi kutucuk ipc\_pseudotime yol haritasını, turuncu kutucuk cyc\_pseudotime yol haritasının göstermektedir.

RTT durumunda, oluşturulan iki hücre yol haritasında meydana gelen değişimleri incelenmek istediğinden bu yol haritalarına ait modüllerin ilk 10 merkez genlerini belirledik ve yol haritalarının bu modüllerdeki eğilimini gösterdik. Ctrl alt grubunda ‘green’ modülündeki eğilimlere göre Rett alt grubundaki ‘red’ ve ‘pink’ modüllerindeki eğilimler bir takım farklılıklar göstermektedir. Özellikle cyc\_pseudotime yolunda bu farklılıklar oluşurken ‘pink’ modülünde ipc\_pseudotime yolunda da ufak farklılıklar görülmektedir. Ctrl grubunda ‘pink’ ve ‘brown’ modüllerindeki eğilimler Rett alt grubunda ‘yellow’ modülü ile karşılaştırıldığında ipc\_pseudotime yolunda bir farklılık görülmezken cyc\_pseudotime yolunda eğilim oldukça farklıdır (Şekil 4A, B). Ctrl ‘green’ modülünün merkez genleri ile Rett ‘pink’ modüllerinin merkez genleri incelendiğinde SOX11 geninin ortak olduğu görülmektedir. Rett ‘pink’ modülünde Ctrl ‘green’ modülünden farklı olarak OCIAD2, FRMD4B, CCNI, TUBB, ABRACL, BCL11A, NFIB, SOX4 ve NEUROD6 genleri görülmekte. Ctrl ‘pink’ ve ‘brown’ modülleri ile Rett ‘yellow’ modülü merkez genleri karşılaştırıldığında hepsinin farklı olduğu görülmekte.

Şekil 4. A) Ctrl alt grubuna seçilen modüllerin merkez ilk 10 genleri ve oluşturulan iki hücre yol haritasının bu modüllerdeki eğilimleri. B) Rett alt grubuna seçilen modüllerin merkez ilk 10 genleri ve oluşturulan iki hücre yol haritasının bu modüllerdeki eğilimleri. Mavi kutucuk ipc\_pseudotime, turuncu kutucuk cyc\_pseudotime yol haritasına ait modülleri temsil etmekte.

## TARTIŞMA

Nörogenez, nöron farklılaşması ve hücre kaderi belirlenmesinde rolü olan SOX11 transkripsiyon faktörünün fare serebral korteks gelişimi sırasında dendritik morfogenezin baskılanmasında da gerekli olduğu gösterilmiştir. Bunun yanında SOX11 ekspresyonunda meydana gelen azalmaların radyal göçün son bulması ile arttığı tespit edilmiştir (Hoshiba ve ark., 2016). SOX11 gibi nöronal gelişimde rol oynayan SOX4'ün glial hücre olan oligodendrositlerin farklılaşmasında etkili olduğu belirtilmiş, bu etkinin temel helix-loop-helix transkripsiyonel baskılayıcısı olan HES5'in SOX4 tarafından indüklenerek nöronal kök hücrelerin oligodendrosite farklılaşması baskılanmaktadır (Bergsland ve ark., 2006; Braccioli ve ark., 2018). Başta sinaptik hedefleme ve nöron motor trafiği olmak üzere nöronal göç ve farklılaşmada önemli rol oynayan mikrotübül yapılarından sorumlu tübülün genlerinde RTT durumunda azalış ve mikrotübül yapısında bozulmalar görülmüştür. Ayrıca, tübülün deasetilazı olan HDAC6' da artış ve bu artışa bağlı olarak asetillenmiş alfa-tübülün de azalmalar raporlanmıştır (Gold ve ark., 2015; Sferra ve ark., 2020). Kortikal projection nöronlarda farklılaşmasının incelenmesi için progenitor ve projection hücrelerde eksprese olan BCL11A ile projection hücrelerde eksprese olan BCL11B mutasyonlarına sahip fareler ile yapılan çalışmada BCL11A/B eksikliğinde kortikal nöronlarda proliferasyonda bozulma ve erken farklılaşma tespit edilmiştir (Du ve ark., 2022). Bu sonuçlara ek olarak, OCIAD2, NFIB, ABRCL ve NEUROD6' da nöronal sistem gelişiminde, hücre farklılaşması ve proliferasyonunda etkil oldukları çeşitli çalışmalar ile gösterilmiştir (Uittenbogaard ve ark., 2010; Hargus ve ark., 2014; Betancourt ve ark., 2014; Fan ve ark., 2021)

## SONUÇ

Bu çalışmada Ctrl verilerine kıyasla Rett verilerinde meydana gelen değişimler in silico olarak araştırılmıştır. Hücre gidişatı analizi ile belirlediğimiz hücre yol haritalarının, ortak modül analizi ile belirlediğimiz modüller üzerindeki eğilimleri incelenmiş. Bu kapsamda Ctrl için 'green', Rett için 'pink' modülleri seçilmiş olup bu modüllere ait ilk 10 merkez genlerindeki ortak olmayan genler belirlenmiştir (SOX11, OCIAD2, FRMD4B, CCNI, TUBB, ABRACL, BCL11A, NFIB, SOX4 ve NEUROD6). Bu genlerin nöronal farklılaşma ile ilişkileri kısaca verilmiş olup, ileride yapılacak klinik çalışmalar için referans olabileceğini düşünmekteyiz.

\*omer\_elkiran@hotmail.com

#### Özet

Bu çalışmada, aromaterapide uçucu yağları kullanılan ve farklı lokasyonlardan alınan *Laurus nobilis* L. (defne) (Lauraceae) bitkisinin yaprak ve meyvelerinin uçucu yağ içeriklerine, örneklerin alındığı bölgedeki toprak yapısına ve bitki elementlerine çevresel faktörlerin etkisi araştırılmıştır. Çalışma kapsamında Hatay (Samandağ), Hatay (Yayladağ) ve Sinop'tan örnekler alınmıştır. Defne bitkisinin yaprak ve meyve örneklerinin uçucu yağları su distilasyonu yöntemiyle çıkarılarak, kimyasal bileşenler gaz kromatografisi-kütle spektrometresinde (GC-MS) tanımlanmıştır. Çalışma sonuçlarına göre, 1,8-sineol yaprak ve meyve uçucu yağlarında, farklı miktarlarda olmak üzere ana bileşen olarak tanımlanmıştır. Toprak örneklerinin analizinde saturasyon, pH, iletkenlik (Tuz), kireç, yarayışlı potasyum, fosfor ve organik madde değerlerine bakılmıştır. İncelenen parametreler farklı lokasyonlarda değişkenlik göstermişlerdir. Ayrıca yaprak ve meyvelerin içerisindeki kimyasal elementler ve miktarları, induktif eşleşmiş plazma-kütle spektrometresi (ICP-MS) cihazında tanımlanmıştır. Kimyasal element analiz sonuçlarına göre Mg, P, K, Ca ve Mn en yüksek oranda çıkan elementlerdir. Yaptığımız literatür taramasında, çalışmamızdaki lokasyonların toprak özellikleri ve bu lokasyonlardan alınan bitki örneklerinin farklı organlarının kimyasal içerikleri çalışmalarına rastlanmamıştır. Dolayısıyla çalışmamızda kullandığımız parametreler ilk kez yapılmıştır. \*Bu çalışma, ikinci yazarın danışmanlığında birinci yazar tarafından yüksek lisans tezinden üretilmiştir.

#### Investigation of the effect of environmental conditions on essential oil content, soil structure and plant elements of *Laurus nobilis* L.

#### Abstract

In this study, the effects of environmental factors on the essential oil content of leaves and fruits of *Laurus nobilis* L. (Lauraceae) plant, the essential oils of which are used in aromatherapy and taken from different locations, the soil structure and plant elements in the area where the samples were taken, were investigated. Within the scope of the study, samples were taken from Hatay (Samandağ), Hatay (Yayladağ), and Sinop. The essential oils of the leaf and fruit samples of the laurel plant were extracted by water distillation method, and the chemical components were identified in gas chromatography-mass spectrometry (GC-MS). According to the results of the study, 1,8-cineol was identified as the main component in leaf and fruit essential oils, with different amounts. In the analysis of soil samples, saturation, pH, conductivity (Salt), lime, useful potassium, phosphorus, and organic matter values were examined. The parameters examined varied in different locations. In addition, chemical elements and their amounts in leaves and fruits were defined in an inductively coupled plasma-mass spectrometer (ICP-MS) device. According to the results of chemical element analysis, Mg, P, K, Ca and Mn are the elements that come out at the highest rate. In our literature review, the soil properties of the locations in our study and the chemical contents of different organs of the plant samples taken from these locations were not found. Therefore, the parameters we used in our study were made for the first time.

\*This study was conducted by the first author as a part of a master's thesis under the supervision of the second author.

**Keywords:** *Laurus nobilis*, GC-MS, 1,8-Cineole, Soil, ICP-MS.

## GİRİŞ

Lauraceae, Embriyofitlerin, trakeofitler (damarlı bitkiler) sınıfında bulunur. Trakeofitlerin Euphyllphytes alt dalında olan lauraceae, spermatofit yani tohumla üreyen kısmında bulunması ile dikkat çeker. Aynı zamanda bilimin katkılarıyla oldukça derinlere inilen sınıflandırmada lauracea kapalı tohumlu bir bitki familyasıdır (Qiu ve ark., 2006).

Lauraceae familyasının bir üyesi olan *Laurus* cinsinin; *Laurus nobilis* L. ve *L. canariensis* Willd olmak üzere iki türünün bulunduğunu belirten çalışmalar bulunmaktadır. Bunun yanında *Laurus nobilis* L. dar yapraklı “*angustifolia*” ve kenarları dalgalı “*crispa*”, *aurea* ve *undula* olmak üzere 4 alt türünün olduğunu söylemek mümkün hale gelmiştir. Ülkemizde bu dört türden sadece bir türünün bulunduğu yapılan araştırmalar sonucunda görülmektedir (Baydar, 2009).

Ülkemizde Akdeniz Bölgesi’ne özgü bir bitki olarak bilinen defne bitkisinin genel olarak 2 ila 6 metre boylarında, çalı formunda olabildiği gibi ağaç formunda da olduğunu yer yer defne bitki boyunun 10 metreyi bulabildiğini görmekteyiz (Baytop, 1999).

*Laurus nobilis* yaprağının kalite özelliklerini etkileyen oldukça farklı faktörler bulunmaktadır. Yapılan araştırmalar sonucu: bitki türü, çeşidi (Türk defnesi, Fas defnesi vs.), yetiştiği lokasyonun özellikleri (Karaburun, Bodrum vs.), kültürel uygulama farklılıkları (gübre, ilaç vs. işlemler ile doğal veya kültür ürünü olması), kurutma yöntemleri (kapalı alanda, gölgede veya suni kurutma), depolama ve ambalajlama, temizlik, lezzet, koku (aromatik madde miktarı), renk (doğal koyu renk tercih edilmekte olup renk açıldıkça eterik yağ miktarı azalmaktadır) bu faktörler arasında sayılmaktadır (Göker ve Acar, 1983).

## MATERYAL VE METOT

### Çalışma Materyallerinin Toplanması

Bitkiler ve toprak örnekleri Sinop merkezden, Hatay (Yayladağı) ve Hatay (Samandağı)’dan doğal ortamlarında Kasım 2021 tarihinde toplanmıştır. Bitkilerin tür tespitleri Flora of Turkey (Davis, 1982) kullanılarak yapılmıştır.

### Uçucu Yağların Elde Edilmesi Ve Analizi

Toplanan bitkiler oda sıcaklığında kurutulmuştur. Klevenger aparatı kullanılarak su distilasyonu yöntemiyle, kurutulmuş organlardan ortalama 200g, 3 saat kaynatılarak yaklaşık 0.5ml uçucu yağ elde edilmiştir. (Görsel 1) Elde edilen uçucu yağlar 4°C’de tutulmuştur. Uçucu yağın kompozisyonundaki kalitatif ve kantitatif değişiklik, uçucu yağların GC-MS (Gaz Kromatografisi- Kütle Spektroskopisi) analizleri sonucu belirlenmiştir. Kimyasal bileşenler W9N11.L ve MPW2011.L kütüphaneleri kullanılarak tanımlanmıştır.

**Görsel 1:** Bitki yaprak ve meyvelerinden uçucu yağ elde etmek için laboratuvar çalışmaları

### ICP-MS Ölçümleri

Bitki yaprak ve meyvelerinin element ölçümleri Sinop Üniversitesi Bilimsel ve Teknolojik Araştırmalar Uygulama ve Araştırma Merkezinde yapılmıştır. Analizler için kurutulmuş örnekler toz haline getirildikten sonra (Görsel 2) ICP-MS cihazıyla ölçümler yapılmıştır.

**Görsel 2:** ICP-MS çalışmaları için ön hazırlıklar (örneklerin kurutularak toz haline getirilmesi)

## Toprak Analizleri

Toprak örnekleri bitki örneklerinin toplanması sırasında, toprak numunesi alma standartları dikkate alınarak paketlenmiş ve analiz için Amasya Merkezi Araştırma laboratuvarına gönderilmiştir (Başaran, 2011). Toprak örnekleri içerisinde; Saturasyon, Ph, İletkenlik (Tuz), Kireç, Yarayışlı Potasyum, Fosfor, Organik Madde ölçümleri yapılmıştır.

## BULGULAR ve TARTIŞMA

### Toprak Analizleri

Çalışmamız kapsamında Hatay (Yayladağ), Hatay (Samandağ) ve Sinop (Merkez)'tan alınan toprak örneklerinin Saturasyon, Ph, İletkenlik (Tuz), Kireç, Yarayışlı Potasyum, Fosfor ve Organik Madde parametreleri açısından analizleri yapılmış, literatürdeki referans değerlere göre ayrı ayrı yorumlanmıştır (Anonim, 2018).

Hatay (Yayladağ)'dan alınan toprak örneği analiz sonuçları Tablo 1'de verilmiş, referans değerler dikkate alınarak literatürdeki diğer çalışmalarla karşılaştırılıp yorumlanmıştır.

Toprak Parametreleri	Metot	Birim	Deney Sonucu
Saturasyon	Saturasyonda	%	72,6
pH	Saturasyonda (pH metre)	pH	7,41
İletkenlik (Tuz)	Saturasyonda (EC metre)	$\mu\text{s}/\text{cm}$	347
Kireç	Kalsimetre	%	55,85
Yarayışlı Potasyum	Amonyum Asetat/Flame	$\text{K}_2\text{O}$ kg/da $\text{P}_2\text{O}_5$	22,4
Fosfor	Olsen Spektrofotometrik	kg/da	4,07
Organik Madde	Walkey Black	%	1,8

**Tablo 1.** Hatay (Yayladağ) toprak örneği analiz sonuçları

Toprak pH değeri, pH metre kullanılarak saturasyon işlemi ile 7,41 bulunmuştur. Bu değer, toprağın pH değerine göre hafif alkali toprak grubunda olduğunu göstermektedir (Anonim, 2018). Toprak iletkenlik (tuz) değeri Saturasyonda (EC metre) kullanılarak  $347 \mu\text{s}/\text{cm}$  yani  $0,347 \text{ mS cm}^{-1}$  bulunmuştur. Bu değer, toprağın iletkenlik (tuz) açısından tuzsuz toprak olduğunu yani iletkenliğinin olmadığını veya zayıf olduğunu göstermektedir. (Anonim, 2018). Toprak kireç oranı kalsimetre kullanılarak %55,85 bulunmuştur. Bu değer, literatürdeki referans değerlere göre toprağın fazla kireçli olduğunu göstermektedir. (Ülgen ve Yurtsever, 1974). Topraktaki yarayışlı potasyum oranı, Amonyum Asetat/Flame metodu kullanılarak  $22,4 \text{ K}_2\text{O}$  kg/da  $\text{P}_2\text{O}_5$  bulunmuştur. Bu sonuç, topraktaki yarayışlı potasyum miktarı olarak, çok düşük yarayışlı potasyum oranına sahip olduğunu göstermektedir. (FAO,1990). Topraktaki fosfor oranı Olsen Spektrofotometrik metodu kullanılarak  $4,07 \text{ kg}/\text{da}$  bulunmuştur. Bu değer, toprağın sahip olduğu fosfor miktarı açısından düşük fosfor

oranına sahip olduğunu göstermektedir. (Ülgen ve Yurtsever, 1974). Topraktaki organik madde oranı, Walkey Black metodu kullanılarak %1,8 bulunmuştur. Bu değer literatürdeki değerlere göre, toprak örneğinin yüksek organik madde oranına sahip olduğunu göstermektedir (Anonim, 2018)

Hatay (Samandağ)'dan alınan toprak örneği analiz sonuçları Tablo 2'de verilmiş, referans değerler dikkate alınarak literatürdeki diğer çalışmalarla karşılaştırılıp yorumlanmıştır.

Toprak Parametreleri	Metot	Birim	Deneş Sonucu
Saturasyon	Saturasyonda	%	77
pH	Saturasyonda (pH metre)	pH	7,45
İletkenlik (Tuz)	Saturasyonda (EC metre)	$\mu\text{s}/\text{cm}$	642
Kireç	Kalsimetre	%	38,8
Yarayışlı Potasyum	Amonyum Asetat/Flame	$\text{K}_2\text{O}$ kg/da $\text{P}_2\text{O}_5$	75,6
Fosfor	Olsen Spektrofotometrik	kg/da	76,02
Organik Madde	Walkey Black	%	2,7

**Tablo 2.** Hatay (Samandağ) toprak örneği analiz sonuçları

Toprak pH değeri, pH metre kullanılarak saturasyon işlemi ile 7,45 bulunmuştur. Bu değer, toprağın pH değerine göre hafif alkali toprak grubunda olduğunu göstermektedir (Anonim, 2018; Çepel, 1983). Toprak iletkenlik (tuz) değeri Saturasyonda (EC metre) kullanılarak 642  $\mu\text{s}/\text{cm}$  yani 0,642 mS cm<sup>-1</sup> bulunmuştur. Bu değer, toprağın iletkenlik (tuz) açısından tuzsuz toprak olduğunu yani iletkenliğinin olmadığını veya zayıf olduğunu göstermektedir (Anonim, 2018). Toprak kireç oranı kalsimetre kullanılarak %38,8 bulunmuştur. Bu değer, literatürdeki referans değerlere göre toprağın çok fazla kireçli olduğunu göstermektedir (Ülgen ve Yurtsever, 1974). Topraktaki yarayışlı potasyum oranı, Amonyum Asetat/Flame metodu kullanılarak 75,6  $\text{K}_2\text{O}$  kg/da  $\text{P}_2\text{O}_5$  bulunmuştur. Bu sonuç, topraktaki yarayışlı potasyum miktarı olarak, düşük yarayışlı potasyum oranına sahip olduğunu göstermektedir (FAO,1990). Topraktaki fosfor oranı Olsen Spektrofotometrik metodu kullanılarak 76,02 kg/da bulunmuştur. Bu değer, toprağın sahip olduğu fosfor miktarı açısından yüksek fosfor oranına sahip olduğunu göstermektedir (Ülgen ve Yurtsever, 1974). Topraktaki organik madde oranı, Walkey Black metodu kullanılarak %2,7 bulunmuştur. Bu değer literatürdeki değerlere göre, toprak örneğinin yüksek organik madde oranına sahip olduğunu göstermektedir (Anonim, 2018).

Sinop'tan alınan toprak örneği analiz sonuçları Tablo 3'de verilmiş, referans değerler dikkate alınarak literatürdeki diğer çalışmalarla karşılaştırılıp yorumlanmıştır.

Toprak Parametreleri	Metot	Birim	Deney Sonucu
Saturasyon	Saturasyonda	%	52,8
pH	Saturasyonda (pH metre)	pH	7,42
İletkenlik (Tuz)	Saturasyonda (EC metre)	$\mu\text{s}/\text{cm}$	439
Kireç	Kalsimetre	%	19,4
Yarayışlı Potasyum	Amonyum Asetat/Flame	$\text{K}_2\text{O}$ kg/da $\text{P}_2\text{O}_5$	30,85
Fosfor	Olsen Spektrofotometrik	kg/da	3,69
Organik Madde	Walkey Black	%	1,5

**Tablo 3.** Sinop toprak örneği analiz sonuçları

Toprak pH değeri, pH metre kullanılarak saturasyon işlemi ile 7,42 bulunmuştur. Bu değer, toprağın pH değerine göre hafif alkali toprak grubunda olduğunu göstermektedir (Anonim, 2018). Toprak iletkenlik (tuz) değeri Saturasyonda (EC metre) kullanılarak 439  $\mu\text{s}/\text{cm}$  yani 0,439 mS  $\text{cm}^{-1}$  bulunmuştur. Bu değer, toprağın iletkenlik (tuz) açısından tuzsuz toprak olduğunu yani iletkenliğinin olmadığını veya zayıf olduğunu göstermektedir (Anonim, 2018). Toprak kireç oranı kalsimetre kullanılarak %19,4 bulunmuştur. Bu değer, literatürdeki referans değerlere göre toprağın fazla kireçli olduğunu göstermektedir (Ülgen ve Yurtsever, 1974). Topraktaki yarayışlı potasyum oranı, Amonyum Asetat/Flame metodu kullanılarak 30,85  $\text{K}_2\text{O}$  kg/da  $\text{P}_2\text{O}_5$  bulunmuştur. Bu sonuç, topraktaki yarayışlı potasyum miktarı olarak, çok düşük yarayışlı potasyum oranına sahip olduğunu göstermektedir (FAO,1990). Topraktaki fosfor oranı Olsen Spektrofotometrik metodu kullanılarak 3,69 kg/da bulunmuştur. Bu değer, toprağın sahip olduğu fosfor miktarı açısından düşük fosfor oranına sahip olduğunu göstermektedir (Ülgen ve Yurtsever, 1974). Topraktaki organik madde oranı, Walkey Black metodu kullanılarak %1,5 bulunmuştur. Bu değer literatürdeki değerlere göre, toprak örneğinin orta düzeyde organik madde oranına sahip olduğunu göstermektedir (Anonim, 2018).

### Defne Bitkisinin Meyve Ve Yapraklarının Kimyasal Analizleri

Bölgelere göre defnenin yaprak ve meyvesinde en fazla bulunan elementlere sırasıyla bakacak olursak;

#### **Mg miktarına göre yapraklar:**

Hatay Yayladağı Yaprığında 3107909 ppb,  
Hatay Samandağ'ı Yaprığında 2556563 ppb,  
Sinop Yaprığında 1771661 ppb miktarında Mg bulunur.

#### **Mg miktarına meyveler:**

1. Hatay Samandağ'ı Meyvesinde 949237 ppb
2. Hatay Yayladağı Meyvesinde 748325 ppb
3. Sinop Meyvesinde 568928 ppb

#### **P miktarına göre yapraklar:**

Hatay Samandağ'ı yaprağında 1863096 ppb  
Sinop yaprağında 1760360 ppb  
Hatay Yayladağı yaprağında 1695099 ppb

#### **P miktarına göre meyveler:**

Hatay Samandağ'ı Meyvesinde 2332026 ppb  
Hatay Yayladağı Meyvesinde 1813188 ppb  
Sinop Meyvesinde 1801037 ppb

#### **K miktarına göre yapraklar:**

Hatay Yayladağı yaprağında 12970883 ppb  
Sinop yaprağında 10985434 ppb  
Hatay Samandağ'ı yaprağında 8892027 ppb

#### **K miktarına göre meyveler**

Hatay Samandağ'ı Meyvesinde 11641157 ppb  
Sinop Meyvesinde 9770916 ppb  
Hatay Yayladağı Meyvesinde 8998593 ppb

**Ca miktarına göre yapraklar**

Hatay Samandağ'ı yaprağında 15097444 ppb  
Sinop yaprağında 12892055 ppb  
Hatay Yayladağı yaprağında 11492966 ppb

**Ca miktarına göre meyveler**

Hatay Samandağ'ı Meyvesinde 1496656 ppb  
Hatay Yayladağı Meyvesinde 1198474 ppb  
Sinop Meyvesinde 731640 ppb

**Mn miktarına göre yapraklar**

Sinop yaprağında 198658 ppb  
Hatay Samandağ'ı yaprağında 56758 ppb  
Hatay Yayladağı yaprağında 11669 ppb

**Mn miktarına göre meyveler**

Sinop Meyvesinde 16309 ppb  
Hatay Samandağ'ı Meyvesinde 11562 ppb  
Hatay Yayladağı Meyvesinde 7600 ppb

Literatür taramamızda çalıştığımız lokasyonlara ait defne bitki elementleri konusunda çalışmaya rastlanılmamıştır. Diğer bölgelerden yapılan çalışma sonuçları, bulduğumuz çalışma sonuçları ile karşılaştırılmıştır. Dolayısıyla tezimizde yer alan bölgeler için Defne organlarının kimyasal içerik çalışması ilk kez yapılmıştır. Yaşar ve ark., (2012) Bartın'dan üç farklı lokasyondan aldıkları defne yapraklarının analiz sonuçlarında Mg elementini ortalama 21,4 olarak, K elementini ortalama 14,9 olarak ve Ca elementini ortalama 9,9 olarak bulmuşlardır (Yaşar ve ark., 2012).

**Defne Bitkisi Meyve Ve Yapraklarının Uçucu Yağ Analizleri**

Hatay (Yayladağ) yaprak uçucu yağ analizinde 11 kimyasal bileşen ( $\% \geq 1$ ) tespit edilmiştir. 1,8-Sineole (66.4%), Sabinene (9.4%), 3-Cyclohexen-1-ol (4.2%) ve  $\alpha$ -Pinene (3.6%) ana bileşenler olarak bulunmuştur. Hatay (Yayladağ) meyve uçucu yağ analizinde 11 kimyasal bileşen ( $\% \geq 1$ ) tespit edilmiştir. 1,8-Sineole (45%),  $\alpha$ -Pinene (9.9%) Sabinene (8.4%), 1-Phellandrene (6.9%) ve  $\beta$ -Elemene (3.8%) ana bileşenler olarak bulunmuştur.

Hatay (Samandağ) alınan yaprak uçucu yağ analizimizde 10 kimyasal bileşen ( $\% \geq 1$ ) tespit edilmiştir. 1,8-Sineole (61.5%), Sabinene (10.6%), Camphene (4.6%) 3-Cyclohexen-1-ol (4.%) ve  $\alpha$ -Terpineol (3.5%) ana bileşenler olarak bulunmuştur. Hatay (Samandağ) meyve uçucu yağ analizinde 11 kimyasal bileşen ( $\% \geq 1$ ) tespit edilmiştir. 1,8-Sineole (40.9%),  $\beta$ -Elemene (13.7%),  $\alpha$ -Pinene (9.8%) Sabinene (9.3%) ve 1-Phellandrene (8%) ana bileşenler olarak bulunmuştur.

Sinop'tan alınan yaprak uçucu yağ analizinde 11 kimyasal bileşen ( $\% \geq 1$ ) tespit edilmiştir. 1,8-Sineole (57.3%), Sabinene (11%), Camphene (5.4%)  $\alpha$ -Pinene(4.2%) 3-Cyclohexen-1-ol (3.6%) ana bileşenler olarak bulunmuştur. Sinop meyve uçucu yağ analizinde 15 kimyasal bileşen ( $\% \geq 1$ ) tespit edilmiştir. 1,8-Sineole (27.6%), 1-Phellandrene (10.1%), 1,3,6-Octatriene (8.5%), Sabinene (7.3%) ve  $\beta$ -Elemene (6.8%), ana bileşenler olarak bulunmuştur.

Çalışma sonuçlarımıza göre defne bitkisinin tıbbi ve ekonomik değerini gösteren, çalışılan organların hepsinde ana bileşen olarak çıkan 1,8-Sineole (66.4%) en yüksek oranda Hatay (Yayladağ)'dan alınan defnenin yapraklarında, en düşük oranda 1,8-Sineole (27.6%) Sinop'tan alınan örneklerin meyvesinde çıkmıştır. Ana bileşenler genel olarak benzerlik göstermektedir. Hatay (Yayladağ)'dan alınan örnekte ana bileşen olan 1,8-Sineole, coğrafik şartlara bağlı olarak en yüksek oranda bulunmuştur diyebiliriz.

Kılıç ve ark., (2004) tarafından yapılan çalışmada Karadeniz bölgesinden toplanan defne bitkisinin yaprak ve meyve uçucu yağlarına bakılmıştır (Kılıç ve ark., 2004). Yapraklarda 1,8-sineole,  $\alpha$ -terpinyl acetate, sabinene,  $\alpha$ -pinene, meyvelerde (E)- $\beta$ -ocimene, bicyclogermacrene, ana bileşenlerdir. Bizim yaprak sonuçlarımızla benzerlik gösterirken, meyve sonuçlarımızla farklılık bulunmaktadır. Karadeniz (2001), tarafından Hatay'dan alınan defne yaprak ve meyveleriyle yapılan uçucu yağ çalışmasında yapraklarda bizim çalışmamızda olduğu gibi 1,8-sineole ana bileşen, meyve uçucu yağ çalışmasında ana bileşen  $\alpha$ -pinen'dir.  $\alpha$ -pinen bizim çalışma sonuçlarımızda da ana bileşenler arasındadır (Karadeniz, 2001). Karık ve ark., (2015) tarafından Türkiye'de

yayıllı gösteren defne bitkilerine yaptıkları yaprak uçucu yağ çalışmasında 1,8-sineol bizim çalışmamızda olduğu gibi ana bileşen olarak tespit edilmiştir (Karık ve ark., 2015).

Literatürde Türkiye’de yayıllı gösteren defne bitkilerine ait uçucu yağ çalışmalarında genel olarak, bizim çalışmamızda olduğu gibi 1,8-sineole ana bileşen olarak tespit edilmiştir. Diğer ana bileşenlerdeki ve 1,8-sineole miktarındaki farklılık bitkinin toplanma yerinin coğrafik özellikleri, toplanma zamanı ve kullanılan yöntemlerinden kaynaklanmaktadır.

## SONUÇ

Yapılan çalışmada konumuz olan defne bitkisi, ülkemiz için tıbbi ve ekonomik değeri yüksek ve insanlar tarafından gıda, şifa amaçlı kullanılan bir bitkidir. Çalışmamızda, farklı ortamlardan alınan bitki örneklerinde uçucu yağ miktarları ve kimyasal bileşenlerin farklı olduğu görülmüştür. Bu sonuçlar, defne konusunda yapılan ve farklı parametrelerin kullanıldığı çalışmaların yeni sonuçlar ortaya çıkarabileceğini göstermektedir. Çalışma sonuçlarımız, bitkinin farklı organlarının uçucu yağ ve kimyasal içerik bakımından farklı olabileceğini göstermekte, coğrafik şartların bitkinin verimini değiştirebileceği konusundaki çalışmaları doğrulamaktadır. Bitkinin yetiştiği ortamların toprak özelliklerine ait verilerimiz, literatürde bu konuda sınırlı çalışmalardan dolayı, yeni çalışmalara kaynak oluşturacaktır. Toprak konusunda yeni çalışmalar yapılarak bitkinin farklı özelliklerinin (Ör: Fitoremediasyon) tespiti gerekmektedir. Elde ettiğimiz verilerin, ülkemizde doğal olarak yayıllı gösteren bu bitkiye ait yeni çalışmalara veri olacağını ve bilim dünyasına katkı sağlayacağını düşünmekteyiz.

## Özet

Nar (*Punica granatum*), Lythraceae familyasından, içinde küçük çekirdekleri ve tanecikleri bulunan, hafif ekşi tadı olan, ılıman iklimlerde yetişen bir meyve türüdür. Nar üretiminde önde gelen ülkeler İran, Hindistan, Çin, Türkiye, ABD, Irak, İspanya, Suriye, Azerbaycan, Afganistan, Mısır, Özbekistan ve Pakistan'dır. Türkiye'de 2002 yılında 3 milyon nar ağacı ve 50-60 bin ton nar üretimi varken olumlu piyasalar ve devlet desteği ile 2010 yılına gelindiğinde 13 milyon ağaç ve 315 bin ton üretime ulaşmıştır. Ülkemizde bölge olarak Akdeniz, Ege ve Güneydoğu Anadolu bölgeleri, il olarak ise Antalya, Muğla, Mersin, Adana nar yetiştiriciliğinde ön plana çıkmaktadır. Tarımsal ürünlerde girdi kullanım miktarlarının, maliyet ve gelirlerin belirlenmesi mikro düzeyde üreticiler ve ekonomi politikasını yürütenler açısından büyük önem taşımaktadır. Bu amaçla Antalya ilinde en fazla nar üretimi yapılan Döşemealtı, Serik ve Aksu ilçelerindeki nar üreticileri nar üretiminde karşılaşılan hastalık ve zararlılar ile mücadele yöntemleri hakkında anket çalışması yapılmıştır. Anket sonuçlarına göre o bölgede en sık rastlanılan zararlılar nar yaprakbiti (*Aphis punicae*), nar beyazsineği (*Siphoninus phillyreae*), turunçgil unlubiti (*Planococcus citri*) iken en çok rastlanılan hastalıklar ise kahverengi leke (*Alternaria alternata*), kök ve kök boğazı çürüklükleri (*Phytophthora spp.*) olarak ifade edilmiştir.

**Anahtar Kelimeler:** Nar, Üretim, Bitki Koruma

### Plant protection practices of pomegranate producers in Antalya province

## Abstract

Pomegranate (*Punica granatum*) is a type of fruit from the Lythraceae family, with small seeds and grains, a slightly sour taste, and grows in temperate climates. The leading countries in pomegranate production are Iran, India, China, Turkey, USA, Iraq, Spain, Syria, Azerbaijan, Afghanistan, Egypt, Uzbekistan and Pakistan. While there were 3 million pomegranate trees and 50-60 thousand tons of pomegranate production in Turkey in 2002, with positive markets and government support, 13 million trees and 315 thousand tons of production were reached in 2010. In our country, the Mediterranean, Aegean and Southeastern Anatolia regions, and Antalya, Muğla, Mersin, Adana come to the forefront in pomegranate cultivation. Determining the amount of input use, costs and incomes in agricultural products is of great importance for producers and economic policy makers at the micro level. For this purpose, pomegranate producers in Döşemealtı, Serik and Aksu districts, where the most pomegranate is produced in Antalya province, were surveyed about the diseases and pests encountered in pomegranate production and control methods. According to the survey results, the most common pests in that region are pomegranate aphid (*Aphis punicae*), pomegranate whitefly (*Siphoninus phillyreae*), citrus mealybug (*Planococcus citri*), while the most common diseases are brown spot (*Alternaria alternata*), root and root collar rots (*Phytophthora spp.*).

**Keywords:** pomegranate, production, plant protection

## GİRİŞ

Nar (*Punica granatum* L.), Lythraceae familyasının Punica cinsinden çok yıllık bir bitki olup ticari değeri kadar kültürel olarak da önemli bir meyvedir. Bu meyvenin ticari türü olan *Punica granatum* L. Ortaçağ'da

çekirdekli elma anlamına gelen “*Pomuni granatum*”dan adını almıştır. Bir Fenike kolonisi olan Kartacalılar Akdeniz havzasında nar ticaretini başlattıkları için eski kaynaklarda “Kartaca (Fenike) Elması” (The apple of Carthage / Carthaginianapple) olarak da yer almaktadır. Günümüzde A.B.D.’de çekirdekli elma (Seedy apple) olarak da bilinmektedir (Kurt ve Şahin 2013).

Çalı formunda olan nar bitkisinin boyları 2 ila 5 metre arasındaki değişkenlik göstermektedir. Meyveleri çok taneli ve etli tohumlardan oluşan, kırmızıdan beyaza kadar değişik tonlarda renklere sahiptir. Özellikle potasyum ve karbonhidrat açısından oldukça zengin bir Akdeniz meyvesidir. Genellikle taze ve meyve suyu olarak tüketilen, çeşitli ve değerli maddelerin elde edildiği bir bitkidir. Son yıllarda yetiştirme tekniği, gıda teknolojisi, depolama ve taşıma alanlarında görülen gelişmeler sonucu daha çok tanınan, yetiştiriciliğine ilgi duyulan bir meyve haline gelmiştir (Özgül ve ark., 2015). Ayrıca günümüzde AIDS için kullanılan yiyecekler sınıfına alınmış ve Japon patentli ilaçlarda yer alan 9 bitkiden biri olmuştur. Narın içerdiği flavanoidlerin güçlü bir antioksidan olduğu belirlenmiştir. Yine, nar meyve suyu ve yağının ömrü uzattığı, kalp hastalıkları ile kanseri önlediği bildirilmiştir (Lansky ve ark., 1998).

Son yıllarda, Türkiye’de nar yetiştiriciliğinin artmasında, insan sağlığına olan faydalarının anlaşılması ve ekonomik olarak da değerinin artması gibi nedenler yer almaktadır. Ülkemizde uzun yıllardan beri bahçe kenarlarında, çit bitkisi ve süs bitkisi olarak yetiştirilen nar bitkisi, son zamanlarda kapama bahçeler şeklinde yetiştirilmeye başlanmıştır. Nar bitkisi, çok çeşitli iklim ve toprak koşullarına kolayca adapte olabilmesi, çoğaltılmasının kolay olması, birim alanda yüksek verim vermesi ve erken meyveye yatması gibi avantajlara sahiptir. Ayrıca, kuru hava şartlarına, yarı çöl ve hatta çöl iklimine antepfıstığı ile birlikte en dayanıklı meyve türü olarak bilinmektedir (Dursun ve ark., 2019).

Nar yetiştiriciliği, yaygın olarak birçok ülkede yapılmasına rağmen dünyada büyük bir potansiyele sahip değildir. Türkiye, narın anavatanı olarak kabul edilen yetiştirici ülkeler arasında ilk sıralarda yer almaktadır. Türkiye’de yetiştiriciliği yapılan diğer meyve çeşitlerinde olduğu gibi, narlarda da yetiştiricilik sorunlarının yanında birçok bitki koruma sorunları ile karşılaşmaktadır. Bu sorunların başında da, zararlılarla mücadele gelmektedir. Gerek yurtiçinde gerekse yurtdışında nar zararlıları ile doğal düşman türlerinin belirlenmesi amacıyla az sayıda faunistik çalışma bulunmaktadır. Türkiye’de sadece Güneydoğu Anadolu Bölgesi ile Antalya İlinde olmak üzere iki faunistik çalışma yapılmış, yurtdışında ise İspanya ve Hindistan’da benzer konuda çalışmalar gerçekleştirilmiştir (Öztürk ve ark., 2005).

Dünya’da ve Türkiye’de özellikle 2000’li yıllardan sonra nar üretiminde önemli artışlar gözlenmiştir (Kurt ve Şahin 2013). Nar, Türkiye’de tüm bölgelerde yetişen bir meyve olmasının yanında özellikle Ege ve Akdeniz bölgelerinde ve Güneydoğu Anadolu bölgesinde yetiştirilmektedir (Gölükcü ve ark., 2008). Ülkemiz nar üretiminde ilk beş sırada yer alan iller sırasıyla Antalya (107.237 ton), Mersin (45.594 ton), Denizli (39.715 ton), Adana (20.769 ton) ve Hatay (20.769 ton)’dır. Bölgelere göre nar üretim miktarı incelendiğinde 234.609 ton ile Akdeniz Bölgesi birinci, 146.080 ton ile Ege Bölgesi ikinci ve 51.790 ton ile Güneydoğu Anadolu Bölgesi üçüncü sırada yer almaktadır Güneydoğu Anadolu Bölgesinin toplam nar üretim payı içerisinde ki değeri %11.62’dir. Güneydoğu Anadolu bölgesinde nar üretimi bakımından Gaziantep birinci, Kilis ikinci, Şanlıurfa üçüncü, Adıyaman dördüncü ve Siirt beşinci sırada yer alırken Batman ili son sırada yer almaktadır (Şimşek ve Gülsoy 2017).

Tarımsal ürünlerde girdi kullanım miktarlarının, maliyet ve gelirlerin belirlenmesi mikro düzeyde üreticiler ve ekonomi politikasını yürütenler açısından büyük önem taşımaktadır. Tarımsal ürün maliyetleri ile ilgili araştırmaların sonuçları, hükümetlerin fiyat politikalarını saptamalarında başvurabilecekleri önemli bir araç olmaktadır. Ayrıca tarımsal ürün maliyetleri, işletmelerde özellikle fiziki üretim girdilerinin kullanım düzeylerinin belirlenmesi, işgücü planlaması, finansman programlarının yapılması, ürün bütçelerinin ve yatırım projelerinin hazırlanması vb. planlama faaliyetlerinde yaygın olarak kullanılmaktadır (Özalp ve Yılmaz, 2013). Bu sebeple üreticilerle yapılan anket çalışmaları oldukça önem kazanmaktadır.

## MATERYAL VE METOT

Bu çalışma da 2020-2021 yılında Antalya ilinde en fazla nar üretimi yapılan Döşemaltı, Serik ve Aksu ilçelerindeki nar üreticileri ile görüşülerek yapılmıştır.

Çalışma kapsamında üretim büyüklükleri dikkate alınarak Döşemaltı’nda 25, Serik’te 15 ve Aksu’da 10 üretici olacak şekilde toplamda 50 nar üreticisi ile görüşülmüştür. Üreticilere 25 sorudan oluşan görüşme formları sunulmuştur. Anket sonucunda elde edilen bilgiler değerlendirilmiştir.

1. Kaç dekar alanda nar üretimi yapıyorsunuz?

%6'sı 1-10 dekar .

%24'ü 10-25 dekar

%8'i 25-40 dekar

**%40'ı 40-50 dekar**

%22'si 50+ dekar

2. Nar üretiminde en fazla karşılaştığınız hastalık ve böcekler nelerdir?

#### **Hastalık**

**%76'sı Kahverengi Leke Hastalığı** (*Alternaria alternata*)

%20'si Kök ve Kök Boğazı Çürüklüğü (*Phytophthora spp.*)

%4'ü Diğer

#### **Böcekler**

**%40'ı Nar Yaprak Biti** (*Aphis punicae*)

%12'si Nar Beyaz Sineği (*Siphoninus phillyreae*)

%38'i Turunçgil Unlubiti (*Planococcus citri*)

%10'u Akdeniz Meyve Sineği (*Ceratitis capitata*)

3. Herhangi bir hastalık ya da zararlı ile karşılaşmak düşüncesiyle bitkileri kontrol etmek için düzenli aralıklarla ilaç atar mısınız?

**%60'ı Evet**

%20'si Bazen

%20'si Hayır

4. Bir hastalığı ya da zararlıyı görür görmez ilaç atar mısınız?

**%92'si Evet**

%8'i Hayır

Hayır ise atmamanızın nedeni nedir?

%0 Masraflı olduğu için

**%50'si Hastalık ya da zararlı az olduğu için**

**%50'si Hastalık ya da zararlı önemsiz olduğu için**

%0'ı Diğer (Belirtiniz)

5. Kullandığınız tarım ilaçlarını nereden temin ediyorsunuz?

**%82'si Zirai İlaç Bayii**

%6'sı Tarım Kredi Kooperatifi

%10'u Ziraat Odası

%2'si Diğer

6. Kullandığımız ilaçları seçerken nelere dikkat edersiniz?

%28'i Kullanacağım ürün için ruhsatlı olmasına

**%34'ü Etkili Olmasına**

%10'u Karışabilir olmasına

%8'i Ekonomik olmasına

%20'si Tanınmış bir ilaç olmasına

%0'ı Diğer (Hasat süresinin kısa olmasına)

7.Bitki koruma ürünleri uygulamaya yönelik kurs ve eğitim aldınız mı?

**%60'ı Evet**

%40'ı Hayır

8.Sezon boyunca kaç ilaçlama yapıyorsunuz?

%0'ı 1-3ilaçlama

%10'u 4-7 ilaçlama

**%84'ü 8-15 ilaçlama**

%6'sı 15>ilaçlama

9.İlaçlamayı ne zaman yapıyorsunuz?

%26'sı Sabah

%2'si Öğle

**%64'ü Akşam**

%8'i Zaman Gözetmeksizin

10.İlaç uygulamasını nasıl yapıyorsunuz?

%0'ı Yağmurlama sulama ile

%0'ı Damlama sulama ile

**%100'ü İlaçlama makinesi ile**

%0'ı Diğer

11.İlaçlama dozunu ayarlama da nelere dikkat edersiniz?

%18'i Etikete göre uygulama yaparım

**%44'ü Bayinin önerisine göre ayarlarım**

%12'u Etiketden biraz fazla uygularım

%18'i Kendi tecrübeme göre

%8'i Diğer üreticilerin yaptıklarını uygularım

12.Tarım ilacını hazırlarken suyun pH'sına bakıyor musunuz?

**%98'i Hayır**

%2'si Evet

13.Kimyasal mücadelede birden fazla ilacı karıştırarak kullanıyor musunuz?

%2'si Hayır

**%98'i Evet**

Evet ise nedeni;

**%82'si Bir ilaçlamada birden fazla hastalık ve zararlıyı yok etmek için**

%2'si Birden fazla ilaç kullanarak tek bir hastalık ve zararlıyı yok etmek için

%16'sı İlaçlama maliyetini azaltmak için

14.Size göre narda mücadelesi en zor zararlı nedir?

%38'i Turunçgil Unlu Biti (*Planococcus citri*)

**%44'ü Nar Yaprak Biti (*Aphis punicae*)**

%12'si Nar Beyazsineği (*Siphoninus phillyreae*)

%6'sı Harnup Güvesi (*Ectomyelois ceratoniae*)

15. Kullandığınız ilaç size göre etkili oluyor mu?

**%56'sı Evet**

%28'i Hayır

%16'sı Bazen

16. Tarım ilaçlarını hazırlarken hangi tedbirleri alıyorsunuz?

%12'si İlaç ambalajındaki gerekli bilgileri okuyorum

%4'ü İlaçların hazırlanmasında eldiven, gözlük kullanıyorum

%4'ü Süspansiyon ve emülsiyon ilaçların çok iyi karışmasına

%26'ü Sigara içmemeye, yemek yememeye uyuyorum

**%54'ü Hiçbir önlem almıyorum**

17. Tarım ilaçlarını atarken hangi tedbirleri alıyorsunuz?

**%50'ü Yemek yememeye, sigara içmemeye uyuyorum**

%2'si Koruyucu elbise kullanıyorum

%48'i Hiçbir önlem almıyorum

%0'ı Diğer (Belirtiniz)

18. Artan ilaçları ve ilaçlama tankının temizlenmesi sırasında oluşan ilaçlı suyu nereye boşaltıyorsunuz?

%18'i Bahçenin bir kenarına döküyorum

%24'ü Boş bir araziye püskürtüyorum

%0'ı Sulama kanalına veya akarsuya boşaltıyorum

**%58'i Başka ağaç ve sebzelerde kullanıyorum**

19. İlaçlamalardan önce ve sonra ilaçlama alet ve ekipmanları hakkında aşağıdakilerden hangisini yapıyorsunuz?

%40'ı Kalibrasyon ayarlarını yapmak

**%60'ı Her uygulamadan sonra ilaç deposu temizliği**

%0'ı Koruyucu giysi ve ekipmanları ilaçlardan ayrı yere koymak

20. Kullanmış olduğunuz tarım ilaçlarını nerede depoluyorsunuz?

%8'i Evin herhangi bir yerinde

**%44'ü Özel bir dolapta**

%28'i Özel bir odada rafta

%0'ı Ahır veya hayvan barınağında

%20'si Ayrı bir binada ya da katta

21. İlaçlı mücadele çevre kirliliğine yol açıyor mu?

%0'ı İlaçların çevreyi kirlettiği doğru değil

%38'i İlaçlar çevre kirliliğine neden oluyor, fakat abartıyorlar

**%62'si İlaçlı mücadele ile çevreyi kirlletiyoruz, ama mücadele gerekli**

22. İlaçlar çevreyi nasıl kirlletiyor?

**%60'ı İlaçlar gereğinden fazla atılarak**

%20'si Kullanılması sakıncalı ilaçlar gereksiz yerlerde kullanılarak

%10'u İlaçlama esnasında hedefin dışına taşarak

%10'u İlaç artıklarını ortada bırakarak

23.Kimyasal mücadelede kalıntı sorunu sizce önemli mi?

%20'si İlaçlamada önemli olan hastalığı ortadan kaldırmak

%20'si Önemli, fakat ilacın yararı daha önemlidir

%20'si Çok önemli, ilacın yararından daha önemli

**%40'ı İlaç atarken özellikle kalıntısının oluşturacağı sorunları dikkate alırım**

24.Boşalan ilaç kutularına ne yapıyorsunuz?

**%50'si Tarlanın bir kenarına atıyorum**

%0'ı Sulama kanalı veya akarsuya atıyorum

%20'si Genel çöp kutusuna atıyorum

%30'u Bir yerde depolayıp, sonra yakarak imha ediyorum

25.İlaçlama ile hasat arasında olması gereken bekleme süresine dikkat ediyor musunuz?

%36'sı Mahsulün olgunlaşmasına göre hasat ederim

%14'ü İlaçlamadan sonra gerekli bekleme süresine uyarım

**%50'si Pazar koşullarına göre hareket ederim**

%0'ı Bekleme süresine dikkat etmem

## **BULGULAR**

Antalya ilinde en fazla nar üretimi yapılan Döşemaltı, Serik ve Aksu ilçelerindeki nar üreticileri ile yapılan anket çalışmasına göre narda en çok görülen hastalığın kahverengi leke (*Alternaria alternata*) en çok görülen zararlı ise Nar Yaprak Biti (*Aphis punicae*) olduğu belirlenmiştir. Üreticilerin %60'nın düzenli olarak ilaç attığı, genellikle pestisitleri zirai ilaç bayilerinden temin ettikleri ve ilaç dozunu ayarlarken de bayilerin önerilerine göre yaptıkları ayrıca pestisitlerin etkili olmasına özen gösterdikleri ifade edilmiştir. Üreticilerin %84'ü sezon boyunca 8-15 kez ilaçlama yapmaktadırlar. Tarım ilaçlarını hazırlarken % 54'ü hiçbir önlem almazken, ilaç uygularken %50'si yemek yememeye, sigara içmemeye dikkat etmektedir. Genellikle ilaçlamayı akşam saatlerinde yaptıklarını, ilaçlama yaparken suyun pH'ına bakmadıklarını, birden fazla hastalık ve zararlı ile mücadele etmek için ilaçları karıştırarak kullandıklarını, üreticilerin tamamının ilaçlamayı ilaçlama makinası ile yaptıklarını belirtmişlerdir. Ayrıca anket çalışması yapılan üreticilerden %60'ı bitki koruma ürünleri uygulamaya yönelik kurs ve eğitim aldıklarını söylemişlerdir.

## **SONUÇ**

Antalya genelinde üreticiler zararlı ve hastalıklarla mücadelede pestisit kullanımını tercih etmektedirler. Özellikle nar üreticileri sezon boyunca ürün ve ağaç kaybı yaşamamak için yüksek oranda insektisit ve fungusit kullanmaktadır. Yapılan anket çalışmasına göre Antalya ilinde nar üretiminde tarımsal faaliyetlerin en önemli kısmını oluşturan çiftçilerin yetiştiricilik ile ilgili bilgi ve sorumlulukları açısından eksiklikler tespit edilmiştir. Bu eksikliklerin giderilmesi amacıyla çeşitli önerilerde bulunulabilir. Üreticilerin gereğinden fazla pestisit kullanma istekleri vardır ve satın aldıkları ilaçları yetersiz bulmaktadırlar. Çiftçilere özellikle pestisitler konusunda Tarım İl ve İlçe Müdürlükleri tarafından doğru pestisit kullanımı ve uygulamaları hakkında bilgi verilmelidir. Bakanlık tarafından zaman zaman pestisitler, çevre sağlığı, doğal denge vb. konularında eğitim ve seminerler verilmelidir. Genel olarak bitki koruma uygulamaları ve pestisit kullanım sorumluluğu konusunda yasal düzenlemelerin getirilmesi ve uygulanmasının sağlanması yararlı olacaktır.

#### Abstract

Cancer metastasis is a complex phenomenon driven by a plethora of mechanical and molecular factors. Although animal models have been widely used for testing of drug candidates to elicit anti-metastatic drug candidates, these *in vivo* models can not fully recapitulate the pathology. Organ-on-chip (OoC) platforms designed to address this unmet need stands out as an advance approach. Organ-on-chips are microfluidic devices consisting of perfused channels and tissue constructs to emulate physiology at the tissue and organ level thus providing favorable environmental conditions for living cells. In the scope of this paper, an in-depth exploration of the key mechanisms underlying cancer metastasis, emphasizing the interplay between mechanical and molecular forces from tissue engineering perspective is provided. Furthermore, the studies related to organ-on-chip platforms that are used to investigate cancer metastasis are critically discussed.

**Keywords:** organ-on-chip, tissue engineering, cancer metastasis, extracellular matrix

#### INTRODUCTION

Cancer is the major cause of death worldwide, posing a serious public health problem. However, tumor metastasis continues to be the main cause of cancer-related deaths, which is the spread of cancer cells from the primary tumor to distant organs or tissues. Although animal models have been used for elicitation of potential drug candidates for many years, the specie differences results in bias (Perrin, 2014; Day et al., 2015) in terms of translation of the data to the clinical setting. Therefore, effective experimental models are required to understand the molecular drivers of metastasis. *In vitro* cell culture models provide an understanding of cellular mechanisms, which include cell differentiation, migration, and growth, which are influenced by chemical and mechanical microenvironments (Duval et al., 2017). 3D *in vitro* dynamic tumor models are known as highly suitable models for cancer research due to their closeness to *in vivo* models (Ma et al. 2012; Moshksayan et al. 2018). These models mostly consist of proliferating, quiescent, apoptotic, hypoxic and necrotic cell types, rendering them suitable for the investigation of intricate metastatic stages including invasion, intravasation, and extravasation (Azimian-Zaraveh et al. 2022). Simultaneously, the integration of microfluidic systems with 3D cultures, allows important cell-cell interactions and spatio-temporal changes to be imitated by both physical and mechanical forces (Saglam-Metiner et al., 2023). This integration closing the gap between traditional tissue culture studies and human systems (Portillo-Lara R et al. 2016; Yesil-Celiktas et al. 2018). To achieve more accurate replication of the complex stages of metastasis and establishment of the tumor microenvironment, it becomes imperative discussion on extracellular matrices (ECM). The ECM, provides structural stability and functional flexibility to cells, tissues, and organs owing to specific macromolecules and enzymes (Kyriakopoulou K et al, 2023). They also consist of proteins and polysaccharides that contain signals not only for the physical environment but also for tissue development, homeostasis, and repairment of the tissue structure. (Gregory and Annette, 2009; Tsang et al., 2010) This makes them prime candidates for the generation of a more verisimilar tumor microenvironment.

Within the scope of tissue engineering aimed at emulating ECM-like tissue, bioinspired materials are being systematically developed that mimic hierarchical structures/patterns in nature with their unique properties and functions (chemical and physical properties, structural hierarchy, composition, and more) (Arslan et al, 2023). Synthetic and naturally derived bioinspired materials cannot fully recapitulate the biological, chemical and mechanical properties of the human tissue microenvironment (Nguyen and Camci-Unal, 2020). Plant-based scaffolds have emerged in recent years to mimic many properties, especially microstructural, of natural ECM. Plant-based scaffolds are promising due to their high surface area, natural vascular networks, varying porosity

ranges, hardness, mechanical properties and water transport (Adamski et al, 2018; Hickey and Pelling, 2019). When mimicking on-chip metastasis models, it is important to create vascularized systems similar to those in the body to better reflect the mechanical and physicochemical process. Instead of the materials and tissue scaffolds used for this purpose, plant-derived vascular systems can be used in metastasis modeling due to their various advantages.

Here we summarize reproducible models of cancer metastasis process in the circulatory system by focusing on *in vitro* microfluidic systems, which have become rapid trend in recent years.

## RESULTS and DISCUSSION

Understanding of cancer metastasis helps to design and fabricate advance organ-on-chip platforms. Indeed, the metastatic cascade is a stepwise process comprising several distinct stages (**Fig. 1**). The first step involves the invasion of cancer cells into the surrounding tissue. This process is facilitated by the loss of cell adhesion, increased cell motility, and the secretion of enzymes that degrade the extracellular matrix (ECM) (Martin et al, 2013). Mechanically, this involves cell contractility and the ability to penetrate tissue barriers. Cancer cells that have invaded locally may enter blood vessels (intravasation) or lymphatic vessels. This step relies on both molecular interactions, such as adhesion molecules like integrins, and mechanical forces generated by cell contractility (Fujimoto et al, 2021).

**Figure 1.** Microfluidic models involving metastatic steps such as invasion/intravasation (A,B) and extravasation (C) processes, by Zhang et al. 2022, Open access publication under CC-BY licence

This is followed by survival in the circulation. Circulating tumor cells (CTCs) face mechanical challenges in the bloodstream, including shear forces. Molecular mechanisms like immune evasion and resistance to anoikis (detachment-induced cell death) are crucial for their survival. Upon reaching distant organs, CTCs must extravasate, or exit the circulation, and enter the parenchyma of the target organ. This process involves interactions with endothelial cells, molecular signals, and mechanical squeezing through tight spaces (Joosse et al, 2015). CTCs that successfully extravasate may form micrometastases in the target tissue (Dujon et al, 2021). This requires the activation of dormancy-associated molecular pathways and the establishment of a suitable microenvironment. To become clinically detectable, micrometastases require sustained growth and angiogenesis, driven by molecular factors like vascular endothelial growth factor (VEGF) and mechanical expansion (Balayan et al., 2022). Eventually, some micrometastases evolve into macro-metastases, causing overt clinical symptoms and complications (Chu et al., 2022). In addition to the metastatic cascade, understanding of mechanical and molecular factors are imperative as well. Cancer metastasis is a multi-step process orchestrated by a myriad of mechanical and molecular factors. An in-depth exploration of the key mechanisms underlying cancer metastasis, emphasizing the interplay between mechanical and molecular forces from tissue engineering perspective is provided.

### ***Mechanical and molecular factors in metastasis***

Cancer cells exhibit enhanced motility driven by actin polymerization, focal adhesion turnover, and membrane protrusions. Mechanotransduction pathways, such as Rho GTPases, play a role in this process. Cancer cells produce matrix metalloproteinases (MMPs) to degrade the ECM, allowing them to infiltrate neighboring tissues. The balance between cell contractility and ECM stiffness influences invasion (Martin et al., 2013). There are circulatory challenges to consider. CTCs experience shear forces, collisions with blood cells, and interactions with the endothelium during circulation. Their ability to withstand these mechanical stresses is crucial for metastasis. Finally, mechanical factors influence the ability of CTCs to extravasate and adapt to the microenvironment at distant sites. This involves interactions with the ECM, stromal cells, and the vasculature. Epithelial-Mesenchymal Transition (EMT) is a critical molecular process in metastasis, involving the downregulation of epithelial markers and upregulation of mesenchymal markers, enhancing cell motility and invasion (Ribatti et al., 2020). Molecular signaling via chemokines and cytokines guides the homing of CTCs to specific organs. The 'seed and soil' hypothesis suggests that interactions between tumor cells (seeds) and the microenvironment (soil) are crucial for metastatic colonization. Molecular signals, including VEGF, promote the formation of new blood vessels within metastatic lesions, ensuring a nutrient supply and facilitating growth. Metastatic cells can evade immune surveillance through various mechanisms, including downregulation of major histocompatibility complex (MHC) molecules and expression of immune checkpoint molecules.

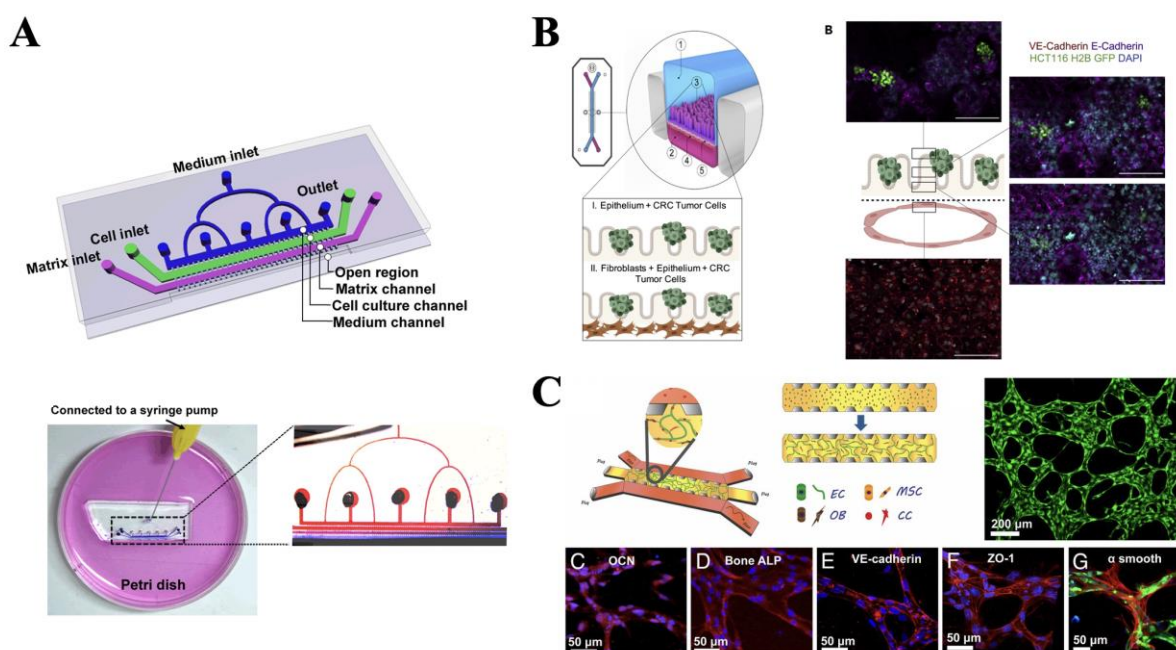

### ***Cancer metastasis-on-chip***

Despite the highly controllable *in vitro* 2D models, reproducing the complexity of the tumor microenvironment poses a significant challenge. The adaptation of cancer metastasis to organ-on-chip technologies are promising for understanding the disease. Specifically, within the realm of 'metastasis-on-chip,' the targeted platforms involve distinct microfluidic chips designed to establish connections between cancer tissues, both within the same chip and across multiple chips, while also interfacing with vascular systems lined with endothelial cells. Metastasis-on-chip has numerous advantages over its *in vivo* counterparts in terms of clinical applications. There are many studies in the literature where it is used to examine the contribution of mechanical and biochemical cues in spread tumor (Carvalho et al., 2015; Lee et al., 2016; Portillo-Lara and Annabi, 2016). In parallel, the spread of invasion, intravasation, extravasation and angiogenesis in the metastasis process has been remodeled (Caballero et al., 2017).

### ***Invasion models***

The invasion process involves the reduction of the capacity of adhesion force in cell-cell interactions and subsequent dispersal of invasive tumor cells from the primary tumor and into the surrounding stroma. During the process, number of substances are secreted to degrade the extracellular matrix and the degradation of the expression of proteins are involved in the control of migration (Martin et al., 2013). In recent years, numerous "metastasis-on-chip" models have been developed with the aim to gain better understanding of the phenomena, elucidate the origin of cancer cells, and examine the differences in the composition of the cellular microenvironment both from mechanical and physicochemical perspectives. In a study an on-chip invasion model, the so-called Petri dish-based liquid feeding system was designed to examine the long-term invasion of gastric cancer, which is known to have high metastatic potential (**Fig. 2A**). The system was characterized by its simplicity, cost-effectiveness, and replicability. It also represented a prospective model for anticancer drug screening, metastasis mechanism research, and even the discovery of new biomarkers associated with metastasis through the investigation of molecular differences such as proteins and microRNA differences between the host and invading cells (Chen et al., 2016).

**Figure 2.** Cancer metastasis-on-chip models. **(A)** A schematic illustration of invasion-on-chip model (Top). A depiction of the microfluidic system comprising a PDMS-glass chip and a Petri dish with culture medium (Bottom left). An image showing a continuous chemical gradient by red and blue dye inside the device using the designed liquid supply system (Bottom right). (Chen et al. 2016, Open access publication under CC-BY license) **(B)** The organ-on-chip intravasation platform (schematic courtesy of Emulate, Inc.) consists of an epithelial channel (1) comprising epithelial and cancerous cells (3) and an endothelial channel (2) comprising HUVEC cells (4) separated by a porous membrane (5). Confocal fluorescence images of a chip cross-section spanning 106  $\mu\text{m}$  from the top of the endothelial channel into the epithelial channel, highlighting the endothelial: epithelial tissue:tissue interface. Scale bar is 100  $\mu\text{m}$  (Strelez et al., 2021, Open access publication under CC-BY license). **(C)** Schematic illustration of the extravasation model. Two side media channels allow addition of cancer cells, biochemical factors, and flow across the vasculature formed in the gel channel. Endothelial cells (ECs), MSCs, and osteoblast-differentiated cells (OBs) are initially seeded in the gel. ECs form vasculature, whereas MSCs and OBs create a microenvironment. Cancer cells introduced in the vessel extravasate into the organ-mimicking gel (Jeon et al., 2015, Open access publication under CC-BY license).

### ***Intravasation models***

The carcinoma cells originated from epithelial cells, locally invade tissues and gain access to the circulatory system through lymphatic or blood vessels. This cascade of events is referred as intravasation (Marciel and Hoffmann, 2017). Examining these critical steps in cancer metastasis is vital to understand the whole process. Within a study, a microfluidic model was devised to understand intravasation, known as the early metastatic period of colorectal cancer, and identify new therapeutic targets in the tumor microenvironment. When examined from an alternative standpoint within the same study, the other objective in developing this system was to create a chip that integrates various cell types and mechanical effects, as well as to examine the effect of the tumor microenvironment with respect to the spread of primary colon tumor (**Fig 2B**). The platform was suitable for researching the colorectal cancer intravasation process by emulating the spread of tumor cells into the blood vessel (Strelez et al., 2021).

### ***Extravasation models***

As previously elucidated, intravasation is a process in which primary tumor cells move beyond the endothelial membrane of blood vessels to join the circulation. Extravasation is the process of tumor cells leaving the circulation and entering a metastatic area or organ. After the extravasation process, secondary tumor formation begins (Zhang et al., 2022). Similar to intravasation, numerous "metastasis-on-chip" devices have been developed to examine extravasation. In a research aimed at elucidating the microenvironment specific to the human vascularized organ was created to investigate the extravasation process of metastatic tumor cells. Within this context, they developed a microfluidic 3D *in vitro* model (**Fig. 2C**) to examine the invasion of

human breast cancer cells into an environment that mimics the bone and muscle microenvironment (Jeon et al., 2015).

### **Angiogenesis models**

Tumor angiogenesis, known as the formation of new blood vessels in the tumor stroma, provides oxygen and nutrients to cancer cells, preparing the ground for the initiation of metastasis (Stroka, 2014). Physiological angiogenesis involves receptor activation of endothelial cells with angiogenic growth factors and subsequent disruption of the basement membrane by endothelial cells (Caplin et al., 2015). Furthermore, tumor angiogenesis has differences compared to physiological angiogenesis. For example, tumor vasculature is characterized by irregular sprouting, tortuous capillary networks, and leaky barrier properties (Portillo-Lara et al. 2016; Lee et al., 2016). However, this angiogenic vascular structure growing around the tumor is abnormal and leaky (Munn et al., 2003).

### **CONCLUSION**

Cancer metastasis is a multifaceted process, driven by intricate interactions between mechanical and molecular factors. Understanding these mechanisms is crucial for the development of targeted therapies aimed at inhibiting metastatic progression and improving cancer patient outcomes. Future research should continue to elucidate the complex interplay between mechanical and molecular forces in metastasis, offering new avenues for intervention and treatment. The utilization of cancer metastasis-on-chip platforms can accelerate the translation of potential drug candidates to the clinical setting.

#### Özet

Bu çalışmamızla, çok fazla kullanım alanı olan ve yararlı etkilerinin yanında yan etkileri de bulunan steroidlerden östrojen hormonunun eksikliğine bağlı görülen şikayetlerin, geliştireceğimiz biyoyumlu implant ile salım profili çıkartılarak ortadan kaldırılacağı ve kontrollü salım sistemlerinin avantajlarından da yararlanılarak daha uygun bir tedavi oluşturulabileceği düşüncesindeyiz. İlaç salım sistemleri oluşturulurken ilacın en kısa sürede istenilen kan konsantrasyonuna ulaşması ve ilacın kontrollü bir şekilde belirlenen süre içerisinde devam ettirilmesi amacıyla HEMA monomeri ve/veya MMA monomerinin UV fotopolimerizasyon yöntemi ile kopolimerizasyonu gerçekleştirdi ve ilaç salım sisteminde implant olarak kullanılacak bu kopolimerler Fourier Transform Infrared Spectroscopy (FTIR), Scanning Electron Microscope (SEM), Differential Scanning Calorimetry (DSC), yüzey temas açısı ölçümü ve biyoyumluluk testleriyle de biyoyumlulukları incelenip karakterize edildi. FTIR spektroskopisinden elde edilen bulgular hedeflenen polimer yapısını gösterdi. Termal kararlılıkları belirlemek amacıyla termogravimetrik analiz yapıldı. Ölçümler 100-500°C sıcaklıklar arasında, hava ve azot atmosferinde 10°C/d hız ile gerçekleştirildi. Termal kararlılığın, pHEMA hidrojelinin yapısına MMA komonomerinin katılması ile azaldığı görüldü. P(HEMA-MMA) kopolimer hidrojelinin fizyolojik fosfat tamponundaki denge suyu içeriğinin HEMA'ya göre daha düşük olduğu gözlemlendi. Elde edilen SEM mikrograflarının görüntüsünden, hidrojel yapıdaki pHEMA ve p(HEMA-MMA)'nın gözeneksiz ve düzgün bir yüzey morfolojisine sahip olduğu görüldü. İlaç salım deneyleri için, östrojenin 0,01mg/ml, 0,1mg/ml ve 0,2 mg/ml üç farklı dozunun salım kinetikleri, fizyolojik fosfat tamponu pH 7.4 PBS içerisinde sürekli akış salım sistemi ile değerlendirildi ve spektrofotometrik metot ile, 260 nm dalga boyundaki spektrumları kaydedildi. pHEMA hidrojellerine yüklenen östrojenin salımı 288 saatte yani 12 günde, p(HEMA-MMA) hidrojellerine yüklenen östrojenin salımı ise 440 saatte yani yaklaşık 18 günde tamamlandı ve bu süre boyunca kontrollü salım sisteminin bazal östrojen seviyesi için başarıyla uygulanabileceği gösterildi. Bu çalışmamızla, pHEMA ve p(HEMA-MMA) hidrojellerinin zamana bağlı kümülatif salım yüzdesi sonuçlarına baktığımızda, geliştirdiğimiz biyoyumlu taşıyıcı implantın hem daha yavaş salım, hem de daha uzun salım profili gösterdiği ve salımın %100 gerçekleştiği görüldü.

**Anahtar Kelimeler:** Biyomalzeme, Hidrojel, Kontrollü salım sistemleri, Östrojen

#### Preparation And Release Profile Of Biocompatible Implant For Controlled Release Of Estrogen From Steroid Hormones

#### Abstract

With this study, we think that the complaints related to the deficiency of estrogen hormone, which has many areas of use and has side effects as well as beneficial effects, will be eliminated by determining the release profile with the biocompatible implant we will develop, and a more suitable treatment can be created by taking advantage of the advantages of controlled release systems. While creating drug delivery systems, copolymerization of HEMA monomer and/or MMA monomer was carried out with the UV photopolymerization method in order to reach the desired blood concentration in the shortest time and to continue the drug within a determined period of time in a controlled manner, and these copolymers to be used as implants in the drug delivery system were examined by Fourier Transform Infrared Spectroscopy (FTIR),

Scanning Electron Microscope (SEM), Differential Scanning Calorimetry (DSC), surface contact angle measurement and was also examined and characterized their biocompatibility using biocompatibility tests. Findings from FTIR spectroscopy showed the targeted polymer structure. Thermogravimetric analysis was performed to determine thermal stabilities. Measurements were carried out at temperatures between 100-500°C, in air and nitrogen atmosphere, at a speed of 10°C/d. It was observed that thermal stability decreased with the incorporation of MMA comonomer into the structure of pHEMA hydrogel. It was observed that the equilibrium water content of the P(HEMA-MMA) copolymer hydrogel in the physiological phosphate buffer was lower than HEMA. From the images of the obtained SEM micrographs, it was seen that pHEMA and p(HEMA-MMA) in the hydrogel structure had a non-porous and smooth surface morphology. For drug release experiments, the release kinetics of three different doses of estrogen, 0.01mg/ml, 0.1mg/ml and 0.2mg/ml, were evaluated by a continuous flow release system in physiological phosphate buffer pH 7.4 PBS and by spectrophotometric method, at 260 nm. wavelength spectra were recorded. The release of estrogen loaded into pHEMA hydrogels was completed in 288 hours, (in 12 days), and the release of estrogen loaded into p(HEMA-MMA) hydrogels was completed in 440 hours (18 days), and during this period, it was shown that the controlled release system could be applied successfully for the basal estrogen level. When we look at the results of time-dependent cumulative release percentage of pHEMA and p(HEMA-MMA) hydrogels in this study, it was seen that the biocompatible carrier implant we developed showed both a slower release and a longer release profile and the release was 100% realized.

## GİRİŞ

Günümüzde “Biyomalzeme Bilimi” büyük gelişmeler olduğu bir bilim dalıdır. Biyomalzemeler temel olarak tıbbi uygulamalarda kullanılmakla birlikte biyoteknoloji alanında da kullanılmaktadır.(1) Kontrollü salım, etkin maddenin bir sistem içerisinde istenilen sürede, belirlenmiş bir hızla ve gereken miktarda salımını sağlayacak şekilde tasarımının yapıldığı bir yöntem olan kontrollü salımda iki ana bileşen vardır; aktif madde ve aktif maddenin salımını düzenleyen polimerik destek maddedir. Kontrollü ilaç serbestleşmesinde kullanılan doğal ya da sentetik polimer, ilaç ile birlikte kullanıldığında etken madde daha önceden tasarlanan şekilde salınır.(2)Bilimsel çalışmalarda oldukça sık kullanılan biyomalzemelerden biri olan hidrojeller, yumuşak ve esnek yapıda olmaları, suyu yapılarında tutabilme özellikleri ile canlı dokulara benzerlik göstermektedirler. Biyolojik olarak parçalanan, toksisitesi olmayan ve biyolojik uyum gösterebilen yapılarından dolayı, hidrojeller biyomalzeme olarak kullanılması giderek güvenli hale gelmektedir. Ayrıca, ilacın salınım hızını düzenleyen geleneksel dozaj yöntemleri karşısında hidrojellerin kontrollü serbest bırakma mekanizması, daha fazla avantaj sağlamaktadır.(3)

Kontrollü salım çalışmalarında kullanılan hidrojellerden p(HEMA) ve/veya p HEMA -MMA sentetik ve mekanik dayanımı yüksek, hidrofilik yapıda, biyolojik olarak uyumlu ve antibakteriyel özelliğe sahip, biyolojik ve kimyasal degradasyona karşı dirençli bir materyaldir ve akrilat kökenlidir. Akrilat kökenli olan diğer bir sentetik polimer de poli (metil metakrilat) -poli(MMA) 'dır . P(MMA) biyomateryal alanında kullanılan bir destek materyalidir.

Çalışmamızda üretilen hidrojellerin kimyasal gruplarını incelemek için, Fourier Dönüşümlü Infrared Spektrofotometre (FTIR) kullanılırken, malzemelerin yüzey morfolojisini incelemek için Taramalı Elektron Mikroskopu (SEM) kullanılacaktır.

Bu çalışmamızla, çok fazla kullanım alanı olan ve yararlı etkilerinin yanında yan etkileri de bulunan steroidlerden östrojen hormonunun eksikliğine bağlı görülen vajinal kuruluk, cinsel isteksizlik, saç dökülmesi, sıcak basması, çarpıntı, gece terlemesi, halsizlik, sinirlilik, depresyon, gibi şikayetlerin, geliştireceğimiz biyoyumlu implant ile salım profili çıkartılarak ortadan kaldırılacağı ve kontrollü salım sistemlerinin avantajlarından da yararlanılarak daha uygun bir tedavi oluşturulabileceği düşüncesindeyiz.

## 2.MATERYAL VE METOT

### 2.1 Materyaller

Tez çalışmamızda kullanılan 2-Hidroxyethylmetakrilat (HEMA), metil methacrylate (MMA), Dr. Zeydanlı Hayat Bilimleri Ltd. Şti firmasından temin edildi. İnsan serum albumini, fibrinojen,  $\gamma$ -globulin, sığır serum albumini Sigma-Aldrich'dan elde edildi. Kullanılan diğer tüm kimyasallar analitik saflıkta olup, Merck AG (Darmstadt, Almanya) firmasından temin edildi.

Çalışmamızın aşamalarının tamamında kullanılan su, Barnstead (Dubuque, IA, USA) ROpure LP marka ters ozmoz, Barnstead D3804 NANOpure organik/kolloid uzaklaştırıcı yüksek akışlı selüloz asetat membran (Barnstead D2731) üniteleri ve iyon-değişimi dolgu yatak kolonundan oluşan ultra-saf su sisteminden elde edildi.

## 2.2 Biyomateryallerin Sentezi

Farklı oranlarda denemesi yapılan ve son monomer oranı 1.00:1.00 (v/v) olacak şekilde kullanılan HEMA ve MMA monomerleri homojen olacak şekilde karıştırıldı. Yapıya çapraz bağlayıcı olarak kullanılacak olan N,N,metilenbisakrilamid (0,01 mg) ve tepkime başlatıcısı olarak amonyum persülfat (0,01 mg) eklendi. Sentezlenecek taşıyıcı implantın biyoyumluluğunu artırmak amacıyla 0,01mg HSA ve 0,02 mg PEG yapıya eklendi ve 2 dakika süresince polimer çözeltisinden, azot gazı geçirildi. Polimerizasyon karışımına hızlandırıcı olarak %10'luk 250µl TEMED eklendi ve 1 dakika boyunca azot gazından geçirilerek, 0.4 cm çapında ve 10 cm uzunluğundaki silindir kalıplara dökülerek oda sıcaklığında UV ışığı fotopolimerizasyon yöntemi ile sentezlendi. Polimerik taşıyıcı implantın (biyomateryalin) farklı miktarda östrojen hormonu yüklü eşlenikleri, yukarıda verilen aynı koşullarda UV ışığı fotopolimerizasyonu ile kontrollü ilaç salım sisteminde kullanılmak üzere sentezlendi. Polimerizasyon sonucunda oluşan silindirik biçimdeki polimerik taşıyıcılar damıtık su ile yıkanarak kullanılabilecek kadar 4 oC sıcaklıkta muhafaza edildi.

## 2.3. Biyomateryalin Karakterizasyonu

Kontrollü salım için tasarlanan sistemler , uygun yüzey morfolojisi sahip olmalıdır. İlaç salım oranını belirleyen en önemli faktörlerden birisi yüzey alanıdır.(4) Çalışmamızda geliştirdiğimiz hidrojellerin salım sisteminin yüzey morfolojisini incelemek için, taşıyıcı sistemlerinin SEM mikrografları JEOL marka (Model, JSM 5600, Japonya) Taramalı Elektron Mikroskopu ile elde edilirken, BET yöntemi ile,gözenekliliği ve spesifik yüzey alanı belirlendi. Yoğunluğu , piknometre ile polimerin çözünmediği bir sıvı içerisinde belirlendi. Dijital kumpas ile de hidrojelin ıslak haldeki kalınlığı ölçüldü.

Piknometreler ,sıvı ve katı numunelerin yoğunluklarının, hassas şekilde ölçülmesi için kullanılan etkin test cihazlarımız içinde yer alır. Toprak dahil olmak üzere sıvı ve katıların yoğunluklarının dışında özgül ağırlıklarını ölçmek için de kullanılır.Genellikle camdan yapılan ve hava kabarcıklarının dışarı çıkması için kılcal tüplü buzlu cam tıpa aparatı bulunur.

Yüzey Analiz ve Porozite Cihazı (BET) , katı (toz) maddelerin çok hızlı, doğru ve hassas olarak yüzey alanı ve gözenek (por) boyut dağılımı bilgilerini elde etmeyi sağlar. Yüzey gözenekliliği, malzeme biliminde araştırmacıların ilgilendiği önemli bir özelliktir. Farmasötik, medikal implant, seramik, katalizör, boya ve kaplamalar, kozmetik, yakıt hücreleri, yerbilimi, adsorbanlar, yapı malzemeleri, elektronikler, maden, plastik ve polimerler, gibi çalışmalarda yaygın olarak kullanılmaktadır.

FTIR Spektroskopisi (Fourier Transform Infrared Spectroscopy)(Bruker, Vertex 70V,USA) ile birçok grup için karakteristik pikler alınmaktadır. Bu sayede spektrumu alınan maddede hangi karakteristik grupların olduğu belirlenerek maddenin yapısı yorumlanır.Özellikle bir kimyasal tepkimeyi izlemede önemli rol oynamaktadır. Bu amaçla; tarım, gıda, ilaç, polimer, petrol, metal, sanayilerindekullanım alanı bulmuştur.(5)

FTIR spektrofotometresi ile taşıyıcı polimerlerin FTIR spektrumu alındı. Kuru hidrojel, KBr ile karıştırılarak pelet hale getirildi. FTIR spektrumları alındı. MMA'in yapıya katılması, kontrol amaçlı kullanılan pHEMA spektrumundan oluşan farklı fonksiyonel gruplara ait bantların yardımı ile tespit edildi. Dijital kumpas ile P(HEMA-MMA) membranların ıslak durumdaki kalınlığı belirlendi. DSC (DifferentialScanningCalorimetry) (Model DSC-60-DTG-60H, Shimadzu, Japan) analizi ile pHEMA ve p(HEMA-MMA) taşıyıcı implantlarının mekanik dayanımı belirlendi.

Hidrojel yapıdaki biyomateryalin şişme özelliği, serum fizyolojik ve distile su içerisinde, oda sıcaklığında tampon sistemi içerisinde (pH2.5-8.5) gravimetrik yöntemle belirlendi. Çözelti pH'sı direkt olarak ölçüldü ve iyonik şiddet 0.2'ye ayarlanarak sabit tutuldu. Örnekler ilk olarak şişme ortamına yerleştirildi. Denge anına ulaşıldıktan sonra ortam değiştirildi. Biyomateryalin şişme oranı aşağıdaki eşitlik kullanılarak hesaplandı.

## 2.4. Serum Proteinleri Adsorpsiyonu

pHEMA ve p(HEMA-MMA) biyomateryallerinin kan uyumluluğunu saptamak için, 1/5 oranında fosfat tamponunda seyreltilmiş insan kan serumu içerisine aktarıldı (7.5 ml, 50 mM, pH 7.4) ve 37°C'de 120 dakika manyetik karıştırılmalı hücrelerde kan serumu ile temasları sağlandı. Serum proteinlerinin adsorpsiyonu kesikli sistemde çalışıldı. Her bir protein için belirli başlangıç konsantrasyonunda çalışıldı. Taşıyıcı implanta adsorplanan protein miktarı flurosans spektrofotometre kullanılarak (Jasco, FP-750, Tokyo, Japonya) belirlendi.(6)

## 2.5. Kan Uyumluluk Analizi

pHEMA, p(HEMA-MMA) taşıyıcı implantları, 0.5 cm boyunda kesilerek, %0.85 NaCl çözeltisi içinde dengeye getirildi. Sağlıklı bir bireyden alınan venöz kan örneği, 1/9 oranında sodyum sitratla karıştırıldı ve 3000 rpm'de 10 dakika santrifüjlenerek plazması elde edildi. Sodyum sitratlı plazmadan, 300 µl alınarak, polimer tüpleriyle temas ettirildi ve 1 saat inkübe edildi. Polimerlerle temas etmemiş plazma kontrol olarak kullanıldı.(7)

## 2.6. İn vitro Salım Çalışmaları

Östrojen kontrollü salımının incelenmesi için , taşıyıcı destek materyaline hazırlanan matriks içi tutuklama yolu ile östrojen yüklendi. PEO(polietilen oksit) ve albumin içeren farklı monomer oranlarına sahip taşıyıcı polimerik implantlara, farklı miktarda östrojen 0,01mg/ml, 0,1mg/ml ve 0,2 mg/ml yüklemesi yapılarak sistem parametrelerinin salım profiline ve salım kinetiğine etkisi araştırıldı. Taşıyıcı implanta yüklenen östrojen miktarı, standart BSA kalibrasyon eğrisinin elde edildiği Bradford yöntemi kullanılarak belirlendi. Östrojen yüklü biyomateryaller sürekli sistem reaktörüne yerleştirilerek sisteme sabit akış hızında, peristaltik pompa ile (Ismatec, IPG Model, Almanya) fizyolojik tampon çözeltisi girişi sağlandı. Belirli zaman aralıklarında alınan örneklerle salınan ilaç miktarı spektrofotometre ile (Labo Med.Inc. Spectro UV-Vırs Spectrophotometer), 260 nm dalga boyunda spektrofotometrik olarak takip edilerek belirlendi.

## 3. BULGULAR

İlaç alanındaki yapılan çalışmalarda asıl hedef, ilaç dozunu en az seviyeye indirmek, doz aralığını uzatmak, hastanın zararlı ve yan etkilerden etkilenmemesini sağlayarak biyoyararlanımını en üst seviyeye çıkartmaktır. Buna bağlı olarak tedavi sürecini kısaltarak hastanın yaşam kalitesini arttırmaktır. Kontrollü salım sistemleri ise bu beklentilere yanıt veren en iyi sistemdir. İlaç salım sistemleri çok kısa zamanda kardiyoloji, onkoloji, oftalmoloji, endokrinoloji ve immünoloji dahil olmak üzere tıbbın birçok dalında etkili olmuştur. Kontrollü salım çalışmalarında kullanılan hidrojellerden p(HEMA) ve/veya pHEMA -MMA sentetik ve mekanik dayanımı yüksek, biyolojik ve kimyasal degradasyona karşı dirençli bir materyaldir, hidrofilik yapıdadır, biyolojik olarak uyumludur. biyoyumlu olan pHEMA ve p(HEMA-MMA), silindir yapıda sentezlenerek karakterizasyon tayininin yapılması hedeflenmiştir. Bu tez kapsamında, protein adsorpsiyonuna karşı dirençli ve kan uyumluluk özelliği artırılarak östrojen hormonunun kontrollü salımında kullanılmak üzere pHEMA temelli yeni bir taşıyıcı implant sisteminin geliştirilmesi tasarlandı.

### 3.1. Biyomateryalin Karakterizasyonu

Kontrollü salım çalışmamızda kullanılacak olan taşıyıcı implantların polimerizasyonunda ilk olarak çapraz bağlayıcı olarak kullanılan bisakrilamit oranı (0.01mg) ve redoks başlatıcısı olarak kullanılan amonyum persülfat (0.01mg) miktarları en uygun hale getirildi. En uygun değer bisakrilamit ve APS için 0.01mg olarak belirlendi. Bu değerlere göre ko-polimer membranı oluşturan HEMA:MMA ko-monomer oranı 1:0 ile 0:1 (v/v) arasında değiştirilerek hidrojel oluşumu, hazırlanan kompozisyondaki membranların yeterli mekanik güce etkisi, deneysel koşullarda incelendi ve elde edilen sonuçlarda p(HEMA-MMA) membranının mekanik gücünün ko-monomer oranına bağlı olarak değiştiği gözlemlendi (Çizelge 3.1). Monomer oranı 1:1 olan p(HEMA-MMA) membran kompozisyonu, yeterli mekanik güce sahip olduğundan çalışmanın daha sonraki aşamalarında kullanıldı.

### **Çizelge 3.1.** Farklı HEMA:MMA oranlarında sentezlenen kompozit

Hidrojelinin mekanik dayanıklılığa etkisi

HEMA:MMA oranı (v/v)	Polimerizasyon	Mekanik dayanıklılık
A) 1.00:0.00	+	Orta
B) 1.00:0.25	+	Orta
C) 1.00:0.50	+	Yeterli
D) 1.00:1.00	+	Yeterli
E) 0.00:1.00	-	Yetersiz
F) 0.25:1.0	-	Yetersiz
G) 0.5:1.0	-	Yetersiz

Dijital kumpas yardımı ile ölçülen destek materyalinin kalınlığı 2.63mm olarak bulundu. Membran yapıdaki taşıyıcı implantın yoğunluğu Gay Lussac piknometresi ile materyal için çözücü olmayan bir sıvı (n-dekan) kullanılarak yapıldı. Hidrojel yoğunluğunun 1.06 g/cm<sup>3</sup> olduğu bulundu. Vakumlu etüvde, 30°C sıcaklıkta kurutulan kompozit hidrojel, azaltılmış basınç altında paladyum ile kaplandı ve taramalı elektron mikroskobu kullanılarak membranların elektron mikrografları elde edildi.

Elde edilen SEM mikrograflarının görüntüsünden, Hidrojel yapıdaki pHEMA ve p(HEMA-MMA)'nın gözeneksiz ve düzgün bir yüzey morfolojisine sahip olduğu görülmektedir. Biyomateryalin bu özelliği ilaç salım hızının yavaş ve kontrollü olmasını sağlayacaktır.

Sıcaklık, pH, çözücü bileşimi, ışık ve basınç gibi değişimlere karşı şişme veya büzülme davranışı gösterebilen hidrojeller, ağırlıklarının 40-50 katı kadar şişme kapasitesine sahiptirler. Yapılarında tuttıkları fazla su miktarından dolayı canlı dokulara benzer özellikler gösterdiğinden hidrojellerin biyomedikal alanlarda kullanımı oldukça dikkat çekmektedir.

Termal kararlılıkları belirlemek amacıyla termogravimetrik analiz yapılmıştır. Ölçümler 50°C -250°C sıcaklıkları arasında, hava ve azot atmosferinde 10°C/d hız ile gerçekleştirilmiştir. Termal kararlılığın, pHEMA hidrojelinin yapısına MMA komonomerinin katılması ile azaldığı görülmüştür.

Elde edilen polimerlerin karakterizasyonlarında FTIR spektroskopisinden yararlanılmış.

Hidrofobite ile serbest yüzey enerjisi arasında ters bir ilişki vardır ve biri artarsa diğeri azalmaktadır. Polimerin hidrofobik karakterinin artması serbest yüzey enerjisinin azalması demektir. Polimerlerin serbest yüzey enerjileri farklı yöntemler (Zisman, Fowkes ve Van Oss Asit – Baz) kullanılarak hesaplanmıştır.

Fowkes Wu yöntemlerine göre hesaplanan yüzey enerjilerinin birbirlerine yakın olduğu, ancak Wu yönteminin Fowkes göre, daha düşük bir yüzey enerjisi polar bileşenine ( $\gamma^p$ ) sahip olduğu gözlemlendi. Her iki yöntemde de, bütün test edilen membranlar için, dispersif bileşenler, toplam yüzey serbest enerjisine ana katkıyı yaptığı görüldü.

Toplam serbest yüzey enerjisi ( $\gamma^{\text{Toplam}}$ ), van Oss yöntemi kullanılarak hesaplandı. van Oss yöntemi, araştırılan tüm membranlara farklı değerlerde uygulanan, Lifshitz-van der Waals ( $\gamma^{\text{LW}}$ ) ve asit-baz bileşenlerinin ( $\gamma^{\text{AB}}$ ) toplamıdır. Membranların baz bileşenlerinin ( $\gamma^-$ ), asit bileşenlerine ( $\gamma^+$ ) kıyasla daha yüksek olduğu görüldü.

### **3.2. Biyomateryalin Kan Uyumluluk Analizleri**

Kan plazma proteinleri, albümin ,globülin ve fibrinojendir. Plazma proteinlerinden albümin kanın ozmotik basıncının ayarlanmasından sorumludur ve plazma proteinlerinin %60 'ını oluşturur. Plazma proteinlerinin %38'ini oluşturan globülinler  $\alpha$  ve  $\beta$  globulinler yağları ve yağda çözünen vitaminleri taşırken  $\gamma$  globulin antikorları taşır. Plazma proteinlerinin %2'sini oluşturan fibrinojen ise pıhtılaşma faktörüdür.

Yapılan birçok araştırmada, biyomateryal olarak kullanılan polimerik biyomateryallerin, kan ile teması sonucunda plazma proteinlerini hızlı bir şekilde adsorpladığı rapor edilmiştir.(8) Sentezlenen pHEMA ve/veya pHEMA-MMA taşıyıcı implant sistemlerinde albumin adsorpsiyonu, biyouyumluluk açısından önemlidir.Fakat, biyomateryal yüzeyine fibrinojen adsorpsiyonu hazırlanan biyomateryalin biyolojik uyumluluğunda azaltılmaktadır. Albumin trombosit dirençli bir özellik göstermesi trombositlerin biyomateryal yüzeyine yapışmasını engeller. Fibrinojenin ise trombositlerin biyomateryal yüzeyine yapışmasını başlatıcı özelliği vardır. Bu sebeple, matriks içi tutuklama yöntemiyle hazırlanan biyomateryale albumin ve polietilen glikol(PEG) yerleştirilerek, biyomateryalin kan uyumluluğunda artış sağlanması hedeflenmiştir.(9)

Yaptığımız çalışmada yapısında albumin ve PEG bulunan pHEMA ve p(HEMA-MMA) taşıyıcı implantlarının adsorplanan kan serum protein miktarlarının ihmal edilebilir düzeyde olduğu görülmüştür.

### 3.3. Östrojen Hormonunun Kontrollü Salımı

İlaçların daha etkili ve daha pratik olarak hedefe iletilmesini hedeflendirilmiş ilaç taşıyıcı sistemler ile sağlanmaktadır. Kandaki ilaç konsantrasyonu, istenilen tedavi edici düzeyde uzun süre sabit tutulur ve böylece ilaçtan sağlanacak fayda artırılır. pHEMA ve p(HEMA-MMA) hidrojellerine yüklenen östrojen salımı, kontrollü

salım sisteminde belirli zaman aralıklarında alınan örneklerin analizi ile belirlenmiştir.

İlaç salım deneyleri için, Östrojenin 0,01mg/ml, 0,1mg/ml ve 0,2 mg/ml üç farklı dozunun salım kinetikleri, fizyolojik fosfat tamponu pH 7.4 PBS içerisinde sürekli akış salım sistemi ile değerlendirildi ve spektrofotometrik metot ile, 260nm dalga boyundaki spektrumları kaydedildi.

pHEMA hidrojellerine yüklenen östrojenin salımı 288 saatte yani 12 günde , p(HEMA-MMA) hidrojellerine yüklenen östrojenin salımı ise 440 saatte yani yaklaşık 18 saatte tamamlandı .Bu süre boyunca kontrollü salım sisteminde bazal östrojen seviyesi için başarıyla uygulanabileceğini gösterdik.

İlaç:polimer oranı, salımın özelliğini etkilediği düşünülen bir diğer parametredir. Hazırlanan taşıyıcı implantın hidrojel yapıda olması östrojenin destek materyalinin içinden dış ortama difüzyonunu kısıtlayan bir engel yoktur. Salım çalışmalarında, östrojenin daha yavaş salımının, taşıyıcı implanttaki ilaç: polimer oranına, gözeneksiz yüzey yapısına bağlı olduğu görüldü.

Bu çalışmamızda, pHEMA ve p(HEMA-MMA) hidrojellerinin zamana bağlı kümülatif salım yüzdesi sonuçlarına baktığımızda geliştirdiğimiz biyoyumlu taşıyıcı implant, hem daha yavaş salım hemde daha uzun salım profili gösterdi ve %100 salım gerçekleşti.

## 4. TARTIŞMA VE SONUÇ

Uzun yıllar çeşitli hastalıkları tedavi edici yeni bir molekül geliştirmek amacıyla, ilaç alanında yapılan çalışmaların ekonomik yükü ,araştırmaların uzun zaman alması ve her zaman istenilen sonucu vermemesi ilaç sanayinin karşılaştığı önemli sorunlar haline gelmiş ve yeni arayışları beraberinde getirmiştir. Bu çalışmalarla hastanın tedavisinin yanı sıra yaşam kalitesini arttırmakta amaçlanmaktadır.İlaç dozunu azaltma, dozlama aralığını uzatma, vücuda yan etki ve zararlı etkilerini ortadan kaldırma, ilacı hedef bölgeye gönderme çalışmaları son yıllarda önem kazanmıştır. Kontrollü salım sistemleri, bu beklentilere en iyi yanıt veren uygulama şeklidir.

Kontrollü salım sistemlerinde sıklıkla doğal veya yapay polimerlerden oluşan veya kompozit halde elde edilen polimerik malzemeler kullanılmaktadır. İlaç taşıyıcı sistemlerin hazırlanmasında daha çok polimerik biyomateryal kullanımı tercih edilir.

Gerçekleştirilen bu çalışmamızda; hidrojel yapıdaki pHEMA ve p(HEMA-MMA), literatür taraması ve denemeler sonucu belirlenen monomer oranlarında hazırlandı. Hazırlanan biyomateryale albumin ve polietilen glikol(PEG) yerleştirilerek, biyomateryalin kan uyumluluğunda artış sağlandı.

Östrojen hormonunun azalmasına bağlı görülen menopozda tedavinin amacı eksik olan östrojen hormonunu yerine koymaktır. Menopoz sonrası dönemde görülen kemik erimesinin önlenmesi ,kalp-damar hastalıkları gibi birçok şikayetin giderilmesini sağlayarak, menopoz öncesi, menopoz ve menopoz sonrası dönemde kadınların hayat standartları hormon replasman tedavisi ile artırılabilecektir.

Çalışmamızda, taşıyıcı implant yüzey polaritesinin belirlenmesi için temas açısı ölçümleri gerçekleştirilmiştir. Su, gliserol ve diiyodometan (DIM) test sıvıları kullanılarak kompozit membranların temas açıları ölçümleri yapılmıştır. Östrojenin 0,01mg/ml, 0,1mg/ml ve 0,2 mg/ml üç farklı dozunun salım kinetikleri, fizyolojik fosfat tamponu (PBS, pH 7.4) içinde sürekli akış salım sistemi ile değerlendirildi ve spektrofotometrik metot ile 260 nm dalga boyunda polimerik silindirlerinden östrojenin salım miktarı tayin edildi. pHEMA hidrojellerine yüklenen östrojenin salımı 288 saatte yani 12 günde , p(HEMA-MMA) hidrojellerine yüklenen östrojenin salımı ise440 saatte yani yaklaşık 18 saatte tamamlandı .Bu süre boyunca kontrollü salım sisteminde bazal östrojen seviyesi için başarıyla uygulanabileceğini gösterdik.

Sonuç olarak yapmış olduğumuz analizlerin verileri sonucunda pHEMA, P(HEMA-MMA) nın kontrollü ilaç salımında taşıyıcı implant olarak başarıyla uygulanabileceğini ve biyolojik olarak en uyumlu hidrojelin p(HEMA-MMA) olduğu gösterilmiştir. Ayrıca toksisiteye yol açmaması, kolay sterilizasyon, organik çözücülerin kullanılmaması, numune dozunun ayarlanması gibi pek çok farklı avantajda sağladığını göstermektedir.

#### Özet

Kinoa (*Chenopodium quinoa* Willd.) geleneksel olarak Güney Amerika kültürleri tarafından binlerce yıldır tüketilen ve günümüzde dünya genelinde işlevsel bir gıda olarak dikkat çeken tahıl benzeri (pseudocereal) bir bitkidir. Günden güne kinoaya ilginin artmasıyla insan ve hayvan beslenmesinde kullanımı yaygınlaşmıştır. Üzerine çalışmalar yapılması ve birçok gıda bileşimine katılması da popülerliğini arttırmıştır. Ülkemizde de yetiştiriciliği ve denemeleri yapılmakta olan bu bitkiye ilgi her geçen gün daha da artmaktadır. 5-6 yıl öncesine kadar Türkiye bu bitkiyi ithal ederken, bugün ihraç eden bir ülke konumuna gelmiştir. Beslenme değerinin yanı sıra olumlu sağlık etkileri ile de ön plana çıkmaktadır. Gıda sektörü son zamanlarda doğal kaynaklardan elde edilen bitkisel materyalleri kullanarak ürün geliştirme çalışmalarına ağırlık vermiştir. Üreticiler bu malzemelerin içerisinde bulunan bileşenlerin fonksiyonel özelliklerinden yararlanarak insan sağlığına uygun alternatif ürünler ortaya koymaya çalışmaktadırlar. Günden güne kinoaya ilginin artmasıyla insan ve hayvan beslenmesinde kullanımı yaygınlaşmıştır. Üzerine çalışmalar yapılması ve birçok gıda bileşimine katılması da popülerliğini arttırmıştır. Bu incelemede kinoanın besin değerleri, ülkemizdeki yeri ve gıdalarda kullanımının nasıl ve ne yönde etki ettiği hususunda, kinoa ve çeşitli özellikleri hakkında genel bilgiler vermek amaçlanmaktadır.

### Quinoa And Uses In Food Industry

#### Abstract

Quinoa (*Chenopodium quinoa* Willd.) is a grain-like (pseudocereal) plant that has been traditionally consumed by South American cultures for thousands of years and today attracts attention as a functional food worldwide. As the interest in quinoa increases day by day, its use in human and animal nutrition has become widespread. Studies on it and its inclusion in many food compositions have increased its popularity. Interest in this plant, which is grown and tested in our country, is increasing day by day. While Turkey was importing this plant until 5-6 years ago, today it has become an exporting country. In addition to its nutritional value, it also stands out with its positive health effects. The food industry has recently focused on product development using plant materials obtained from natural sources. Manufacturers are trying to produce alternative products suitable for human health by taking advantage of the functional properties of the components contained in these materials. As the interest in quinoa increases day by day, its use in human and animal nutrition has become widespread. Studies on it and its inclusion in many food compositions have increased its popularity. In this review, it is aimed to give general information about quinoa and its various properties, its nutritional values, its place in our country, how and in what direction its use in foods affects.

**Keywords:** Quinoa, Nutritional Value, Properties, Use in Foods

## GİRİŞ

Kinoa, Amerika kıtasının en eski mahsullerinden biridir. Kuzey Şili'deki arkeolojik bulgular, kinoanın MÖ 3000'den önce kullanıldığını göstermiştir. Ayacucho, Peru'da kinoanın MÖ 5000'den önce yetiştirildiğine dair kanıtlar elde edilmiştir (Jancurova, Minarovicova, & Dandar, 2009). Kinoa (*Chenopodium quinoa* Willd.) kökeni Güney Amerika olan ve çok farklı tipteki topraklarda ve iklimlerde tarımı yapılabilen, *Chenopodiaceae* familyasına ait tek yıllık bir bitkidir (Özgören & Yapar, 2022). Yetiştirilen ve toplanan *Chenopodium* türleri, Tiahuanacotan ve İnka kültürlerinin bir parçası olmuştur. Kinoa bu ata kültürlerde çeşitli roller üstlenmiş, insan ve hayvan beslenmesindeki rolünün yanı sıra kutsal bir öneme sahip olmuştur (Valencia, Mari, & Serna, 2011). Kinoa, 1–2 m. boyunda, derinlere nüfuz eden köklere sahip, geniş yapraklı bir bitkidir ve deniz seviyesinden 3800 m. yüksekliğe kadar yetiştirilebilir. Bitki donmaya, tuzluluğa ve kuraklığa tolerans gösterir ve alışlagelmişin dışındaki topraklarda gelişme kabiliyetine sahiptir. Kinoa tanesi, olağanüstü protein kalitesi, yüksek orandaki mineral ve vitamin mevcudiyeti sayesinde oldukça besleyicidir (Sevindik, Gültekin, & Uran, 2021). Farklı şekil, büyüklük, renk ve tane kompozisyonuna sahip kinoa çeşitleri bulunmakta ve kinoa türlerinin sınıflandırılmasında genellikle beyazdan siyaha değişen renk karakteristiklerinden yararlanılmaktadır. Kinoa türlerinin renklerindeki bu farklılık kinoa yapısında yer alan betalainlere atfedilmektedir (Alaşalvar, Erinç, & Çolakoğlu, 2019). Kinoa ıspanakgiller familyasından olup strese dayanıklı bir bitkidir. Botanik yapısı nedeniyle yalancı tahıl olarak da adlandırılmaktadır (Yağan, 2019).

Tahıl ana olarak adlandırılan kinoa son derece besleyicidir. Kinoa tohumu protein, kalsiyum, magnezyum, demir, çinko gibi mineraller, diyet lifi ile E ve B grubu vitaminlerince nispeten iyi bir kaynaktır. Ayrıca esansiyel aminoasitlerin tamamını içeren kinoa lizin, sistein ve methionin aminoasitleri açısından da zengin olduğundan çok iyi bir protein kaynağı olarak kabul edilmektedir. Buğday, çavdar, yulaf, darı, mısır ve pirinçten çok daha fazla protein içermektedir. Yağ oranı ise yağlı tohumlardan az ancak tahıllardan daha yüksektir. Kinoa gluten içermediği için glutene duyarlılığı olan çölyak hastaları ve veganların (hayvansal ürün yemeyen) protein ve karbonhidrat ihtiyaçlarını karşılayan besleyici bir besindir. Bunların yanı sıra kinoa kolesterol de içermemektedir (Keskin & Kaplan Evlice, 2015). Kinoa modern dünyanın gündemine 2000'li yıllarda gelmiştir. Kinoanın popüler olmasında iki önemli gelişme rol oynamıştır. Bunlardan birincisi Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO)'nün 2013 yılını kinoa yılı ilan etmesidir. Teşkilat bu uygulama ile kinoanın dünyada gıda sıkıntısı yaşayan toplumlar için bir umut ışığı olduğuna dikkat çekmek istemiştir. Kinoanın tanınmasına yardımcı olan diğer bir gelişme ise NASA tarafından astronotların beslenmesinde kullanılmaya başlanmasıdır. Bitkinin tohumları küçük hacimde yüksek besleme değerine sahiptir. Bu nedenle uzay araştırmalarına da konu olmaktadır. Bu iki önemli gelişme kinoaya olan ilgiyi artırmış, dünya üzerindeki ticaret hacmi yükselmiştir. Ülkemizde de yetiştiriciliği ve denemeleri yapılmakta olan bu bitkiye ilgi her geçen gün daha da artmaktadır. 5–6 yıl öncesine kadar Türkiye bu bitkiyi ithal ederken, bugün ihraç eden bir ülke konumuna gelmiştir (Tan & Temel, 2019). Gıda sektörü son zamanlarda doğal kaynaklardan elde edilen bitkisel materyalleri kullanarak ürün geliştirme çalışmalarına ağırlık vermiştir. Üreticiler bu malzemelerin içerisinde bulunan bileşenlerin fonksiyonel özelliklerinden yararlanarak insan sağlığına uygun alternatif ürünler ortaya koymaya çalışmaktadırlar. Özellikle çeşitli tohumlar veya bunlardan elde edilen proteinler ve karbonhidratlar bunlara örnek olarak gösterilebilirler. Bu malzemelerin kullanımı ile sağlıklı beslenmeye uygun ürünler ortaya koymanın yanı sıra, gıdalarda ortaya çıkabilen duyusal ve kimyasal problemlerin de önüne geçilmeye çalışılmaktadır (Meral & Kılınççeker, 2022). Bu çalışma kinoanın besin değerleri, ülkemizdeki yeri ve gıdalarda kullanımının nasıl ve ne yönde etki ettiği hususunda bilgi vermeyi amaçlamaktadır.

### **Kinoa'nın Ülkemizdeki Yeri**

Ülkemizde ise kinoa üretimi, 2010 yılında bu ürünü ilk kez duymuş çiftçiler tarafından başlatılmıştır. Bu süre zarfında üniversiteler ve araştırma enstitüleri tarafından yürütülen araştırmalar ile kinoanın ülkemiz koşullarına adapte olan çeşitleri belirlenmeye, verim odaklı bitki besleme programları ve ekim dönemleri tespit edilmeye başlanmıştır. 2015 yılına gelindiğinde aradan geçen 4 yıllık süreçte, kinoa üretimini başarıyla

sonuçlandıran profesyonel üreticiler ortaya çıkmaya başlamıştır ve 2015 yılından itibaren, ticari boyutta üretim modellerine geçilmeye başlanmıştır (Bayram, Pekacar, & Deliorman Orhan, 2018).

### Kinoa'nın Besin Değeri

Kinoa bitkisinin içerisinde bulunan protein; özellikle histidin (%3,2) ve lisin (%6,1) yönünden zengindir. Yağının yüksek kalitesi sayesinde ve bazı çeşitlerinin % 9,5'e kadar yağ konsantrasyonlarına sahip olmasından dolayı; potansiyel olarak değerli yeni bir yağ maddesi olarak ta görülmektedir. Kinoa bitkisi 1 kg kuru ağırlık bazında, diğer tahıllara kıyasla daha fazla Ca (1487 mg), Fe (132 mg), K (9267 mg), Mg (2496 mg), Cu (51 mg), Mn (100 mg) ve Cl (1533 mg) barındırmaktadır ve Na:K oranı 1:76 çıkmaktadır. RDA(önerilen günlük besin alım miktarı)'lar yani tavsiye edilen diyet içeriği bakımından ve yaş ve cinsiyete bağlı olarak 100 g yenilebilir kinoa porsiyonu %27-40 Fe, %23-76 Mg, %47-200 Cu, %11-16 P, %15-19 K, %10-15 Zn ve sadece %1-2 Na sağlamaktadır. Kinoa'nın içerisinden ayrılması gereken madde saponinlerdir. Yıkama ya da aşındırıcı kabuk ayırma yoluyla çıkarılabilir; 100 g yenilebilir porsiyonda 0,01 g'dan fazla saponin olamaz (Yağan, 2019).

Kinoadaki ana bileşen karbonhidratlardan oluşur ve kuru maddenin %67 ila %74'ü arasında değişir. Nişasta yaklaşık %52-60 yapar. Nişasta bileşiği tohumlarının perispermde bulunur. Nişasta, basit birimler veya küresel agregatlar olarak mevcut olabilir. Amiloz içeriği, pirinç (%17), buğday (%22) veya arpa (%26) gibi tahıllardan daha düşük olarak yaklaşık %11'dir. Kinoa %2 ile %10 arasında yağ içerir. Kinoa ve soya yağları, benzer yağ asidi bileşimleri sergiler; bu nedenle kinoa, linolenik ve linolenik gibi esansiyel yağ açısından zengin bir kaynaktır (Jancurova, Minarovicova, & Dandar, 2009).

### KİNOA'NIN FİZİKSEL ÖZELLİKLERİ

Tohumların fiziksel, gravimetrik, sürtünme ve aerodinamik özellikleri, temizleme, sınıflandırma, taşıma, havalandırma, kurutma ve depolama gibi farklı hasat sonrası işlemlerin tasarlanmasında faydalıdır. %4,6 ile %25,8 (kuru bazda) arasında değişen nem içeriğine sahip kinoa tohumu numunelerinin bu özelliklerini belirlemiştir. %15'lik bir ortalama nem içeriğine sahip kinoa tohumunun boyu 1,7 ila 2 mm arasında değişirken, %72 tanede %5'lik tane bulunurken, %27,4'lük tohum boyutu Tablo 1'de verilen 2 mm'den büyük olmuştur. Diğer Özellikler Aşağıdaki gibi tablolaştırılmıştır (Sharma, Chandra, Dwivedi, & Parturkar, 2015).

Tablo 1: Kinoa Tohumlarının Fiziksel Özellikleri

	Özellik	Nem %4,6 d.b.	Nem %25 d.b.
Gravmetrik	1000 Tohum Ağırlığı	2,53 gr	3,11 gr
	Gerçek Yoğunluk	928 kg m <sup>-3</sup>	1188 kg m <sup>-3</sup>
	Kütle Yoğunluğu	747 kg m <sup>-3</sup>	667 kg m <sup>-3</sup>
	Yatak Gözenekliliği	0.19	0.44
Sürtünme	Durma Açısı Statik	18 <sup>0</sup>	25 <sup>0</sup>
	Sürtünme Katsayısı	0,14	0,27
Aerodinamik	Terminal Hızı	0,6 ms <sup>-1</sup>	1,02 ms <sup>-1</sup>

## KİNOA'NIN KİMYASAL VE BESİN ÖZELLİKLERİ

Tablo 2: Kinoa Tohumlarının Kimyasal Bileşimi

Diğer Tahılların Karşılaştırılması				
Enerji Değeri	Kinoa	Buğday	Pirinç	Mısır
Kcal/100g	350,00	309,00	353,00	338,00
Protein/100g	13,81	11,50	7,40	9,20
Yağ/100g	5,01	2,00	2,20	3,80
Karbonhidratlar mg/100g	59,74	59,40	74,60	65,20
Kalsiyum mg/100g	66,60	43,70	23,00	15,00
Fosfor mg/100g	408,30	406,00	325,00	256,20
Magnezyum mg/100g	204,20	147,00	157,20	120,00
Potasyum mg/100g	1040,00	502,00	150,00	330,00
Demir mg/100g	10,90	3,30	2,60	-
Manganez mg/100g	2,47	3,40	1,10	0,48
Çinko mg/100g	7,47	4,10	-	2,50

Rezervlerin yakın bileşimi, proteinlerin kimyasal karakterizasyonu, yağların yağ asidi bileşimi, mineral içeriği ve fonksiyonel ve besin değerleri gibi hususları kapsayan kinoa hakkında kapsamlı literatür mevcuttur. And bölgesinde yetiştirilen dört farklı kinoa çeşidinin yakın bileşimi, yani. Blanca de Juli, Kancolle, La Molina 89 ve Sajama Valencia tarafından belirlenmiş olup, (2011) analiz sonuçları Tablo 3'te sunulmuştur (Jancurova, Minarovicova, & Dandar, 2009).

Tablo 3: Dört Kinoa Çeşidinin Yaklaşık Bileşimi (% kuru bazda)

Bileşen	Blanca de Juli	Kcancolla	La Molina 89	Sajama
Nem	11,39	10,78	12,03	12,62
Kül	3,38	3,52	5,46	3,04
Protein	13,96	15,17	15,47	14,53
Doymuş Yağ	5,51	5,77	6,85	4,69
Ham Lif	2,00	3,07	3,38	1,92
Karbonhidratlar	75,15	72,47	68,84	75,82

Ekstrüzyonla pişirme yöntemiyle kinoadan üretilen hazır unun yaklaşık bileşimi, bileşimi şu şekilde göstermiştir: nem %4,8, protein %12,2, lipitler %5,6, kül %2,3, toplam karbonhidrat %74,9 ve lif %4,1 (Jancurova, Minarovicova, & Dandar, 2009). Kinoa unu, düşük prolamin ve glutamin içeriği nedeniyle gluten açısından düşüktür. Genellikle bisküvi, erişte ve hamur işlerinin hazırlanmasında pişirme unlarını zenginleştirmek ve fırınlanmış gıdaların hazırlanmasında nemi korumak ve hoş bir tat vermek için kullanılır. Kinoa ve diğer temel gıdaların besin içerikleri Tablo 4'te karşılaştırılmıştır (Jancurova, Minarovicova, & Dandar, 2009).

Tablo 4: Diğer Temel Gıdalarla Karşılaştırıldığında Kinoanın Besinsel Bileşimi (%)

Bileşenler	Kinoa	Et	Yumurtalar	Peynir	İnek Sütü	İnsan Sütü
Proteinler	3,4 ve	30,00	14,00	18,00	3,50	1,80
Yağlar	6,10	50,00	3,20	-	3,50	3,50
Karbonhidratlar	71,00	-	-	-	-	-
Şeker	-	-	-	-	4,70	7,50
Demir	5,20	2,20	3,20	-	2,50	-
100 g başına kalori	350,00	431,00	200,00	24,00	60,00	80,00

Besleyici bileşenlerin yanı sıra kinoa tohumu perikarpi, toksik ve acı tadı olan bileşenler olan saponinler içerir ve bu da, gıda ürünlerinin üretimi için yemeden veya işlenmeden önce ortadan kaldırılmasını gerekli kılar. Biyopolimerler tanelerin belirli kısımlarında da bulunur, nişasta perisperm hücrelerini işgal ederken, lipit gövdeleri, fitinin globoid kristallerine sahip protein gövdeleri ve fitoferritin birikintileri olan proplastitler endosperm ve embriyo dokularının depolama bileşenleridir (Jancurova, Minarovicova, & Dandar, 2009).

### KİNOA'NIN PROTEİN İÇERİĞİ

Kinoanın protein miktarı ve kalitesi genel olarak tahıl tanelerinden daha üstün olup, glütensiz olma özelliği ve yüksek sindirilebilirlik sunar. Kinoanın toplam protein içeriği (%12,9 ila %16,5), arpa (%10,8 ila %11,0), yulaf (%11,6), pirinç (%7,5 ila %9,1) ve mısırdan (%10,2 ila %13,4) ve toplam protein içeriğine eşit buğday (%14,3 ila %15,4). Kinoanın depolama proteinleri çoğunlukla globulin ve albüminde oluşur ve pek çok tahıl ürünüde ana depolama proteinleri olan prolaminler çok az bulunur veya hiç bulunmaz. Buğdaydan gliadin, çavdardan sekalin ve arpadan hordein (toplu olarak "glutenler" olarak anılır) gibi prolaminler, çölyak hastalarında otoimmün tepkileri indükler (Jancurova, Minarovicova, & Dandar, 2009). 15 kinoa çeşidi üzerinde yakın zamanda yapılan bir in vitro çalışma, yalnızca 2 çeşidin çölyak için toksik prolamin epitoplarının herhangi bir saptanabilir seviyesini göstermiştir. Bağışıklık tepkileri ise in vitro tam gıda tüketimi ile kopyalanmamıştır. Bu sonuçlar, kinoanın tahıl taneleri için güvenli bir glütensiz ikame olduğunu göstermektedir. toplam proteininin %37'sini, FAO (Abugoch James) tarafından lösin, izölösün ve fenilalanin ve tirozin için bir referans kaynağı haline gelen globulin 11S tipi bir protein olan chenopodin oluşturur (Jancurova, Minarovicova, & Dandar, 2009).

Literatürde kinoa tohumu için bildirilen ortalama protein içeriği kuru bazda (db) %16,3'tür. Kinoa tohumlarının protein içeriği arpa (%11 db), pirinç (%7,5 db) veya mısırdan (%13,4 db) daha yüksektir ve buğdayinkiyile (%15,4 db) karşılaştırılabilir. Kinoa tohumu nispeten daha az protein içerir. baklagil tohumlarına kıyasla proteinler (Tablo 5). Kinoa proteininin besin değeri süt proteinininkiyile karşılaştırılabilir. Acısı alınmış ham kinoadaki protein verimlilik oranı (PER), kazeininkinin %78-93'üdür. Bu rakamlar kinoa pişirildiğinde artmakta ve kazeinin %102-105'i olmaktadır (Jancurova, Minarovicova, & Dandar, 2009).

Tablo 5: Kinoa ve Bazı Tahıl ve Baklagillerin Kimyasal Bileşimi (g/100g kuru ağırlık)

Bileşenler	Kinoa	Arpa	Mısır	Pirinç	Buğday	Fasulye	Acı Bakla	Soya
Protein	16,5	10,8	10,22	7,6	14,3	28,0	39,1	36,1
Yağ	6,3	1,9	4,7	2,2	2,3	1,1	7,0	18,9
Lif	3,8	4,4	2,3	6,4	2,8	5,0	14,6	5,6
Kül	3,8	2,2	11,7	3,4	2,2	4,7	4,0	5,3
Karbonhidratlar	69,0	80,7	81,1	80,4	78,4	61,2	35,3	34,1
kcal/100g	399	383	408	372	392	367	361	451

Lizin, çoğu tahıl tanesinde sınırlayıcı bir amino asittir. Kinoa'nın amino asit bileşimi Koziol (1992) tarafından incelenmiştir, kinoa tohum proteinindeki esansiyel amino asit dengesi, tahıllar ve baklagil proteinlerinden daha yüksek lizin (%5.1-6.4) ve metiyonin (%0.4-1) içeriği nedeniyle mükemmeldir. Kinoa proteinleri (QP), mısır, pirinç ve buğday proteinlerinden daha yüksek histidin içeriğine sahiptir. (Tablo 6) (Jancurova, Minarovicova, & Dandar, 2009).

Kinoa'nın metiyonin artı sistin içeriği de çocuklar (2-12 yaş) ve yetişkinler için yeterlidir. FAO/WHO'nun 10 yaşındaki çocuklar için önerdiği gereksinimlere göre, kinoa proteini yeterli düzeyde aromatik amino asitlere (fenilalanin ve tirozin) ve benzer şekilde histidin, izolösin, treonin, fenilalanin, tirozin ve valin içeriğine sahiptir. Karşılaştırıldığında, QP'lerdeki lizin ve lösin, 2-5 yaşındaki bebekler veya çocuklar için amino asitleri sınırlandırırken, FAO/WHO'ya göre bu proteinin tüm temel amino asitleri yeterlidir (Tablo 6) (Jancurova, Minarovicova, & Dandar, 2009).

Tablo 6: Kinoa ve Diğer Besinlerdeki Esansiyel Amino Asitler (g/100 g protein)

Amino Asitler	Kinoa	Mısır	Pirinç	Buğday	Fasulye	Süt	FAO <sup>a</sup>
Histidin	3,2	2,6	2,1	2,0	3,1	2,7	2,6
İzolösin	4,9	4,0	4,1	4,2	4,5	10,0	4,6
Lösin	6,6	12,5	8,2	6,8	8,1	6,5	9,3
Lizin	6,0	2,9	3,8	2,6	7,0	7,9	6,6
Metiyonineb	5,3	4,0	3,6	3,7	1,2	2,5	4,2
Fenilalaninec	6,9	8,6	10,5	8,2	5,4	1,4	7,2
Treonin	3,7	3,8	3,8	2,8	3,9	4,7	4,3
Triptofan	0,9	0,7	1,1	1,2	1,1	1,4	1,7
Valline	4,5	5,0	6,1	4,4	5,0	7,0	5,5

## KİNOA'NIN KARBONHİDRAT İÇERİĞİ

Karbonhidratlar, kinoa tohumunun kuru maddesinin başlıca kısımlarıdır; ana bileşenler olarak nişasta ve diyet lifleri içerir. Kinoa tohumlarındaki karbonhidrat içeriği, kuru maddenin %67 ila %74'ü arasında değişir; bunun dışında nişasta yaklaşık %55-65'ini oluşturur. Kinoa tohumlarında başlıca nişasta bileşimi, perispermde basit birimler veya 3 µm'den küçük çok küçük tane boyutuna sahip küresel kümeler halinde bulunur. Amiloz içeriği ile karşılaştırıldığında kinoa nişastası, pirinç

(%17), buğday (%22) veya arpa (%26) gibi diğer tahıllardan daha az olan %11 amiloz içerir (Jancurova, Minarovicova, & Dandar, 2009).

Lamothe ve diğerleri, (2015)'e göre kinoa, %10 toplam diyet lifi içerir. Lif, ince bağırsakta enzimatik sindirime ve emilime dirençli, kalın bağırsakta genellikle tam veya kısmi fermantasyona uğrayan karbonhidrat fraksiyonudur. Diyet lifi, optimal sindirim sağlığı için gerekli kabul edilir ve ayrıca çeşitli fonksiyonel faydalar sağlar (Jancurova, Minarovicova, & Dandar, 2009). Kinoa nişastasının jelatinleşme sıcaklığı nispeten düşüktür, 57-64°C'dir. Kinoa nişastası, buğday nişastasından daha yüksek viskozite sergiler, ancak mısır nişastası kadar yüksek değildir. Mumsu mısır nişastası gibi kinoa nişastası da normal mısır nişastasına göre üstün donma-çözülme stabilitesine sahiptir. Bulunan diğer karbonhidratlar pentosanlar (%2,9-3,6), disakkaritler (%2,3), ham lif (%2,5-3,9) ve monosakkaritlerdir (Jancurova, Minarovicova, & Dandar, 2009).

### KİNOA'NIN YAĞ İÇERİĞİ

Kinoa %2 ila %9 yağ içerir, ortalama yağ içeriği yaklaşık %6 USDA'dır, sahte yağ ürünü olarak kabul edilebilir. Bu yüzdeler kabaca mısırın yağ içeriğine benzer, ancak soya fasulyesinden (%20-25 yağ) çok daha azdır. Kinoa, Mısır ve Soya yağları benzer yağ asidi bileşimleri sergiler. Soya fasulyesi ve çoğu tahılda olduğu gibi, linoleik asit baskın yağ asididir, benzer şekilde kinoa, linolenik (18:2n-6: %52) ve linolenik (18:3n-6: %40) gibi zengin bir esansiyel yağ asitleri kaynağıdır. Tüm kinoa tohumlarının genel yağ asidi bileşimi, mevcut ana asitler olarak linoleik, oleik ve palmitik asitlerle diğer tahıl tanelerine benzerdir. Tablo 7'de farklı tahıllardaki yağ asidi kompozisyonları verilmiştir (Jancurova, Minarovicova, & Dandar, 2009).

Tablo 7: Kinoa ve Genel Tahıl Tanelerinin Yağ Kalitesi (Değerler Toplam Yağın Yüzdesi Olarak İfade Edilmiştir)

Yağ Asitleri	Kinoa	Buğday	Arpa	Pirinç	Mısır
Baskın Asit	18:2	18:2	18:2	18:1	18:2
Doymuş	13%	23%	26%	32%	16%
Tekli Doymamış	34%	22%	16%	37%	31%
Çoklu Doymamış	53%	55%	58%	31%	53%

Kinoa tohumundan ve tohum fraksiyonlarından izole edilen lipidler, Przybylski tarafından lipid sınıfları ve yağ asidi kompozisyonu için karakterize edildi, analiz edildiğinde, kinoa tohumu lipidlerinin diğer tohum fraksiyonları arasında en fazla miktarda nötr lipid içerdiği, tüm kinoa tohumunda daha yüksek miktarlarda SYA tespit edildiği ve toplam lipidlerin sırasıyla %18.9'u ve %15.4'ü kabuğunda bulunduğu, nötr lipidlerin %50'si trigliseridler; digliseritler, nötr lipid fraksiyonlarının %20'sine katkı sağladığı ve tüm tohumda mevcut olduğu gözlenmiştir (Jancurova, Minarovicova, & Dandar, 2009). Fosfolipitler arasında lizofosfatidil etanolamin bütün tohum fosfolipidlerinin %45'ini ve fosfatidil kolin %12'sini oluşturmuştur (Sharma, Chandra, Dwivedi, & Parturkar, 2015).

### KİNOA İÇİNDEKİ MİNERALLER

Kinoa iyi bir mineral kaynağıdır; Arpa, yulaf, pirinç, mısır veya buğday gibi yaygın temel gıdalar ile karşılaştırıldığında, kinoa tohumları yüksek kaliteli proteinler, daha yüksek seviyelerde enerji, kalsiyum, fosfor, demir, lif ve B vitaminleri içerir. Kinoa tohumlarının mineral içeriğine ilişkin karşılaştırmalı veriler Tablo 8'de sunulmaktadır (Jancurova, Minarovicova, & Dandar, 2009). Daha

yüksek miktarlarda kalsiyum (874 mg kg<sup>-1</sup> ), fosfor (5,3 g kg<sup>-1</sup> ), magnezyum (2,6 mg/100 g), demir (81 mg kg<sup>-1</sup> ), çinko (36 mgkg<sup>-1</sup> ), potasyum (12) g kg<sup>-1</sup> ) ve bakır (10 mg kg<sup>-1</sup> ) yaygın tahıl tanelerinin çoğundan daha fazla olduğu, tohumların cilalanması ve yıkanması mineral içeriğini bir dereceye kadar azalttığı, demir, çinko ve potasyumda %12-15, bakırda %27 ve magnezyumda %3 oranlarında azalma olduğu saptanmıştır. (Sharma, Chandra, Dwivedi, & Parturkar, 2015).

Tablo 8: Kinoa ve Bazı Tahıllarda Mineral Bileşimi (mg kg<sup>-1</sup> kuru ağırlık)

Mineraller	Kinoa	Buğday	Pirinç	Arpa
Kalsiyum	1487	503	69	430
Magnezyum	2496	1694	735	1291
Potasyum	9267	5783	1183	5028
Fosfor	3837	4677	1378	3873
Demir	132	38	7	32
Bakır	51	7	2	3
Çinko	44	47	6	35

### KİNOA'NIN VİTAMİN İÇERİĞİ

A vitamini, E vitamini gibi yağda çözünen vitaminler ve tiamin, riboflavin, niasin ve askorbik asit gibi suda çözünen vitaminlerin aralığı Ruales ve diğerleri (1992) tarafından ölçülmüş ve Tablo 9'da ifade edilmiştir. Kinoa iyi bir kaynak olarak kabul edilir. Tiamin (0,4 mg/100 g), folik asit (78,1 mg/100 g) ve C vitamini (16,4 mg/100 g) gibi vitaminler içermektedir. Saponinlerin tohumlardan uzaklaştırılması işlemi, vitamin ve mineral içeriklerini bir dereceye kadar azaltmaktadır. Potasyum, demir ve manganez durumunda kayıp önemlidir (P < 0.001) (Jancurova, Minarovicova, & Dandar, 2009).

Tablo 9: Kinoa Tanesinin Vitamin İçeriği (mg/100g kuru madde)

S. No.	Vitaminler	Aralık
1.	A Vitamini (Karoten)	0,12 - 0,53
2.	E Vitamini	4,60 - 5,90
3.	Tiamin	0,05 - 0,60
4.	Riboflavin	0,20 - 0,46
5.	Niasin	0,16 - 1,60
6.	Askorbik Asit	0,00 - 8,50

## KİNOA'NIN FONKSİYONEL ÖZELLİKLERİ

**Antioksidan Özelliği:** Seçilmiş sözde tahıllar amarant ve kinoa tohumlarının ve filizlerinin antioksidan potansiyeli, Plazmanın Ferrik İndirgeme Yeteneği (FRAP) testi, radikal süpürme aktivitesi (ABTS) ve radikal süpürme aktivitesi (DPPH) gibi yöntemlerle yapıldı. Toplam polifenoller ve antosiyaninler de belirlendi. Bu çalışmada, kinoa da bulunan iyi bir antioksidan kaynağı olarak filizin besin değerine odaklanılmıştır. Filiz değerleri de ölçülmüş olup, kinoa tohumlarının ve filizlerinin önemli ölçüde yüksek antioksidan aktivite gösterdiği saptanmıştır (Jancurova, Minarovicova, & Dandar, 2009).

Araştırma sonucunda, filizlerin tohumlardan önemli ölçüde daha yüksek bir antioksidan aktiviteye sahip olduğunu göstermiştir. Bu polifenoller, antosiyaninler ve diğer bileşiklerin içeriğindeki farklılığın bir sonucu olabilir ve Amarant ve kinoa filizleri, "yeni" sebzelerdir; veganların ve vejeteryanların beslenmesinde ortak bir diyet olarak da kullanılabilir (Jancurova, Minarovicova, & Dandar, 2009).

**Antimikrobiyal Özellik:** Şili'nin üç farklı coğrafi bölgesinden (her bölgeden iki adet) altı farklı kinoa tohumu çeşidi (Ancovinto, Cancosa, Cahuil, Faro, Regalona ve Villarrica) antimikrobiyal özellikleri açısından incelenmiştir. Tohumun kuru etanol ekstraktı suda çözüldü (30.0 mg ekstrakt/mL damıtılmış su) ve disk difüzyon testi tekniği kullanılarak Staphylococcus aureus (ATCC 25923) (Gram pozitif) ve Escherichia coli (ATCC 25922) (Gram negatif) olmak üzere iki mikroorganizmaya karşı inhibisyon bölgesini test etmek için kullanılır. Tüm kinoa örneklerinin ekstraktları, E. coli için 8,3-14,8 mm inhibisyon bölgesi ve S. aureus için 8,5-15,0 mm inhibisyon bölgesi aralığında antimikrobiyal aktivite göstermiştir. Cancosa tohumları en yüksek antimikrobiyal etkiye sahipti (Jancurova, Minarovicova, & Dandar, 2009).

Altı çeşidin tamamında Toplam Fenolik İçerik (TPC), Toplam Flavonoid İçeriği (TFC), Toplam Saponin İçeriği (TSC) ve inhibisyon bölgesi arasındaki Pearson katsayısı korelasyonları yapılmıştır. TFC ile E. coli ve S. aureus'a karşı antimikrobiyal aktiviteler arasındaki ilişki orta (sırasıyla  $r = 0.60$  ve  $0.43$ ) ancak E. coli için pozitif olarak anlamlı ( $p < 0.05$ ) bulundu, bu da flavonoid bileşiklerin antimikrobiyal aktivitelere katkıda bulunabileceğini gösteriyor E. coli ve S. aureus'a karşı (Jancurova, Minarovicova, & Dandar, 2009).

## KİNOA'NIN GIDALARDA KULLANIMI

### Makarna

Makarnanın zenginleştirilmesi amacıyla yürütülen çalışmalarda makarnanın ana bileşeni olan durum buğdayının bileşiminde bulunmayan ya da az miktarda bulunan besleyici/fonksiyonel elementlerinin takviyesi hedeflenerek, makarna formülasyonlarına bitkisel ya da hayvansal kaynaklı ilaveler yapılmaktadır. Bitkisel kaynaklı olarak farklı tahıl, pseudo-tahıl (kinoa, amarant, karabuğday vb.) ve baklagil unları ile çeşitli kaynaklardan elde edilen meyve sebze lifleri ve posaları kullanılabilir (Demir, 2018).

Pseudo-tahıllar yalancı tahıl (tahıl benzeri) olarak adlandırılmakta, gluten içermediğinden çölyak hastalarının beslenmesi için de alternatif hammadde olarak düşünülmektedir. Bunlar arasında karabuğday, kinoa ve amarant en fazla dikkat çekenler olup son zamanlarda gıda formülasyonlarında yaygın olarak kullanılmaya başlanmıştır (Demir, 2018).

### **Erişte**

% 30 kame oranı esas alınarak erişte formülasyonuna, 10 farklı kombinasyonda pseudo-tahıl (amarant, kinoa, karabuğday) ikameleri gerçekleştirilmiştir. Üretilen erişte örneklerinde bazı fiziksel kimyasal, besinsel ve duyuşal özellikler incelenmiştir. Erişte kombinasyonlarına pseudo-tahıl ikamesi ile son ürünlerin  $L^*$  değeri azalırken  $a^*$  ve  $b^*$  değeri artmıştır. Ayrıca ikameler ile eriştinin mineral madde, toplam fenolik madde, fitik asit, ham protein, ham yağ ve kül miktarlarında şahit (%100 buğday unu ile yapılan erişte) erişte örneğine göre artışlar tespit edilmiştir. Tüm değerlendirme kriterleri göz önünde bulundurularak %20 amarant + %10 kinoa ikameli 5 numaralı erişte kombinasyonunun en uygun kombinasyon olduğu sonucuna varılmıştır (Öncel, 2017). Erişte örneklerindeki kinoa unu oranlarının artışı, duyuşal olarak görünüş, doku ve lezzet ortalama puanlarının azaltmıştır. %20 oranında kinoa unu kullanılarak elde edilen erişte, en iyi örnek olarak belirlenmiştir (Argan, 2019).

### **Bisküvi**

Bu çalışmada farklı boyutlarda kinoa kepeği kullanılarak, laboratuvar ortamında bisküvi üretimi yapılmış ve farklı boyutlarda kinoa kepeğinin bisküvilerin fiziksel, tekstürel ve duyuşal özelliklerine olan etkisi incelenmiştir. Elde edilen verilere göre, kinoa kepek unu boyutuna bağlı olarak bisküvilerin karakteristiklerinde önemli değişimler meydana getirmektedir. Çalışma sonucunda kinoa kepeğinin sağlıklı beslenen bireyler için yeni bir alternatif hammadde olarak bisküvi üretiminde kullanılabileceği sonucuna varılmıştır (Erinç, 2020).

### **Kek**

Farklı boyutlarda kinoa kepek unları değirmende öğütülmüş ve 5 farklı boyutta buğday unundan yapılmış keklere %25 oranında katılmıştır. Elde edilen sonuçlara göre kinoa kepek ununun boyutları küçüldükçe örneklerin kuru madde oranı artış göstermiştir. Yine kepek unu boyutlarının küçülmesi ile kek iç ve dış parlaklık değerlerinde azalma gözlenmiştir. Keklerin tekstür ve duyuşal özelliklerinde kinoa katılımı sonucun düşüş belirlenmiştir ve bu olumsuzluk kepek boyutu küçüldükçe daha fazla olmuştur. Elde edilen verilere göre, kinoa kepek unu boyutuna bağlı olarak keklerin karakteristiklerinde değişimler meydana getirmektedir (Alaşalvar, Erinç, & Çolakoğlu, 2019).

### **Muffin Kek**

%100 buğday unundan üretilen kontrol grubu örnek ve buğday ununa farklı oranlarda (%25 ve 50) kinoa unu ikame edilmesi ile üretilen muffin keklerde meydana gelen fizikokimyasal ve duyuşal değişimler araştırılmıştır. Muffin kek formülasyonunda kinoa unu ikame oranı arttıkça örneklerin protein, yağ, kül ve amino asit içerikleri ile tekstür profil analizi sonucunda elde edilen sertlik değerlerinde artış meydana gelirken, karbonhidrat içeriğinde ve spesifik hacimde azalma meydana gelmiştir. Duyusal özellikler bakımından %50 oranında kinoa unu ikame edilmiş örnekte gözeneklilik, tekstür, tat ve genel beğeni puanlarında anlamlı düzeyde azalma ( $p < 0.05$ ) meydana gelmiştir. Kinoa ikame edilme oranı %25 olan muffin kek örneğinin ise kontrol örneği ile benzer duyuşal ve tekstürel özelliklere sahip olduğu belirlenmiştir. Tüm sonuçlar göz önüne alındığında, kinoanın protein ve yağ gibi önemli gıda bileşenlerini yüksek oranda bulundurması ve zengin amino asit içeriğine sahip olması nedeniyle iyi bir zenginleştirme materyali olarak kullanılabileceği belirlenmiştir (Özgören & Yapar, 2022).

Yapılan bu çalışma ile kinoa ununun buğday ununa kıyasla daha yüksek protein, kül ve yağ içeriğine sahip olduğu belirlenmiştir. Bunun yanında dengeli ve yüksek oranda amino asit içeriğine sahip olması sayesinde özellikle unlu mamullerde iyi bir zenginleştirme kaynağı olarak kullanılabileceği kanaatine varılmıştır (Özgören & Yapar, 2022). Kinoa unu ikame edilmiş muffin kek örneklerinin yalnızca buğday unundan üretilen örneklere kıyasla gıda bileşenleri açısından daha zengin olduğu belirlenmiştir. Kinoa unu ikame oranının artışı belli bir seviyeye kadar kalite özelliklerini olumsuz etkilememiştir. %25 oranında kinoa unu ikame edilmiş muffin kek örneği duyuşal ve tekstürel özellikler açısından kontrol örneği ile benzer bulunmuştur. Ayrıca protein, yağ, kül miktarı ve amino asit kompozisyonu açısından kontrol örneğine kıyasla daha zengin bir içeriğe sahip olduğu belirlenmiştir. Kinoa unu ikame edilen örneklerin kalori değerinde ise belirgin bir değişim tespit edilmemiştir (Özgören & Yapar, 2022). Tüm bu nedenlerden dolayı %25 oranına kadar kinoa unu

ikamesinin muffin keklerin kalite özelliklerinde olumsuz etkiye neden olmadan kullanılabilceği belirlenmiştir (Özgören & Yapar, 2022).

### **Probiyotik Yoğurt**

Probiyotik yoğurtlarda kinoa ununun prebiyotik katkı olarak kullanım olanakları ve farklı oranlarda kinoa unu ilavesinin probiyotik yoğurtların fizikokimyasal, tekstürel, mikrobiyolojik ve duyuşal özellikleri üzerine etkisi araştırılmıştır. Farklı oranlarda kinoa unu (A:kontrol(%0.0), B:%0.5, C:%1.0, D:%2.0 ve E:%4.0) ilave edilerek üretilen probiyotik yoğurtlar  $4\pm 2^{\circ}\text{C}$ 'de 21 gün süreyle depolanmıştır. Depolamanın 1., 11. ve 21. günlerinde yoğurtların fizikokimyasal, tekstürel, mikrobiyolojik ve duyuşal özelliklerini belirlemek amacıyla analizler yapılmıştır (Hafif, 2019). Elde edilen analiz sonuçlarına göre probiyotik yoğurt örneklerine kinoa unu ilavesinin fizikokimyasal özelliklerden kuru madde, titrasyon asitliği, pH, kül, protein, yağsız kuru madde, serum ayrılması, viskozite, su tutma kapasitesi değerleri; tekstürel özelliklerden sertlik, konsistens(kıvam), iç yapışkanlık ve viskozite indeksi değerleri; mikrobiyolojik özelliklerden *Lactobacillus acidophilus*, *Streptococcus thermophilus* ve *Bifidobacterium animalis subsp. lactis* (BB-12) sayıları; duyuşal özelliklerden renk ve görünüş, yapı ve kıvam, tat ve aroma puanları üzerine etkisi önemli ( $p<0.01$ ) bulunmuştur. Depolama süresinin de probiyotik yoğurtların bu özellikleri üzerine etkisi benzerlik göstermiştir (Hafif, 2019).

Farklı oranlarda kinoa unu ilavesinin probiyotik yoğurtlarda prebiyotik etkisinin araştırıldığı bu çalışmada, mikrobiyolojik özellikler değerlendirildiğinde kinoa ununun prebiyotik etki gösterdiği görülmüştür. Ayrıca fizikokimyasal, tekstürel ve duyuşal özellikler değerlendirildiğinde kinoa ununun probiyotik yoğurtlara ilavesinin bu özelliklere olumlu katkılar yaptığı ve özellikle %0.5 ile %1.0 kinoa unu ilavesinin probiyotik yoğurtlarda rahatlıkla kullanılabilceği kanısına varılmıştır. Yüksek oranlarda (%2.0 ve %4.0) kinoa unu ilavesinin probiyotik yoğurtların duyuşal özelliklerini olumsuz etkilemesi sebebiyle bu oranlardaki (%2.0 ve %4.0)kinoa ununun meyveli/aromalı yoğurtlarda denenebileceği düşünülmektedir (Hafif, 2019).

### **Fırın Ürünleri**

Çeşide bağılı olarak değişmekle birlikte, yaklaşık % 10 - 18 protein, % 4.50 - 8.75 yağ, % 54,1 - 64,2 karbonhidrat, % 2.40 - 3.65 kül ve % 2,1 - 4,9 lif içermektedir. Ayrıca, E vitamini, B grubu vitaminler, lizin aminoasidi ve esansiyel yağ asitleri açısından da zengin bir bitkidir. Bu nedenle buğday ununa ilave edildiğinde elde edilen ürünlerin besin değerini artırmaktadır. Ancak kinoanın bileşiminde acılığa sebep olan saponinlerin bulunması ve buğday gluten proteinlerinin eksikliği fırın ürünlerinde kullanımını sınırlandırmaktadır. Yapısında bulunan saponinler uzaklaştırıldıktan sonra, kinoa zenginleştirme amacı ile ekmekek, kek, bisküvi gibi fırın ürünlerinin üretiminde tat, aroma, tekstür, görünüş gibi özellikler dikkate alınarak, buğday ununa belli oranlarda katılabilmektedir. Bunun yanı sıra çölyak hastaları için ekmekek yapımında kinoa nişasta kaynağı olarak da kullanılabilir (Keskin & Kaplan Evlice, 2015). Kinoa yapısında gluten proteinlerini içermediğinden, buğday ununa belli oranlarda katılarak yüksek proteinli ekmekek, kek ve bisküvi gibi fırın ürünlerinin üretiminde kullanılmaktadır. Böylece hem besin değeri artırılmakta hem de kabul edilebilir aromaya sahip ürünler elde edilmektedir. Ayrıca, çölyak hastalarının kullanabileceği alternatif bir bitki konumundadır (Keskin & Kaplan Evlice, 2015)

### **Ekmekek**

Karabuğday, kinoa ve amarant unları iki farklı yöntemle fermente edilerek glutensiz ekmekek üretiminde farklı oranlarda (%0, 15, 30 ve 45) kullanılmıştır. Pseudo-tahıl fermente hamur ilavesinin, ekmekeklerin bazı, fiziksel, kimyasal ve duyuşal özellikleri üzerine etkisi incelenmiştir. Ekmekeklerde en düşük parlaklık ve en yüksek kırmızılık değerleri karabuğday içeren örneklerde belirlenmiştir. Formülasyonda pseudo-tahıl fermente hamur oranının artması ekmekeklerde kül, protein, fitik asit, toplam fenolik madde, antioksidan aktivite ve mineral madde (Ca, P, K, Fe, Mg ve Zn) miktarının yükselmesine neden olmuştur Kinoa ve amarant katkılı ekmekekler 48. ve 72. Saatte karabuğday katkılı ekmekeklerden daha düşük sertlik değerlerine sahip olmuştur. Maya kullanılarak fermente edilen ekşi hamurdan hazırlanan ekmekeklerde hacim ve spesifik hacim değerleri daha yüksek, sertlik değerleri ise daha düşük belirlenmiştir. Amarant katkılı ekmekekler simetri, gözenek yapısı ve görünüş açısından yüksek puanlar almasına rağmen tat-koku açısından tüketiciler tarafından daha az

beğenilmiştir. Pseudo-tahılların %15-30 fermente hamurları ile hazırlanan ekmekler, kontrole yakın genel kabul edilebilirlik puanları almıştır (Yeşil, 2021).

Pseudo-tahıl içeren ekmeklerde kontrolden daha yüksek gözenek yapısı, tat-koku, görünüş ve çiğnenebilirlik puanlarının elde edilmesini sağlayarak glutensiz ekmeklerde hem teknolojik hem de duyu kalitenin geliştirilmesinde en uygun emülgatör uygulamaları olmuştur. Pseudo tahılların yüksek kullanım oranlarında meydana gelebilecek teknolojik ve duyu kalite kayıplarının önlenmesi için emülgatörlerin yanı sıra farklı enzimler kullanılabilir. Ekmek formülasyonunda, pseudo-tahılların kullanımı ile artan fitik asit miktarının azaltılması amacıyla farklı yöntemlerin denenmesi besinsel kalitenin yükseltilmesi açısından faydalı olacaktır (Yeşil, 2021).

### **Glutensiz Ekmek**

Farklı oranlarda (%5, 10, 20 ve %30) kinoa unu içeren ve kısmi pişirilerek dondurma yöntemiyle üretilen glutensiz ekmeklerin 0, 5, 10, 15, 30, 45 gün depolanması sonrasında bazı kimyasal, fiziksel, tekstürel ve duyu kalite kriterlerinin incelenmesi amaçlanmıştır. Glutensiz un formülasyonu olarak; %53.15 pirinç unu, %24.53 nohut unu, %12.32 patates nişastası, %5 mısır unu ve %5 mısır nişastası karışımı kullanılmıştır. Analiz sonuçlarına göre; kinoa unu ilavesi ekmek örneklerinin protein ve toplam diyet lif miktarlarını etkilemezken, nem, kül, kalsiyum (Ca), magnezyum (Mg) ve fosfor (P) miktarları ile sertlik, sakızimsılık ve çiğnenebilirlik gibi tekstürel değerlerini arttırmıştır. Renk değerlerinden parlaklık (L\*) değeri azalmış, kırmızılık (a\*) değeri artmış, sarılık (b\*) değeri ise değişiklik göstermemiştir.

Depolanan glutensiz ekmeklerde sertlik ve sakızimsılık artarken, elastikiyet ve esneklik azalmıştır. Soğuk depolama ile renk değerlerinde önemli bir değişiklik olmadığı belirlenmiştir. Duyusal analiz sonuçlarına göre; kinoa unu ilavesi ve kısmi pişirilerek dondurulup depolama işlemi glutensiz ekmeklerin kabul edilebilirliğini olumlu yönde etkilemiştir. Sonuç olarak kinoa ununun %30 oranına kadar formülasyona ilave edilmesinin uygun olduğu ve glutensiz ekmeklerin 45 güne kadar kısmi pişirilerek dondurulup depolanabileceği tespit edilmiştir (Hayıt & Gül, 2019). Glutensiz ekmek formülasyonuna kinoa unu ilave edilip, elde edilen ekmekler kısmi pişirilerek dondurulmuş ve üretilen ekmeklerin ekmek özellikleri incelenmiştir. Kinoa ilavesi glutensiz ekmeklerin mineral madde değerini ve kül içeriğini arttırmıştır. Tekstürel, renk ve duyu özelliklere olumsuz bir etki göstermemiştir (Hayıt & Gül, 2019). Bu yüzden glutensiz ekmeklerin besin içeriğini arttırmak için formülasyona %30 oranına kadar kinoa ilavesinin yapılabileceği sonucuna varılmıştır. Ayrıca çalışma sonucunda kısmi pişirilerek dondurulan glutensiz ekmeklerin 45 güne kadar kalitelerinde büyük problemler olmadan depolanabileceğine duyu değerlendirme sonucunda karar verilmiştir. Hastaların en büyük ve önemli sorunlarından olan taze ekmeğe ulaşım probleminin kısmi pişirilerek dondurma yöntemi ile çözülebileceği sonucuna varılmıştır (Hayıt & Gül, 2019).

### **Lavaş Ekmeği**

Kinoa tohumu biyolojik değeri yüksek proteinleri, düşük glisemik indeksli karbonhidratlar, fitosteroidler, esansiyel amino asitler, mineral maddeler, vitaminler ve biyoaktif bileşenler bakımından zengindir. Kinoa diğer tahıl taneleri gibi gluten içermemesi, gluten hassasiyeti olan insanlar için önemli bir gıda kaynağı olduğunu göstermektedir. Buğday ununa kinoa unu katılarak lavaş yapılması, lavaşı protein, yağ, mineral madde ve esansiyel amino asitler bakımından zenginleştirmektedir. Böylece besin madde bakımından zenginleştirilmiş fonksiyonel lavaş üretilebilecektir. Kinoa ununu %20 düzeyinde kullandığımızda ekmek özellikleri bakımından herhangi bir olumsuzlukla karşılaşmadığından lavaş yapımında %20'ye kadar kullanılabilmesi kanısına varılmıştır (Akturfan, 2018).

### **Kinoa ve Kayısı Karışımı Sostan Elde Edilen Puding**

Kinoa ve kayısı karışımı ile hazırlanan sosun (%30 kayısı, %3 kinoa, aroma verici, şeker, su modifiye nişasta, siyah havuç suyu konsantresi, karragenan ve beta karoten) %3, %5 ve %7 oranlarda eklendiği pudingler hazırlanmış ve protein, yağ, kuru madde analizleri yapılarak; tekstür analizi ve pH değerleri ile toplam mezofilik aerob bakteri (TMAB) sayısı 5 gün boyunca takip edilmiştir. Tüm analizler üç tekerrürlü olacak şekilde yürütülmüştür.

Kontrol grubu olarak; sos içermeyen puding hazırlanmıştır. Pudinglerin hepsi aynı formülasyonla hazırlanmışlardır. Ayrıca, 9'lu hedonik skalanın kullanıldığı duyusal analiz 9 panelist tarafından analizin 1., 3. ve 5. günlerinde değerlendirilmiştir. Çalışmanın sonuçları incelendiğinde; pH değerleri; sade, %3, %5 ve %7 sos içerikli pudinglerde sırasıyla ortalama olarak 5 gün için 6.71, 6.47, 6.41 ve 6.36 olarak ölçülmüştür. Yağ değerleri; sade, %3, %5 ve %7 sos içerikli pudinglerde ortalama olarak sırasıyla 2.37, 2.34, 2.28 ve 2.26 olarak ölçülmüştür (Çolak Şaşmaz, Özoğlu, & Korukluoğlu, 2019).

Yine aynı şekilde protein değerleri 2.37, 2.15, 2.18 ve 2.10 olarak ölçülürken; kuru madde değerleri %21.59, %23.39, %24.32 ve %25.55 olarak ölçülmüştür. TMAB sayıları tüm örneklerde ilk gün 1 log'dan az iken 5.günde 2 log değerlerine ulaşmıştır. Duyusal analiz sonuçları incelendiğinde ise genel olarak puding beğeni seviyesinin 7 (beğendim) seviyelerinde olduğu, beğenin zaman geçtikçe düşüş gösterdiği ve soslu pudingler içerisinde %5 orana sahip olanın daha yüksek beğeni aldığı gözlemlenmiştir. Sonuç olarak %5 sos içeriğine sahip puding tüketiciye alternatif ve fonksiyonel bir tatlı olarak sunulabilir (Çolak Şaşmaz, Özoğlu, & Korukluoğlu, 2019).

### **Pişmemiş Tavuk Köftesi**

Buğday unu ve kinoa unundan hazırlanan karışımların soğukta depolanan tavuk köftelerin tekstür özellikleri üzerine etkisi araştırılmıştır. Bu karışımlar ile hazırlanan pişmemiş tavuk köfteler, soğukta muhafazanın 1, 3, 7 ve 10'uncu günlerinde tekstür analizine tabii tutulmuştur. Çalışma sonucunda köfte bileşiminde kinoa unu kullanımının tekstür değerlerini değiştirebildiği belirlenmiştir (Meral & Kılınççeker, 2022). Araştırma sonucunda et ve ürünlerinde pişmiş ürünlerde olduğu kadar pişmemiş ürünlerde de tekstürel profilinin değişim gösterebileceği ve satış esnasında tercihi etkileyebileceği anlaşılmıştır. Çalışmada kullanılan ve fonksiyonel özelliğe sahip bileşenler bakımından zengin kinoa ununun ise bu değişimleri etkileyebileceği gözlenmiştir (Meral & Kılınççeker, 2022). Köftelerin depolanması sürecinde zamana bağlı olarak tekstür profil değerlerinde bir azalma belirlenirken, bu değişimleri azaltmada özellikle % 30 ve % 50 kinoa unu karışımlarının kullanımının daha avantajlı olabileceği ve tavsiye edilebileceği sonucuna varılmıştır (Meral & Kılınççeker, 2022).

### **Et Ürünleri**

Kinoa (*Chenopodium quinoa* wild.)'nın gıda sanayii için önemli olan bazı özellikleri ve et ürünlerinde sağlayabileceği faydalar üzerinde durulmuştur. Özellikle kimyasal yapısı ele alınarak, et sektöründeki uygulamalarından örnekler verilmiştir (Kılınççeker & Karahan, 2019). Kinoa tohumunun fonksiyonel özellikteki yüksek karbonhidrat ve protein içeriği, esansiyel yağ asitleri profili, antioksidan bileşikler ve yüksek demir içeriği nedeniyle et ürünleri üretiminde önemli faydalar sağlayabileceği düşünülmektedir. Ancak çalışmalara bakıldığında, et ürünlerinde kinoa ile ilgili araştırmaların yetersiz olduğu gözlenmiştir. Dolayısı ile bu derlemede kinoa'nın sahip olduğu yapısal özelliklerden dolayı et ürünlerinin kalitesini geliştirmede katkısının olabileceği ve daha fazla deneysel çalışmaya ihtiyaç olduğu ortaya konulmuştur (Kılınççeker & Karahan, 2019). Kinoa'nın et ürünlerini hazırlamada alternatif bir bitkisel katkı olabileceği anlaşılmaktadır. Özellikle sahip olduğu renk özelliği, içerdiği protein, nişasta, lif oranları ve diğer bileşenler ile bunların fonksiyonel özelliklerinden dolayı ürün kalitesine önemli katkılar sağlayabileceği düşünülmektedir. Ancak yapılan çalışmalara bakıldığında özellikle kırmızı ve beyaz et ürünlerinde kullanımı ile ilgili verilerin yetersiz olduğu ve daha fazla uygulamaya ihtiyaç duyulduğu anlaşılmıştır (Kılınççeker & Karahan, 2019).

## Ek Gıda

Kinoa (*Chenopodium quinoa* Willd.) unu ilave edilmiş ek gıda formülasyonlarının (CF) fizikokimyasal, reolojik, moleküler, termal ve duyuşsal özelliklerini değerlendirmektedir. Bu çalışmada, ek gıda (CF) formülasyonuna kinoa unu (QF) ilavesinin, ek gıdanın fizikokimyasal ve reolojik özelliklerini önemli ölçüde etkilediği, ürünlerdeki protein, lif miktarını artırırken, şeker miktarının algılanmasının azalmasına neden olduğu tespit edilmiştir. Kinoa ununun (QF), 15K örneği haricindeki ek gıdalarda partikül boyutunda azalmaya neden olduğu gözlenmiştir (Ayseli, 2020). Kinoa unu (QF) ilavesiyle camsı geçiş sıcaklığı düşmüştür. FT-IR analizlerine ait piklerde aromatik-amino asitler gözlenmiştir. GC, GC-MS ve GC-O analizleri sonucunda önemli bir kısmını aldehit, keton ve alkollerin oluşturduğu 50 adet aroma ve 23 adet aroma-aktif bileşik tespit edilmiştir. Duyusal test sonuçlarına göre en fazla beğeniyi 8K örneği almıştır. Sonuç olarak kinoa unu (QF) ilavesinin bebek ve küçük çocuk ek gıdalarının fizikokimyasal ve duyuşsal özelliklerini olumlu yönde geliştirdiği gözlemlenmiştir (Ayseli, 2020). Yalnızca kinoa değil ülkemizde hali hazırda yetişen organik ve konvansiyonel tahılların ek gıda üretimi amacıyla işlenmesinde kaynak olarak kullanılacağını, bu sayede de ithal ikamesi tahıl bazlı bebek ve küçük çocuk ek gıdası üretim faaliyetlerinin orta vadede artacağı öngörülmektedir (Ayseli, 2020).

## Türk Mantısı

Buğday unu ile kombine edilmiş en uygun kinoa ve amarant kullanım oranının saptanması, elde edilen hamurun ürünün niteliklerine etkisi araştırılmıştır. Bu amaçla, %0, %5, %10, %15 ve %20 oranında kinoa ve amarant unları kullanılarak 9 farklı mantı hamuru elde edilmiştir. Hamurların pişme (pişme süresi, hacim ve ağırlık artışları, suda çözünen madde miktarı), fiziksel (renk), kimyasal (yağ, protein, toplam fenolik madde, antioksidan aktivite) ve duyuşsal özellikleri incelenmiştir. Kinoa ve amarant ilaveli mantı numunelerinde protein ve yağ oranının arttığı gözlemlenmiştir. En yüksek protein değeri %20 kinoa mantıda %12,86, en yüksek yağ oranı ise %20 amarantlı mantı örneğinde %2,87 olarak tespit edilmiştir. Toplam fenolik madde miktarının ikame unların ilavesi ile arttığı görülmüş ve %20 kinoa içeren örnekte 31,34 mg GAE/100g, %20 amarant içeren mantı örneğinde ise 27,93 mg GAE/100g, olarak bulunmuştur. Antioksidan aktivite kinoa içeren mantı örneklerinde daha fazla gözlemlenmiş ve %20 kinoa içeren mantı örneğinde %44,67 olarak elde edilmiştir. Pişme testlerinde ise pişme süresi ikame unların miktarı ile artmış ve kinoa unu içeren mantı örneklerinde daha fazla olduğu görülmüştür. Son olarak gerçekleştirilen duyuşsal analizde tüm örnekler kabul sınırları içinde değerlendirilmiştir (Aygün, 2021).

Kinoa ve amarant unu ilavesi ile mantı örneklerinde pişme sonrası ağırlık artışı meydana gelmekle beraber en yüksek artış olan kontrol numunesine ulaşamamışlardır. Pişme sonrası ölçülen hacimsel artış sonuçlarına göre ise en yüksek hacim artışı %20 oranında kinoa ve amarant içeren mantı örneklerinde gözlemlenmiştir. Bu durum, kinoa ve amarant nişasta yapısının ile şişme kapasitesinin daha fazla olmasının bir sonucu olabileceğini göstermektedir. Mantı örneklerinin suya geçen madde miktarı istatiki olarak incelendiğinde mozaik yapı göstermesi pişme işleminde oluşan madde kaybının kontrol numunesi ile benzer olduğunu göstermektedir. Mantı örneklerinin pişme sürelerine bakıldığında, kinoa ve amarant miktarı arttıkça pişme sürelerinin de arttığı saptanmıştır (Aygün, 2021). Kinoa içeren mantı örneklerinin istatiki olarak daha fazla pişme süresine sahip olduğu, en düşük pişme süresinin kontrol örneğinde gözlenmiştir. Pişme analizleri göz önünde bulundurulduğunda kinoa ve amarant katkısı mantı örneklerinin pişme özelliklerine olumsuz yansımamıştır (Aygün, 2021).

Pseudo-tahıllardan olan kinoa ve amarant, yüksek fenolik madde, doymamış yağ asitlerince zengin olması mantı örneklerinin fonksiyonelliği arttırmıştır. Bu çalışma sonucunda endüstriyel ya da ev yapımı mantılarda kinoa ve amarant ilavesinin mantı örneklerinin besleyicilik ve kalite özelliklerini arttırması nedeniyle tüm kinoa ve amarant oranlarının mantı formülasyonlarında kullanılabileceği görülmüştür (Aygün, 2021).

## Tarhana

Tarhana üretiminde kinoa, karabuğday ve lüpen unları 5 farklı ikame oranında (% 0, 10, 20, 30 ve 40) kullanılmıştır. Tarhana üretimi (3 x 5) x 2 deneme desenine göre iki tekerrürlü olarak yürütülmüştür. Üretilen

tarhana örneklerinde fiziksel, kimyasal, besinsel ve duyusal özellikler belirlenmiştir. Duyusal açıdan incelendiğinde tarhanaya ilave edilen unlar arasında en fazla tat, koku, ekşilik ve genel beğeni skorları % 20 kinoa unu ilavesi ile sağlanmış, % 20 lüpen unu ilavesinin ise renk üzerine olumlu etkiler gösterdiği panelistler tarafından belirtilmiştir. Ülkemizde endüstriyel ve ev yapımı olarak üretilen tarhanaların besinsel, fonksiyonel ve duyusal açıdan zenginleştirilmesinde kinoa ve lüpen ununun rahatlıkla tarhana formülasyonuna ilave edilebileceği, karabuğday ununun ise besinsel ve fonksiyonel özellikleri artırmada oldukça etkili olduğu fakat duyusal açıdan karabuğdayın kendine özgü tadını tarhanada da hissettirdiği için panelistler tarafından fazla beğeni almadığı kanaati uyanmıştır (Çevik, 2016).

### Sonuç ve Öneriler

Birçok bireyde gıda alerjisi ve intoleransı görülmektedir. Çölyak, gluten ataksi ve gluten intolerans gibi rahatsızlar söz konusu olduğunda gluten tüketiminden kaçınılmalıdır. Gluten içermeyen darı, mısır ve pirinç gibi tahıllar, karabuğday, amarant ve kinoa gibi pseudo-tahıllar iyi bir mineral, vitamin ve lif kaynağı olmaktadır. Bu çalışmada, kinoanın besin değerlerinden, ülkemizdeki yerinden ve gıdalarda kullanımından bahsedilmiştir. Çalışma sonucunda kinoanın çölyak gibi glutenden kaynaklanan hastalıklardan dolayı, gluten içeren ürünleri tüketemeyen kişiler için alternatif bir tahıl olduğu görülmüştür. Ülkemizde gluten içeren unlardan üretilen ekmek, makarna, bisküvi, kek gibi birçok gıdanın kinoa unu ile alternatifinin geliştirilmeye başlandığı ve kinoanın daha da yaygınlaştığı fark edilmiştir. Ancak toplumumuzda kinoa, amarant ve karabuğday gibi alternatif pseudo-tahılların farkındalığı oluşturulması gerektiği, kinoa konusunda çalışmaların daha da artırılması gerektiği öngörülmüştür.

#### Abstract

*Canine herpesvirus-1* (CHV) is one of the primary causes of the disease known as kennel cough in dogs. The virus leads to respiratory and genital system infections in adult dogs and fatal hemorrhagic diseases in newborns. CHV-1 has been studied worldwide for many years using methods such as PCR and ELISA. In this study, blood samples were collected from a total of 192 dogs in the provinces of Izmir and Yozgat in Türkiye, and these samples were analyzed using PCR and ELISA. Our results revealed no presence of CHV-1 antigen in the Yozgat province. The detection of the disease from the blood is only feasible during the viremia stage. Therefore, our inability to identify the antigen from the collected samples indicates not the absence of the disease, but rather the absence of the dog being in the viremia stage. In Izmir province, the CHV-1 seroprevalence was found to be 2.7% (2/74), while no CHV-1 antibodies were detected in Yozgat province. Taking into account all studies conducted in Türkiye, CHV-1 seroprevalence was determined to be 39.01%. In conclusion, the future molecular detection and characterization of the disease are also of importance.

**Keywords:** Canine herpesvirus, Dog, ELISA, PCR, Prevalence, Türkiye

#### INTRODUCTION

*Canine herpesvirus-1* (CHV-1), a 125171 bp enveloped double-stranded DNA virus, is a member of the Varicellovirus genus, Alphaherpesvirinae subfamily, and Herpesviridae family. It causes kennel cough (Day et al., 2020; Gracin et al., 2023; Matsuu et al., 2020; Kaczorek et al., 2016) with significant mortality rates, particularly in puppies (Gracin et al., 2023; Krogenaes et al., 2014; Nöthling et al., 2008). CHV-1 causes respiratory and genital system infections in adult dogs and fatal hemorrhagic diseases in newborn puppies (Bottinelli et al., 2015; Day et al., 2020; Nöthling et al., 2008; Sahna and Aslan, 2014). In adult dogs, the infection usually follows a subclinical course or localizes in the upper respiratory tract and eyes. In puppies, the infection generally leads to the loss of the majority of the litter (Erles et al., 2004; Gracin et al., 2023). The severity of CHV-1's impact on dog health reveals the need for further research into the virus and its potentially serious consequences.

Numerous studies on CHV-1 have been conducted in many countries around the world (Bottinelli et al., 2015; Cobzariu et al., 2018; Dahlbom et al., 2009; Day et al., 2020; Erles and Brownlie, 2005; Erles et al., 2004; Gracin et al., 2023; Kaczorek et al., 2016; Krogenaes et al., 2014; Lavan and Knesl, 2015; Matsuu et al., 2020; Musayeva et al., 2013; Nöthling et al., 2002; Okonkowski et al., 2021; Pratelli et al., 2014; Rezaei et al., 2020; Rota et al., 2020). However, the studies conducted in Türkiye are quite limited (Acar et al., 2009; Gur and Acar, 2007; Sahna and Aslan, 2014; Yapici et al., 2018; Yesilbag et al., 2012). The majority of global studies focus on antigen detection using PCR (Bottinelli et al., 2015; Day et al., 2020; Erles and Brownlie, 2005; Erles et al., 2004; Gracin et al., 2023; Kaczorek et al., 2016; Lavan and Knesl, 2015; Matsuu et al., 2020; Okonkowski et al., 2021; Pratelli et al., 2014; Rezaei et al., 2020) and antibody detection through serum neutralization or ELISA (Bottinelli et al., 2015; Cobzariu et al., 2018; Dahlbom et al., 2009; Erles and Brownlie, 2005; Gracin et al., 2023; Krogenaes et al., 2014; Musayeva et al., 2013; Nöthling et al., 2002; Pratelli et al., 2014; Rota et al., 2020). Studies conducted in Türkiye have been carried out using ELISA and similar methods for antibody detection. In Türkiye, no study has been reported targeting antigen detection using ELISA, PCR, or any other method.

For antigen detection, PCR is the most widely accepted method worldwide (Bottinelli et al., 2015; Day et al., 2020; Erles and Brownlie, 2005; Erles et al., 2004; Gracin et al., 2023; Kaczorek et al., 2016; Lavan and Knesl, 2015; Matsuu et al., 2020; Okonkowski et al., 2021; Pratelli et al., 2014; Rezaei et al., 2020). Additionally, studies have shown that ELISA provides more sensitive results than other tests for the detection of CHV-1 antibodies (Nöthling et al., 2008; Ronsse, et al., 2002; Yesilbag et al., 2012).

In this study, PCR analysis was performed for the molecular detection of CHV-1 in dogs. CHV-1 IgG ELISA analysis was conducted to determine seroprevalence. In Izmir, previously collected serum samples were examined with ELISA. Samples collected from Yozgat were assessed with PCR and ELISA for the detection of CHV-1 antigen and antibody presence. Our hypothesis is the low level or no detection of CHV-1 antigen presence and the detection of antibody presence in dogs in Izmir and Yozgat.

## **MATERIALS AND METHODS**

### **Ethics Statement**

The research protocol of the current study was approved by the Erciyes University Ethics Committee for the Local Use of Animals in Experiments (No. 23/017 and 23/018).

### **Sample Collection and Preparation**

During the course of the study, a total of 192 dog samples were collected from the provinces of Izmir and Yozgat in Türkiye.

For Izmir, samples were collected from a total of 74 dogs in 2020, comprising 46 owned dogs and 28 shelter dogs, all over the age of 1.5 years, in 2 different shelters. All sampled dogs were unvaccinated against CHV-1. Approximately 3 mL of blood samples were collected in EDTA-containing tubes, placed on an ice pack within a styrofoam container, and swiftly transported to the mobile laboratory located within the animal shelter for plasma separation. Within 3 hours after the samples were collected, they were centrifuged at 3000 g for 20 minutes. Carefully avoiding the mixing of layers, 1 mL of the blood plasma was transferred into 1.5 ml tubes. The plasma samples were subsequently transported to the Yozgat Bozok University, Faculty of Veterinary Medicine laboratory in dry ice. Plasma samples were stored at -20°C until they were analyzed using ELISA.

For Yozgat, samples were collected from 118 mixed-breed shelter dogs, all over the age of 1.5 years, in 3 different shelters within Yozgat in 2023. All dogs were vaccinated against rabies only. Approximately 3 mL of blood samples were collected in EDTA-containing tubes, placed on an ice pack within a styrofoam container, and promptly transported to the Yozgat Bozok University, Faculty of Veterinary Medicine laboratory. Upon arrival at the laboratory, 400 µl of 100 samples were transferred to 1.5 ml tubes for genetic analysis and stored at -20°C until DNA isolation. To perform the ELISA analyses, the 118 blood samples were centrifuged at 3000 g for 20 minutes. Without mixing with other layers, 1 mL of the blood plasma was carefully transferred to 1.5 ml tubes. The plasma samples were preserved at -20°C until the ELISA analyses were conducted.

### **DNA Isolation**

For the Yozgat samples, due to the isolation kit's capacity for 100 samples, 18 samples were randomly excluded from the isolation process. A spin column-based blood DNA isolation kit (Macherey Nagel, Germany) was utilized for DNA isolation. The isolation procedure was performed following the kit's protocol. The DNA isolations of the Yozgat samples were conducted at the Yozgat Bozok University, Faculty of Veterinary Medicine laboratory. The obtained DNA samples were stored at -20°C in a freezer until they were used in the PCR analysis.

### **PCR Analysis**

The primers implemented in the PCR analysis possess the following sequences: Forward: CCTAAACCTACTTCGGATGA and Reverse: GGCTTTAAATGAACTTCTCTGG (Ronsse et al., 2005). These primers are specific to CHV-1 and amplify a 443 base-pair region. For each sample, the PCR mixture contained 2.5 µl of 10X DreamTaq Buffer, 1 µl of 10 mM dNTP mix, 1 µl of each primer, 0.25 µl of DreamTaq DNA polymerase (5 U/µl) (Thermo Scientific, USA), and 18.25 µl of nuclease-free water. Individually, 6 µl of the isolated DNA samples were added to each mixture. The tubes containing the PCR mixtures were placed in a Thermal Cycler (T100, Biorad, Germany). The applied thermal cycling conditions for the PCR

were as follows: an initial denaturation step at 96°C for 4 minutes, followed by 35 cycles of 1 minute at 51°C, 1 minute at 72°C, and 1 minute at 94°C, with a final step of 1 minute at 50°C and 10 minutes at 72°C.

To visualize the PCR products, a 100 ml 1% agarose gel was prepared. Agarose, TBE (Tris-Boric Acid-EDTA), and ethidium bromide were used in the gel preparation. In each well of the prepared gel, 5 µl of Gel Loading Dye and 5 µl of the PCR sample were added for each sample. A 100 bp DNA Ladder was used as a control, and the electrophoresis was carried out at 100 V and 50 mA. Following electrophoresis, the gel was visualized using a gel imaging system.

### ELISA Analysis

CHV-1 ELISA Antibody Kit (Shanghai Coon Koon Biotech, China) was used for the 74 Izmir and 118 Yozgat samples. The kit is based on the detection of CHV-1 IgG. All ELISA procedures were conducted following the kit's protocol. The plates were then read using spectrophotometry with a 450 nm filter on an automatic ELISA reader (SPECTROstarnano, BMG Labtech, Germany) according to the manufacturer's protocol. The ELISA procedures were conducted at the Yozgat Bozok University, Faculty of Veterinary Medicine laboratory.

### RESULTS and DISCUSSION

As a result of the PCR analyses, CHV-1 presence was not detected in 100 samples from Yozgat. Similarly, no antibody presence was detected in 118 samples collected from Yozgat. In Izmir, out of a total of 74 dogs, including 46 owned dogs and 28 shelter dogs, CHV-1 antibody presence was detected in two dogs (2.7%), one owned dog, and one shelter dog (Table 1). Until now, the presence of CHV-1 antigen has not been reported in Türkiye. Considering all the studies conducted in Türkiye to date, the seroprevalence of CHV-1 is seen as 39.01% (Figure 1; Table 1). Global studies on CHV-1 generally focus on PCR for antigen detection, ELISA, and serum neutralization studies for antibody detection. The results of these studies vary greatly from one another.

**Table 1.** Temporal Variation of CHV-1 Antibody Prevalence and PCR Results in Türkiye

Sampling Year	Sample Number	Positive	Negative	Location	References
<b>Antibody Prevalence</b>					
2007 2010	560	39.3%	60.7%	Balıkesir Bursa	Yesilbag et al., 2012
2007	94	48.8%	51.2%	Afyonkarahisar	Gur and Abay, 2007
2009	110	71.8%	28.2%	Afyonkarahisar	Acar et al., 2009
2010 2011	141	68.8%	31.2%	Antalya Konya	Yapici et al., 2018

<b>PCR Results</b>					
2023	100	0%	100%	Yozgat	This study
Total	118	0%	100%	All	

In England, in one of two different studies, 80 dogs with canine infectious respiratory disease (CIRD) were examined by PCR, but no positive samples were found (Erles and Brownlie, 2005). In another study, 12.8% of 211 tracheal samples taken from dogs were found to be PCR-positive (Erles et al., 2004). In Europe, between 2011-2015, PCR analysis was performed on different types of samples taken from 1,354 dogs with and without canine infectious respiratory disease complex in Germany, Italy, and Finland, but CHV-1 presence was not detected (Bottinelli et al., 2015; Day et al., 2020; Pratelli et al., 2014). In a study conducted in Poland between 2014-2015, 40 dogs with canine infectious respiratory disease complex were examined, and a positivity rate of 80% was detected. However, this rate was found to be 40-50% one week later (Kaczorek et al., 2016). In Croatia, no CHV-1 antigen presence was found in the samples collected from 203 dogs (Gracin et al., 2023). In Japan, between 2017-2018, CHV-1 was detected by PCR in 1.2% to 8.2% of samples taken from owned and shelter dogs, respectively (Matsuu et al., 2020). In a study in the USA, 503 dogs were examined by PCR, and CHV-1 presence was found in only 0.8% of the dogs (Lavan and Knesl, 2015). In another study in the same country, 133 owned dogs and 295 shelter dogs were examined for CHV-1 presence by PCR; CHV-1 presence was detected in 1.5% of owned dogs and 2.7% of shelter dogs. The same study found no difference in the risk of contracting CHV-1 between owned dogs and shelter dogs (Okonkowski et al., 2021). In a study conducted with 140 dogs in Iran, CHV-1 presence was detected in 15% of dogs by PCR (Rezaei et al., 2020). In Türkiye, there is no other study aimed at detecting CHV-1 presence by PCR (Figure 1). As can be understood from past studies, the detection of CHV-1 antigen by PCR is quite challenging in situations where almost the entire shelter is not infected. Moreover, the detection of the disease from the blood is only feasible during the viremia stage. Therefore, our inability to identify the antigen from the collected samples indicates not the absence of the disease, but rather the absence of the dog being in the viremia stage.

Figure 1. CHV-1 Distribution in Türkiye

In a study conducted in South Africa, the CHV-1 seropositivity rate was found to be 22% in samples taken from 328 dogs across 38 different shelters, with 18 shelters showing no presence of CHV-1 (Nöthling et al., 2002). In a study carried out in England, dog populations in two shelters were examined over a year, and CHV-1 seroprevalence was reported to be 7.9% (Erles and Brownlie, 2005). In a 2014 study in Italy, the CHV-1 seropositivity rate was found to be 14.6% in 865 dogs (Pratelli et al., 2014). In the same country, in a 2015 study conducted in a shelter, 243 dogs were examined for CHV-1, but no antibody presence was detected (Bottinelli et al., 2015). In another study in Italy in 2020, 370 dogs were examined, and 50.3% of the dogs were found to have CHV-1 antibodies. However, the seropositivity rate was zero in 10 of the 33 shelters (Rota et al., 2020). The CHV-1 seropositivity rate was found to be 81.5% in Finland in 2009 (Dahlbom et al., 2009), 26.8% in Lithuania in 2010 (Musayeva et al., 2013), 85.5% in Norway in 2014 (Krogenaes et al., 2014), 86.36% in Romania in 2018 (Cobzariu et al., 2018), and 32.02% in Croatia in 2023 (Gracin et al., 2023). The very low detection rate of CHV-1 in Izmir province presents a similar situation to the study conducted by Erles and Brownlie (2005). In addition, as in previous studies (Matsuu et al., 2020; Okonkowski et al., 2021), the same number of positive samples were detected in owned and shelter dogs. The study conducted in Yozgat province reveals similar results to the study carried out by Bottinelli et al. (2015). Although the sampled shelters represent the entire province of Yozgat, the number of shelters is limited to 3, and in previous studies, even when samples were taken from many shelters, CHV-1 was detected in only half of them. Furthermore, seroprevalence values are found at very different levels in different countries (Cobzariu et al., 2018; Dahlbom et al., 2009; Gracin et al., 2023; Krogenaes et al., 2014; Musayeva et al., 2013; Nöthling et al., 2002), they can change over the years within the same country, as in the case of Italy (Bottinelli et al., 2015; Pratelli et al., 2014; Rota et al., 2020). Therefore, not detecting CHV-1 in Yozgat province does not necessarily imply that the disease has never been present in this region.

Upon reviewing the research conducted in Türkiye, among the 560 serum samples collected from dogs in Balıkesir and Bursa provinces between the years 2007 and 2010, 39% of these samples were found to be seropositive for CHV-1 (Yesilbag et al., 2012). In different studies conducted in Afyonkarahisar province, CHV-1 seroprevalence was determined to be 48.8% in stray dogs in 2007 (Gur and Acar, 2007), and 71.8% in Kangal breed dogs in 2009 (Acar et al., 2009). Before 2011, 141 samples collected from Antalya and Konya provinces were examined, and 68.79% of the dogs were found to have CHV-1 antibodies (Yapici et al., 2018). In a study conducted in Kayseri and Sivas provinces in 2014, research was carried out to detect CHV-1 antibodies in 95 dogs, 40 of which were German Shepherds and 55 were Sivas Kangals. In total, 25.2% of the dogs were found to be positive for CHV-1 antibodies. However, it was observed that only 2.5% of the German Shepherd dogs were seropositive, while 41.8% of the Sivas Kangal dogs were seropositive. This situation has been discussed as possibly being due to breed susceptibility to infection (Sahna and Aslan, 2014). Since human mobility is relatively lower in Yozgat province compared to many other cities, it is thought that animal mobility may also be limited. It can also be considered that the dogs in Yozgat, which mate with each other continuously, may create a situation similar to breed-specific conditions (Sahna and Aslan, 2014; Yesilbag et al., 2012).

## CONCLUSION

In our findings, a seropositivity rate of 2.7% was observed in the province of Izmir. Neither antigen nor antibody presence was found in Yozgat. The presence and molecular characterization of CHV-1 antigen in Türkiye have not yet been reported. Considering all studies related to CHV-1 conducted in Türkiye over the last 15 years, the seropositivity rate is 39.01%. For a detailed understanding of CHV-1 in Turkey, future molecular detection and characterization of the disease are crucial.

## ORAL PRESENTATION

### Study of environmental state in Vlora Bay, Albanian coast

Vanela Prifti<sup>1\*</sup>, Sonila Kane<sup>2</sup>, Pranvera Lazo<sup>2</sup>

<sup>1</sup> National Environmental Agency, Sector of Sampling and Laboratory Analyses, Tirana, Albania.

<sup>2</sup> University of Tirana, Faculty of Natural Sciences, Department of Chemistry, Tirana, Albania.

#### Abstract

Vlora Bay is the most popular and frequented tourist destination in the south of Albania. The assessment of ecological status involves the assessment of the quality of the structure and functioning of surface water ecosystems. To reach good ecological and chemical status of surface waters according to WFD, the reduction of water pollution is crucial and a main topic in water management. Those pollutants are caused by diffuse sources of pollution and point sources of pollution. Point source pollution is mainly caused by urban inhabitants with discharges from waste water treatment plants, the activity along the coastal area.<sup>(3)</sup> In our study we have monitored three sampling sites positioned at a distance of 10 m from the coastal line, one site positioned at the delta of the Vjosa River estuary discharging site, and a control site positioned 100 m away from the coastal line have been selected to assess the water quality of the Vlora Bay estuary. Seawater quality is assessed based on physicochemical parameters such as: water temperature, pH, total suspended solids, dissolved oxygen, COD, BOD<sub>5</sub> and total phosphorous (according to Albanian Standard DCM 177, dated March 31, 2005). The main significant pressures on surface water bodies are untreated discharge in the receiving area, nutrient enrichment, chemical pollution and altered habitats due to morphological changes.

#### INTRODUCTION

Water is vital for the three pillars of Europe's sustainable growth: its society, its economy, and its environment. All three pillars depend on the adequate availability and supply of water of sufficient quality at the right time and in the right location. Eutrophication of marine ecosystems, including coastal and estuarine areas, is affected by nutrient over-enrichment from nitrogen and phosphorus coming from land-based sources, marine activities, and atmospheric deposition, as well as fluxes from neighbouring water bodies. The resulting excessive availability of nitrogen and phosphorus accelerates the growth of microalgae and higher forms of plant life, with indirect effects on aquatic organisms and water quality.

Vlora is very rich in historical and archaeological landmarks and from natural beauty point of view, one of the most attractive tourist centres in the Eastern part of the Mediterranean Sea. In the last 10 years the city economy has been marked by a construction boom that was directed to build new residences for an increasing population and to accommodate tourists, and it was the main destinations over the recent years. Due to the high urbanization and development in Vlora there are many problems associated with unmanaged urbanization, such as pollution, weak sewerage infrastructure and waste disposal, poor water supply, presence of illegal settlements and traffic congestion.

This study aims at assessing the quality of the coastal water in Vlora Bay, and the Water Framework Directive (WFD) 2000/60/EC of the European Parliament and the Council of October 23, 2000 and for assessing the quality of the Vjosa Estuary sampling point is classified according to the Water Framework Directive 2000/60/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 23 October 2000) there are five classes of classification where Class III – Moderate state is the minimum level of water quality acceptance.

#### MATERIALS AND METHODS

Three sampling points in the coastal area of the Bay of Vlora, which monitor the impact of urban discharges, were selected as monitoring sites based on the scheme where the discharge collector represents the pollution source. Monitoring sites located after discharge in the receiving area, at a distance of 10 m, to assess its impact on the quality of the coastal area. The urban discharge in Vlora city are realised through the pumping station. The sampling stations of this study are shown in the table below (Table 1).

**Table 1.** Sampling stations in Vlora Bay

No.	Laboratory code of the sample	Area	Sampling point	Coordinates
1.	V1	Vlorë	After the pumping station	N 40.470928 E 19.458578
2.	V3	Vlorë	Plazhi i Vjeter - Kabinat	N40.453422 E 19.478732
3.	V4	Vlorë	Marine School	N 40.442729 E 19.494879
4.	V2	estuary	Vjosa Estuary	N 40.383400 E 19.192000
5.	Vcontrol	Vlore	Controlling site, marine sample	N 40.399285 E 19.419600

The observed data were compared with the Albanian Standard DCM 177, dated March 31, 2005, "The Permitted Values of Liquid Discharges and Zoning Criteria of the Water Receiving Environment." It revealed that the measured parameters did not go above the allowed limits. The water quality classification for the Vjosa estuary is done according to Water Framework Directive (WFD) 2000/60/EC of the European Parliament and the Council of October 23, 2000. The monitoring data, compared to the requirements of WFD for the nutrients, classifies the Vjosa estuary sample as in a good status (Class I). Also, the controlling site that is the sampling station Vcontrol is classified in good quality, where all the physico – chemical parameters are in low concentrations (limit of detection of the methods) as there is no negative impact and we can use this sampling site as a reference station.

### Water temperature

Temperature is an important parameter for assessing water quality as it affects other water parameters and can alter the physical and chemical properties of water. This parameter is measured on site with the multimeter. The water temperatures measured varied from 13°C to 38.8°C, as low temperatures are measured on winter expedition and high temperature on summer measurement.

### Dissolved Oxygen

Dissolved oxygen, DO, is a key parameter to determine the quality of the water and refers to the level of free, non-compound oxygen present in water. It has a strong effect to the on the organisms living within a body of water, by making it an important parameter in assessing the quality of the water bodies.

Dissolved oxygen is necessary to various forms of life including fish, invertebrates, bacteria and plants, which use oxygen in their respiration process. Fish and crustaceans obtain oxygen for respiration through their gills, while plant life and phytoplankton require dissolved oxygen for respiration when there is no light for photosynthesis. Bottom feeders, need minimal amounts of oxygen (1-6 mg/l), while shallow water fish need higher levels (4-15 mg/l). The DO is measured on site and the values are presented in the graph below assessing that in all the stations the water is saturated in oxygen and all above the WFD limit values (red line) for the "moderate" class of water.

### pH

Measurement of pH is one of the most important tests in water chemistry, usually determined on site. This parameter is proportional with the logarithmic value of H<sup>+</sup> concentration in water. pH ranged between 0 and 14 and defines how acidic or basic a body of water is along a logarithmic scale. In the coastal sampling stations the values measured are 7.24 – 8.1, and at Vjosa River estuary pH is measured 7.85.

## Biochemical Oxygen Demand - BOD<sub>5</sub>

Biochemical oxygen demand is a key parameter to determine the scale of the quality of water and is determined by a respirometric method with oxi-top system inhibited for 5 days in the incubator. The results for the three monitoring stations in the coastal samples is assessed higher of the allowed values only in station V1 – the pumping station as shown in the graph below (Fig.1).

At Vjosa estuary the BOD<sub>5</sub> is estimated below the detection limit (< 1 mgO/l) classifying in High State (Class I).

High BOD<sub>5</sub> values are as a result of the urban discharges without any treatment that are domestic and industrial sewage, where the process of decomposition of organic matter requires oxygen, the amount of organic matter in river can be measured in terms of oxygen demand (biochemical oxygen demand BOD and chemical oxygen demand COD) concluding in high rates of BOD and COD.

## Suspended solids

Suspended solids refers to small particles which remains in suspension in water as a colloid or due to motion of the water, where the suspended particles that are not dissolved in a sample water and is determined by gravimetric method. As can be seen from the graph (Fig.5) the suspended solids determination is within the limits.

## Ammonia

Ammonium determination is performed with the spectrophotometric method. Ammonium concentrations are normally raised as a result of organic pollution, caused by discharges from wastewater, industrial effluents and agricultural runoff. It exerts a demand on oxygen in water as it is transformed to oxidised forms of nitrogen. In addition it is toxic to aquatic life at certain concentrations in relation to water temperature, salinity and pH.

## Nitrite/Nitrate

Nitrite concentration originates from fertilizers through run-off water, sewage and mineral deposits.

Nitrate in water in the most common cases originates primarily from fertilizers, septic systems, and manure storage or manure spreading operations.

## Phosphorous

Phosphorus is an essential element for plant life, but when there is too much of it in water, it can speed up eutrophication of the aquatic environment. Phosphorus originates from a variety of sources, many of which are related to human activities where major sources include human and animal wastes, detergents, and agricultural runoff. Phosphorus is measured in two ways, as ortho-phosphate (soluble reactive phosphorus) and total phosphorus.

According to the measured values we have higher concentration of total phosphorous in V1 – pumping station in Vlora, in two other stations it is within the limits. The monitoring value for Vjosa estuary is at very low concentration assessed as limit of detection.

## RESULTS AND DISCUSSION

At Table 2 and 3 are presented the monitoring data of the five sampling stations at Vlora Bay, and in Figures 1,2 and 3 are shown the monitoring data in a graphical form.

**Table 2.** The monitoring data of the parameters monitored in situ.

Parameters determined	Water temperature	pH	Salinity	Conductivity	Dissolved Oxygen
	°C		mg/l	mS/cm	mg/l
V1	20.4	7.2	0.9	1913	4.6
V3	21.4	8.1	35.2	53.7	10.5
V4	20.6	8.1	35.4	54.4	8.7
V2(Vjosa)	18.4	7.9	37.1	57	13
Vcontrol	19.6	8.2	36.3	67.8	11.2

**Table 3.** The monitoring data of the parameters monitored in the laboratory.

Parameters determined	Alkalinity	Conductivity	TSS	COD	BOD <sub>5</sub>	NH <sub>4</sub> <sup>+</sup>	NO <sub>2</sub>	NO <sub>3</sub>	P-PO <sub>4</sub>	P <sub>total</sub>
	mg/l	mS/cm	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l
V1	328	1913	33	24	14	6.55	0.0088	0.871	0.526	0.6

Table 4 gives us the information about the dispersion to have a better understanding of our environmental monitoring data at Vlora Bay. Based on coefficient of variation data, it is shown that water temperature, pH, salinity, alkalinity, DO, nitrite, and nitrate are relatively stable along river basin (CV% ranged between 25 to

75%). Other parameters, conductivity, TSS, COD, BOD<sub>5</sub>, and NH<sub>4</sub><sup>+</sup> revealed high variability by indicating high anthropogenic inputs in Ishmi River (Figure 4)

**Figure 1.** Temp, pH, salinity, DO, COD and BOD

**Figure 2.** Alkalinity, conductivity and TSS parameters

**Figure 3.** DO, COD, BOD, and the nutrients.

As it is expected, the highest values of BOD<sub>5</sub> and COD measured in station V1 – After the pumping station indicates for organic pollution resulting in poor quality of the monitored station. Also, high concentration of total suspended solids and total phosphorous are measured. The monitoring results indicate the presence of urban discharges above the allowed limits.

**Variables**

- Cluster 1 temp pH Sal DO NO2
- Cluster 2 Alcal. Cond. TSS COD BOD5 NH4+ N O3 P-PO4 Ptotal

**Figure 6:** The dendrogram Cluster1 and Cluster 2

Figure 6 presents the Cluster 1 and 2 analysis which is done based on Pearson correlation coefficients (Figure 5), as the variables shows that the parameters under monitoring are clustered into 2 groups (Complete Linkage; Correlation Coefficients Distance).

Cluster 1 has grouped together in a similarity level between the parameters: water temperature, pH, salinity, dissolved oxygen and nitrite. Cluster 2 has grouped together in a similarity level between the parameters like: alkalinity, conductivity, total suspended solids, COD, BOD, ammonia, nitrate, ortho – phosphorous and total phosphorous.

For the classification of the sampling station V2 - Vjosa estuary we have compared the monitoring data with the maximum permitted values of the EU WFD 2000/60/EC referring to the classification of the surface water, which classify the water in 5 classes.

- Class I – high state;
- Class II – good state;
- Class III – moderate state;
- Class IV – poor quality; and
- Class V – bad quality/immediate measures.

The quality status of Vjosa estuary sample according to EU WFD resulted as follows:

**Table 5:** Classification of Vjosa estuary sample according to EU WFD

No.	Parameter	Values measured	Norm of WFD	Classification
1.	pH	7.85	9	Alkaline
2.	Dissolved oxygen*	13	>5	High oxygen saturation
3.	BOD <sub>5</sub> *	< 1	< 7	Class I – high state
4.	Ammonia*	0.009	< 0.6	Class I – high state
5.	Nitrite*	0.002	< 0.12	Class I – high state
6.	Nitrate	0.423	< 4	Class I – high state
7.	Ortho-phosphorous*	0.003	< 0.2	Class I – high state
8.	Total phosphorous*	0.0062	< 0.4	Class I – high state

\* mg/l

The measurements indicate that Vjosa estuary monitoring station is in high state – excellent water quality (Table 5).

All the data monitored in three sampling stations in Vlora Bay gives us the information that in the first station V1 – which is the pumping station of the city for the parameters monitored classifies this station not in a good quality as there is low dissolved oxygen, high in BOD, suspended solids and total phosphorous as a result of the urban discharges without any treatment that are domestic and industrial sewage. The chemical oxygen demand is high but within the limited values. The controlling site indicates good quality as there is no pressure and no activity in the sampling point.

## CONCLUSION

Assessing all the monitoring data we face that there is a high contamination from anthropogenic factors (domestic and activities operating in the area) like urban wastewater dischargement that goes directly into the receiving environment without the right treatment contributing in poor quality of the water, as the requirements for reaching a good environmental status is not respected.

We must admit that the environment pollution is health risk for the population and in coastal area is dangerous for the bathers.

Main sources of pollution are:

Direct dischargement of wastewater and high scale of urbanization

Rapid development of tourism

Hotels and other activities that operates along the coast which do not respect the environmental permit requirements

## ACKNOWLEDGEMENTS

All the analytical procedure, sampling and analyses are carried out at the National Environmental Agency in Albania depending from the Ministry of Tourism and Environment.

## ORAL PRESENTATION

### Çet koyunlarında DGAT1/AluI gen polimorfizminin belirlenmesi

Mervan Bayraktar

Çukurova Üniversitesi, Ziraat Fakültesi, Zootekni Bölümü

Mervan.bayraktar@gmail.com

#### Özet

Trigliserid sentezinin ana düzenleyicisi olan Diacylglycerol acyltransferase 1 (DGAT1), anahtar bir enzim olarak kabul edilmektedir. Koyunlarda, DGAT1 geni süt, karkas ve büyüme özelliklerini etkileyen güçlü bir fonksiyonel aday genidir. Bu çalışmada, genetik materyal olarak 45 Çet koyunu kullanılmıştır. PCR-RFLP yöntemi kullanarak genotipleme, işlemi gerçekleştirilmiştir. 309 bp'lik PCR ürünü, AluI kesim enzimi ile muamele edilerek genotipik farklılıklar ortaya konulmuştur. Elde edilen üç farklı genotip TT, TC ve CC olmuştur. Belirlenen genotip ve allel frekansları sırasıyla 0.60 (TT), 0.33 (TC), 0.07 (CC); 0.77 (T) ve 0.23 (C) tespit edilmiştir. DGAT1 gen lokusu Hardy weinberg dengesinde olduğu belirlenmiştir ( $P>0.05$ ). Çet koyunlarında tespit edilen DGAT1/AluI gen polimorfizmi, bu hayvanların genetik çeşitliliğinin ve ekonomik özellikler üzerindeki potansiyel etkisinin bir göstergesidir. Baskın olan T allelinin olumlu özelliklerle ilişkilendirilmesi, ıslah stratejileri oluşturulması için önemli kriter olabilmektedir. Bu bulgular, Çet koyunlarında genetik ıslah çalışmalarının yönünü belirlemek için önemli bir yere sahiptir.

**Anahtar kelimeler:** Çek koyunu, DGAT1, Polimorfizm, PCR-RFLP, Allel frekansı

#### Giriş

Koyunculuk, ülkemiz hayvancılığı içerisinde önemli bir yere sahiptir. Koyun eti ve sütü beslenmemizde değerli birer protein kaynağıdır. Aynı zamanda yapağı ve diğer hayvansal ürünler açısından da koyun önemli bir hayvan türüdür. Ülkemizin sahip olduğu meralar, koyun yetiştiriciliği için uygun ekolojik koşullar sunmaktadır. Ancak son yıllarda meraların azalması, küresel ısınma ve çevresel sorunlar koyun yetiştiriciliğini olumsuz etkilemektedir. Bu nedenle mevcut koyun varlığımızın ıslahı ve verim özelliklerinin artırılması büyük önem taşımaktadır (Balcioglu ve ark. 2014; Bayraktar ve Shoshin 2022). Çukurova Et Koyunu (Çet), melez bir koyun ırkıdır. İvesi, Sakız, ile-de France ve Rambouillet koyunlarının melezlenmesi sonucunda ortaya çıkan bu özel ırk, bölgenin iklimine ve coğrafyasına uyum sağlamış, özgün genetik özelliklere sahip bir koyun ırkıdır (Bayraktar ve ark. 2023).

Koyunların genetik karakterizasyonu, ıslah çalışmaları için başlangıç noktasıdır. Yerli koyun ırklarımızın saf olarak korunması, melezleşmenin önlenmesi gerekmektedir. Aynı zamanda bu ırkların üretim özelliklerini belirleyen genlerin tanımlanması, genetik potansiyellerinin değerlendirilmesi açısından kritik öneme sahiptir. Son yıllarda gelişen biyoteknoloji araçları, aday genlerin belirlenmesinde büyük kolaylık sağlamaktadır. Özellikle PCR tabanlı yöntemler, koyunlardaki genetik varyasyonların hızlı ve doğru bir şekilde tespit edilmesine olanak tanımaktadır (Aytekin ve Boztebe 2013). Diacylglycerol acyltransferase 1 (DGAT1), süt yağı sentezinde görev alan önemli bir enzimdir. Koyunlarda DGAT1 genindeki varyantlar, süt verimi, et verimi ve büyüme hızı gibi ekonomik özelliklerle ilişkilendirilmiştir. Bu nedenle DGAT1 geni koyun ıslahı için önemli bir aday gen olarak kabul edilmektedir. Bu çalışmanın amacı, Çet koyunlarında DGAT1 genindeki varyasyonları PCR-RFLP yöntemiyle incelemek ve elde edilen bulgular ışığında bu ırkın genetik profilini ortaya koymaktır. Çalışma sonuçlarının, Çet koyunlarının korunması ve ıslahına yönelik çalışmalara katkı sağlayacağı düşünülmektedir.

#### Materyal ve Yöntem

Bu çalışmada materyal olarak, Çukurova Üniversitesi Ziraat Fakültesi Araştırma ve Uygulama Çiftliği'nde yetiştirilen 45 adet Çet koyunu kullanılmıştır. Hayvanlardan alınan kan örneklerinden HibriGen DNA izolasyon kiti kullanılarak genomik DNA izolasyonu yapılmıştır. DGAT1 gen bölgesinin çoğaltılması için forward primer 5'- GCATGTTCCGCCCTCTGG-3' ve reverse primer 5'- GTCCTAAATAGGTCCTCTCG-3' (Xu ve ark. 2009) kullanılarak polimeraz zincir reaksiyonu (PCR) gerçekleştirilmiştir. PCR ürünlerinin AluI (AG↓CT) restriksiyon enzimi ile muamele edilmesiyle PCR-RFLP analizi yapılmıştır. PCR-RFLP analiz sonucu üç farklı

genotip TT, TC ve CC elde edilmiştir. Genotip ve allel frekansları POPGENE (v1.32) istatistik programı kullanılarak hesaplanmıştır. Elde edilen verilerin istatistiksel analizleri için chi-square testi uygulanmıştır.

### Sonuç ve Tartışma

Bu çalışmada, Çet koyunlarında DGAT1 geni AluI bölgesindeki polimorfizmin belirlenmesi amacıyla PCR-RFLP yöntemi kullanılmıştır. Çalışma sonucunda, TT, TC ve CC olmak üzere üç farklı genotip tespit edilmiştir. TT genotipinin frekansı 0.60, TC genotipinin frekansı 0.33 ve CC genotipinin frekansı 0.07 olarak bulunmuştur. Allel frekanslarına bakıldığında, T allelinin 0.77 ile populasyonda baskın olduğu, C allelinin ise 0.23 frekansla daha az rastlandığı görülmüştür. DGAT1 gen lokusu Hardy weinberg dengesinde olduğu belirlenmiştir ( $P>0.05$ ).

Bu sonuçlar, literatürdeki diğer çalışmalarla karşılaştırıldığında bazı benzerlikler ve farklılıklar göstermektedir. Örneğin; Nanekarani ve ark. (2016) Lori koyunları üzerinde yaptığı çalışmada, C allelinin frekansı %56, T allelinin frekansı ise %43 olarak bulunmuştur. Bu, Çet koyunlarına kıyasla T allelinin Lori koyunlarında daha az baskın olduğunu göstermektedir. Xu ve ark. (2009) Tan koyunları üzerindeki çalışmasında C alleli %41, T alleli ise %59 frekansa sahiptir, bu da T allelinin baskınlığını doğrulamaktadır. Yang ve ark. (2011) Qiaoke koyunları üzerinde gerçekleştirdiği çalışma, C allelinin %62, T allelinin %38 frekansta olduğunu göstermiştir. Aydın (2021) Morkaraman koyunlarında T allelinin frekansını %69, C allelinin frekansını %31 olarak; Tuj koyunlarında ise T allelinin frekansını %72, C allelinin frekansını %28 olarak tespit etmiştir. Aynı zamanda, Bayraktar ve Shoshin'in (2022) İvesi koyunları üzerinde yaptığı çalışmada, C allelinin frekansı %58, T allelinin frekansı ise %42 olarak tespit edilmiştir.

Bu çalışmaların ışığında, farklı koyun ırklarında DGAT1 geninin allel frekanslarının değişkenlik gösterdiği gözlenmektedir. Ancak genel bir eğilim olarak, T allelinin birçok ırkta C alleleline göre daha baskın olduğunu söyleyebiliriz. Çet koyunlarında bu baskınlık daha da belirgindir. Bu, Çet koyunlarının genetik yapısının, süt ve et verimi gibi ekonomik özellikler üzerinde diğer koyun ırklarından farklı bir etkisi olabileceğine işaret edebilir. Ayrıca, farklı çalışmalarda elde edilen sonuçların coğrafi, çevresel ve genetik faktörlere bağlı olarak değişkenlik gösterebileceğini de göz önünde bulundurmak gerekir. Bu nedenle, bir ırkın genetik yapısının ve potansiyel ekonomik avantajlarının tam olarak anlaşılabilmesi için daha geniş ölçekli ve kapsamlı çalışmalara ihtiyaç duyulmaktadır.

### Öneriler

Bu çalışmada, Çet koyunlarında ekonomik önemi olan bir aday gen olan DGAT1 üzerinde PCR-RFLP analizi gerçekleştirilmiştir. Çalışılan 45 Çet koyununda TT, TC ve CC olmak üzere üç farklı genotip saptanmıştır. TT genotipi %60, TC genotipi %33 ve CC genotipi %7 oranında görülmüştür. T ve C allel frekansları sırasıyla 0.77 ve 0.23 olarak hesaplanmış olup, T allelinin populasyonda baskın olduğu görülmüştür. Elde edilen bulgular, Çet koyunlarının DGAT1 lokusunda polimorfik olduğunu ve farklı genotip dağılımı sergilediğini ortaya koymaktadır. Bu sonuçların, Çet koyunlarının genetik karakterizasyonu, ıslah çalışmaları ve üretim potansiyelinin artırılması bakımından yararlı olacağı düşünülmektedir. Ancak daha kesin sonuçlara ulaşmak için daha geniş örneklerle yapılacak çalışmalara ihtiyaç vardır. Bu çalışma, Çet koyunlarının moleküler düzeyde incelenmesine yönelik atılan önemli bir adım olarak değerlendirilebilir.

## Özet

Bakır ve alaşımları, insanlık tarihinin gelişmesinde ve ilerlemesinde; önemli ve belirleyici role sahiptir. Kolay ve düşük maliyetle üretilmesi, yüksek termal ve elektriksel iletkenliğe sahip olması, bakır metaline, başta kimya ve mikro elektronik uygulamaları olmak üzere çok sayıda farklı alanda kullanım alanı oluşturmuştur. Bakır malzemenin kullanımını kısıtlayan en önemli faktör ise korozyon eğiliminin fazla olmasıdır. Korozyonu tamamen engellemek mümkün olmamakla birlikte; farklı uygulamalar ile hızını azaltmak mümkündür. Organik inhibitörler kullanılarak korozyon hızını yavaşlatmak mümkündür. Organik inhibitörlerin yüksek maliyetleri doğa ve çevreye verdiği zarar, onların kullanımını sınırlandırmaktadır. İnhibitörler kullanıldıkları ortamlarda önemli sorunlar oluşturmazlarken, kullanıldıkları sistemlerde ortaya çıkacak kaçaklar, boşaltma ya da temizlik gibi işlemler inhibitörlerin doğaya karışmasına neden olmaktadır. Bunun için inhibitör seçimi yaparken çok titiz davranmak gerekir. Bu durum, tamamen doğal ürünler olan ve çevreye herhangi bir zararları bulunmayan, bitki ve bitki atıklarını (kök, gövde, yaprak, çekirdek, kabuk ve çiçek) korozyon inhibitörü uygulamalarında ön plana çıkartmaktadır. Yapılan çalışmalar, bitki ekstraktının, inhibisyon etkinliği yüksek doğal olarak sentezlenmiş, amino asitler, organik asitler, alkaloidler, polifenoller ve tanenler açısından oldukça zengin kaynaklar olduğu belirlenmiştir. Bu anlamda ekonomik, çevresel fayda sağlayan, çevresel olarak güvenli tabir edilen bitki ekstraktının inhibitör olarak kullanılması yaygınlaşmaktadır. Bu çalışmada farklı derişimlerde hazırlanan avokado (metanol içerisinde) ekstarktının, bakırın korozyon hızına etkisi 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde, E<sub>ocp</sub>-zaman, polarizasyon eğrileri ve elektrokimyasal impedans spektroskopisi ile değerlendirilmiştir. İnhibitörün karakterizasyonu SEM ve temas açısı ölçümleri ile belirlenmiştir. Sonuçlar, avokado ekstraktının, bakırın korozyonunu yavaşlattığı ve oluşan filmin yüzeye sıkıca tutunduğunu göstermektedir.

**Anahtar Kelimeler:** Korozyon, yeşil inhibitör, avokado

### Investigation of the effect of avocado (*Persea Americana*) on the corrosion of copper in acidic environment.

## Abstract

Copper and its alloys play a significant and defining role in the development and progress of human history. Their ease of production at low cost and their high thermal and electrical conductivity have given copper metal a wide range of applications, particularly in fields such as chemistry and microelectronics. The most significant factor limiting the use of copper material is its high susceptibility to corrosion. While it is not possible to completely eliminate corrosion, it is possible to reduce its rate through various applications. The corrosion rate can be slowed down by using organic inhibitors. However, the high cost of organic inhibitors and the environmental damage they cause restrict their usage. Inhibitors themselves do not pose significant issues in the environments where they are used, but leaks, discharge, or cleaning procedures in the sistem where they are applied can lead to the introduction of inhibitors into the environment. Therefore, it is crucial to be extremely careful when selecting inhibitors. This situation highlights the prominence of corrosion inhibitors derived from entirely natural sources, such as plant and plant residues (roots, stems, leaves, seeds, bark, and

flowers), which have no adverse effects on the environment. Studies have shown that plant extracts are rich sources of naturally synthesized compounds with high inhibition efficacy, including amino acids, organic acids, alkaloids, polyphenols, and tannins. In this context, the use of plant extracts as inhibitors is becoming more widespread, offering economic and environmental benefits and being considered environmentally safe. In this study, the effect of avocado extract prepared at different concentrations (in methanol) on the corrosion rate of copper was evaluated in a 0.5 M H<sub>2</sub>SO<sub>4</sub> solution using  $E_{ocp}$ -time, polarization curves, and electrochemical impedance spectroscopy. The characterization of the inhibitors was determined through SEM and contact angle measurements. The results indicate that avocado extract slows down the corrosion of copper and tightly adheres to the surface, forming a protective film.

**Keywords:** corrosion, green inhibitor, avocado

## GİRİŞ

Bakır, dünyanın bir çok yerinde rezerv olarak bulunan ve üretimi bölgesel anlamda sorun oluşturmayan bir metaldir. Bakır ve alaşımları; mükemmel termal iletkenlik, nisbeten iyi süneklik, kimyasal kararlılık ve iyi elektrik iletkenliklerinden dolayı başta, ısı değişim malzemeleri, kablo gibi elektriksel aksamlarda, inşaatlarda ve yapı malzemelerinde yaygın olarak tercih edilirler [1]. Kullanımları süresince geçen zamanla birlikte, bakır doğrudan yada dolaylı olarak korozyona uğrayabilir. Korozyon olayı bakır metal ekipmanın hizmet ömrünün büyük ölçüde kısalmasına neden olur. Ömrü kısalmış ve hatta hurdaya çıkarılmış metalik malzemeler büyük ekonomik kayıplara yol açacaktır. Bu durum, üretimin durmasına, çalışma ortamının bozulmasına, kaynak tüketimine, ürün kalitesinin düşmesine, çevre kirliliğine neden olacak, yeni teknolojilerin gelişimini büyük ölçüde etkileyecektir [2]. Bakır metalinin, korozyona karşı korunmasında, inhibitör kullanımı en yaygın ve popüler yöntemlerden bir tanesidir. İnhibitörler, korozif etkiyi azaltmak veya önlemek için korozyon ortamına katılan maddelerdir. Son yıllarda dünyanın her yerinde özellikle ekolojik çevreye ve insan güvenliğine daha fazla önem verilmektedir. Bu nedenle, korozyon inhibitörleri ile yapılan çalışmalar yeni, yeşil ve yüksek verimliliğe sahip çevre dostu maddelerin tercih edilmesine doğru ilerlemektedir. Bu kapsamda özellikle bitki ekstraktlarının doğal ortamdaki kolayca elde edilmeleri, parçalanabilir olması ve yenilenebilir olması araştırmacıların ilgisini çekmektedir [3,4]. Bu çalışmada avokadonun (*Persea Americana*) (A) asidik ortamda bakırın korozyonuna inhibisyon yetkisi, değişik elektrokimyasal teknikler ile araştırılmıştır. Bakır yüzeylerinin yapısı SEM ve temas açısı teknikleri ile aydınlatılmıştır.

## MATERYAL VE METOT

Bu çalışmada kullanılan avokado meyvesinin etli bölümleri diğer kısımlarından ayrılmıştır. Bu etli bölümlerin kurutulması, baskısız kağıt üzerinde güneş ışığı almayan havada bir odada gerçekleştirilmiştir. Kurutulan materyaller laboratuvar tipi değirmende öğütülerek (10 mesh) tanecik boyutu küçültülmüştür. Her bir ekstrakt materyalinden 20 g tartılarak amber cam flaslara alınmıştır. Ekstrakt materyalinin üzerine 400 mL metanol:kloroform (1:1;v:v) ilave edilerek laboratuvar koşullarında ekstrakte edilmiştir. Ekstraksiyon çözücüsü döner buharlaştırıcı kullanılarak alçak basınç altında 40°C'yi aşmayan sıcaklıklarda uzaklaştırılmıştır.

A'nın 0,5 M H<sub>2</sub>SO<sub>4</sub>' de bakır metalinin korozyonuna etkisi üç elektrot tekniği kullanılarak belirlenmiştir. Çalışma elektrotu olarak 0,283 cm<sup>2</sup> yüzey alanı silindirik bakır (%99,9), karşı elektrot olarak Pt levha (1 x 1 cm<sup>2</sup>) ve referans elektrot olarak Ag/AgCl, KCl (3,0 M KCl) kullanılmıştır. Çalışma elektrotları 5 cm uzunluğunda kesilerek, bir yüzüne iletkenliği sağlamak için bakır tel geçirilmiştir. Diğer yüzü açıkta kalacak şekilde poliester blok içerisinde gömülmüştür. Tüm elektrokimyasal deneyler 273 K de ve atmosfere açık koşullarda, en az üç tekrar olacak şekilde CHI 6096E (Electrochemical Analyzer, Seri No. R0679) marka elektrokimyasal analizör cihazı kullanılarak, inhibitör içermeyen ve farklı derişimlerde (1000 – 50 ppm) A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltilerinde gerçekleştirilmiştir. İnhibitörlü ve inhibitorsüz ortamlarda, çalışma

elektrotlarının açık devre potansiyelleri ve elektrot potansiyellerinin dengeye geldiğini belirlemek için  $E_{ocp}$ -t eğrileri 1 saat boyunca kaydedilmiştir.

$E_{ocp}$ -t eğrileri 1 saat boyunca kaydedildikten hemen sonra elektrokimyasal impedans (EIS) ölçümleri, okunan açık devre potansiyelinde 100 kHz frekanstan başlayarak 5 mV genlik ile yapılmıştır. EIS ölçümleri bitir bitmez aynı sistemde lineer polarizasyon (LPR) ölçümleri yapılmıştır (1 mV s<sup>-1</sup>). Elde edilen akım-potansiyel eğrilerinin eğiminden polarizasyon dirençleri ( $R_p$ ) hesaplanmıştır. Potansiyodinamik polarizasyon (PPE) ölçümleri, LPR ölçümleri bitir bitmez aynı sitemde yapılmıştır. Ölçümler açık devre potansiyelinden başlanarak, anodik ve katodik yönler doğru 1 mV s<sup>-1</sup> tarama hızı ile yapılmıştır. İnhibitörlü ve inhibitörsüz ortamda bakır elektrodun yüzey analizleri taramalı elektron mikroskopu (SEM) ve temas açısı ölçümleri ile yapılmıştır.

## BULGULAR ve TARTIŞMA

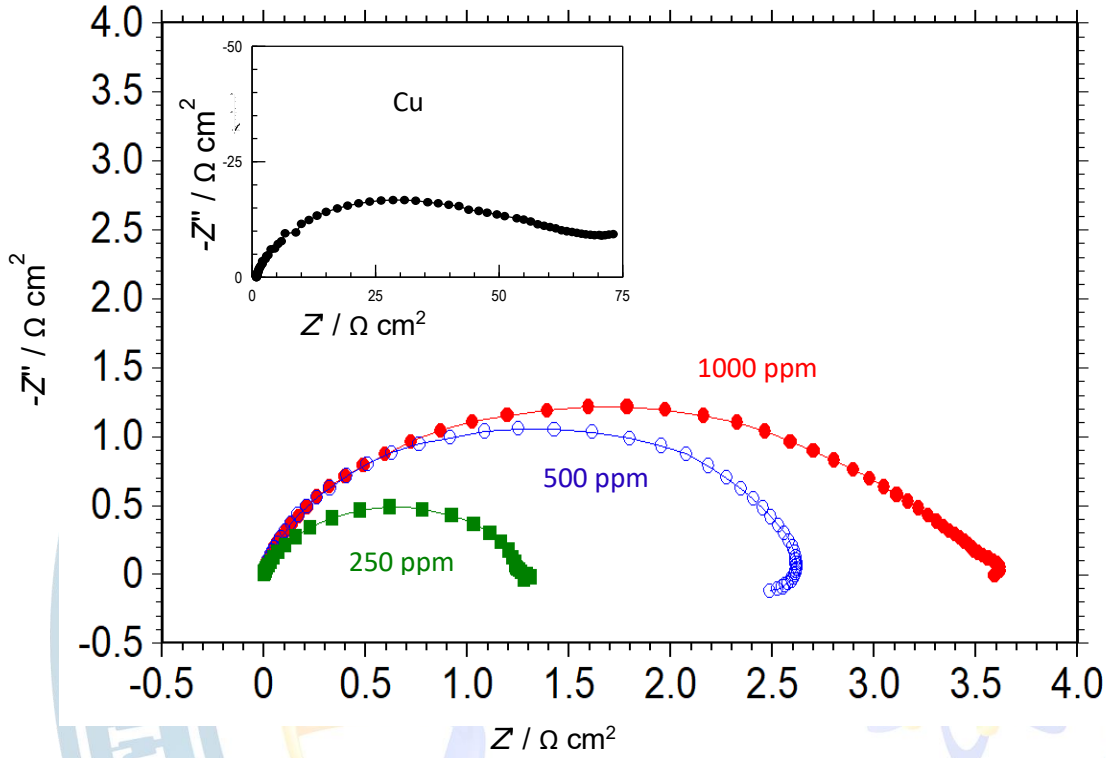

Bakır elektrot, inhibitör içermeyen ve farklı derişimlerde A inhibitörü içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde 1 saat boyunca daldırılarak,  $E_{ocp}$ -t eğrileri takip edilmiştir (Şekil 1). Şekil 1’de görüldüğü gibi, inhibitör içeren ortamlarda,  $E_{ocp}$  değerlerinin, inhibitör içermeyen ortama kıyasla daha negatif bölgelerde olduğu belirlenmiştir.

Şekil 1. Bakır elektrotun 0,5 M H<sub>2</sub>SO<sub>4</sub> ve farklı derişimlerde A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde elde edilen  $E_{ocp}$ -t eğrileri

Bakır için inhibitör içermeyen ve farklı derişimlerde (1000 ppm, 500 ppm ve 250 ppm) A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde 1 saat daldırma süresi sonunda elde edilen Nyquist eğrileri Şekil 2’de verilmiştir. Şekil 2’de verilen Nyquist eğrileri incelendiğinde; inhibitör içeren ortamlarda, her derişim için eğrinin şekli değişmemekle birlikte inhibitör içermeyen ortamlarla kıyaslandığında direncin önemli ölçüde arttığı görülmektedir. İnhibitör içeren ortamlarda  $R_p$  değerleri artan derişimle birlikte artmaktadır. Bakır için Nyquist eğrilerinden hesaplanan  $R_p$  değeri 77 ohm cm<sup>2</sup>’dir. En yüksek derişim için belirlenen  $R_p$  değeri 3578 ohm cm<sup>2</sup>’dir. Bu artış, inhibitörün metal yüzeyine adsorplanıp koruyucu bir film oluşturduğunu göstermektedir. Ayrıca Tablo 1’de görüldüğü gibi LPR ölçümlerinden elde edilen  $R_p$  değerleri, Nyquist eğrilerinden elde edilen değerler ile uyumludur. Metal/çözelti ara yüzeyinde inhibitör moleküllerinin adsorpsiyonu,  $R_p$  değerlerini arttırmaktadır.  $R_p$ ’nin artması, bakırın korozyon hızının azaldığını göstermektedir.

İnhibitör içermeyen ve farklı derişimlerde (1000 ppm, 500 ppm ve 250 ppm) A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde bakırın elektrokimyasal davranışları yarı logaritmik akım potansiyel eğrilerinden faydalanarak belirlenmiştir. Elde edilen eğriler Şekil 3'de, bu eğrilerden hesaplanan korozyon hızı ( $i_{kor}$ ) ve korozyon potansiyeli ( $E_{kor}$ ) sonuçları Tablo 2'de verilmiştir. Bakırın, inhibitör içermeyen 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde belirlenen  $E_{kor}$  değeri 0,020 V'dur. Aynı ortamda ve aynı koşullarda ortama farklı derişimler de inhibitör eklenmesi ile eğrilerinin karakteristiğinin değişmediği, bununla birlikte  $E_{kor}$  değerlerinin daha negatif potansiyellere kaydığı gözlemlenmiştir.  $E_{kor}$  en yüksek derişim olan 1000 ppm için -0,271 V olarak hesaplanmıştır

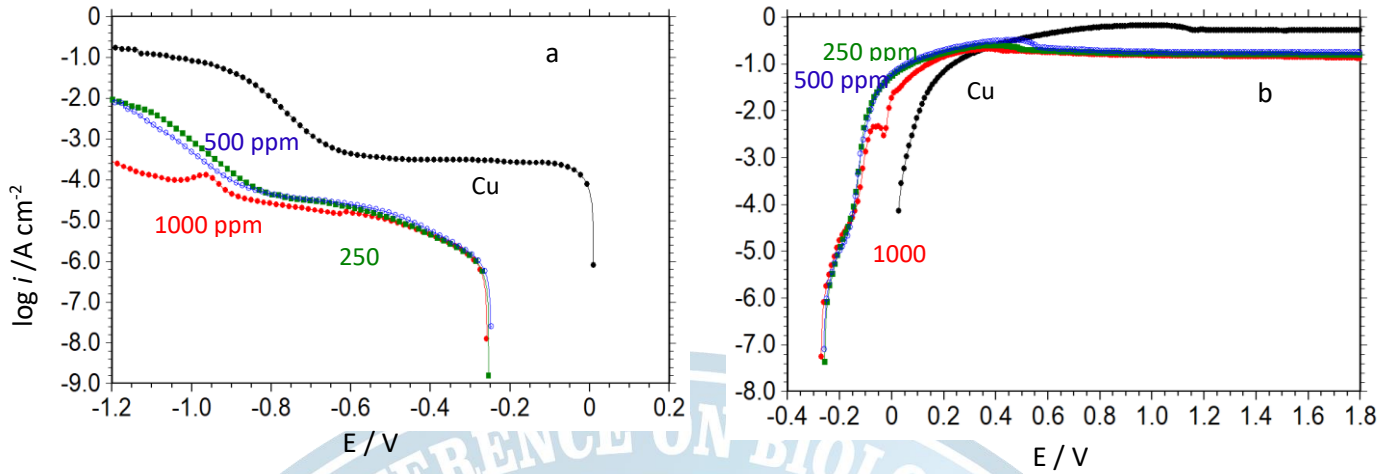

Şekil 2 Bakır elektrotun inhibitör içermeyen ve farklı derişimlerde A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde elde edilen Nyquist eğrileri

Tablo 1. Bakır elektrotun inhibitör içermeyen ve değişik derişimlerde A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltilerinde EIS ve LPR ölçümlerinden belirlenen elektrokimyasal parametreler

	Derişim ppm	EIS		LPR	
		$R_p$ ( $\Omega \text{ cm}^2$ )	$E\%$	$R_p^*$ ( $\Omega \text{ cm}^2$ )	$E\%$
Cu	-	77	-	77	-
	50	345	77,60	351	78,06
	100	655	88,24	676	88,60
A	250	1281	93,98	1333	94,22
	500	2487	96,90	2504	96,92
	1000	3578	97,84	3303	97,66

**Şekil 3.** Bakır elektrotun inhibitör içermeyen ve farklı derişimlerde A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltilerinde elde edilen katodik (a) ve anodik (b) akım-potansiyel eğrileri.

**Tablo 2.** Farklı derişimlerde A içeren ve içermeyen 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltilerde yarı logaritmik akım-potansiyel eğrilerinde elde edilen korozyon parametreleri

	Derişim (ppm)	$E_{kor}$ (V, Ag/AgCl)	$i_{kor}$ ( $\mu A cm^{-2}$ )
Cu	-	0,020	4,78
A	50	-	-
	100	-	-
	250	-0.252	0,997
	500	-0.255	0,870
	1000	-0.271	0,830

Tablo 2'den görüleceği gibi inhibitör içermeyen asidik ortamda bakır için  $i_{kor}$  değeri  $4,78 \mu A cm^{-2}$  dir. 1000 ppm A'nın varlığında ise  $i_{kor}$  değer,  $0,830 \mu A cm^{-2}$  dir. Bu rakamsal verilerden de anlaşılacağı gibi, asidik ortama A inhibitörünün farklı derişimlerde eklenmesi, anodik metal çözünmesi ve katodik bölgede hidrojen oluşum reaksiyonunu azaltmaktadır. 1000 ppm A içeren asit çözeltisinde bakır için potansiyodinamik ölçümlerden belirlenen etkinlik değerleri % 82,6 dır.

Şekil 4'de Bakırın inhibitör içermeyen ve 1000 ppm A içeren 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltilerinde 1 saat bekletildikten sonra elde edilen SEM görüntüleri verilmektedir. Asidik ortamda bakırın SEM görüntüleri incelendiğinde, 1 saat sonunda yüzeyde çok fazla değişme meydana gelmediği sadece zımpara izlerinin olduğu görülmektedir. İnhibitör içeren ortama bakıldığında ise, bakır yüzeyinde A'nın dikkat çekici bir şekilde film oluşturduğu görülmektedir.

**Şekil 4.** İnhibitör içermeyen (a) ve 1000 ppm A içeren (b) 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde daldırılan bakır elektrodun SEM görüntüleri

Şekil 5’de inhibitör içermeyen ve 1000 ppm A içeren asidik ortamda bakır için elde edilen temas açısı sonuçları görülmektedir. Şekil den de görüleceği gibi, inhibitörlü ortamda bakır yüzeyi hidrofobik özelliğe sahiptir.

**Şekil 5.** İnhibitör içermeyen (a) ve 1000 ppm A içeren (b) 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisinde daldırılan bakır elektrodun temas açıları

## SONUÇ

Ekonomik değeri olan çevre dostu doğal ürün A’ nın 0,5 M H<sub>2</sub>SO<sub>4</sub> çözeltisindeki bakırın korozyonuna inhibisyon etkisi araştırılmıştır. Bu amaçla elektrokimyasal yöntemlerden yararlanılmıştır. Elde edilen sonuçlar aşağıda maddeler halinde özetlenmiştir.

- Yapılan deneysel çalışmalar sonucunda A’ nın bakırın asidik ortamda korozyon hızını yavaşlattığı belirlenmiştir.
- A’ nin bakır koruma etkinliği asidik ortamdaki artan derişimi ile artmaktadır. İnhibisyon etkinliği 1000 ppm A derişiminde %97,84 olup pratik uygulamalar için son derece etkilidir
- EIS ve LPR sonuçları birbirleri ile uyum içindedir.
- Potansiyometrik polarizasyon çalışmaları, A’ nın hem bakırın anodik çözülme ve hidrojen oluşum reaksiyonunun hızını azalttığını göstermektedir. Dolayısı ile organik türler karma inhibitör olarak sınıflandırılabilir

## TEŞEKKÜR

Bu çalışma Bingöl Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimine (BÜBAP) (BAP-GMYO.2021.001) sunulan projeden üretilmiştir. BÜBAP birimine, Bingöl Üniversitesi Merkezi Araştırma Laboratuvarına ve İş Sağlığı ve Güvenliği Bölümüne teşekkür ederiz.

#### Abstract

The drying kinetics of *Mentha piperita* L. leaves grown under the ecological conditions of Malatya province in Turkey were investigated. The leaves were dried both in the shade and in the oven. To understand the drying kinetics and predict the moisture ratio (MR, %), an Artificial Neural Network (ANN) model with a three-layer feed-forward backpropagation network structure was developed. Drying time (min.) and drying methods (shade drying, oven drying at 35°C, and 50°C) were selected as input parameters to predict the MR. The performance of the model was evaluated using statistical criteria, including the correlation coefficient (R), mean absolute percentage error (MAPE, %), root mean square error (RMSE), and mean square error (MSE). For the test phase, these values were calculated as 0.9999 (R), 0.9223% (MAPE), 0.0034 (RMSE), and  $1.14 \times 10^{-5}$  (MSE), respectively. Additionally, these values were determined as 1.0000 (R), 0.5422 (MAPE, %), 0.0012 (RMSE), and  $1.42 \times 10^{-6}$  for the training phase. According to these criteria, the ANN model performs excellently in predicting the MR of *Mentha piperita* L. MR under different drying conditions.

#### INTRODUCTION

Fresh and dried spearmint samples have been used as ingredients in food, therapeutics, flavor and fragrance additives and pharmaceuticals. Many spearmint samples are dried to enhance the quality of dried peppermint leaves, including improvements in polyphenol content, antioxidant capacity, and yield of peppermint essential oils and extend their shelf life. Drying is a complex process where heat transfer and mass transfer co-occur. Various drying processes are employed, including sun drying, shade drying, hot air drying, vacuum drying, freeze drying, microwave drying, osmotic drying, and infrared drying. Determining the drying kinetics is essential to analyze and understand the drying behavior of a food product. Thin-layer drying models are commonly used to describe the drying kinetics of many plants. These models can be categorized as theoretical, semi-theoretical, and empirical models. Thin-layer models are considered semi-theoretical models, as they are derived by simplifying the general series solution of Fick's second law, and they do not consider the material's geometry, conductivity, and diffusivity.

Alternatively, some artificial intelligence (AI) techniques, such as Artificial Neural Networks (ANN), can be employed to predict the moisture ratio of plants. When developing thin-layer drying models, separate optimization is necessary for each drying condition, and the calibrated model is valid only under specific conditions. In contrast, AI models are developed using data from all drying conditions. AI models can be considered more advantageous, as a single ANN model is sufficient to explain all drying processes, making it a more versatile option than kinetic models.

The ANN model is one of the most popular AI models used in drying studies, with numerous instances in the literature where drying processes have been modeled using ANN. For instance, Sarımeşeli and Yüceer (2014) conducted a study investigating the microwave drying kinetics of thyme leaves, employing ANN methods to model the experimental data. The statistical performance metrics were impressive, with R-square, MAPE (%), and RMSE values calculated as 0.9999, 4.0937, and 0.025, respectively. Furthermore, Sarımeşeli and Yüceer explored the infrared drying of spinach leaves in another study (Sarımeşeli and Yüceer, 2015). They utilized sample amount, power, and drying time as input variables to estimate the moisture ratio (MR), achieving high-quality results with R-square, MAPE%, and RMSE values of 0.9999, 0.95262, and 0.00284, respectively.

In a separate study conducted by Jafari and colleagues (Jafari et al., 2016), onions were subjected to drying using a pilot plant fluidized bed dryer. In addition to ANN, fuzzy logic and nonlinear regression methods were developed and assessed in this research. Notably, the ANN model outperformed the other two methods regarding performance.

Furthermore, Beigi and Ahmadi (Beigi and Ahmadi, 2019) employed the ANN method to predict the drying curves of celeriac (*Apium graveolens* L.). They used chamber pressure, air temperature, and time as input variables to estimate the moisture content.

Kaveh and colleagues (Kaveh et al., 2018) employed both Adaptive Neuro-Fuzzy Inference System (ANFIS) and ANN structures to predict the moisture-specific energy consumption and diffusivity of potatoes, cantaloupe, and garlic. Interestingly, the ANFIS model demonstrated superior performance compared to the ANN approach.

In another study conducted by Omari and colleagues (Omari et al., 2018), both static and dynamic ANN models were developed for drying mushrooms. The input variables selected for this study included temperature, microwave power density, and moisture content. The ANN network utilized two hidden layers. Notably, the dynamic model exhibited superior performance compared to the static model.

Furthermore, in a study conducted by Karakaplan and colleagues (Karakaplan et al., 2019), an ANN model was developed to predict the moisture content of *Mentha spicata*. The model's performance was assessed using the coefficient of determination ( $R^2$ ), RMSE, and MAPE (%).

Selvi and colleagues (Selvi et al., 2022) developed an ANN model to characterize the drying kinetics of linden leaves with different thicknesses, ranging from 0.210 mm to 0.230 mm. This study used infrared drying at three different temperatures (50°C, 60°C, and 70°C). The validation results indicated that the predicted moisture ratio by the ANN model aligned well with the experimental moisture ratio data.

In the current study, the drying kinetics of *Mentha piperita* L. samples were investigated using the ANN model, with drying time and drying methods defined as input parameters. Model performance was assessed using four statistical criteria: R, MAPE%, RMSE, and MSE. According to these statistical criteria, the ANN model strongly predicted the moisture ratio (MR) of *Mentha piperita* samples.

## MATERIALS AND METHODS

### Drying Experiments

The plant samples were subjected to two different drying methods: shade drying and oven drying. The drying time was defined as the duration required for the mint samples to reach an approximate moisture level of 10% from their initial moisture content. A constant initial weight of 20g ( $\pm 0.5$ g) was maintained for all experiments.

The shade drying experiments were conducted in a closed environment at an ambient temperature of approximately 23°C, while the oven drying experiments were carried out at two different temperatures, namely 35°C and 50°C. Weight loss measurements were recorded at various time intervals during the drying process. Each drying temperature experiment was conducted in triplicate.

### Artificial Neural Network (ANN) Design

The Artificial Neural Network (ANN) is employed for solving nonlinear problems. A simple network structure has three layers: the input layer, the hidden layer, and the output layer. The input layer receives data from external sources and passes it on to the other layers. In this layer, information is transmitted to the hidden layers without processing. The data received from the input layer is processed within the hidden layer and then transmitted to the output layer. While some artificial neural networks lack a hidden layer, others can have multiple intermediate layers. The number of neurons in these layers is independent of the number of inputs, output variables, and the complexity of the process. The output layer combines information from the hidden layers with the network's outputs.

In this study, two input parameters (drying methods and drying time) were used to predict the moisture ratio of *Mentha piperita* L. samples. A feed-forward neural network structure was selected, with the hyperbolic tangent sigmoid (*'tansig'*) activation function used in the hidden layer and the linear function (*'purelin'*)

employed in the output layer. The Levenberg-Marquardt algorithm (*'trainlm'*) was chosen to train the network structure. A total of 115 data points were collected from experiments, and these data were randomly divided into a training set (70%) and a testing set (30%). The network structure is illustrated in Figure 1.

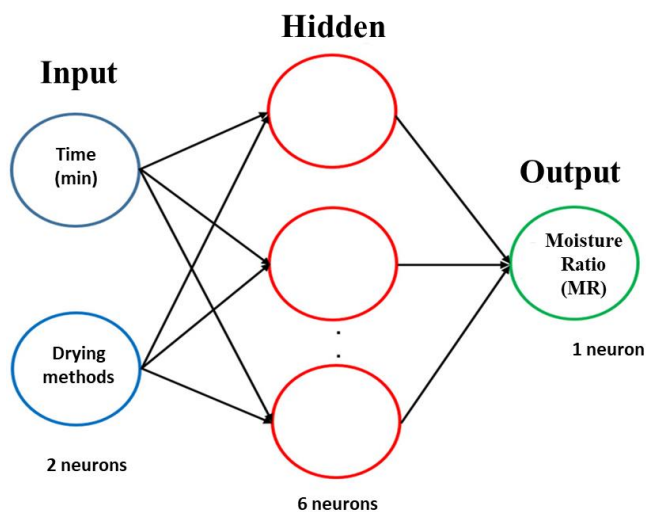

Figure 1. ANN structure

## RESULTS

### Artificial Neural Network (ANN) Model

In this study, experimental data were modelled using ANN. Training and test phase graphs can be found in Figure 2.

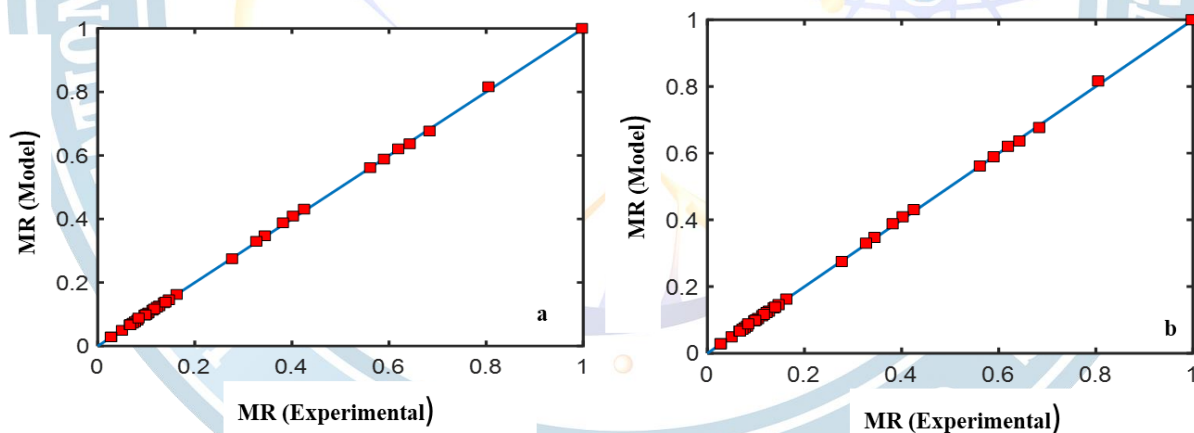

Figure 2. The experimental-model fit graph (a: training phase b: test phase)

The statistical evaluation criteria for the ANN models are presented in Table 1.

**Table 1.** Performance criteria values of ANN models

Training phase			
R	%MAPE	RMSE	MSE
1.0000	0.5422	0.0012	$1.42 \times 10^{-6}$
Test Phase			
R	%MAPE	RMSE	MSE
0.9999	0.9223	0.0034	$1.14 \times 10^{-5}$

According to Table 1, the ANN model demonstrates excellent performance due to its high correlation coefficient ( $R \approx 1$ ) and low values for MAPE%, RMSE, and MSE.

## CONCLUSION

Drying is a highly complex process where heat and mass transfer occur simultaneously. It has become imperative to employ drying processes to enhance the activity and properties of medicinal plants. This study employed three different drying methods: shade drying, oven drying at 35°C, and oven drying at 50°C. In recent years, numerous kinetic models have been developed to comprehend drying kinetics. However, modeling drying kinetics using thin-layer models can be time-consuming due to the need for optimization steps to calculate kinetic parameters. On the other hand, the development of artificial intelligence (AI) models offers a more straightforward way to understand the drying mechanism. Additionally, an AI model with good performance can reduce the experimental requirements in various studies.

#### Özet

Yıldı atları Türkiye'nin doğusundan batısına kadar farklı bölgelerde bulunmaktadır. Kış şartlarına uzun süre dayanabilen yıldı atları, bazen soğuğa ve açlığa yenik düşerek ölmektedirler. Vücudun tüm ağırlığını taşıyan ayaklar, buzları da kırarak suya ulaşımı sağlarlar. Klinik değerlendirmeler için ayak anatomisi ve morfometrisi oldukça önemlidir. Bu çalışma, yıldı atlarında parmak kemikleri (phalanx proximalis, phalanx media ve phalanx distalis)'nin ön ve arka ayak ile sağ ve sol taraf arasındaki morfometrik farklılıklarını ortaya koymak amacıyla gerçekleştirilmiştir. Çalışmada Adana'nın Pozantı ilçesinin yüksek dağlarında yoğun kış şartları nedeniyle ölen ve Ceyhan Veteriner Fakültesi Anatomi anabilim dalına getirilen 8 yıldı atı kullanılmıştır. Yıldı atlarının tüm ayaklarının parmaklarından bazı morfometrik ölçümler alınmıştır. Elde edilen ölçüm değerlerine göre yapılan analiz sonucunda ön ve arka ayak ile sağ ve sol taraf arasında istatistiki olarak fark olmadığı tespit edilmiştir. Phalanx media'nın uzunluğu phalanx proximalis'in uzunluğunun yaklaşık yarısı kadar olduğu görülmüştür. Bu çalışmadan elde edilen morfometrik verilerin yıldı atlarının anatomik bilgi birikimine katkı sağlamanın yanı sıra, klinik araştırmalarda ve ayak biyomekaniğinin anlaşılmasında katkı sağlayacağı düşünülmektedir.

**Anahtar Kelimeler:** Yıldı atı, parmak, anatomi

#### Morphometry of phalanxes of forelimb and hindlimb in wild yıldı horse

#### Abstract

Yıldı horses are found in different regions from east to west of Turkey. Yıldı horses, which can withstand winter conditions for a long time, sometimes die by succumbing to cold and starvation. The feet, which carry the entire weight of the body, break the ice and provide access to water. Foot anatomy and morphometry are very important for clinical evaluations. This study was carried out in order to reveal the morphometric differences of the foot bones (phalanx proximalis, phalanx media and phalanx distalis) between the forelimb and hindlimb and the right and left sides of the horses. In the study, 8 horses that died in the high mountains of Adana's Pozantı district due to intense winter conditions and were brought to the Ceyhan Veterinary Faculty Anatomy Department were used. Some morphometric measurements were taken from the bones of all foot of the yıldı horses. As a result of the analysis made according to the measurement values obtained, it was determined that there was no statistical difference between the forelimb and hindlimb and the right and left sides. The length of the phalanx media was found about half of the length of the phalanx proximalis. It is thought that the morphometric data obtained from this study will contribute to the anatomical knowledge of yıldı horses, as well as to clinical research and understanding of foot biomechanics.

**Keywords:** Yıldı horse, phalanx, anatomy

#### GİRİŞ

Yıldı atları Türkiye'de Raman dağından Manisa'ya kadar Türkiye'nin çeşitli bölgelerinde görülür (Eyidogan, 2022). Yabani yıldı atlar, sert doğa şartlarına adapte olmuş, son derece dayanıklı ve güçlü atlardır (Kandır, 2013). Kış şartlarına karşı doğada birkaç nesil direnen hayvanlar araziye uyum sağlarlar. Ancak çoğu da kış şartlarının üstesinden gelemez ve sert geçen kış dönemleri yıldı atlarının ölümüne neden olur. Ayrıca artan çevre sorunları, özellikle su kaynaklarının atıklarla kirlenmesi, yıldı atlarının yaşam mücadelesini zorlaştırır (Kutukcu, 2017).

Yılkı atlarının ayakları güçlü bir yapıya sahip olduklarından donmuş göletleri kırarak, diğer canlıların da sudan faydalanmasına imkan sağladılar (Hacan ve ark., 2018). Ekstremitelerin distal kısımlarında oldukça fazla yaralanmalar meydana gelir. Phalanx distalis ise atın vücudunun tüm ağırlığını taşır (Pasko ve ark., 2017). Bu nedenle anatomisi ve şekli, hareketin biyomekaniğinde son derece önemli bir rol oynar (Dzierzecka ve ark., 2016).

Ayak anatomisi bilgisi, ayakta meydana gelen anatomik değişikliklerin teşhisi için oldukça önemlidir. Ayağın klinik değerlendirilmesinde, anatomik değişikliğin etkili bir şekilde saptanması ve miktarının belirlenmesi gerekmektedir. Bu klinik açıdan önemlidir, çünkü tedavi sonucu ve iyileşme beklentileri anatomik derece ile ilişkilidir (Vosugh ve ark., 2017).

Literatür araştırmalarında; saf İran Arap atının, Nijarya atının ve eşeğin ön ayaklarının phalanx distalis'inin normal radyografik morfometrisinin belirlendiği ((Vosugh ve ark., 2017; Ogbanya ve ark., 2018; Elrashidy ve ark., 2022), Holstein sığırların ön ve arka ekstremitelerinin tüm phalanx'larına ait ölçüm değerlerinin ortaya konulduğu (Ocal ve ark., 2004; Gundemir ve ark., 2020) çalışmaların olduğu görüldü. Bu çalışmada, yılkı atlarında parmak kemikleri (phalanx proximalis, phalanx media ve phalanx distalis)'nin ön ve arka ayak ile sağ ve sol taraf arasında morfometrik farklılıkları ortaya koymak amaçlandı.

## MATERYAL VE METOT

Çalışma Orman ve Su İşleri Bakanlığı 26.08.2016 tarih ve 27006244-445.01.01-173572 sayılı izni ile gerçekleştirilmiştir. Çalışmada materyal olarak Adana'nın Pozantı ilçesinin yüksek dağlarında yoğun kış şartlarına dayanamayıp ölen ve Ceyhan Veteriner Fakültesi Anatomi Anabilim Dalı'na getirilen 8 adet yetişkin yılkı atı kullanıldı. Atın ön ve arka ayaklarına ait tüm phalanx proximalis, phalanx media ve phalanx distalis'inden digital kumpas ile bazı morfometrik ölçümler literatür (Ocal ve ark., 2004; Dzierzecka ve ark., 2016; Gundemir ve ark., 2020)'e uygun olarak alındı.

Phalanx proximalis'ten; phalanx uzunluğu, phalanx proximal uç genişliği, phalanx distal uç genişliği, phalanx diaphysis genişliği'nin ölçümleri alındı (Şekil 1).

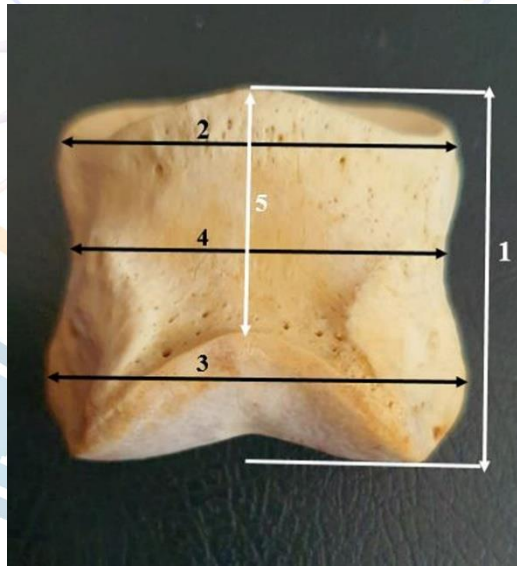

Phalanx media'dan; phalanx uzunluğu, phalanx proximal uç genişliği, phalanx distal uç genişliği, phalanx diaphysis genişliği, phalanx dorsal uzunluğu'nun ölçümleri alındı (Şekil 2).

Phalanx distalis'ten; phalanx dorsal uzunluğu, phalanx proc. extensorius'da yüksekliği, phalanx proc. palmaris medialis'in yüksekliği, phalanx proc. palmaris lateralis'in yüksekliği, phalanx medialinde plantar uzuluğu, phalanx lateralinde plantar uzuluğu, phalanx facies solearis'in orta genişliği'nin ölçümleri alındı (Şekil 3).

Şekil 1. Phalanx proximalis üzerinden alınan ölçüm yerleri. 1. phalanx uzunluğu, 2. phalanx proximal uç genişliği, 3. phalanx distal uç genişliği, 4. phalanx diaphysis genişliği

Şekil 2. Phalanx media üzerinden alınan ölçüm yerleri. 1. phalanx uzunluğu, 2. phalanx proximal uç genişliği, 3. phalanx distal uç genişliği, 4. phalanx diaphysis genişliği, 5. phalanx dorsal uzunluğu

**Şekil 3.** Phalanx distalis üzerinden alınan ölçüm yerleri. 1. phalanx dorsal uzunluğu, 2. phalanx proc. extensorius’da yüksekliği, 3. phalanx proc. palmaris medialis’in yüksekliği, 4. phalanx proc. palmaris lateralis’in yüksekliği, 5. phalanx medialinde plantar uzuluğu, 6. phalanx lateralinde plantar uzuluğu, 7. phalanx facies solearis’in orta genişliği

İstatistiksel analizler SPSS 15.0 paket programı ile yapıldı. Bağımsız t-testi ile phalanx proximalis, phalanx media ve phalanx distalis’e ait ölçümlerin ortalama ve standart sapma değerleri verilerek, ön ayak ile arka ayak, ayrıca sağ taraf ile sol taraf arasındaki farklar belirtildi. İstatistiksel anlamlılık  $P < 0.05$  olarak kaydedildi.

## BULGULAR

Yılkı atlarının phalanx’ları üzerinden alınan morfometrik ölçüm değerlerinden elde edilen istatistiksel işlemler sonucunda hiçbir ölçüm değerinde anlamlı olmadığı görüldü.

**Tablo 1.** Yılkı atında phalanx proximalis’den elde edilen morfometrik ölçümler. (ortalama  $\pm$  SD)

Ölçümler	Ön ayak		Arka ayak	
	Sağ (n=8)	Sol (n=8)	Sağ (n=8)	Sol (n=8)
Phalanx uzunluğu (mm)	81.29 $\pm$ 8.77	80.63 $\pm$ 6.97	80.97 $\pm$ 10.16	80.20 $\pm$ 8.19
Phalanx proximal uç genişliği (mm)	49.28 $\pm$ 7.24	48.34 $\pm$ 6.50	49.41 $\pm$ 6.96	48.90 $\pm$ 7.31
Phalanx distal uç genişliği (mm)	40.92 $\pm$ 4.79	39.41 $\pm$ 4.91	40.30 $\pm$ 6.70	39.43 $\pm$ 6.06
Phalanx diaphysis genişliği (mm)	30.29 $\pm$ 4.79	29.11 $\pm$ 4.11	29.54 $\pm$ 5.09	29.30 $\pm$ 4.73

\*Aynı satırda istatistiksel olarak anlamlı ( $P < 0.05$ )

Tablo 1’e göre phalanx proximalis’e ait morfometrik ölçüm değerlerinin istatistiki olarak ön ayak ile arka ayak arasında, ayrıca sağ ve sol taraf arasında farklılık göstermediği tespit edildi. Phalanx proximalis’in proksimal ucunun distal ucundan daha geniş olduğu görüldü.

**Tablo 2.** Yılık atında phalanx media'dan elde edilen morfometrik ölçümler. (ortalama  $\pm$  SD)

Ölçümler	Ön ayak		Arka ayak	
	Sağ (n=8)	Sol (n=8)	Sağ (n=8)	Sol (n=8)
Phalanx uzunluğu (mm)	42.78 $\pm$ 4.52	43.28 $\pm$ 4.45	44.25 $\pm$ 5.24	41.36 $\pm$ 4.66
Phalanx proximal uç genişliği (mm)	46.68 $\pm$ 7.02	47.41 $\pm$ 6.68	47.20 $\pm$ 7.24	45.37 $\pm$ 5.76
Phalanx distal uç genişliği (mm)	44.30 $\pm$ 6.93	44.12 $\pm$ 6.77	43.70 $\pm$ 6.57	43.77 $\pm$ 4.86
Phalanx diaphysis genişliği (mm)	40.38 $\pm$ 5.77	38.79 $\pm$ 6.67	40.01 $\pm$ 6.26	40.59 $\pm$ 5.87
Phalanx dorsal uzunluğu (mm)	26.61 $\pm$ 4.20	26.20 $\pm$ 3.13	27.39 $\pm$ 3.27	24.58 $\pm$ 2.37

\*Aynı satırda istatistiksel olarak anlamlı (P<0.05)

Tablo 2'e göre phalanx media'dan alınan morfometrik ölçüm değerlerinden elde edilen istatistiki işlem sonuca göre, hem sağ ve sol taraf arasında hem de ön ve arka ayak arasında fark olmadığı tespit edildi. Ayrıca proximal ucunun distal ucundan daha geniş olduğu görüldü.

Phalanx media'nın uzunluğunun, phalanx proximalis'in uzunluğunun yaklaşık yarısı kadar olduğu görüldü. Fakat phalanx media'nın diaphysis genişliğinin phalanx distalis'ten daha geniş olduğu fark edildi.

**Tablo 3.** Yılık atında phalanx distalis'den elde edilen morfometrik ölçümler. (ortalama  $\pm$  SD)

Ölçümler	Ön ayak		Arka ayak	
	Sağ (n=8)	Sol (n=8)	Sağ (n=8)	Sol (n=8)
Phalanx dorsal uzunluğu (mm)	44.68 $\pm$ 6.50	45.58 $\pm$ 6.71	45.23 $\pm$ 8.63	48.25 $\pm$ 7.39
Phalanx proc. extensarius'da yüksekliği (mm)	34.95 $\pm$ 5.22	37.96 $\pm$ 7.06	37.95 $\pm$ 6.13	37.98 $\pm$ 4.84
Phalanx medialinde plantar uzuluğu (mm)	62.49 $\pm$ 12.91	60.37 $\pm$ 13.33	59.16 $\pm$ 14.21	59.10 $\pm$ 12.79
Phalanx lateralinde plantar uzuluğu (mm)	60.00 $\pm$ 12.02	56.83 $\pm$ 14.22	57.67 $\pm$ 12.49	56.86 $\pm$ 12.12

Phalanx proc. palmaris lateralis'in yüksekliği (mm)	19.81 $\pm$ 3.10	21.22 $\pm$ 5.24	18.38 $\pm$ 2.98	17.76 $\pm$ 3.03
Phalanx facies solearis'in orta genişliği (mm)	61.12 $\pm$ 9.88	60.51 $\pm$ 11.01	55.21 $\pm$ 8.97	56.00 $\pm$ 9.80

\*Aynı satırda istatistiksel olarak anlamlı (P<0.05)

Tablo 3'de phalanx distalis'ten elde edilen morfometrik verilerin istatistiki sonucuna göre ön ve arka ayak ile sağ ve sol taraf arasında istatistiki fark olmadığı görüldü.

## TARTIŞMA

Yılkı atlarının phalanx (phalanx proximalis, phalanx media ve phalanx distalis)'ları üzerinde yapılan morfometrik çalışmada, hem ön hem de arka ayakta ölçülen parametrelerde sağ ve sol taraf arasında istatistiki olarak fark olmadığı tespit edilmiştir. Saf İran atlarının phalanx'larının radyografik görüntüleri üzerinde yapılan morfometrik çalışmada da ön ayakta sağ ve sol taraf arasında istatistiksel olarak anlamlı olmadığı belirtilmiştir (Vosugh ve ark., 2017). Akhal-teke atlarının phalanx distalis'lerinin ön sağ ve sol ayakları arasında herhangi bir istatistiki farkın olmadığı radyolojik görüntüler üzerinden elde edilen ölçümlerle ifade edilmiştir (Masoudifard ve ark., 2014). Holstein sığırların da yılkı atlarında olduğu gibi phalanx proximalis, phalanx media ve phalanx distalis'leri üzerinden alınan ölçüm değerlerine göre sağ ve sol taraf arasında istatistiki olarak anlamlı olmadığı ifade edilmiştir (Ocal ve ark., 2004).

Yapılan çalışmada ön ayak ile arka ayak arasında tüm phalanx'lara ait ölçümlerin istatistiki olarak anlamlı olmadığı görülmüştür. Fakat Holstein sığırların ön ayaktaki phalanx proximalis ve phalanx media'nın değerleri, arka ayaktan daha küçük değerlerde olduğu bildirilmiştir (Ocal ve ark., 2004; Gundemir ve ark., 2020). Phalanx distalis'in ön ayağın medialinde bulunan en yüksek değere sahipken, arka ayakta lateralinde bulunanın ise küçük değerlere sahip olduğu belirtilmiştir (Ocal ve ark., 2004). Ayrıca Holstein sığırlarda ön ile arka ayakların medialdeki phalanx proximalis'in proximal uç genişliği ve phalanx media'nın distal uç genişliği arasında istatistiki olarak anlamlı olduğu, diğerlerinde ise yılkı atlarında olduğu gibi ön ve arka ayak parmakları arasında fark olmadığı bildirilmiştir (Gundemir ve ark., 2020).

Yılkı atının phalanx proximalis uzunluğu ortalama sağ ön ayakta 81,29 mm, sağ arka ayakta ise 80,97 mm olarak; phalanx media uzunluğu ortalama sağ ön ayakta 42,78 mm, sağ arka ayakta 44,25 mm; phalanx distalis uzunluğu ise ortalama sağ ön ayakta 44,68 mm, sağ arka ayakta 45,23 mm olarak ölçülmüştür. Eşekte ortalama phalanx proximalis'in uzunluğu 67,4 mm, phalanx media uzunluğu 36,2 mm ve phalanx distalis uzunluğu ise 28,2 mm olduğu bildirilmiştir (El-Shafaey ve ark., 2017). Buna göre yılkı atının phalanx'larının, eşek phalanx'larından daha uzun olduğu görülmektedir.

Yılkı atında phalanx media'nın proximal ucunun genişliği ortalama ön ayağın sağ tarafında 46,68 mm, sol tarafında 47,41 mm; arka ayağın ise sağ tarafında 47,20 mm, sol tarafında ise 45,37 mm olarak ölçülmüştür. Eşeğin radyografik görüntülerinde ise ortalama 30,5 mm olduğu ifade edilmiştir (Elrashidy ve ark., 2022). Buna göre yılkı atının phalanx media'sı eşekten daha büyük bir yapıya sahiptir.

## SONUÇ

Sonuç olarak, yılkı atlarının ön ve arka ayak ile sağ ve sol taraftaki phalanx'larının istatistiki olarak farklı olmadığı gözlemlendi. Bu çalışmadan elde edilen morfometrik verilerin yılkı atlarının klinik araştırmalarında ve ayak biyomekanikinin anlaşılmasına katkı sağlayacağı düşünülmektedir.

## Özet

Yapılan bu çalışmada; *Kochia scoparia* L. bitkisinden modifiye aktif karbon elde edilerek optimum şartlar belirlenmiştir. Doğada atıl durumda bulunan *Kochia Scorparia* L. bitkisi aktif karbon olarak değerlendirilmiş ve adsorpsiyon kapasitesinin artırılması için  $ZnCl_2$  ile aktive edilmiştir. Bu işlem sırasında  $ZnCl_2$  farklı oranlarda kullanılmış ve karbonizasyon sıcaklığı  $400^\circ C - 500^\circ C$  ve  $600^\circ C$  olarak belirlenmiştir. Yapılan BET yüzey alanı analizi sonuçlarına göre; 1:2 oranında  $ZnCl_2$  ile muamele edilen ve  $400^\circ C$  sıcaklık değerinde karbonizasyon işlemine tabii tutulan *Kochia Scorparia* L. bitkisinin yüzey alanı değeri  $599,57 m^2xg^{-1}$  olarak bulunmuştur.

**Anahtar Kelimeler:** *Kochia scoparia* L. bitkisi, aktif karbon,  $ZnCl_2$

### Obtaining modified activated carbon from *Kochia scoparia* L. plant

## Abstract

In this study; optimum conditions were determined by obtaining modified activated carbon from the *Kochia Scorparia* L. plant. *Kochia Scorparia* L. plant, which is dormant in nature, was evaluated as activated carbon with  $ZnCl_2$  to increase its adsorption capacity. During this process,  $ZnCl_2$  was used in different proportions and carbonization temperature was applied at  $400^\circ C - 500^\circ C$  and  $600^\circ C$ . According to the results of BET surface area analysis; It was concluded that the surface area of the *Kochia Scorparia* L. plant, which was treated with  $ZnCl_2$  at a ratio of 1:2 and subjected to carbonization at  $400^\circ C$ , was  $599,57 m^2xg^{-1}$ .

**Keywords:** *Kochia Scorparia* L. plant, activated carbon,  $ZnCl_2$

## GİRİŞ

Su tüm canlıların ve insanların temel fonksiyonlarını yerine getirebilmesi için hayati önem taşır. Su kaynaklarının azalması, su kirliliğinin artması ve arıtım sonucu su geri kazanımının daha az verimle gerçekleşmesi gibi nedenlerden dolayı su kaynaklarının korunması gittikçe daha da önem kazanmaktadır. Su içerisinde bulunan bazı kirlilikler beklenmedik kirleticiler olarak adlandırılır. Bu maddelerin arıtımı veya uzaklaştırılması için alınan önlemler birçok ülkede az ilgi görmüş ve çeşitli nedenlere bağlı olarak su kaynakları insan sağlığını tehdit edecek zararlı maddeler bulundurmaya başlamış ve bu maddeler su kaynakları içerisinde yayılmıştır.

Adsorpsiyon yönteminde biyokütleyle uygulanan kimyasal işlemler neticesinde aktif karbonların yapısı değişerek modifiye edilmektedir. Bu aktif karbonlar adsorban olarak adlandırılırlar ve bir çok çalışmada modifiye edilmiş selülozik veya farklı yapıdaki adsorbanların modifiye edilmemiş selüloz ve ya adsorbanlara göre daha yüksek adsorpsiyon kapasitesi sahip olduğu gösterilmiştir (Yahya ve ark.,2015).

Canlılık faaliyetleri esnasında ortaya çıkan organik maddeler, inorganik anyonlar, toksik ağır metaller, zehirli gazlar ve birçok kirletici çevreye bırakılmakta ve özellikle sularda yüksek oranda kirlilik meydana

getirmektedir. Yakın gelecekte insanlığı bekleyen en büyük tehdit canlılığı sürdürmek için gerekli ve temiz su kaynaklarının bulunamayacak olmasıdır. Canlılık için hayati önem taşıyan suyun geri kazanılması amacıyla yapılan bilimsel çalışmalar son yıllarda artış göstermektedir.

Bu amaçla çevre dostu, uygun maliyetli arıtma teknolojilerine ihtiyaç büyük önem arz etmektedir.

Atık sulardan çeşitli kirlilikleri uzaklaştırmak için kullanılan adsorpsiyon işlemi çevre dostu arıtma teknolojilerinden biridir. Bu işlemde çeşitli doğal kaynaklardan elde edilebilen selülozik maddeler adsorplayıcı madde olarak kullanılabilir.

Gaz veya çözülmüş maddelerin katı yüzeyinde yoğunlaşması olayına adsorpsiyon adı verilir. Yüzeide konsantrasyonu artmış maddeye adsorplanmış madde, adsorplayan maddeye de adsorplayıcı madde veya adsorban denir (Berkem ve ark., 2020.)

Aktif karbonların adsorpsiyon özelliklerinin geliştirilmesi için  $ZnCl_2$ ,  $H_3PO_4$ ,  $H_2SO_4$ ,  $K_2S$ ,  $KCNS$ ,  $HNO_3$ ,  $H_2O_2$ ,  $KMnO_4$  ( $NH_4$ )<sub>2</sub>  $NaOH$ ,  $KOH$  ve  $K_2CO_3$  gibi kimyasal maddeler ile aktive edilmektedir bu süreç kimyasal aktivasyon olarak adlandırılır (Petroviç ve ark.,2003).

Bu kimyasal aktive edici ajanlar arasında  $ZnCl_2$  nin istenen mikro gözenekli yapıyı ve daha büyük bir yüzey alanını üretmede etkili olduğu için yaygın olarak tercih edilmektedir (Berkem ve ark., 2020).

## MATERYAL VE METOT

Aktif karbon kaynağı olarak *Kochia scoparia* L bitkisi yaz döneminde toplanıp gölgede kurutulmuş ve uygun boyutlara getirilerek aktif karbon olarak kullanıma hazırlanmıştır. Morfolojik yapının gözlenmesi adına TGA analizi yapılmış maddenin ısıl davranışları ve bozunumu göz önüne alınarak karbonizasyon sıcaklık değerlerine karar verilmiştir. *Kochia scoparia* L bitkisinin adsorpsiyon kapasitesini anlayabilmek için BET yüzey alanı ölçümü yapılmış. Daha sonra *Kochia scoparia* L bitkisi  $ZnCl_2$  kimyasal maddesi varlığında yaş emdirme işlemine tabii tutulmuştur.

$ZnCl_2$  literatürde aktif karbon üretiminde en etkili aktive edici madde olarak bilindiğinden bu bilgi doğrultusunda *Kochia scoparia* L. bitkisine 1:1, 1:2,1:3, ve 1:4 oranlarında ortama  $ZnCl_2$  eklenerek yaş emdirme işlemi gerçekleştirilmiştir.

*Kochia scoparia* L . bitkisinin hem ham haline BET analizi yapılmış, hem de farklı oranlarda  $ZnCl_2$  ile yaş emdirme işleminden sonra 400°C – 500 °C ve 600 °C karbonize edilerek BET analizleri yapılmıştır.

Şekil 1. Ham maddeye uygulanan TGA analiz sonucu

**Tablo 1.** Kochia scoparia L. bitkisi ZnCl<sub>2</sub> ile yaş emdirilip 400 °C 'ta karbonize edildiği BET analizi

BET parameters	400-1	400-2	400-3	400-4
Surface Area/m <sup>2</sup> ×g <sup>-1</sup>	283.61	599.57	491.22	553.02
Pore Volume/cm <sup>3</sup> ×g <sup>-1</sup>	0.020	0.088	0.042	0.069
Average pore width by BET/nm	2.65	2.88	2.84	1.96

### BULGULAR ve TARTIŞMA

Kochia scoparia L bitkisinin ham haline uygulanan TGA analizindeki amaç; bitkinin yapısının hangi sıcaklıklarda bozunduğunu görebilmek, aktif karbon üretirken karbonizasyon işleminin kaç °C sıcaklıkta gerçekleşeceğine karar verebilmek ve BET yüzey ölçümü yaparken ortama verilecek inert gazın kaç °C sıcaklıkta gideceğini belirleyebilmektir. Bu sonuçlara göre Kochia scoparia L bitkisinin yapısı 400 °C değerine yaklaşırken kayda değer bozunum göstermiş ve yapısının 600°C'tan sonra kaybetmeye başlamıştır. Bu analiz sonucuna göre karbonizasyon sıcaklıklarının 400°C – 500 °C ve 600 °C olması uygun görülmüştür.

Kochia scoparia L . bitkisinin ham haline BET Analizi yapıldığında yüzeyinin azot adsorpsiyonu yapmadığı görüldü. Yapısında bulunan kuvvetli selülozik yapılardan dolayı azot adsorplamadığı yorumu yapıldı. Fakat Kochia scoparia L . bitkisi ZnCl<sub>2</sub> ile modifiye edilip 400 °C 'ta karbonize edildikten sonra yüzey morfoojisi değişerek adsorpsiyonu yapabildiği gözlemlenmiştir

### SONUÇ

Bu sonuçlar doğrultusunda ham madde ile 1:2 oranında ZnCl<sub>2</sub> ile 400 °C 'ta karbonize edilmiş aktif karbonun en yüksek yüzey alanı ve por hacmi değerlerini verdiği sonucuna ulaşılmıştır.

Literatürle karşılaştırıldığında ham madde ile 1: 1,5 - 2 oranında aktive edici madde ile elde edilmiş aktif karbonun en yüksek yüzey alanı ve por hacmi değerlerini verdiği görülmektedir. Elde edilen deneysel veriler literatürde yapılmış olan çalışmaları desteklemektedir.

Yapılan çalışmadan çıkartılacak en önemli sonuç ise; ham haliyle hiçbir şekilde adsorpsiyon yapma kapasitesi bulunmayan maddenin aktive edici maddeler ile muamelesi sonucunda adsorpsiyon özelliği kazanabilmesidir. Ayrıca elde edilen aktif karbonun doğadan uygun maliyetli ve ulaşılabilir bir maddeden elde edilmiş olması çevre dostu bir proses olduğuna işaret etmektedir.

#### Abstract

It is a crucial issue for the processes to become sustainable in the textile industry as one of the sectors polluting the environment the most and consuming high volumes of water. It is noteworthy that the most preferred natural fiber, cotton and the reactive dye used in its dyeing require very high amount of chemicals and water. For this reason, in this study, the usability of nanobubble water technology, an innovative technology, in reactive dyeing was examined. The results of the study were analyzed basically in terms of colorimetry and fastness. According to the colorimetry results, it was revealed that nanobubble technology effected color coordinates of dyed fabrics. Moreover, nanobubbles had an effect on the color strength, causing a decrease compared to conventional ones. Although good level of fastness values were achieved with this technology, the fact that their values were half a point lower than the those of the conventional ones revealed the need to investigate the use of this technology in detail, especially in cleaning processes such as washing.

**Keywords:** Sustainability, Environmentally-friendly, Nanobubble, Colorimetry, Washing fastness

#### INTRODUCTION

The nanobubbles (NBs) history began in 1950 with the Epstein-Plesset theory (Zhou et al. 2021). Nanobubbles are fine bubbles with less than 1  $\mu\text{m}$  in diameter (Haris et al. 2020). Although many studies have been done with nanoscale gas bubbles (Zhou et al. 2021), there are still debates about NBs short-life paradox and their longevity in water (Weijs et al. 2012, Yasui et al. 2016, 2018, Meegoda et al. 2019). NBs are also characterized by mass transfer efficiency, high zeta potential, producing high dissolved oxygen concentration, and large specific surface area (Takahashi et al. 2007, Qian et al. 2019, Haris et al. 2020). The nanobubble (NB) technology has been used in health protection, aquaculture, agricultural and many other fields in recent years (Azevedo et al. 2019, Zhou et al. 2019, Endo-Takahashi and Negishi 2020, Minamikawa and Makino 2020, Ma et al. 2022). The NB technology is generally used in wastewater treatment in textile (Bui and Han 2020, Wu et al. 2021, Anis et al. 2022, Rojviroon and Rojviroon 2022) because NBs decompose organic substances by generating free radicals (Sakr et al. 2022). NB technology has started to be used in textile dyeing and finishing processes as a new application area alongside water treatment (Mohsin et al. 2020, 2022)

Reactive dyes are used in more than 50% of cotton dyeing (Grancarić et al. 2013), so they are the most popular dye class for cotton dyeing (Gopalakrishnan et al. 2019). Some of the reasons why reactive dyes are preferred are that their high washing fastness, ease of applications, and wide bright color gamut. Contrary to these advantages, high amounts of salt and alkali are required for exhaustion and fixation, respectively (Varadarajan and Venkatachalam 2016, Arivithamani and Giri Dev 2018). That is, reactive dyeing is characterized by high electrolyte and alkali concentrations (Khatri et al. 2013, Zhang et al. 2022). Moreover wastewater is highly colored because of hydrolyzed/unfixed dyes (Burkinshaw et al. 2000, Ramasamy and Kandasamy 2005). Because of removing hydrolyzed/unfixed dyes after dyeing, high volumes of water is used (Khatri and White 2016). Consequently, in terms of environmental impact, reactive dyeing is a water-intensive dyeing process and its wastewater discharged is highly polluted.

As in all sectors, sustainability has gained great importance in textiles. In textile as one of the sectors polluting the environment the most, one of the most critical issues that is emphasized with sensitivity is the environmentally-friendly production processes. In this concern this study attempted to investigate the probability of cotton in the presence of NBs. The results were analyzed in terms of colorimetry and color fastnesses.

## MATERIALS AND METHODS

In the study, woven cotton fabrics were used and supplied from Yürek Tekstil. The black, red and blue reactive dyes were purchased from Archroma. Alkali (sodium carbonate) and salts (sodium chloride) as dyeing auxiliaries were of analytical grade and provided by Merck.

The dissolved oxygen level was controlled and the water taken from the NB generator was used in the dyeing processes. Reactive dyeing of woven fabrics was carried out 80°C in 60 minutes at a concentration of 40 g/L salt (NaCl) and 20 g/L sodium carbonate (Na<sub>2</sub>CO<sub>3</sub>) with %2 o.w.f. dye concentrations. The reactive washing cycle consisted of cold (20 °C-30°C, 10') and warm (70 °C-80 °C, 10') washing, soaping (90 °C-95 °C, 20'), and warm (70 °C-80 °C, 10') and cold (20 °C-30 °C, 10') rinsing, respectively (Toprak-Cavdur et al. 2022). Dyeing and washing were carried out at 10:1 liquor ratio. Duration-temperature diagram of reactive dyeing is given in Fig. 1.

**Figure 1.** Duration-temperature diagram of reactive dyeing

The CIELAB (1976) L\*, a\*, b\*, C\* and h° color coordinates were measured and color strength values were calculated using a Konica Minolta CM-3600D spectrophotometer (under D65 illuminant and 10° standard observer) in specular component included (SCI) mode. Four measurements were taken from each sample with a 90° rotation to reduce possible experimental errors.

The color strength (K/S) values were calculated using the Kubelka-Munk equation. The K/S formula (Akgun et al. 2014) is presented in Equation 1.

$$K/S = \frac{(1-R)^2}{2R} \quad (1)$$

In the Equation 1, *R* is the decimal fraction of the reflectance of fabric, *K* is the absorption coefficient, and *S* is the scattering coefficient.

The washing fastness measurements of the dyed fibers were carried out by a TEST color fastness tester, using the color fastness to domestic and commercial laundering standard test method (EN ISO 105-C06/A1M).

All experiments were repeated three times and results were averaged.

## RESULTS

### Colorimetry

Color coordinates of cotton fabrics are given in Table 1. a\*-b\* plot of the samples are presented in Figure 2.

**Table 1.** Color coordinates of the dyed samples

	L*	a*	b*	C*	h°
<b>Black</b>	14.73	-1.03	-1.84	2.11	241.46
<b>Black-NBs</b>	17.77	-0.48	-0.79	0.92	239.42
<b>Navy</b>	21.32	-0.68	-14.30	14.32	267.82
<b>Navy-NBs</b>	21.63	0.02	-16.10	16.10	270.60
<b>Red</b>	34.04	50.68	26.19	57.04	27.17
<b>Red-NBs</b>	36.63	50.55	27.19	57.40	28.11

**Figure 2.** a\*-b\* plot of the dyed samples

NBs resulted in lighter colors in all dyeing processes in which they were used except in the one for the blue color. The effects of NBs on the coordinates of colors on the red-green (a\*) and yellow-blue (b\*) axis were different. For example, while NBs reduced greenness and blueness in black, it decreased greenness and increased blueness in blue. Moreover, NBs also increased the yellowness of the red color. The results of Table 1, especially increased L\* values, could be explained by the possibility that reactive oxygen species, the proliferation of which was promoted by NBs (Yasui et al. 2018, Wang et al. 2020), could have degraded the dye molecules (Chen et al. 1999, Ismail and Sakai 2022, Mahanna and El-Bendary 2022). This degradation could also have been caused by NBs increasing the oxidation reaction by increasing the dissolved oxygen level (Rojviroon and Rojviroon 2022). These could explain the changes in the a\*-b\* coordinates of the colors. Figure 3 shows color strengths of dyed fabrics.

**Figure 3.** Color strengths of the dyed samples

The presence of NBs in the dyeing bath caused lower color strengths, especially in black and red. Although the effect of NBs on the color strength of the blue color was not as significant as those of the others, it still caused a slight decrease. It has also been revealed in previous studies that the use of NBs causes a decrease in color strength (Anis et al. 2022, Toprak-Cavdur 2023). This situation could have explained by (i) the NBs deterioration the structure of dye molecules (Chen et al. 1999, Ismail and Sakai 2022, Mahanna and El-Bendary 2022) by increasing the dissolved oxygen level (Rojviroon and Rojviroon 2022), (ii) the zeta potential of the fiber surface cannot be reduced due to the adsorption of some of the  $\text{Na}^+$  ions in the dyeing medium onto the NBs (Atkinson et al. 2019, Yasuda 2023), and (iii) the interfacial free energy and high surface area of NBs (Atkinson et al. 2019, Ma et al. 2022) could have prevented the dye aggregates from accumulating on the fiber surface.

### Washing Fastness

Washing fastness values of fabrics are given in Table 2.

**Table 2.** Washing fastness of samples  
Staining

	AC	CO	PA	PES	AC	WO
<b>Black</b>	4/5	4/5	4/5	4/5	4/5	4/5
<b>Black-NBs</b>	4/5	4	4/5	4/5	4/5	4/5
<b>Blue</b>	4/5	4/5	4/5	4/5	4/5	4/5
<b>Blue-NBs</b>	4/5	4	4/5	4/5	4/5	4/5
<b>Red</b>	4/5	4/5	4/5	4/5	4/5	4/5
<b>Red-NBs</b>	4/5	3/4	4/5	4/5	4/5	4/5

The washing fastness of the dyed samples with/without NBs were good to excellent. The use of NBs in dyeing did not cause changes staining of different fabrics, except cotton. NBs, like other substances (Wu et al. 2008, Liu and Craig 2009, Ushida et al. 2012), could have effectively removed unfixed/hydrolyzed dye molecules from the fiber surface, resulting in half point lower CO staining values. In general, the reasons for the high washing fastness values of the fabrics after dyeing could be explained by the strong covalent bonding of dye anions to cotton (Lewis 2011).

## CONCLUSION

In this study, an environmentally-friendly textile process was designed using innovative NB water technology. According to the colorimetry results, the NBs effected  $L^*a^*b^*$  values. Obtaining lighter shades compared to the traditional ones when using NBs in dyeing could have been explained by the deterioration of reactive dye molecules (Chen et al. 1999, Ismail and Sakai 2022, Mahanna and El-Bendary 2022). This situation was also supported by the lower color strengths obtained with using NBs compared to conventional dyeings. The effective removal of unfixed/hydrolyzed dye molecules from the fiber surface, could have been effective in obtaining a half point lower cotton staining values with NBs compared to the conventional ones. According to these results, it is concluded that it could be beneficial to investigate the use of NB technology in detail, especially in washing.

#### Özet

Kuşlar özellikle kanatları ve tüyleri ile karakterize olan, Aves sınıfına giren sıcakkanlı omurgalı hayvanlardır. Bazı kuşlar uçuş yeteneklerini kaybetmişlerdir. Tüyler derinin epidermal tabakasından üretilmiş beta-keratinden oluşan yapılardır. Göz alıcı renk ve yapıya sahip olan tüyler sadece uçuş fonksiyonuna sahip olmayıp, çeşitli işlevlere sahiptirler. Bunlar; uçuş, sıcak tutmaya yardımcı olma, vücut sıcaklığı kontrolü, yüzme ve dalış, karda yürüme, kızakla kayma, denge ve destek, iştah, yiyecek arama ve yeme, temiz tutma, his, sindirime yardımcı olma, ses çıkarma, yuva yapma, su taşıma, avcılardan kaçma, görsel sinyaller gönderme, kamuflaj, koku, çiçeklerin döllenmesine yardımcı olma ve rüzgâr, nem ve güneşten koruma olarak ifade edilebilir. Tüm kuşların ayırt edici bir özelliği olan tüyler, küçük ama dayanıklı yapılarıyla kuşları yaralanmaktan da korurlar. Birçok fonksiyona sahip olan tüyler olmadan kuşların yaşaması pek de mümkün görünmemektedir.

**Anahtar Kelimeler:** kuş, tüy, fonksiyon

#### Creative and interesting use of feathers in birds

#### Abstract

Birds are warm-blooded vertebrate animals belonging to the Aves class, characterized especially by their wings and feathers. Some birds have lost their ability to fly. Feathers are structures composed of beta-keratin produced from the epidermal layer of the skin. Feathers with eye-catching color and structure do not only have the function of flight, but also have various functions. These can be expressed as; flying, helping to keep warm, controlling body temperature, swimming and diving, walking on snow, sledding, balance and support, hearing, foraging and eating, keeping clean, feeling, aiding digestion, making sounds, building nests, carrying water, escaping from predators, sending visual signals, camouflage, scent, helping pollinate flowers and protecting from wind, moisture and sun. Feathers, a distinctive feature of all birds, also protect birds from injury with their small but durable structure. It does not seem possible for birds to survive without feathers, which have many functions.

**Keywords:** bird, feather, function

#### GİRİŞ

Kuşlar sıcakkanlı omurgalı olup, Aves sınıfına girerler. Kuşlar tüm dünyada her ortamda ortaya çıkmıştır. Pek çok kuş uçuşmanın yanı sıra koşabilir, engelleri aşabilir ve yüzebilir. Penguenler gibi bazı kuşlar kanatlarını korumuş, ancak uçuş yeteneklerini kaybetmişlerdir (Murakami, 2022).

Tüyler, bugün yalnızca kuşlarda bulunan, epidermal beta-keratinden oluşan boru şeklindeki yapılardır (Prum, 1999). Tüyler, kuş biyolojisi için son derece önemlidir ve deriden üretilmiş en önemli yapılarından biridir (Murakami, 2022). Kuşların derileri diğer omurgalı hayvanlara göre oldukça incedir. Eğer vücut tüylerle örtülü olmasaydı ağaç ve diğer sert cisimlerle sık sık yaralanırdı (Kuru, 1999).

Bazı kuş tüylerinin harika renkleri vardır. Bu renkler, ışığın kırılması ile oluşturulur. Yanardönerlik denilen bu ışık türü bir nesneye baktığınız açıya bağlı olarak renk değiştirebilir (Kazilek, 2009). Yanardönerlik, düzenli hava boşluklarının, melanin tüplerinin, keratin liflerinin düzenlenmesinin vb. üretiminden kaynaklanan ışık girişimiyle üretilir ve tondaki değişiklikler, tüylere farklı açılardan bakıldığında aralık değişikliklerinden kaynaklanır (Yu ve ark., 2004).

## TÜYLERİN İŞLEVLERİ

Son dönem kuşlarının tüyelerinin bir takım işlevleri ve biyolojik rolleri vardır (Bock, 2000). Karmaşık bir yapıya sahip olan tüylerin görevleri; uçma, sıcak tutmaya yardımcı olma, vücut sıcaklığı kontrolü, yüzme ve dalış, karda yürüme, kızakla kayma, denge ve destek, ısıtma, yiyecek arama ve yeme, temiz tutma, his, sindirime yardımcı olma, ses çıkarma, yuva yapma, su taşıma, avcılardan kaçma, görsel sinyaller gönderme, kamuflaj, koku, çiçeklerin döllenmesine yardımcı olma ve rüzgâr, nem ve güneşten koruma şeklinde sıralanabilir (Stettenheim, 2006; Terrill ve Shultz, 2023).

### 1. Uçma

Uçma tüyleri, kuşların kanatlarında bulunan çok güçlü ve sert tüyledir (Stettenheim, 2006). Kuşlar, kanatlardan ve kuyruktan elde edilen kaldırma gücü sayesinde güçlü uçuş ve süzülme elde ederler (Maybury ve ark., 2001). Uçan kuşların kanatları ve kuyrukları tarafından oluşturulan kaldırma kuvvetinin sağladığı manevra kabiliyetine ek olarak, bazı kuş türlerinin havada manevra yapmaya yardımcı olan uzun kuyrukları vardır (Terrill ve Shultz, 2023). Kuyruk tüyleri yönlendirme için kullanılır (Murakami, 2022).

Suda uçma, havada uçmaya kıyasla kanadın yapısal bileşenlerine ve tüyelerine çok farklı mekanik kuvvetler uygular. Bu ikilik, hava ve suyun fiziksel özelliklerindeki önemli farklılıklardan kaynaklanmaktadır (Johnson, 2012).

Uçamayan kuşlar genellikle üç kategoriye ayrılabilir; (a) uçmayan ancak su altında 'uçmak' için ilgili yapıları kullanan kanatlı dalgıçlar, (b) tamamen uçamayan kuşlar ve kanatlı olmayan dalgıçlar ve (c) yıllık döngüleri sırasında uçuşlarını kaybeden ve yeniden kazanan türler (Kulp et al., 2018).

**2. Sıcak tutmaya yardımcı olma:** Tüyler, kuşun vücuduna yakın hava ceplerini hapsederek, onu sıcak tutmaya yardımcı olur. Kuşlar soğukta tüyelerini kabartarak, vücut ısısını hapseder ve daha sıcak kalmak için fazladan hava ekler (Stettenheim, 2006). Genel olarak, soğuk ortamlarda yaşayan kuşların daha uzun tüyleri vardır ve daha fazla havayı hapsedmek için diken yoğunlukları azdır (Pap ve ark., 2017). Bununla birlikte, kısmi su geçirgenliğine izin vererek kaldırma kuvvetini azaltan tüyler bile vücudun yakınında küçük bir hava tabakasını hapseder ve bu da çok soğuk suda bile etkili bir yalıtıcı görevi görür (Gremillet ve ark., 2005).

Tüyler, kuşların şiddetli rüzgârlara maruz kaldıkları ve buzlu kutup sularında dalış yaptıkları gibi en zorlu ortamlarda hayatta kalmalarını ve ortam sıcaklıkları -40°C'nin altına düştüğünde bile sabit bir yüksek vücut sıcaklığını sürdürmelerini sağlar (Pap ve ark., 2020).

**3. Vücut sıcaklığı kontrolü:** Tüyler ayrıca sıcak ortamlarda ısı düzenleyici bir rol oynar. Tüylerin termoregülasyondaki rolü, kuşları serin tutmak için güneş radyasyonunu yansıtmasıdır (Medina ve ark., 2018). Kuşlar vücut ısısını sabit tutmak için, çok ısınmışsa soğuması için başlarını ve ayaklarını havaya veya suya maruz bırakabilir veya ısınmaya yardımcı olmak için tüyelerinin arasına sıkıştırabilir (Stettenheim, 2006).

**4. Yüzme ve dalış:** Pek çok kuş, yapısal değişikliklerle tüyelerini su geçirmez hale getirir (Terrill ve Shultz, 2023). Kuşlar, tüyelerinde hava tutma oranını artırarak kaldırma kuvvetini artırabilir (Lovvorn ve Jones, 1991). Ördek gibi su kuşları, tüylerde hapsedilmiş havayı kullanarak suda yüzebilir ve soğuk sudan koruma sağlayabilir (Dove ve Agreda, 2007). Bazı suda yaşayan kuşların tüyelerinde ayrıca daha yüksek nodus yoğunluğu vardır, bu da kuş tüyünün kohezyonunu (yapışkanlık) artırabilir ve bu da onu sudan gelen basınca karşı daha dirençli hale getirir (D'Alba ve ark., 2017). Yağlar suyun yüzey gerilimini azaltır ve bu nedenle kuşlar çevrelerinde petrolle karşılaştıklarında su geçirmezlikleri ciddi şekilde tehlikeye girebilir (Whitmer ve ark., 2018).

Tüm kanatlı dalgıçlar yüzerken tüy kullanırlar. Bu kuşlar tüyelerinde çeşitli morfolojik adaptasyonlar gösterirler, bu da genellikle kanatların yüzmek ve uçmak için kullanılması arasındaki ödünleşmeyi yansıtır. Havadan uçuş yeteneklerini koruyan dalış kuşları, uzun, ince birincil ve ikincil uçlara sahip olma eğilimindedir (Spear ve Ainley, 1997). Penguenler kanatlarını geliştirerek onları harika yüzücüler yapan sert, düz yüzgeçlere dönüştürmüşlerdir (Stettenheim, 2006).

**5. Karda yürüme:** Sıra dışı tüy kullanımlarından biri de karda yürüyüş yapmaktır. Karla kaplı bölgelerde yaşayan tavuğu andıran orman tavuğu kuşlarının, kışın tıpkı kar ayakkabısı gibi ayak boyutunu artıran tüylerle kaplı ayakları vardır. Bu, kuşların kara batmasını önler (Stettenheim, 2006).

**6. Kızakla kayma:** Antartika kuşları, karınlarının pürüzsüz tüyelerinin üzerine çökerler ve palet benzeri kanatlarını ayaklarıyla birlikte kullanarak karda ve buzda kızak gibi hareket ederler (Stettenheim, 2006).

**7. Denge ve Destek:** Pek çok kuş, uçmadığı zamanlarda, ağaçkakanlarda görüldüğü gibi, yerdeyken veya ağaçların kenarlarına tırmanırken kuyruk tüylerini destek olarak kullanır (Stettenheim, 2006). Akrobatik olarak yiyecek arama eğiliminde olan kuşlar, kendilerini desteklemek için kuyruklarını kullanırlar ve baş aşağı veya kısaca dikey yüzeylere karşı yiyecek ararken denge sağlarlar (Manegold, 2008). Ayrıca kuyruk tüyleri, dikey bir yüzeye yapışarak uyuyan kuşlar için de yararlı olabilir (Van Els ve Whitney, 2011).

**8. İtme:** Bazı yırtıcı hayvanlar, özellikle baykuşlarda görülür (Hausmann et al., 2009). Baykuşlar sesleri toplamak ve kulaklarına yönlendirmek için yüz tüylerini iki tabak (yüz diskleri) gibi düzenler, böylece karanlıkta avlarını daha doğru bir şekilde bulabilirler (parabolik reflektör) (Stettenheim, 2006).

**9. Yiyecek arama ve yeme:** Göl ve akarsu sularında balık avlayan balıkçılar gibi bazı kuşlar, bazen tüylerini başlarının üzerinde bir şemsiye oluşturmak için kullanırlar. Bu, suda balıkları görmelerini kolaylaştırabilir. Örneğin karabalıkcı, avını çeken gölge oluşturmak için kanatlarını kullanır. Birçok böcekçi kuşun kanatlarında veya kuyruğunda yiyecek arama sırasında düzenli ve aniden ortaya çıkan gizli beyaz noktalar vardır (Jablonski, 2001).

Tüyler, gözleri ve burun deliklerini koruyarak, bıyık benzeri dokunsal sensörler olarak hareket ederler (Terrill ve Shultz, 2023). Bazı böcek yiyen kuşların ağızlarının çevresinde riktal kıllar adı verilen özel uzun tüyler bulunur. Bunlar havadaki böceği yakalamak için bir huni görevi görebilir veya böceği yakalarken gözleri koruyabilir. Diğer kuşlar, meyveleri seçmek için ağızlarının yan tarafındaki tüyleri kullanır (Stettenheim, 2006).

**10. Temiz tutma:** Tüyler, deri üzerinde fiziksel bir bariyer oluşturarak veya kimyasal caydırıcılar üreterek kuşları parazitlerden korur (Terrill ve Shultz, 2023). Birçok kuş türü, sivrisinekleri caydırmak için çoğunlukla baş ve ayaklarının hareketine ve konumuna güvenir (Darbro ve Harrington, 2007). Balıkçılar gibi bazı kuşların, normal tüylere sürtmek ve onları uygun durumda tutmak için gagaları ve ayaklarıyla ezdikleri, toz tüyü adı verilen küçük tüyleri vardır. Bu pudra tüyü ayrıca akarlar gibi tüy parazitlerini kontrol etmeye de yardımcı olabilir (Stettenheim, 2006). Kuşlar, kimyasal savunmalar ve iç tüy pigmentleri kullanarak tüylerini bu bakterilere karşı korurlar (Ruiz-Rodriguez ve ark., 2009). Kuşun diğer vücut parçalarının yanı sıra tüylerinde de zehirli kimyasalların bulunduğu ve birçok amfibi derisinde bulunana benzer bir kimyasal savunma görevi görebilir (Dumbacher ve Pruett-Jones, 1996).

**11. His:** Tüylerin sinirleri yoktur, ancak tüyün kuşa bağlandığı yeri çevreleyen sinirleri uyarırlar. Kuşlar, bu sinirlerin uyarılmasına bağlı olarak tüylerinin pozisyonunu ve duruşunu ayarlayabilirler (Stettenheim, 2006).

**12. Sindirime yardımcı olma:** Bazı balık yiyen kuşlar kendi tüylerini yerler. Bu, kuşu keskin balık kemiklerinden korumaya yardımcı olur (Stettenheim, 2006). Bununla birlikte, kimyasal sindirim için midede yiyecek tutma ve sindirilmemiş yiyeceklerin bağırsağa girmesini filtreleme işlevi gördüğü de belirtilmektedir (Jehl, 2017). Tüy yeme, tutsak kuşlarda, özellikle papağanlarda ve tavuklarda da bilinmektedir, ancak bu durumda işlevsel olmayan bir davranış bozukluğu gibi görünmektedir. (McKeegan ve Savory, 1999).

**13. Ses çıkarma:** Kuş seslerini şarkı ya da uğultu olarak düşünürüz, ancak bazı kuşlar tüylerini kullanarak uğultu, davul ve ıslık gibi birçok farklı ses çıkarabilirler. Baykuş gibi geceleri avlanan kuşlar, avlarına yaklaşırken kanatlarını kullanarak kendi seslerini boğabilirler (Stettenheim, 2006).

**14. Yuva yapma:** Kuşlar yuvalarını yaparken kendi tüylerini ve diğer kuşların tüylerini kullanırlar (Winkler, 1993). Pek çok kuş (özellikle su kuşları) yuvalarını kuş tüyleriyle kaplar. Bu, yumurtalarını sıcak tutmaya yardımcı olur ve ayrıca yumuşak bir dolgu sağlar. Muhabbet kuşu gibi bazı kuşlar, otları ve yaprakları yuvalarına taşımak için aslında altlarında ve alt sırtlarında bulunan tüyleri kullanırlar (Stettenheim, 2006).

**15. Su taşıma:** Çölde yaşayan bazı kuşların (kum tavuğu gibi) su tutmada çok iyi olan özel karın tüyleri vardır (Benitez-Lopez ve ark., 2014). Yumurtaları ve civcivleri büyütürken, birçok yetişkin kuş yuvaya dönmeden önce tüylerini karınlarına batırır. Daha sonra yumurtaların kurumaması önlemek ve civcivlerine su vermek için suyu kullanabilirler. Bu adaptasyon, su birikintilerine yakın bölgelerde bulunan daha yüksek sayıda avcıdan kaçınmak için su deliklerinden daha uzakta yuva yapmalarını sağlar (Stettenheim, 2006).

**16. Avcılardan kaçma:** Kuşlar saldırıya uğradıklarında veya korktuklarında kuyruk tüylerinin bir kısmını düşürebilirler. Buna korku tüy dökümü denir. Bu bazen kuşun kaçmasına yardımcı olur ve saldırganın yalnızca ağız veya ayağı tüylerle dolu kalır (Stettenheim, 2006).

**17. Görsel sinyaller gönderme:** Tüy renkleri ve desenleri, eşlere ve rakiplere sinyal göndermek için kullanılır. Bu muhtemelen tüylerin en büyük ve en çok kullanılan işlevidir (Stettenheim, 2006). Tüy fenotipleri cinsiyet hormonları tarafından değiştirilebilmektedir (Yu ve ark., 2004). Erkek kuşlar dişilere göre daha renkli olma eğilimindedir ve bu cinsel dimorfizmi tanımlamaktadır (McGraw ve ark, 2002). En iyi bilinen örneği erkekleri cinsel teşhirde kullanılmak üzere olağanüstü tüy renkleri ve şekilleri sergileyen cennet kuşlarıdır (Scholes, 2008).

Tüyer çeşitli renklerde evrimleşmiştir. Tüyer, çarpıcı desenlerde dağılmış olağanüstü bir renk çeşitliliği sergiler. Renk, kimyasal renk, fiziksel renk veya her ikisinin kombinasyonu ile oluşturulabilir. Pigmentler, ışığı belirli dalga boylarında emen kimyasal bileşiklerdir. Kuşlarda üç ana pigment türü vardır: melaninler, karotenoidler ve porfirinler (Lucas ve Stettenheim, 1972).

**18. Kamuflaj:** Bazen parlak renkler iyi değildir. Yırtıcı hayvanlar tarafından görülmek için birçok kuşun ölü yapraklara veya yaşadıkları çevrenin diğer kısımlarına benzeyen tüyleri vardır, bu nedenle yırtıcılar onları göremez. Bazı yırtıcı hayvanlar da avlarının daha yakına gelebilmesi ve avın yakalanmasını kolaylaştırmak için karışmayı severler (Stettenheim, 2006).

**19. Koku:** Bazı tüyer kendine özgü kokular yayar. En çok çalışılan tüy kokusu, tepeli alklet'in tüyerinin mandalina kokusudur (Hagelin ve ark., 2003).

**20. Çiçeklerin döllemesine yardımcı olma:** Sinek kuşlarının, başlarının etrafındaki tüyer bir çiçekten polen toplarken çiçeklerin tozlaşmasına yardımcı olur. Daha fazla nektar aramaya devam ettikçe, polen diğer çiçeklere aktarılır (Stettenheim, 2006).

**21. Rüzgâr, nem ve güneşten koruma:** Güçlü ve çıkıntılı kontur tüyeri, kuşları rüzgardan korur. Tüyerin yapı taşı olan beta-keratin sert bir malzeme olup, suya ve aşınmaya dayanıklıdır. Daha koyu renkli tüyer de güneşten koruma sağlayabilir. Tüyer ayrıca kuşları yağmurdan korur. Birbirine geçen tüy dikenleri ve yağlı veya mumlu özel kaplama ile suyun aktığı bir kalkan oluşturur (Stettenheim, 2006).

## SONUÇ

Birçok işleve sahip olan tüyer, kuşların karakterize özelliğini yansıtmaktadır. Güzel görünümünün yanında birçok hayati öneme sahiptir.

#### Abstract

Silver nanoparticles have been one of the nanomaterials that have been widely studied in recent years due to their unique antibacterial and mechanical properties. Reducing agents play a key role in the synthesis of silver nanoparticles with desired features. Hydrazine and sodium boron hydride are used as reducing agents, however, the fact that these agents are carcinogenic and toxic materials. Green reducers such as glucose and ascorbic acid are important candidates instead of these toxic chemicals which enable the synthesis of silver nanoparticles at low nano sizes. In this study, the properties of tannic acid and ascorbic acid-synthesized silver nanoparticles were compared statistically. The thermal conductivity, absorbance @410-420 nm, zeta potential, and particle size distribution of the synthesized silver nanoparticles were determined. By proposing a systematic experimental design, quality criteria were characterized using Taguchi L<sub>4</sub> orthogonal arrays, and the results were evaluated with the help of main effect plots. Characterization of the synthesized nanoparticles was carried out with FTIR, Zetasizer, and Ultraviolet-Visible Spectroscopy (UV-Vis) devices. It has been shown that glucose/AgNO<sub>3</sub> and ascorbic/AgNO<sub>3</sub> molar ratios are the most important factors in the particle size distribution of AgNPs. The findings show that the lowest variance AgNPs were produced at the highest ascorbic/AgNO<sub>3</sub> molar ratios. As a result, it can be said that a better quality AgNPs production process is possible by adjusting the ascorbic acid/AgNO<sub>3</sub> molar ratio.

**Keywords:** Ascorbic acid, tannic acid, silver nanoparticles, statistics.

#### INTRODUCTION

Nanotechnology is a multidisciplinary branch of science that provides unique material production that has a wide range of usage in fields such as medicine, biology, and chemistry (Kakakhel et al., 2021). Nowadays, nanomaterials have become attractive for applications in biochemistry, the medicine industry, health monitoring, scientific diagnostics, water treatment, and ensuring food safety (Sharma et al., 2021).

Primary components of metal nanoparticles include gold, silver, copper, magnetic elements (cobalt, nickel), and semiconductors (Ramya et al., 2022). Among these, silver nanoparticles (AgNPs) come in front due to their low toxicity and ease of production (Reidy et al., 2013). Moreover, AgNPs exhibit extraordinary physicochemical properties such as conductivity, chemical stability, catalytic and antibacterial activity (Rudrappa et al., 2022). Owing to the mentioned features, AgNPs are used in a wide variety of fields such as food (additives, food packaging, refrigerator liners), textiles (clothing and bedding), cosmetics and hygiene products (toothbrushes, hair straighteners, disinfectant sprays, etc.), optics, electronics, magnetic, catalysis, and medicine (He et al., 2019).

Dubas and Pimpan synthesized silver nanoparticles by exposing silver nitrate solution to a low-power UV source in the presence of poly (methacrylic acid) (PMA), which acts as both a reducing and capping agent and used it as a colorimetric analysis to detect ammonia applications in water (Dubas and Pimpan 2008). Karhan et al. (2017) first applied the response surface methodology-based desirability function approach to obtain silver nanoparticles of the desired size using the green synthesis method. Using the proposed methodology, they achieved a 7.9% improvement in the average particle size distribution in the AgNP production process and showed that an 89.3% lower standard deviation was achieved compared to studies in the literature. Ponsanmti et al. (2020) examined the synthesis of silver nanoparticles by the green method using corn starch, cassava starch, and sago starch. They found that the size of flower-shaped silver nanoparticles obtained from corn starch had a smaller particle distribution of 47.8 nm than cassava starch (107.5 nm) and sago starch (118.9

nm). Zamarchi et al. (2021) obtained pine nut extract and used it as a reductant and stabilizer in the synthesis of silver nanoparticles. To optimize the synthesis of silver nanoparticles, they investigated factors such as temperature, extract: water ratio, silver nitrate concentration and extract stability time. Kanniah et al. (2021) used the seed extract of *P. nigrum* as a reducing agent for the synthesis of silver nanoparticles. Silver nanoparticles exhibited effective antibacterial activity against *Bacillus subtilis* and *Escherichia coli*, while silver nanoparticles also showed effective antibacterial activity against compromised human cancer cells and cytotoxicity. Mahendran et al. (2022) biogenically synthesized silver nanoparticles using *Cissus quadrangularis* aqueous leaf extract and examined their antimicrobial activities. They found the average crystallite size of AgNPs as 35 nm and confirmed that it has unique antibacterial activity.

In light of the above mentioned information, tannic acid and ascorbic acid were selected as green reducing agents, and starch was used as the capping agent for environmental friendliness. The effects of solid/liquid ratio (reducing agent/AgNO<sub>3</sub> molar ratio), reducing agent type, and pH on the thermal conductivity, absorbance @410-420 cm<sup>-1</sup>, zeta potential, and particle size properties of the synthesized AgNPs were examined. Experiments were performed using the Taguchi L<sub>4</sub> orthogonal array and the results were evaluated with main effect graphs.

## MATERIALS AND METHODS

### Materials

Silver nitrate (AgNO<sub>3</sub>, >99.5%) and soluble starch from potatoes used in the experiments were purchased from Sigma Aldrich. D-(+)-Glucose (anhydrous) and sodium hydroxide pellets (NaOH, >99%) were from Merck Millipore, tannic acid was from Aromel Chemistry Medical, L (+) ascorbic acid was obtained from Carlo Erba company.

### Synthesis of Silver Nanoparticles

In a 2000 mL beaker, 50 mL of 0.2% starch solution was taken and stirred for 10 minutes on a magnetic stirrer at 65°C. Then, depending on the reducing agent/AgNO<sub>3</sub> mole ratio (S/L), a defined amount of 0.001 M AgNO<sub>3</sub> solution and reducing agent (RA), (0.1 M glucose, 0.1 M tannic acid, or 0.001 M ascorbic acid) solution was added. Then, the pH of the mixture was adjusted as specified in the experimental design using 0.002 M NaOH solution, and the color change was observed. Thus, glucose, tannic acid, and Ascorbic acid reduced silver ions (Ag<sup>+</sup>) to metallic silver (Ag<sup>0</sup>) in a sodium hydroxide alkaline solution (Karhan et al., 2017; Waberi, 2023). This reduction mechanism is given in equation (1) below, and the experimental system and the synthesized AgNPs are given in Figure 1.

Figure 1. Synthesis of AgNPs a) experimental setup, b) synthesized AgNPs

## Method

The Taguchi method uses orthogonal arrays to evaluate all possible combinations of parameters, thus reducing the number of experiments that are possible to solve a problem (Hasanzadeh et al., 2022). The selection of the appropriate orthogonal array is determined by the total degrees of freedom. The degrees of freedom of each factor are calculated by subtracting one from the number of levels of the factors (Şimşek, 2014). In this case, the total degree of freedom is 4 and therefore the  $L_4$  orthogonal index was selected. By using the Taguchi method, the factor levels at which the best performance criterion value was obtained could be found, without performing all combinations. The results obtained were analysed with the help of the MINITAB software and main effect graphs were drawn. The symbols and levels of the factors determined for AgNPs synthesis are shown in Table 1.

**Table 1.** Factors and levels for AgNPs synthesis

Exp. No	Symbol	A (solid to liquid ratio)	B (Reducing agents)	C (pH)
0	REF	3.5	Glucose	9
1	15AA9	1.5	Ascorbic acid	9
2	15TA95	1.5	Tannic acid	9.5
3	35AA95	3.5	Ascorbic acid	9.5
4	35TA9	3.5	Tannic acid	9

## Characterization of Silver Nanoparticles

The chemical structure of the AgNPs was investigated using FTIR spectroscopy. Bruker Tensor II device with a wavelength range of 400 to 4000  $\text{cm}^{-1}$  was used to perform FTIR analysis. A PerkinElmer UV-visible spectrophotometer has been used to characterize AgNPs. The colloidal suspension of the AgNPs has been characterized by the UV-visible spectrophotometer within the range of 300–600 nm. The absorption peak is observed around 400 nm in the UV-visible spectrophotometric graphs, which have been confirmed in the presence of the silver nanoparticles for all experimental runs.

## RESULTS and DISCUSSION

### FTIR Characterization

FTIR spectra of the synthesized AgNPs are given in Figure 2. The apparent peak at 3401  $\text{cm}^{-1}$  is related to O-H bond stretching vibrations due to ascorbic acid and tannic acid reduction reaction. The peak at 1720  $\text{cm}^{-1}$  is attributed to the C=O bond stretching vibrations present in functionalities of ascorbic acid (ketones and aldehydes) and the carbonyl bond stretching vibration (C=O) in the carboxylic acid groups (COOH) of tannic acid. An absorption peak around 600  $\text{cm}^{-1}$  is also observed, attributed to the stretching vibrations of carbon dioxide ( $\text{CO}_2$ ).

**Figure 2.** FTIR spectra of AgNPs

## Experimental Results

Experimental results obtained for thermal conductivity, absorbance at the range of 410-420 nm, zeta potential, and particle size are given in Table 2, and the main effect graphs obtained with the help of the MINITAB program are given in Figure 3.

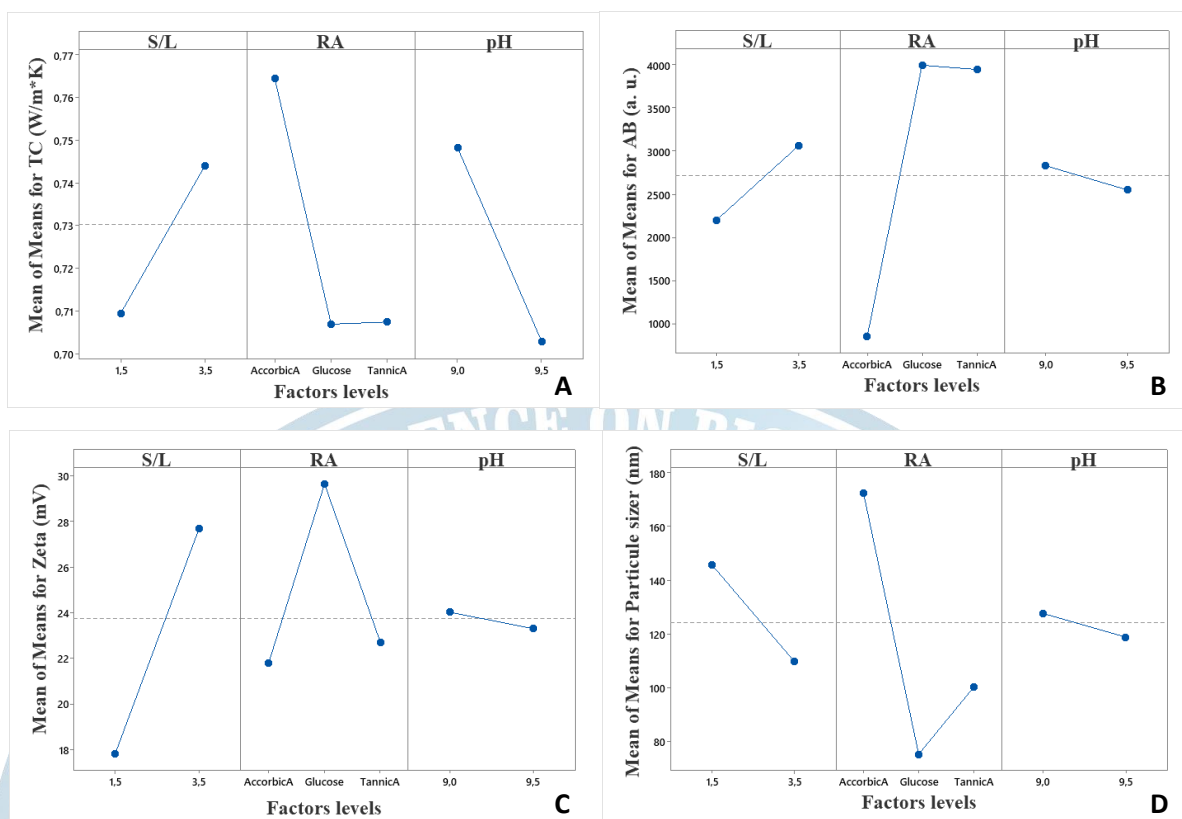

**Table 1.** Experimental results

Symbol	TC (W/m*K)	Absorbance @410-420 nm	Zeta potential (mV)	Particle size (nm)
REF	0.707±0.0389	4000	29.66±0.550	75.2±1.369
15AA9	0.771±0.0193	500	16.3±0.818	199.5±3.292
15TA95	0.648±0.0086	3900	19.3±2.551	92.2±5.830
35AA95	0.758±0.0394	1200	27.3±1.153	143.5±0.416
35TA9	0.767±0.0766	4000	26.1±1.877	108.3±1.021

When the main effect graphs were examined, it was seen that as the solid/liquid ratio increased, the thermal conductivity and particle size of AgNPs decreased, while the absorbance and zeta potential increased. Since AgNPs have a higher thermal conductivity, the presence of solid silver nanoparticles in solution can increase the overall thermal conductivity of the system. While AgNPs synthesized with ascorbic acid have the highest thermal conductivity, those synthesized with glucose and tannic acid have low thermal conductivity. Reducing the pH from 9 to 9.5 decreased the thermal conductivity of dispersed AgNPs.

While glucose-reduced AgNPs showed the highest absorbance value, increasing the pH to 9.5 decreased the absorbance value. The highest zeta potential of 30 mV was obtained by glucose-reduced AgNPs, while the lowest zeta potential of 22 mV was obtained with the use of ascorbic acid. Increasing the pH in the solution slightly reduced the zeta potential. While the highest particle size was obtained by ascorbic acid-reduced AgNPs, the particle size of those synthesized with glucose and tannic acid remains low. The concentration of silver ions affects the reduction kinetics and subsequent growth of nanoparticles. Higher concentrations of reducing agents lead to smaller particle sizes. However, above at a level of certain concentrations, particle size may begin to increase due to the agglomeration phenomenon. A slight decrease in particle size was observed with an increase in pH value. An increase or decrease in pH can affect the surface charge of nanoparticles, affecting their stability and interaction with the surrounding environment.

**Figure 3.** Main effect plots for a) thermal conductivity, b) absorbance @410-420 nm, c) zeta potential, and d) particle size of synthesized AgNPs

## CONCLUSION

In this study, tannic acid and ascorbic acid-reduced AgNPs were prepared using Taguchi orthogonal arrays and compared with the glucose-reduced AgNPs using main effect plots. It was concluded that while the thermal conductivity of AgNPs decreases with increasing solid/liquid ratio, AgNPs obtained with ascorbic acid have the highest thermal conductivity. Moreover, the highest absorbance value at a range of 410-420 nm as an indicator of productivity was obtained by tannic acid at the ratio of 3.5 solid/liquid, and the level of pH=7. Furthermore; with the increase of the solid/liquid ratio, the zeta potential increased from 18 mV to 28 mV and the use of glucose showed the highest zeta-potential value for AgNPs. The use of ascorbic acid resulted in a high particle size for AgNPs.

#### Abstract

Climate change caused by global warming is seen as extreme changes, especially in temperature and precipitation. Data obtained from studies conducted by researchers and organizations in different parts of the world support that anthropogenic climate change is occurring. This study was carried out in Mersin, located in the Eastern Mediterranean part of the Mediterranean Region, in order to determine the changes in annual average temperature and total annual precipitation amounts on a regional scale in the 43-year period (1980–2022). Between 1980 and 2022, the annual average temperature in Anamur, Mersin, and Silifke varies between 17.90–21.30°C, 18.00–21.50°C, and 17.80–21.60°C, respectively. It was determined that the lowest and highest average temperatures in this period were in Silifke (17.80°C and 21.60°C, respectively). Simple linear regression model (SLRM) results revealed that the annual average temperature (Anamur;  $r = 0.8448$ , Mersin;  $r = 0.8865$  and Silifke;  $r = 0.8329$ ) had an increasing trend. However, according to the results of simple variance analysis, there is no statistical difference ( $P > 0.05$ ) between the average temperature values. During the 43-year period, the total annual precipitation in Anamur varied between 447.10 and 1755.10 mm, in Mersin between 301.60 and 1033.70 mm, and in Silifke between 300.50 and 1007.70 mm. During the study period, the lowest annual total precipitation was obtained in Silifke and the highest annual total precipitation was obtained in Anamur. In the regression analysis model made to determine the change between 1980 and 2022, the average total precipitation increased in Mersin ( $r = 0.0979$ ) and decreased in Anamur ( $r = -0.05$ ) and Silifke ( $r = -0.0436$ ) appears to be trending. Simple variance analysis indicates that there is a statistical difference ( $P < 0.05$ ) between the annual total precipitation values of Anamur, Mersin, and Silifke. The results of the study reveal that temperatures tend to increase on a regional scale, as a sign of global warming, and that there are changes in the precipitation regime and distribution. If these trends continue, it is predicted that more severe floods or drought events may occur in this region and its surroundings.

**Keywords:** Anamur, global warming, regression model, temperature, Silifke, precipitation

#### INTRODUCTION

Temperature and precipitation, the main elements of climate, are of great importance in determining climate change trends in a region. Both climate elements can show large changes on both spatial and temporal scales. In particular, temporal changes in precipitation and temperature not only reveal spatial differences but also create oscillations in climate (Bahadır, 2011). Recent analyses of climate trends show that the global average surface temperature has increased by approximately 0.3 to 0.6°C since the late 19<sup>th</sup> century and by approximately 0.2 to 0.38°C in the last 40 years. It is also stated that daily minimum temperatures generally increase at a higher rate than maximum temperatures, causing a decrease in the daily temperature range in various parts of the world. While there was a slight increase in global precipitation by about 1% on land in the 20<sup>th</sup> century, there was a greater increase in the high latitudes of the Northern Hemisphere, especially in the cold season. Studies indicate that significant spatial and temporal changes have occurred in the past 100 years.

However, it is reported that the trends in increasing temperature (warming), precipitation, and decrease in daily temperature range are not the same globally (Nicholls et al., 1996; Zhang et al., 2000). On the other hand, it is reported that there are significant differences (increases–decreases) in the precipitation regime for various regions of the world (Popova et al., 2018). In a study examining temperature and precipitation trends in Bologna (Italy) from 1952 to 1999, it is emphasized that although the average annual precipitation was 750 mm, there was a lot of variability between years with a standard deviation of 159 mm. It is stated that this variability in the amount of precipitation is not statistically significant, but with a decrease of approximately 120 mm throughout the entire period, the region has evolved into a drier climate (Ventura et al., 2002).

Data from the Intergovernmental Panel on Climate Change (IPCC, 2001) report an increase in temperature of  $0.6\pm 0.2^{\circ}\text{C}$  during the 20<sup>th</sup> century. It is noted that most of the warming has occurred in the last 20 years, with the nineties being the warmest decade since 1861. In the same report, it is predicted that the global average surface temperature will increase between  $1.4\text{--}5.8^{\circ}\text{C}$  in the period 1990–2100 (Apak and Ubay, 2007). However, according to the IPCC's latest report (6<sup>th</sup> Assessment Report – AR6) published on August 9, 2021, global temperature is increasing much faster than expected. Additionally, the report states that the temperature increase between 2010 and 2019 was more than  $1^{\circ}\text{C}$  ( $1.07^{\circ}\text{C}$ ) compared to the period 1850–1900 (IPCC, 2021).

Like the results obtained worldwide, a study conducted in our country reports that there is a significant change in the amount of precipitation and that this change is seen in both winter and autumn seasons. It is stated that winter precipitation in the western provinces of Turkey has decreased significantly in the last fifty years, while autumn precipitation has increased mostly in stations located in the northern parts of Central Anatolia. In general, precipitation decreases on the Aegean and Mediterranean coasts of Turkey, whereas it increases on the Black Sea coasts (Apak and Ubay, 2007). Another study reveals that there is a partial temperature increase in the Black Sea climate region ( $0.3^{\circ}\text{C}$ ), but the increase in temperature manifests itself excessively ( $0.5\text{--}0.6^{\circ}\text{C}$ ) in Continental and Mediterranean climate conditions. These data coincide with the predicted surface temperature increases according to climate regions around the world (Bahadır, 2011). Apart from these studies, according to the IPCC 3<sup>rd</sup> evaluation report published in 2001, it is predicted that annual average temperatures in Turkey will increase by  $1\text{--}3^{\circ}\text{C}$  by 2050. It is estimated that precipitation will show a decreasing trend in the Mediterranean climate area (IPCC, 2001). Global climate changes, which increased especially after the 1950s and became a problem for the whole world in the 1990s, have been the subject of many studies, directly or indirectly, within the framework of the developments explained above (Gao and Giorgi, 2008; Evans, 2009; Bolat et al., 2016; Öztürk et al., 2016; Bolat et al., 2017; Bolat et al., 2018, Şensoy and Ateşoğlu, 2018). In this study, data between 1980 and 2022 (43-year period) from some stations (Anamur, Mersin–Central, and Silifke), from which regular data has been received for many years in Mersin province, were used. By examining monthly–annual average temperatures and monthly–annual total precipitation amounts, it was aimed to determine the changes in these parameters on a regional scale.

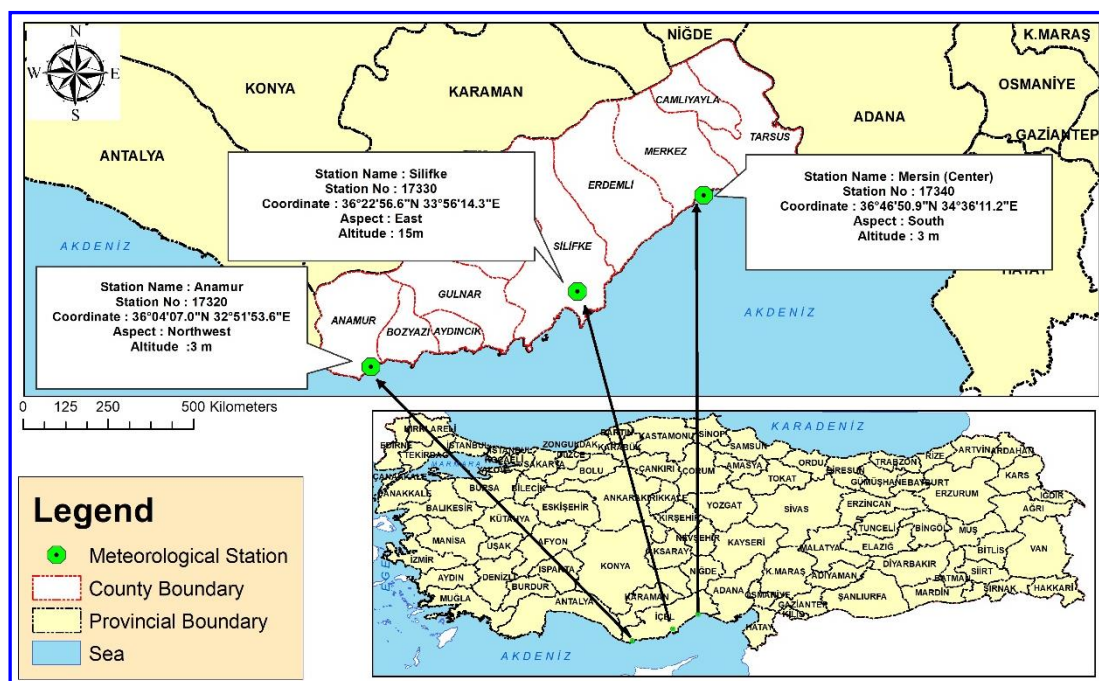

## MATERIALS AND METHODS

### Location of the Study Area

Mersin, one of the 81 provinces of Turkey, is located between  $36\text{--}37^{\circ}$  northern latitudes and  $33\text{--}35^{\circ}$  eastern longitudes. Mersin province, formerly known as İçel, is surrounded by Adana in the east, Antalya in the west, Niğde, Konya, and Karaman provinces in the north, and the Mediterranean Sea in the south. Due to its geographical location, Mersin is located in the west of the Çukurova section of the Mediterranean Region and covers a significant part of the Eastern Mediterranean Basin. The surface area of the province is  $15,853\text{ km}^2$  (Eren and Sezgin, 2017; URL–1, 2023).

### Study Data

In this study, periodic data of Anamur, Mersin (Central) and Silifke stations belonging to the Mersin Meteorology Station Directorate affiliated with the General Directorate of Meteorology for the years 1980–2022 (43 years) were used. Monthly and annual average temperature values, monthly average total precipitation, and annual total precipitation data of three stations with synoptic or automatic observation between 1980 and 2022 were evaluated. Annual averages are arranged as the arithmetic average of twelve months in the calendar year. Some information about the stations and their locations in Türkiye are given in Figure 1. The reason why this climate data is preferred is that changes in temperature and precipitation are the most important indicators of global climate change. While changes in temperature and precipitation affect the distribution of vegetation around the world, these changes also cause more extreme weather and climate events (Çepel, 2003; Türkeş, 2010; Liu et al., 2017).

**Figure 1.** Mersin province and location of meteorological stations

### Evaluation of Data and Statistical Analysis

Simple linear regression model (SLRM) was used to evaluate the average temperature and precipitation data used in the study. Whether there is a statistical difference ( $P < 0.05$ ) between the average temperature and total precipitation values of the meteorological stations was revealed by one-way analysis of variance (One-way ANOVA). S–N–K (Student–Newman–Keuls) test was applied to determine the different group or groups.

## RESULTS AND DISCUSSION

### Annual Average Temperature

The lowest average temperature in Mersin province Anamur meteorology station was 1992 ( $17.9^{\circ}\text{C}$ ) and the highest was 2018 ( $21.3^{\circ}\text{C}$ ) (Figure 2). According to SLRM (Figure 2), which shows the change over the years, the annual average temperature in Anamur tends to increase. The average temperature in Anamur between 1980 and 2022 is  $19.6^{\circ}\text{C}$  (Figure 5). According to this result, it is lower than the average temperature of Anamur compared to Mersin and Silifke. However, there is no statistical difference ( $P > 0.05$ ) between the average temperature values of Anamur, Mersin and Silifke (Figure 5).

**Figure 2.** Change in monthly average temperature values of Anamur meteorological station for long terms (1980–2022)

The lowest annual average temperature at the Mersin meteorology station in Mersin province was 1992 with a value of 18.0°C, and the year with the highest was 2018 with a value of 21.5°C. (Figure 3). SLRM (Figure 3) reveals that the annual average temperature in Mersin has an increasing trend ( $r = 0.8865$ ). The average temperature in Mersin between 1980 and 2022 is 19.9°C (Figure 5). This result shows that the average temperature of Mersin is higher than Anamur and Silifke. However, there is no statistical difference ( $P > 0.05$ ) between the average temperature values of Anamur, Mersin and Silifke (Figure 5).

**Figure 3.** Change in monthly average temperature values of Mersin meteorological station for long terms (1980–2022)

The average annual temperature at Silifke meteorological station was the lowest in 1992 with 17.8°C, and the highest in 2018 with 21.6°C. According to SLRM (Figure 4), it was revealed that the annual average temperature in Silifke has an increasing trend ( $r = 0.8329$ ). The average temperature in Mersin between 1980 and 2022 is 19.8°C (Figure 5). According to this result, the average temperature of Silifke is higher than Anamur and lower than Mersin. However, there is no statistical difference ( $P > 0.05$ ) between the average temperature values (Figure 5).

**Figure 4.** Change in monthly average temperature values of Silifke meteorological station for long terms (1980–2022)

As a result of the analysis of variance conducted to reveal whether there is a difference between the annual average temperature values of Anamur, Mersin, and Silifke, it was revealed that there is no difference ( $P > 0.05$ ). Between 1980 and 2022, Mersin has the highest (19.9°C) and Anamur the lowest (19.6°C) annual average temperature value (Figure 5).

**Figure 5.** Average temperature values of Anamur, Mersin and Silifke meteorological stations between 1980 and 2022. Columns represent mean  $\pm$  standard error. The same letters indicate that there is no difference between average temperatures ( $P < 0.05$ )

The average temperature in Türkiye between 2010 and 2020 is  $14.1^{\circ}\text{C}$ . According to long-term data, it is reported that the average temperature in Turkey between 1970 and 2020 was  $13.2^{\circ}\text{C}$  (URL-2, 2022). Between 1971 and 2021, the highest annual average temperature in Turkey was  $15.5^{\circ}\text{C}$  in 2010, and the lowest annual average temperature was  $11.7^{\circ}\text{C}$  in 1992. There have been positive temperature anomalies in Turkey's average temperatures since 1994 (except for 1997 and 2011). This result means that the annual average temperature in Turkey has an increasing trend (URL-3, 2023). The average temperature values of Anamur, Mersin, and Silifke, which are the subject of this study, are above the general average of Turkey. Like the increasing trend of the annual average temperature in Turkey, it was determined that the annual average temperature of Anamur, Mersin, and Silifke also tended to increase between 1980 and 2022 ( $r = 0.8448$ ;  $r = 0.8865$ ;  $r = 0.8329$ , respectively). According to a recent study, it has been reported that Turkey's summer and autumn temperatures have increasing trends and this warming is getting stronger. It is stated that this warming occurred relatively strongly in other regions except the Black Sea region (Türkeş, 2019). Based on the average temperature data from the study conducted at 27 stations in Turkey, it is reported that there are significant warming trends in the regions located in the south and southwest of Turkey, where a large amount of urbanization is experienced. However, it is emphasized that minimum temperatures show a general increasing trend and annual maximum temperature series tend to increase in the Mediterranean, Southeastern Anatolia, and the southern parts of Eastern Anatolia. Average temperatures in Turkey tend to increase, like global average surface temperatures. The rapid temperature increase, which has been continuing on a global scale since the 1980s, has been observed in Turkey since the 1990s (Demir et al., 2008). In a study conducted in the Western Black Sea region of Turkey, it was determined that the annual average temperature in Bartın, Zonguldak, and Düzce (Bartın;  $r = 0.568$ , Zonguldak;  $r = 0.653$ , Düzce;  $r = 0.584$ ) had an increasing trend (Bolat and Şensoy, 2023a). A similar result is seen in the study conducted in Sinop and Kastamonu regions. According to the SLRM result in the study, it is stated that the annual average temperature in Sinop ( $r = 0.498$ ) and Kastamonu ( $r = 0.225$ ) has an increasing trend (Bolat and Şensoy, 2023b). Results similar to those showing that the temperature is on an increasing trend in Turkey are also seen on a world scale. One of the many studies was conducted in Southern Canada with data covering the years 1900–1998. The results report increasing trends in annual and seasonal daily average temperatures. It is stated that there was a statistically significant positive trend corresponding to an increase of  $0.98^{\circ}\text{C}$  in the region, especially in the period 1961–1990 (Zhang et al., 2000). The results obtained in this study are compatible with the results of previous studies that draw attention to warming.

### Total Annual Precipitation

The change in annual total precipitation ( $P_{\text{TAn}}$ ) amount in Anamur, Mersin province is shown in Figure 6.  $P_{\text{TA}}$  was a minimum (447.10 mm) in 1990 and a maximum (1755.10 mm) in 2012. The average total precipitation ( $P_{\text{TAv}}$ ) in Anamur between 1980 and 2022 was recorded as 904.0 mm. This result shows that Anamur receives more  $P_{\text{TAn}}$  compared to Mersin and Silifke (Figure 9). There is also a statistical difference ( $P < 0.05$ ) between

$P_{TAn}$  values. On the other hand, according to the SLRM created with the  $P_{TAn}$  amount distribution (Figure 6), it was revealed that the amount of precipitation in Anamur was in a decreasing trend ( $r = -0.05$ ).

**Figure 6.** Change in annual total precipitation values of Anamur meteorological station between 1980 and 2022

The change in the annual total precipitation ( $P_{TAn}$ ) amount in Mersin is shown in Figure 7.  $P_{TAn}$  was minimum (301.60 mm) in 1982 and maximum (1033.70 mm) in 2012. During the period 1980–2022, the average total precipitation ( $P_{TAV}$ ) was recorded as 609.70 mm. This result reveals that Mersin receives less total annual precipitation than Anamur but more than Silifke (Figure 9). According to the SLRM created with  $P_{TAn}$  data (Figure 7), it was revealed that the amount of precipitation in Mersin tended to increase ( $r = 0.0979$ ).

**Figure 7.** Change in annual total precipitation values of Mersin meteorological station between 1980 and 2022

$P_{TAV}$  was minimum (300.50 mm) in 1999 and maximum (1007.70 mm) in 2001, and the change in the amount of  $P_{TAV}$  in the period 1980–2022 is shown in Figure 8. In Silifke,  $P_{TAn}$  was recorded as 561.0 mm in this period. According to this result, Silifke has less total annual rainfall than Anamur and Mersin (Figure 9). According to SLRM (Figure 8), it was revealed that the amount of precipitation in Silifke was in a decreasing trend ( $r = -0.0436$ ).

**Figure 8.** Change in annual total precipitation values of Silifke meteorological station between 1980 and 2022

As a result of the analysis of variance, it was revealed that there was a statistical difference ( $P < 0.05$ ) between the annual total precipitation of Anamur, Mersin and Silifke. According to the results of the S–N–K (Student–Newman–Keuls) test, Anamur was separated from Mersin and Silifke and placed in a different group, while Mersin and Silifke were included in the same group. Between 1980 and 2022, Anamur had the highest (904.0 mm)  $P_{TAV}$  value, while Silifke had the lowest (561.0 mm)  $P_{TAV}$  value (Figure 9).

**Figure 9.** Total precipitation values of Anamur, Mersin and Silifke meteorological stations between 1980 and 2022. Columns represent mean  $\pm$  standard error. Different letters indicate a difference between means at the  $P < 0.05$  significance level

It is reported that the average annual total precipitation in Turkey was 621.4 mm between 1970 and 2020, and 619.3 mm between 2010 and 2020 (URL–4, 2022). The average annual areal rainfall across Turkey between 1991 and 2020 is 573.4 mm. In terms of area, the average annual rainfall across Turkey between 1991 and 2020 is 573.4 mm. According to long–term averages, the highest precipitation in Turkey occurs above 1600 mm on the coasts of Rize and Artvin in the Eastern Black Sea Region, while the lowest precipitation is observed in the central parts of Central Anatolia and around Şanlıurfa and Iğdır. From 1930 to the present, 2008 is the year with the least precipitation (444.9 mm). In addition, precipitation in 2020 (500 mm) and 2021 (525 mm) was below normal. When evaluated spatially, the average precipitation in 2021 was 524.8 mm and there was a decrease of 8.5% compared to precipitation norms (URL–5, 2023). According to Turkey's long–term average rainfall values, Anamur and Mersin are above the average, while Silifke is below the average. In the regression analysis model made to determine the change in average total precipitation over the years, a relative increase

in Mersin ( $r=0.0979$ ) and a decreasing trend in Anamur ( $r=-0.05$ ) and Silifke ( $r=-0.0436$ ) were determined. Turkey's long-term trends and changes generally show that there is a significant decrease in winter and spring precipitation in the Marmara, Aegean, Mediterranean and Southeastern Anatolia regions, where the Mediterranean precipitation regime is dominant, and in the Central and Eastern Anatolia regions. In the cumulative rainfall calculated between 01 October 2013 and 17 January 2014 for Turkey in general, there was a decrease of 37% compared to the long-term average and 47.4% compared to 2013 (Türkeş, 2019). In a study conducted using data from 88 stations in Turkey for the period 1940–2006, although there was no significant trend in the annual standardized precipitation series, a slight increase was determined in the Black Sea and Continental Eastern Anatolia Regions and a slight decreasing trend in the Mediterranean, Mediterranean Transition, and continental Mediterranean regions (Demir et al., 2008). In a study conducted to determine the trend of average total precipitation by years, it was revealed that the average total precipitation tended to decrease in Bartın province ( $r=-0.081$ ) and increase in Zonguldak ( $r=0.423$ ) and Düzce ( $r=0.306$ ) provinces (Bolat and Şensoy, 2023a). On the other hand, in a study covering the years 1965–2015, no significant change trend was determined in monthly, seasonal, and annual precipitation in Bartın province (Yaman and Ertuğrul 2020). In a recent study in the Sinop and Kastamonu region, it was revealed that the average total precipitation in Sinop ( $r=-0.094$ ) and Kastamonu ( $r=-0.276$ ) provinces has a decreasing trend (Bolat and Şensoy, 2023b). Türkeş (2019) states that the variations in precipitation are not in the form of long-term trends but in the form of changes and fluctuations, but significant changes have been determined in the frequency and magnitude of dry-humid periods. It is noted that the spatial variation in precipitation variations is also strong. In terms of annual total precipitation trends, this study reveals similar results and is compatible with previous evaluations of precipitation trends and changes in Turkey.

## CONCLUSIONS

The average temperature of Mersin is higher than Anamur and Silifke. However, there is no statistical difference between the average temperature values of Anamur, Mersin and Silifke. When the average temperature changes of Anamur, Mersin and Silifke are examined, it is seen that the temperatures tend to increase. Average total precipitation is higher in Anamur than in Mersin and Silifke. The trend of average total precipitation is relatively increasing in Mersin and decreasing in Anamur and Silifke. There is also a statistical difference between the annual total precipitation values of Anamur, Mersin and Silifke. As a result of all these, it can be said that annual average temperatures tend to increase, while total annual precipitation may become irregular, and the downward trend is more dominant. It is predicted that the Mersin region will evolve into a drier climate. Therefore, in the following years, undesirable meteorological events such as floods, drought, and increased irregular rainfall may occur frequently in the Mersin region and even in the entire southern parts of Turkey.

## ACKNOWLEDGEMENTS

We would like to thank the Mersin Meteorology Station Directorate of the General Directorate of Meteorology of the Ministry of Environment, Urbanization, and Climate Change for the meteorological data used in the study.

#### Abstract

In order to reduce the amount of cement in concrete, researchers have turned to plant-derived additives in recent years. The addition of filler plays an important role in determining the mortar properties of cementitious composites. In this study, cement composites containing silver nanoparticles (AgNPs), multi-walled carbon nanotubes (MWCNTs), graphene oxide (GO) and sodium alginate (SOAL) were obtained. The thermal conductivity of these cement composites was measured and characterized using FTIR spectroscopy. The results showed that as the amount of sodium alginate increased in the cement mortar, the thermal conductivity decreased. The mechanical properties of sodium alginate added cement mortars could not be measured because the material dispersed during the curing process. It may be possible to determine its mechanical properties if mixed with different cement types instead of pozzolanic cement.

**Keywords:** Sodium alginate, vegetable cement paste, thermal conductivity, sustainability.

#### INTRODUCTION

The use of natural additives for sustainable concrete production has become extremely important with the increase in concrete production. Sustainability in concrete production is achieved by developing new concrete mixtures and improving performance (Greco et al., 2016). Natural additives and plant extracts have been shown to be valuable alternatives in the production of green and low-cost concrete, improving the mechanical properties of concrete while also reducing the production cost (Shanmugavel et al., 2020). Wang et al. (2023) used cactus sativus extract and mulberry leaf extract as additives in cement mortar making in their study and showed that these extracts increased the consistency of cement mortar and did not change the hydration reaction and hydration products of the mixture (Wang et al., 2023). Pan et al. (2023) reported that using carrot extract as a sustainable additive material significantly improved the mechanical properties and durability of concrete by increasing the compressive strength and splitting tensile strength of tunnel lining concrete (Pan et al., 2023).

Developments in nanotechnology in recent years affect many application areas such as chemical engineering, biology and construction (Dahlan et al., 2010). Nanomaterials provide extraordinary mechanical and thermal properties to cementitious composites thanks to their large surface areas. For this reason, the applications of these materials in the construction industry have attracted significant attention in recent years (Şimşek et al., 2021). When the literature is examined, it can be seen that carbon-based nanomaterials such as graphene oxide (Cheng et al., 2023), reduced graphene oxide (Wang R et al., 2023), and multi-walled carbon nanotubes (Mesquita et al., 2023) are being investigated to improve the thermal, optical, electrical, mechanical and other properties of cement composites (Bheel et al., 2023).

Sodium alginate ((C<sub>6</sub>H<sub>7</sub>O<sub>6</sub>Na)<sub>n</sub>) is a biodegradable and environmentally friendly bio-based polymeric additive consisting of the sodium salt of alginate, obtained by extraction from the cell walls of brown algae (Shang et al., 2022). It is seen as a low-cost alternative to synthetic additives and is reported to be renewable and abundant (Liu et al., 2023). Sodium alginate is rich in carboxyl and hydroxyl groups and has a circular long side chain structure (Yao et al., 2022). It also forms a viscous colloidal liquid when dissolved in water. Sodium alginate is widely applied in the field of cell engineering such as cell immobilization technology due to its good biocompatibility (Zhang et al., 2023).

It is reported that alginate can form gel when in contact with cementitious materials. Liu et al. (2022) in their study, they investigated the effect and retardation mechanism of sodium alginate on the hydration properties of magnesium potassium phosphate cement (MKPC) suspension and reported that sodium alginate could prolong the hydration of MKPC with limited content and further increasing the sodium alginate content would not produce a better effect (Liu et al., 2022).

In this study, it was aimed to investigate the effect of silver nanoparticles (AgNPs), multi-walled carbon nanotubes (MWCNTs) and graphene oxide (GO) nanomaterials as well as sodium alginate on the thermal conductivity of cement composites. At the same time, the obtained cementitious composites were characterized by Fourier transform infrared spectroscopy (FTIR).

## MATERIALS AND METHODS

### Materials

Pozzolanic-type cement (grade 32.5R) equivalent to CEM IV/B (specific gravity of 2.78, Blaine fineness: 5105 cm<sup>2</sup>/g) was used in this study. Polycarboxylate-ether-based type plasticizer (BASF Master Glenium 608) and distilled water were used for preparing cementitious composites. AgNPs (purity: >99.995%, size: 48-78 nm) and industrial grade MWCNT (purity: 92%, outer diameter: 48–78 nm, specific surface area: 50 m<sup>2</sup>/g) were supplied from Nanografi Nanotechnology. GO particles (D-peak-to-G-peak intensity: 0.9, specific surface area: 180 m<sup>2</sup>/g, thickness: 10–15 nm, average particle: 1.5–2 μm) were obtained by the improved Hummers method. Sodium alginate (molar mass: 216.121 g/mol) was supplied from Aromel Chemistry Medical.

### Mixing and Casting Procedure

Table 1 presents the formulation detail of cementitious composites and the water-to-cement ratio was kept constant at 0.428. for all mixtures. Since the consistency of the cement mortar increases as the amount of sodium alginate increases, the amount of superplasticizer used was adjusted accordingly. Sodium alginate were added at a dosage of 0%, 0.3%, 0.6% and 1.0% by mass of cement. Three hybrid SOAL-cementitious composites were prepared with AgNPs, MWCNTs and GO at a dosage of 0.1% wt. Cement, water, and the super-plasticizer were premixed for 2 min., then nanofillers were put into the mixture gradually and the fresh mix was mixed for 2 more min. to obtain a compact design. After 24 h., all samples were de-molded.

**Table 1.** Mix proportions for cementitious composites

Exp. No.	Compounds						
	Cement (g)	DIW (ml)	SP (g)	SOAL (g)	AgNPs (g)	MWCNT (g)	GO (g)
SOAL0	525	225 <sup>1</sup>	1.5	0	0	0	0
SOAL0.3	525	225	5.5	1.575	0	0	0
SOAL0.6	525	225	12	3.150	0	0	0
SOAL1	525	225	23	5.250	0	0	0
SOAL1AG	525	225	26	5.250	0.525	0	0
SOAL1CNT	525	225	26	5.250	0	0.525	0
SOAL1GO	525	225	26	5.250	0	0	0.525

## Characterization of Cementitious Composites

Fourier Transform Infrared Spectroscopy (FTIR) analysis were carried out on powdered cementitious composites to evaluate the chemical changes in the cementitious composites. In the analysis, Bruker Tensor II device with a wavelength range of 400 to 4000  $\text{cm}^{-1}$  was used.

## Thermal Conductivity Measurements

A C-Therm thermal conductivity analyzer (Figure 1) was used to determine the 28-day thermal conductivity of the samples, according to ASTM D7984-16 (D-16, 2016).

**Figure 1.** Thermal conductivity measurements of cementitious composites

## RESULTS and DISCUSSION

### FTIR Characterization

FTIR spectroscopy is frequently used to evaluate hydrated cement phases such as CSH (colloidal gel-like structures), portlandite, afwillite (crystalline microstructure) and calcite (Şimşek et al., 2022). FTIR spectra of the cementitious composites are given in Figure 2. The main characteristic peaks at 874, 1006 and 1100  $\text{cm}^{-1}$ , indicating CSH content, correspond to Si-O-Si stretching vibrations. The intensity of the peaks between 874 and 1100  $\text{cm}^{-1}$  decreased with the addition of sodium alginate. With the addition of 0.1 wt% MWCNT, the CSH peak intensity reached the highest level. The intensity of the peak observed around 1451  $\text{cm}^{-1}$  due to C-O stretching vibrations and attributed to calcite increased with sodium alginate content. The peaks at 2322, 2900 and 3394  $\text{cm}^{-1}$  correspond to the stretching vibrations of H-O-H and O-H can be attributed to H<sub>2</sub>O molecules.

C:\Users\Win7\Desktop\BABIb BYMPEK\SOAL 5-7-2023\SOAL 7.0.dpt	

**Figure 2.** FTIR spectra of cementitious composites

### Thermal Conductivity

Thermal conductivity results of the cementitious composites are given in Table 2. When the thermal conductivity results were examined, increasing the amount of sodium alginate in cementitious composites decreased the thermal conductivity values from 0.287 W/m.K to 0.194 W/m.K.

**Table 2.** Thermal conductivity results of the cementitious composites

	Temperature (°C)	Thermal conductivity (W/m.K)
<b>SOAL0</b>	22.28	0.287±0.010
<b>SOAL0.3</b>	22.44	0.280±0.011
<b>SOAL0.6</b>	25.05	0.249±0.004
<b>SOAL1</b>	25.00	0.194±0.007
<b>SOAL1AG</b>	25.47	0.168±0.004
<b>SOAL1CNT</b>	25.61	0.164±0.004
<b>SOAL1GO</b>	25.09	0.153±0.003

### CONCLUSION

In this study, it was aimed to analyse the properties of sodium alginate added cement mortars. Since it is a green material, it was preferred as an additive material and the following results were obtained:

As the amount of sodium alginate increased, the thermal conductivity of the cement mortar decreased and it was determined that it provided thermal insulation to the mortar.

In the mechanical tests performed on sodium alginate-added cementitious mortars, the 28-day compressive strength could not be determined due to the disintegration of the cement mortar. Even if graphene oxide and silver nanoparticle nanomaterials were added at 0.1% (by weight instead of cement), no significant improvement was observed in mechanical strength tests.

As a result of the study, it was concluded that different cement types should be used in order to use sodium alginate as a cement mortar substitute.

### Abstract

The increase in diversity in food production, which is associated with the diversification of technological developments and changes in consumers' nutritional habits, has also increased the number of processed foods. In this context, additives applied to food products play an important role in consumers' preferences. Food additives are substances added to food to maintain, enhance, or improve its safety, freshness, taste, flavor, texture, or appearance (WHO, 2018). Colorants, which constitute an important class of food additives, are used to gain consumer appreciation, strengthen the natural color, restore the color lost during processing, or color a colorless product. Colorants may be derived naturally from plants and animals or may be synthetic. Synthetic colorants used in food industries are relatively cheaper, more durable, and brighter than natural ones. On the other hand, studies show that these additives pose a toxicological risk to health. The potential health risks associated with the use of these additives cause concern among consumers and spark controversy in society. Many synthetic food colorants have been banned in some countries on the grounds that they are carcinogenic due to experimental studies. Conflicting results in current studies evaluating its possible effects on health increase the controversy.

**Keywords:** Food additives, colorants, health

### INTRODUCTION

With technological developments and changing consumer eating habits, the number of processed foods has also increased. Therefore, additives added to food products are important in consumers' preferences. (Silva vd., 2022).

Today, in the use of food additives in the food industry, many factors such as the sensory properties and nutritional value of the food, its ability to maintain its quality for a long time, and consumers' health and habits are taken into consideration. The diversification and widespread use of food additives also increases the risks to human health. The diversification and widespread use of food additives also increases the risks to human health (Bilişli, 2012).

In recent years, consumers' interest in sustainable foods, including compliance with environmental standards, food safety, product quality and effects on health, has increased. With the emergence of this awareness among consumers, food businesses have begun to consider the health risks of food products as well as their appeal (Gebhardt et al., 2020).

Despite using food additives in specified doses, some people who are sensitive to certain chemicals may experience many health problems such as allergies, hyperactivity, attention deficit, obesity, diabetes, gastrointestinal system, autoimmunity and neurodegenerative disorders (Körkoca and Bahşi, 2021; Sezgin and Ayyıldız, 2017). Therefore, before using food additives, their potentially harmful effects on human health should be evaluated. Recently, more and more attention has been paid to the toxicity of additives used in food. The Expert Committee on Food Additives (JECFA) is an international committee that conducts risk assessments of food additives (WHO, 2018). The European Parliament and the Council published a regulation stating that, as of 2009, the toxicity of food additives should be re-evaluated by the European Food Safety Authority (EFSA). EFSA is investigating available information on toxicity issues, particularly of synthetic food colourings, using official reports and current studies. The studies provide a summary of the evidence regarding the possible harmful effects of synthetic colorants and provide direction for future research (Amchova et al., 2015).

Food colorants constitute an important functional class of food additives. Recently, increasing attention has been paid to the toxicity of color additives used in foods, namely azo dyes. This group of colorants generally

consists of bright colors. However, the main concern that often limits their use is their potential carcinogenic effect following reaction with metabolites by the gut microbiota (Feng et al., 2012).

### **Food Additives and Toxicological Assessments**

Food additives can ensure the preservation of the quality and nutritional value of foods and increase their appeal, but their use in excessive amounts or for adulteration may cause potential risks to human health. Therefore, a risk assessment must be carried out before these additives are allowed to be used in foods (Bilişli, 2012).

Before starting to use food additives, ADI (Acceptable Daily Intake) and NOEAL (No Observable Adverse Effect Level) doses are calculated experimentally. "ADI" is the amount of additive that an adult can safely consume without experiencing any harmful effects, that is, the acceptable daily intake value. The ADI value is expressed as amount (mg) per body weight (kg). "NOEAL" is defined as the dose that does not cause any observable side effects for an additive. The ADI value is found by dividing the NOEAL value by the safety factor (100). When determining the maximum amount of use of a food additive in a food, the daily consumption amount and ADI value of foods containing this additive are considered (Amchova et al., 2015; Savaş, 2022). This value indicates the amount of food additive that can be consumed daily without posing a significant risk to consumer health (Amchova et al., 2015).

After food additives are approved by international organizations such as WHO, FAO, JECFA, a decision is made about which foods they can be added to and in what proportions. In the European Union (EU), safety assessments of food additives are carried out by a panel established within EFSA. The panel evaluates the safety of new food additives and the permitted uses of food additives. (EFSA, 2023). In our country, the competent authority for regulations regarding the use of food additives is the Ministry of Agriculture and Forestry.

### **Food Colorants**

Color is considered one of the most important features that directly affects the consumer's food choice and eating desire (Sezgin and Ayyıldız, 2017). Colourants, which are indispensable components to attract the attention of consumers and determine their preferences, constitute an important class of food additives (Ukwo et al., 2022).

Colorants are used to restore the natural color of foods lost during production and storage or to strengthen the weak color and present it to the consumer. Colorants are also called food dyes. Today, colorants are added to products that are considered snacks, such as cakes, chips, biscuits, chocolate, chewing gum, pudding, flavored milk, fruit yoghurt, candies and jellybeans, which are especially consumed by children (Sezgin and Ayyıldız, 2017).

Colorants can be classified according to different criteria. The most used classification is that they are divided into natural or synthetic according to their source. Natural colorants can be obtained from plant tissue (carotenoids, anthocyanins, curcumin, chlorophylls etc.), animal cells (carminic acid), microorganism metabolism or mineral sources (calcium etc). Synthetic dyes are obtained by chemical synthesis and are not found in nature (Novais et al, 2022).

The first synthetic dye was a purple pigment called mauve, derived by William Henry Perkin in 1856 (Mota et al., 2023). Synthetic food dyes are azo dyes (Tartrazine, Sunset Yellow FCF, Azorubine, Amaranth, Ponceau 4 R, Allura Red, Brilliant Black BN, Brown FK, Brown HT, Red 2 G, Lithol rubine BK, Brilliant Blue, FCF, Patent Blue V and Fast Green FCF), Erythrosine, Indigotin and Quinoline Yellow) (Amchova et al., 2015).

In order to identify food additives, inform consumers and avoid any confusion, food additives approved for use by the EU are given the "E" code. It consists of the letter "E" and 3-digit numbers. All chemicals defined as additives and used in foods, whether natural or artificial, are included in this coding system (Sezgin and Ayyıldız, 2017). Food colorants contain E codes between E 100-180 (Karatepe and Ekerbiçer, 2017).

According to the Turkish Food Codex (TGK) Food Additives Regulation, the list of all colorants allowed to be used in foods in Türkiye is given in Table 1.

**Table 1.** Food Colorants (TGK, 2013)

E-code	Name	E-code	Name
E 100	Curcumin	E 150d	Ammonium sulfite caramel
E 101	Riboflavin	E 151	Brilliant Black BN, Black PN
E 102	Tartrazine	E 153	Vegetable carbon
E 104	Quinoline Yellow	E 155	Brown HT
E 110	Sunset Yellow FCF/Orange Yellow	E 160a	Carotenes
E 120	Cochineal, Carminic acid, Carmine	E 160b	Annatto, Bixin, Norbixin
E 122	Azorubine, Carmosine	E 160c	Paprika extract, Capsanthin
E 123	Amaranth	E 160d	Lycopene
E 124	Ponzo 4R, Cochineal Red A	E 160e	Beta-apo-8'-carotenal (C30)
E 127	Eritrosin	E 161b	Lutein
E 129	Allura Red AC	E 161g	Canthaxanthin
E 131	Patent Blue V	E 162	Beet root red, betanin
E 132	Indigotin, indigo carmine	E 163	Anthocyanins
E 133	Brilliant Blue FCF	E 170	Calcium carbonate
E 140	Chlorophylls and chlorophyllins	E 171	Titanium dioxide
E 141	Copper complexes of chlorophylls	E 172	Iron oxides, hydroxides
E 142	Green S	E 173	Aluminum
E 150a	Caramel	E 174	Silver
E 150b	Caustic sulphite caramel	E 175	Gold
E 150c	Ammoniac caramel	E 180	Litolrubin BK

### Synthetic Food Colorants and Toxicity Assessment

Existing studies published since the 2009 EFSA official report have been reviewed and information on the toxicity of synthetic food colorants has been re-evaluated (Amchova et al., 2015).

Synthetic colorants are common ingredients added to food products, some of which can be metabolized by enzymes and absorbed or excreted after consumption. Metabolized dyes can become toxic and adversely affect health if consumed in large quantities (Gholami et al., 2021a, Rahnama et al., 2022). Studies provide evidence of the possible harmful effects of food coloring mixtures on children's behavior. Excessive consumption may aggravate attention deficit hyperactivity symptoms and asthma in sensitive children. Moreover, frequent headaches, cancer formation, neurological and genetic disorders, chromosomal damage, thyroid tumors, urticaria, allergies, respiratory problems, abdominal pain, weakening of the immune system, serious damage and disorders in fat metabolism, decrease in IQ and vitamin levels, etc. may cause (Gholami et al., 2021b).

Due to their negative effects on health, natural dyes extracted from plant materials of known origin are generally preferred by consumers in foods instead of synthetic dyes. However, instead of natural dyes, manufacturers have turned to synthetic dyes due to their low cost, stability and more attractive colors. (Shakoor et al., 2022). Today, numerous side effects (allergic reactions, behavioral and neurocognitive effects, and toxicity, etc.) are associated with both medium and long-term use of food colorants (Martins et al., 2016).

Tartrazine (E102) is a lemon yellow artificial azo dye used in products such as confectionery, sauces, chewing gum, puddings, beverages and ice cream. The FDA recommends an ADI of 3.75 mg/kg for tartrazine. Additionally, WHO recommends limiting ADI to 2.5 mg/kg (He et al., 2018). In a study, the neurobiochemical effects were investigated by giving ADI amount of tartrazine to rats, and it was found that tartrazine caused oxidative damage in brain tissue (Bhatt et al., 2018). For another azo dye, sunset yellow (E110), the ADI value allowed by JECFA and EFSA is 0-2.5 mg/kg body weight (EFSA, 2014). Certain studies have shown that dyes such as sunset yellow and tartrazine cause allergic reactions such as dermatitis, urticaria, exacerbation of asthma in sensitive individuals, and restlessness. Besides, it was reported that these colorants exacerbate sleep disorders and hyperactivity in children (Rahnama et al., 2022).

Quinoline yellow (E104) is also an artificial azo dye. It is used in products such as fruit drinks and chewing gum (25). A study not evaluated by JECFA and EFSA found increased hyperactivity in children aged 8-9 years exposed to quinoline yellow. EFSA Panel on Food Additives and Nutrient Sources added to Food (ANS) evaluated the studies and concluded that quinoline yellow has negative long-term carcinogenicity as well as in

vitro genotoxicity. The panel determined the ADI value as 0.5 mg/kg using the NOAEL obtained from the chronic toxicity and carcinogenicity study with reproductive toxicity stage in rats (EFSA, 2009a). A study has shown that quinoline yellow used in concentrations above the determined ADI value causes a mutagenic effect on human lymphocytes (Chequer et al., 2015).

Azorubine/Carmosine (E122) is a red-colored azo dye that is licensed as a food additive in the EU and is widely used in the food, pharmaceutical and cosmetic industries. In 2009, the EFSA ANS Panel re-evaluated the safety of the use of E122 as a food additive and the levels of use permitted in the legislation. The ADI value determined based on this evaluation is 0-4 mg/kg (EFSA, 2009a).

Amaranth (E123) is a synthetic dye with a red-brown appearance. It is used in cherry candies, some types of alcoholic beverages and fish roe (Gültekin, 2021). The ADI value, which was determined as 0-0.8 mg/kg for E123 based on the results of a 90-day animal trial study by JECFA and EFSA, was changed to 0-0.5 mg/kg after a long-term carcinogenicity study in animals. In 2010, the ADI of E123 was re-evaluated by the ANS Panel and determined as 0.15 mg/kg. Nowadays, allura red is preferred instead of amaranth due to its negative effects on health (EFSA, 2010a).

Allura Red (E129) is a colorant permitted for use in food and beverages, dietary supplements, pharmaceuticals and other consumer products worldwide (Gültekin, 2021). It is approved as a color additive by the "Food, Drug and Cosmetics" Committee in the USA. Research conducted since 1980 has shown that this colorant is genotoxic, etc. Although its effects are controversial, it was evaluated to be safe as a food additive at the last JECFA meeting in 2016 and its ADI value was determined as 0-7 mg/kg body weight/day (Joint, 2016). Consistent evidence has been found in many in vitro and in vivo studies that Allura red does not have carcinogenic and genotoxic potential (Bastaki et al., 2017).

Studies have shown that some food additives cause hyperactivity in children. A recent study in England found that children with no history of hyperactive disorder showed varying degrees of hyperactivity after consuming fruit drinks containing varying levels of additives. Tartrazine (E102), quinoline yellow (E104), Sunset yellow (E110), Carnosine (E122), Allura red (E129) were among the colorants examined (Kumar and Joshi, 2023).

Brilliant Blue (E133) is obtained from petroleum and is widely used all over the world. It is a food dye that is allowed to be used in many countries, including the EU, Japan, the USA and Turkey. It is used to color breakfast cereals, cakes, candies, chewing gum, dairy products, beverages, packaged soups, desserts, creams, flavored waters, frozen treats, etc. The ADI value for E133 by EFSA is 6.0 mg/kg body weight per day (Joint, 2017; EFSA, 2010b).

Indigotin (E132) is another food coloring of artificial origin. It is blue at pH 11.4 and yellow at pH 13.0. It is very sensitive to light and oxidizing substances. It is used in flavored and alcoholic beverages, sauces, confectionery, flavored fermented milk products, spices, desserts, edible ice and snacks. ADI value is 5 mg/kg. No changes or side effects were detected in chronic toxicity studies at doses lower than 500 mg/kg. However, some studies have reported the possible presence of potentially carcinogenic substance residues on human health and side effects such as allergy. In addition, simultaneous consumption with delicatessen products containing sodium nitrite (E250) is not recommended. Studies in animal models have reported adverse health effects such as nausea, vomiting, skin rashes, and brain tumors (Silva et al., 2022).

Iron oxides (E172) are widely used to color desserts, olives or the outer surface of cheese. E172 can be black, yellow, red or orange-brown. The ADI value has been determined by JECFA as 0.5 mg/kg body weight. Since there is no adequate biological and toxicological database, they are considered safe food pigments with low acute toxicity. E172 is permitted for use in cosmetics only in the United States. It is used as food coloring in many other countries, including our country (Sun et al., 2017; EFSA, 2015).

It is known that most approved food colorants are synthetic and have carcinogenic potential with side effects, toxicity and other adverse reactions when used incorrectly. In this regard, regulatory bodies around the world have banned some synthetic additives. However, a global consensus on food additives legislation has not yet been established. For example, Coloring agents Carmoisine (E122), amaranth (E123), and patent blue (E131) are allowed in the EU but banned in the USA. For all these reasons, especially in developed countries, curcumin (E100), carmines (E120), chlorophylls (E140, E141), carotenes (E160a), anatto extracts (E160b), paprika extract (E160c), lycopene (E160d), beet root (E162), anthocyanins (E163), such as there is a need to use natural additives with fewer side effects (Carocho et al., 2014; Novais et al., 2022).

## CONCLUSION

The use of food colorants to improve and improve the sensory properties of foods is a technological necessity. The use of colorants contrary to legislation poses a risk to food safety. Additionally, most food colorants are synthetic, which raises concerns among consumers. Although research on food colorants and their effects on health is increasing day by day, health risks remain unclear, especially due to conflicting results obtained regarding synthetic colorants. This situation brings about discussions about the reliability of synthetic food colorants.

In order to prevent the use of food colorants contrary to the legislation, food producers should be made aware of this issue, inspected and control mechanisms should be constantly improved. Consumers should be made aware of synthetic food colorants and the health effects of foods containing them. In this context, it is important to avoid food items containing synthetic colorants that are considered dangerous to health or to reduce their use in the diet in order to avoid possible risks. Consumption of foods containing these additives should be limited, especially in children, pregnant women and sensitive people.

#### Özet

Bu çalışmada, streptozotosin (40 mg/kg, s.c.) ile indüklenmiş diyabetik sıçanlarda beyin ve testis lipid değerleri üzerine Rosemary (biberiye) yağının etkinliği test edilmiştir. Otuz iki Wistar albino sıçan dört gruba ayrılmıştır: sağlıklı kontrol (K, n:6), Rosemary (RSM, n:6), diyabetik kontrol (DM, n:10) ve diyabetik + Rosemary (DM+RSM, n:10). Kontrol ve DM gruplarına herhangi bir tedavi uygulaması yapılmazken, RSM ve DM+RSM gruplarına Rosemary yağı (günde 200 mg/kg, oral) 21 gün boyunca uygulanmıştır. DM grubunda beyin ve testis total trigliserit (TG) ve kolesterol (TC) düzeyleri kontrol grubuna göre istatistiksel olarak önemle derecede artmıştır. Diyabet oluşturulan grupların Rosemary ile tedavi edilmesi (DM+RSM) ise bu etkileri tersine çevirerek bu lipid profilleri üzerine iyileşme sağlamıştır. Bu çalışmanın bulguları, biberiye uygulamasının diyabetik sıçanlarda daha iyi lipid profili sağladığını göstermektedir.

**Anahtar Kelimeler:** Diyabet, beyin, biberiye, kolesterol, testis, trigliserit.

#### The Effect of Rosemary Oil on Cholesterol and Total Triglyceride Levels in Diabetic Rats' Brain and Testis

#### Abstract

In this study, the effectiveness of Rosemary oil on brain and testis lipid levels was tested in diabetic rats induced with streptozotocin (40 mg/kg, s.c.). Thirty-two Wistar albino rats were divided into four groups: healthy control (K, n:6), Rosemary (RSM, n:6), diabetic control (DM, n:10), and diabetic + Rosemary (DM+RSM, n:10). While no treatment was applied to the control and DM groups, Rosemary oil was administered to the RSM and DM+RSM groups orally at a dose of 200 mg/kg for 21 days. In the DM group, total triglyceride (TG) and cholesterol (TC) levels in the brain and testis were significantly increased compared to the control group. Treatment with Rosemary in the diabetic groups (DM+RSM) reversed these effects, leading to an improvement in these lipid profiles. The findings of this study demonstrate that Rosemary application provides a better lipid profile in diabetic rats.

**Keywords:** Diabetes, brain, rosemary, cholesterol, testicles, triglycerides.

#### GİRİŞ

Diyabetes mellitus (DM), vücutta insülin aktivitesinin azalması veya insülin salınımının azalması sonucu meydana gelen bir metabolik bozukluktur. Hastalığın ilerlemesiyle birlikte, vücutta kaçınılmaz olarak nefropati, retinopati ve kardiyovasküler komplikasyonlar gibi patolojik değişiklikler meydana gelir (Padhi ve ark., 2020). Tip 2 Diyabetes Mellitus (T2DM), insüline duyarlı dokularda yetersiz insülin etkisi ve anormal insülin salınımı nedeniyle yüksek kan glukoz seviyeleri ile karakterize edilen en yaygın metabolik bozukluklardan biridir (Li ve ark., 2012, Roden ve Shulman 2019). Beta hücreleri, metabolik ihtiyaçları karşılamak için yeterli insülin üretme veya salgılama kapasitesini kaybettiğinde veya periferik dokular, insülin sinyaline yanıt verme yeteneklerini yitirerek insülin direnci geliştirdiğinde, bu durum açlık plazma glukoz seviyelerinin yükselmesine neden olur (Zaccardi ve ark., 2016). İnsülin direnci genellikle T2DM teşhisinden önce ortaya çıkar ve yüksek TAG ve NEFA, düşük HDL-C seviyeleri ve aterosjenik küçük yoğun LDL partiküllerinin baskınlığı ile karakterize edilen belirgin bir dislipidemi ile birlikte görülür (Filippatos ve ark., 2017, Galicia-Garcia ve ark., 2020). T2DM'li hastalar arasında diyabetik dislipidemi (DD) çok yaygındır (prevalans %72-85) (Turner ve ark., 1998, Vergès 2015). DD, aterosklerozun oluşumunda ve ilerlemesinde

merkezi bir rol oynadığından, bu fenomen DM'si olmayan bireylere kıyasla önemli ölçüde artmış kardiyovasküler hastalıklar riski ile ilişkilidir (Battisti ve ark., 2003). DD'nin başlıca kantitatif lipoprotein anormallikleri artmış trigliseritler (TG'ler) ve total kolesterol (TC) ile ilişkilidir (Doucet ve ark., 2012). DD, temel olarak yağ dokusu ve karaciğerin bozulmuş insülin duyarlılığına bağlı olarak gelişir. Yağ dokusu insüline karşı dirençli hale geldiğinde, hormona duyarlı lipazın inhibisyonu ve glikoz emiliminin azalması nedeniyle kontrolsüz lipoliz gözlenir ve dolaşımdaki NEFA seviyelerinin artmasına neden olur (Filippatos ve ark 2017, Galicia-Garcia ve ark 2020). Karaciğerde, insülin TAG bakımından zengin lipoprotein üretimini düzenler; yani insülin direnci durumunda, hepatik aşırı üretim nedeniyle dolaşımdaki VLDL artar (Filippatos ve ark 2017, Galicia-Garcia ve ark 2020). T2DM ile ilişkilendirilen hiperglisemi ve hiperinsülinemi, HDL'nin yapısı ve işlevini etkileyebilir (Constantinou ve ark., 2016, Xepapadaki ve ark., 2021). T2DM'de dislipideminin patofizyolojisi tam olarak anlaşılmamış olsa da hiperglisemi, insülin direnci, hiperinsülinemi, adipokinler ve adipositokinler gibi çeşitli faktörlerin rol oynadığı düşünülmektedir (Taskinen 2003). Son gelişmeler, potansiyel olarak aterosklerotik lipid ve lipoprotein anormalliklerinin bir kümesi olan diyabetik dislipideminin karmaşık doğasını kabul etmiştir (Navab ve ark., 2011). DD'nin ana bileşenleri artmış plazma trigliseritleri ve düşük HDL kolesterol konsantrasyonlarıdır ve bu bileşenler, küçük yoğun LDL ve aşırı postprandiyal lipemi gibi daha yeni tanımlanan özelliklerle metabolik olarak sıkı bir ilişki içindedir (Taskinen 2003). Bu nedenle son yıllarda, DM ve DD gibi çeşitli metabolik sendromların tedavisinde yaygın olarak araştırılan, daha az yan etkiye sahip ve çok hedefli tedaviye yönelik bitkisel ilaçlara ilgi giderek artmaktadır (Ramadan ve ark., 2013, Bhatti ve ark., 2022).

*Rosmarinus officinalis* Linn. (Lamiaceae), biberiye (Rosemary) olarak bilinen, hipoglisemi tedavisinde kullanılan, çok çeşitli farmakolojik aktivitelere sahip, yenilebilir, tıbbi, süs ve esansiyel yağ içeren bir bitkidir (Kontogianni ve ark., 2013, Abdelrahman ve ark., 2020). Önemli bir şekilde, son klinik çalışma, T2DM hastalarının biyokimyasal parametrelerinin, antropometrik parametrelerinin ve lipid peroksid seviyelerinin, 3 ay boyunca biberiye çayı tüketiminden sonra önemli ölçüde azaldığını ve pankreatik  $\beta$ -hücre işlevinin ve insülin direncinin önemli ölçüde iyileştiğini bulmuş, bu da biberiyenin diyabet üzerindeki tedavi edici etkisini doğrulamıştır (Quirarte Báez ve ark., 2019). Ancak, biberiye uygulamasının diyabetle ilişkili olarak beyin ve testis lipid profilleri üzerindeki etkileri hala tam olarak anlaşılamamıştır. Bu yüzden mevcut çalışmada deneysel olarak (streptozotosin-STZ) DM oluşturulan ratlarda biberiyenin beyin ve testis dokuları trigliserid (TG) ve total kolesterol (TK) düzeyleri üzerine etkinliği araştırılmıştır.

## MATERYAL VE METOT

### Deney Hayvanı Temini ve Etik Kurul Kararı

Tüm deneysel prosedürler, hayvan refahına ilişkin Avrupa Ekonomik Topluluğu Direktiflerine (86/609/CEE ve 2010/63/EU) uygun olarak gerçekleştirildi. Çalışma sırasında sıçanlar, 12 saat gündüz ve 12 saat gece ışık döngüsüne sahip, oda sıcaklığı  $22\pm 2^\circ\text{C}$  ve  $50\pm 10\%$  nem olan kafeslerde barındırıldı. Selçuk Üniversitesi Veteriner Fakültesi Deney Hayvanı Üretim ve Araştırma Merkezi Etik Kurulu, çalışmanın araştırma etiğine uygunluğunu onayladı (Onay No: 2021-61).

### Deneysel Grupların Oluşturulması ve Lipid Profilinin Belirlenmesi

Araştırmada 250-300 gr ağırlığında 32 adet sağlıklı yetişkin Wistar Albino sıçan kullanıldı. Ratlar şu şekilde dört gruba ayrıldı: Grup I (K, n:6): Herhangi bir uygulama yapılmadı. Grup II (RSM, n:6): 3 hafta boyunca her gün oral yolla 200 mg/kg biberiye yağı verildi (Yesilbag ve ark., 2011). Grup III (DM, n:10): Çalışmanın başlangıcında iki gün boyunca günde tek doz subkutan 40 mg/kg streptozotosin verilerek diyabet oluşturuldu. Diyabet oluşumu gerçekleşen ratlara herhangi bir uygulama yapılmadı. Grup IV (DM+RSM, n:10): Çalışmanın başlangıcında iki gün boyunca günde tek doz subkutan 40 mg/kg streptozotosin ile diyabet oluşturuldu. Diyabet oluşumu gerçekleşen ratlara 3 hafta boyunca her gün oral yolla 200 mg/kg biberiye yağı verildi.

Deneme gruplarında (DM ve DM+RSM), streptozotosin enjeksiyonundan bir hafta sonra ratların kuyruk venasından alınan kanlarını glikometre ile ölçerek diyabet oluşumunu kontrol ettik. Kan glikoz düzeyi 250 mg/dl'nin üzerinde olan ratlar, diyabet gruplarına dahil edildi. Deneysel çalışmanın ardından tüm hayvanlara sedasyon altında (10 mg/kg ksilazin ve 90 mg/kg ketamin) ötenazi ve nekropsi uygulandı. Servikal dislokasyon yöntemiyle ötenazi edilen hayvanların beyinleri ve testisleri hızlı bir şekilde çıkarılıp tuzlu su ile yıkandıktan sonra sıvı nitrojenle donduruldu, TG ve TC düzeyleri belirlenene kadar  $-80^\circ\text{C}$ 'de saklandı. Beyin ve testis dokularında TG ve TC düzeyleri otoanalizörde belirlendi.

## İstatiksel Analizler

Çalışmada elde edilen veriler SPSS istatistik programı yardımıyla One-Way ANOVA testi ve ardından çoklu karşılaştırma testlerinden Duncan testiyle analiz edilerek grupların ortalama değerleri arasındaki farkların önem dereceleri istatistiksel yöntemlerle belirlendi. Sonuçlar ortalama  $\pm$  ortalamanın standart deviation şeklinde tablolandı. Tüm şekiller GraphPad Prism version 5.0 for Windows (GraphPad Software, San Diego, California USA) kullanılarak üretilmiştir.

## BULGULAR

### Biberiye tüketimi DM'ye karşı beyin ve testis TG ve TC düzeyini iyileştirdi

Biberiye kullanımının, diyabetes mellitus'a karşı fitofarmakolojik tedavisinin potansiyeline dair veriler Tablo 1'de sunulmuştur. DM grubunun beyin ve testis dokularındaki total trigliserid (TG) ve kolesterol (TC) düzeyleri, kontrol grubuna kıyasla istatistiksel olarak anlamlı bir şekilde yükselmiştir ( $p < 0.05$ ). Ayrıca, biberiye takviyesinin özellikle beyinde TC düzeyini azalttığı ( $p < 0.05$ ) ve hatta kontrol grubuyla benzer seviyelere getirdiği gözlemlenmiştir. Buna ek olarak, bu fitoterapötik uygulamanın her iki dokuda da TG düzeylerini, DM grubuna göre anlamlı bir şekilde azalttığı tespit edilmiştir ( $p < 0.05$ ).

**Şekil 1.** Biberiyenin () STZ ile deneysel diyabet modeli oluşturulan ratlarda beyin total kolesterol (TC) ve beyin trigliserit (TG) düzeylerine etkisi. '\*\*\*'; Kontrol grubuna göre istatistiksel olarak anlamlı farklılık göstermektedir ( $p < 0,05$ ), '###'; DM grubuna göre istatistiksel olarak anlamlı farklılık göstermektedir ( $p < 0,05$ ). 'ns'; Kontrol grubuna göre istatistiksel olarak anlamlı bir fark olmadığını göstermemektedir ( $p > 0,05$ ). RSM: Üç hafta boyunca günde 200 mg/kg vücut ağırlığında oral biberiye yağı uygulanan grup. DM: STZ ile diyabet oluşturulan grup. DM+RSM: STZ ile diyabet oluşturulduktan sonra üç hafta boyunca günde 200 mg/kg vücut ağırlığında oral biberiye yağı uygulanan grup.

**Şekil 2.** Rosemary'nin (RSM, 200 mg/kg vücut ağırlığı/gün) STZ ile deneysel diyabet modeli oluşturulan ratlarda (DM) testis total kolestrol (TC) ve testis trigliserit (TG) düzeylerine etkisi. '\*\*\*'; Kontrol grubuna göre istatistiksel olarak anlamlı farklılık göstermektedir ( $p < 0,05$ ), '###'; DM grubuna göre istatistiksel olarak anlamlı farklılık göstermektedir ( $p < 0,05$ ). 'ns'; Kontrol grubuna göre istatistiksel olarak anlamlı bir fark olmadığını göstermemektedir ( $p > 0,05$ ). RSM: Üç hafta boyunca günde 200 mg/kg vücut ağırlığında oral biberiye yağı uygulanan grup. DM: STZ ile diyabet oluşturulan grup. DM+RSM: STZ ile diyabet oluşturulduktan sonra üç hafta boyunca günde 200 mg/kg vücut ağırlığında oral biberiye yağı uygulanan grup

## TARTIŞMA

Diyabetin glukoz metabolizması üzerindeki etkilerini inceleyen çok sayıda çalışma mevcutken, diyabetin komplikasyonlara yatkın dokuların lipid içeriği ve metabolizmasını nasıl etkilediğini araştıran çalışmaların sayısı oldukça sınırlıdır. Bu bilgi eksikliğini ele almak amacıyla araştırma grubumuz, beyin ve testis dokularındaki trigliserit (TG) ve toplam kolesterol (TC) düzeylerini ve bu lipidler üzerine iyileştirici etkisi olabileceğini düşündüğümüz biberiye (rosemary) yağının etkinliğini incelemiştir. Bu çalışmada, oral yolla verilen biberiye yağının, STZ ile oluşturulan diyabet modeli üzerinde beyin ve testis dokularında TC ve TG düzeylerini nasıl etkilediğini değerlendirdik. Deneylerimiz sonucunda, diyabet oluşturulan ratların beyin ve testis dokularında TG ve TC düzeylerinin arttığını fakat üç hafta boyunca günde 200 mg/kg oral yolla uygulanan biberiye yağının bu profili iyileştirdiğini gösterdik.

T2DM'de glisemik kontrolün iyileşmesine rağmen diyabetik komplikasyon riskinin devam etmesi, metabolik sendromun diğer bileşenlerinin bu komplikasyonların başlangıcında ve ilerlemesinde rol oynayabileceğini düşündürmektedir (Eid ve ark., 2019). DM'nin makrovasküler komplikasyonlarıyla yakından ve nedensel olarak ilişkili olan en önemli bileşenlerinden biri diyabetik dislipidemi (DD) (Turner ve ark 1998, Farmer 2008). T2DM hastalarında hiperinsülinemi, sıklıkla DD ile ilişkilidir (Isomaa ve ark., 2001). Yüksek kan glukozu ve insülin direncine yanıt olarak artan hepatik lipogenez ve yağ dokusu yağ asidi metabolizması hem tip 1 hem de tip 2 diyabette dislipidemiye katkıda bulunur (Vergès 2015). Araştırmamız sonuçlarına göre, DM'li sıçanlarda beyin ve testislerinde TG ve TC düzeylerinde kontrol grubuna kıyasla artışlar tespit edilmiştir. Birçok çalışma, plazma TG düzeylerindeki artıştan sorumlu patojenik mekanizmaların esas olarak TG'den zengin lipoprotein partiküllerindeki, özellikle de insülin direnciyle doğrudan bağlantılı olan büyük VLDL'deki artışın bir sonucu olduğunu belgelemiştir (Taskinen 2003, Selmi ve ark., 2017). Bunun yanı sıra beyinde TC'deki bu artış HMG-CoA redüktaz aktivitesinin artmasından kaynaklanmaktadır (Bopanna ve ark., 1997). Ayrıca diyabetik sıçanların beyinde gözlenen yüksek TG seviyeleri ise insülin eksikliği ile ilişkilidir, çünkü normal koşullar altında insülin TG'leri hidrolize eden lipoprotein lipaz enzimini aktive etmektedir (Mainzen Prince ve ark., 2011). DM'nin dünya çapında artan insidansı, kaçınılmaz olarak üreme çağındaki erkeklerde bu patolojinin daha yüksek prevalansı ile sonuçlanacaktır ve DM ile ilişkili subfertilite veya infertilitenin

önümüzdeki yıllarda dramatik bir şekilde artması beklenmektedir (Alves ve ark., 2013). Sonuçlarımızla benzer şekilde DM'nin rat testis dokularında kolesterol, esterleşmemiş yağ asitleri, trigliseritler ve fosfolipitleri artırdığı da bildirilmiştir (Ma ve ark., 2023). Her ne kadar DM'nin erkek üreme sağlığını reaktif oksijen türlerinin aşırı üretimi üzerinden bozsa da, testisi hangi mekanizmalarla etkilediği tam olarak bilinmemektedir (Atta ve ark., 2017). Ayrıca DM'nin erkek üreme fonksiyonu üzerinde farklı düzeylerde önemli bir etkisi olduğu görüşü de vardır (Alves ve ark., 2013).

Tip 2 diyabetin patofizyolojisinde obezite ve dislipidemi gibi faktörlerin rol oynadığı bilinmektedir (Kahn ve ark., 2006). Bu nedenle, bu değişikliklerin geri çevrilmesi, diyabetin ve onun komplikasyonlarının yönetimi ve tedavisinde etkili bir strateji olabilir (Sobczak ve ark., 2019). Mevcut araştırmamızda, biberiye yağının, diyabet grubuyla karşılaştırıldığında beyin ve testislerdeki TG ve TC düzeylerini azalttığı bulunmuştur. Çalışmamızda benzer şekilde STZ ile indüklenen diyabetik sıçan modelinde, biberiye sıcak su ekstresi günde 0,55 g/sıçan dozunda oral olarak verilmiş ve uygulamayı takiben kan şekeri, kolesterol, TG, LDL'de önemli bir düşüş ve HDL'de artış gözlenmiştir (Abu-Al-Basal 2010). Ayrıca STZ ile diyabet oluşturulan farelerde biberiye uygulamasının plazma glikoz, TG, TC ve LDL-C seviyelerini düşürdüğü, HDL-C'yi ise arttırdığı bildirilmiştir (Al-Jamal ve Alqadi 2011). Yukarıdaki bulgulara benzer şekilde, biberiyenin sulu ekstresi (200 mg/kg, STZ uygulamasından 2 hafta önce ve 3 hafta sonra) STZ-diyabetik sıçanlarda TC, LDL, TG ve HDL plazma seviyelerini iyileştirmiştir (Alnahdi 2012). Biberiyenin her iki dokuda da göstermiş olduğu hipolipidemik etki kısmen hem bağırsak emiliminin hem de lipid biyosentezinin baskılanmasıyla ilişkili olabileceği düşünülmüştür. Biberiye ve aktif bileşikleri lipid sentezinin yanı sıra TG sentezinden sorumlu ana enzimler olan DGAT1 ve DGAT2 üzerinden lipolizi de modüle edebilir (Cui ve ark., 2012). Biberiye ve aktif bileşikleri ayrıca Faz 2 enzimlerinin indüksiyonu yoluyla dislipidemiği iyileştirebilir (Takahashi ve ark., 2009). Fakat hayvan ve *in vitro* deneylerden elde edilen birçok kanıtla rağmen, biberiyenin insanlardaki etkinliğini ve güvenliğini doğrulamak için daha fazla klinik çalışmaya ihtiyaç vardır.

## SONUÇ

Sonuç olarak, bu çalışma, biberiye yağının, streptozotosin ile oluşturulan diyabetli sıçan modelinde beyin ve testis dokularındaki trigliserit (TG) ve toplam kolesterol (TC) seviyelerini azalttığını göstermektedir. Diyabetin lipid profilleri üzerindeki olumsuz etkileri, biberiye yağı uygulaması ile tersine çevrilebilmektedir. Bu bulgular, biberiye yağının diyabetle ilişkili lipid değişiklikleri üzerinde olumlu etkilere sahip olabileceğini göstermektedir. Ancak, biberiye yağının benzer etkileri ve güvenlik profillerini insanlarda gösterip göstermediğini doğrulamak için daha fazla klinik araştırmaya ihtiyaç vardır. Yine de bu çalışma, diyabetin bu dokulardaki lipid metabolizmasını nasıl etkilediğini anlamamıza ve hastalığın potansiyel komplikasyonlarını hafifletmek için doğal bir yaklaşımın potansiyelini değerlendirmemize katkı sağlamaktadır.

#### Özet

Sağlık çalışanları hem teşhis hem de tedavi amacıyla iyonlaştırıcı radyasyona maruz kalabilmektedir. Ayrıca insan vücudundaki radyosensitif organlardan biri de tiroid bezidir. Bu çalışmada mesleki radyasyona maruz kalan sağlık çalışanlarında tiroid yapı ve fonksiyonlarında gözlenen değişikliklerin incelenmesi amaçlandı. Bu çalışmada öncelikle iyonlaştırıcı radyasyonun tıpta kullanıldığı alanlara değinilmiştir. Ayrıca iyonlaştırıcı radyasyon ile tiroid fonksiyonu ve yapısı arasındaki ilişki sağlık profesyonellerinin katıldığı çalışmalarda incelenmiştir. Radyolojik görüntüleme prosedürleri, iyonlaştırıcı radyasyona maruz kalmanın önde gelen uygulamaları arasındadır. Radyosensitif tümörlerin tedavi seçeneklerinden biri olan radyoterapi, tıpta iyonlaştırıcı radyasyonun kullanıldığı alanlardan biridir. İyonlaştırıcı radyasyonun kullanıldığı bir diğer tıp alanı olan nükleer tıp, radyoaktif maddelerin kullanıldığı en büyük teranostik alandır. İyonlaştırıcı radyasyona maruz kalan sağlık çalışanlarında hipotiroidizm riski artmaktadır. Ek olarak, bu maruziyet tiroid hormonları üzerindeki etkiyle ve tiroid bağışıklık hastalıklarının gelişme olasılığının artmasıyla ilişkilendirilmiştir. Ek olarak, kadın radyasyon sağlık çalışanları, erkek meslektaşlarına göre daha yüksek düzeyde anormal tiroid nodülleri, triiyodotironin ve tiroid uyarıcı hormon düzeylerine sahiptir. Ayrıca bu meslek grubundaki kişilerde yaşla birlikte anormal tiroid nodülleri, triiyodotironin ve tiroksin düzeyleri de artmaktadır. Öte yandan iyonlaştırıcı radyasyona maruz kalmanın bu sağlık çalışanlarında tiroid kanseri riski ile ilişkilendirilmemiştir. Sonuç olarak iyonlaştırıcı radyasyona mesleki maruz kalma, radyosensitif bir organ olan tiroid bezinde hasara neden olabilir. Tiroid organının fonksiyonlarında ve yapısında sağlık sorunlarının önlenmesi için mesleki olarak iyonlaştırıcı radyasyona maruz kalanların kişisel korunma yöntemlerini mümkün olduğunca titizlikle uygulamaları gerekmektedir.

**Anahtar Kelimeler:** Radyasyon, Tiroid, Triiyodotironin, Tiroksin, Sağlık çalışanı, Hipotiroidizm

#### Thyroid gland with occupational exposure to ionizing radiation in health

#### Abstract

Healthcare workers may be exposed to ionizing radiation for both diagnosis and treatment purposes. In addition, one of the radiosensitive organs in the human body is the thyroid gland. This study aimed to examine the changes observed in thyroid structure and functions in healthcare workers exposed to occupational radiation. In this study, firstly, the areas where ionizing radiation is used in medicine are mentioned. Additionally, the relationship between ionizing radiation and thyroid function and structure has been examined in studies involving health professionals. Radiological imaging procedures are among the leading applications of exposure to ionizing radiation. Radiotherapy, one of the treatment options for radiosensitive tumors, is one of the areas in medicine where ionizing radiation is used. Nuclear medicine, another field of medicine in which ionizing radiation is used, is the largest theranostic field in which radioactive substances are used. The risk of hypothyroidism increases in healthcare workers exposed to ionizing radiation. Additionally, this exposure has been associated with an effect on thyroid hormones and an increased likelihood of developing thyroid immune diseases. Additionally, female radiation healthcare workers have higher levels of abnormal thyroid nodules, triiodothyronine, and thyroid-stimulating hormone than their male counterparts. In addition, abnormal thyroid nodules, triiodothyronine and thyroxine levels increase with age in people in this occupational group. On the other hand, exposure to ionizing radiation was not associated with the risk of thyroid cancer in these healthcare workers. As a result, occupational exposure to ionizing

radiation can cause damage to the thyroid gland, which is a radiosensitive organ. In order to prevent health problems in the functions and structure of the thyroid organ, those who are occupationally exposed to ionizing radiation should apply personal protection methods as meticulously as possible.

**Keywords:** Radiation, Thyroid, Triiodothyronine, Thyroxine, Healthcare professional, Hypothyroidism

## GİRİŞ

İyonlaştırıcı radyasyon, içinden geçtiği ortamın atomlarını iyonlaştırabilen malzeme parçacıklarının veya elektromanyetik radyasyonun fotonlarının akışını ifade eder. Hücresel düzeyde hasar, hücre ölümü veya sitogenetik bilgilerinin değişmesiyle ortaya çıkabilir. Bu olaylar, belirtilerin doz eşiğinin aşılmasına bağlı olduğu olumsuz doku reaksiyonlarına (deterministik etkiler) veya hasar olasılığının dozla birlikte arttığı sitokastik etkilere yol açabilir (Havránková 2020). İnsan vücudu üzerindeki en kötü sitolojik etkisi hücre ölümü olan iyonlaştırıcı radyasyon, hızlı teknik gelişmelerle birlikte sıradan yaşamda daha geniş bir uygulama alanında varolmuştur (Jiao ve ark., 2022). Tıpta hem tanı hem de tedavi açısından önemli bir uygulama alanı olan iyonize radyasyon, önemli ilerlemelere katkıda bulunmuş olsa da, risksiz de değildir. Bu risk, 1982'den bu yana hastaların tıbbi radyasyona maruz kalma oranındaki 3 kat artışı içermektedir; Bazı potansiyel riskler bilinmesine rağmen, bu risklerin nicelikselleştirilmesine yönelik zorluklar devam etmektedir (Chambers, 2017).

İyonlaştırıcı radyasyona maruz kalmanın deneysel modelleri ve bunların canlı organizmalar üzerinde hasar oluşturma mekanizmalarıyla ilgili tıbbi literatürdeki mevcut kanıtlar, deoksi ribonükleik asit (DNA) çift sarmalının bir veya her iki ipliğinin "sitokastik kırılması" teorisine dayanmaktadır. Bu teoriye göre, yüksek doz iyonlaştırıcı radyasyon, her iki DNA zincirine de zarar vererek hücre için potansiyel olarak ölümcül olan kırılmalara neden olabilirken, düşük doz iyonlaştırıcı radyasyon, esas olarak tek iplikçiklerde kolayca onarılabilen ve kalıcı bir hasara yol açmayan kırılmalara neden olabilir. Diğer bir taraftan düşük dozda iyonlaştırıcı radyasyon maruz kalmanın, hem maruz kalan bireylerde hem de sonraki nesillerde yıllar veya on yıllar sonra bile kanserojen etkilere sahip olduğu göstermektedir. Ek olarak, düşük dozlara maruz kaldıktan sonra hayatta kalan hücreler, görünüşte normal olmalarına rağmen, moleküler sinyaller ve komşu veya uzak hücreleri içeren karmaşık doku alışverişi nedeniyle doğrudan ışınlanmayan hücrelerde bile bulunabilen klonal olmayan kromozomal anormallikler gibi kendi nesillerinde belirgin hale gelen hasarları biriktirir (Burgio ve ark., 2018). Epidemiyolojik bir çalışmada radyasyonun neden olduğu genomik istikrarsızlık kanser insidansı ile ilişkilendirilmiştir (Eidemüller ve ark., 2009). Streffer (2010), karsinogenezde genomik istikrarsızlığın rolüne ilişkin kanıtları gözden geçirmekte ve artan radyosensitiviteye yönelik genetik yatkınlığın, artan genomik istikrarsızlık ve kanser yatkınlığı ile ilişkili olduğu sonucuna varmaktadır.

Tiroid bezi en büyük endokrin organdır ve boynun ön kısmında bulunur. Büyümeyi, metabolizmayı ve insan vücudunun diğer önemli fizyolojik süreçlerini düzenleyen tiroid hormonları, tiroksin (T4) ve triiyodotironin (T3)'i sentezlemek için iyotu içerir ve kullanır (Braverman ve Cooper, 2012). Tiroid bezi insan vücudunda radyasyona diğer organlara göre daha duyarlı (radyosensitif) olan organlardan biridir. Yüksek dozda ışınlamayı takiben, hipotiroidizm ile kendini gösteren önemli radyasyon etkileri gözlemlenebilmektedir. Hipotiroidizmden farklı olarak neoplazi, insanlarda tiroide radyasyonun neden olduğu iki önemli olumsuz sonuçtan biridir (Virgili, 2020). Diğer bir taraftan orta veya düşük dozda ışınlamanın hipotiroidizm ve otoimmün tiroidit üzerinde geçici bir etkisi olabildiği ve eğer varsa bu etkinin geri dönüşümlü olduğu ifade edilmektedir (Nagayama, 2018).

İyonlaştırıcı radyasyonun etkisi, hücre hasarı, hücre ölümü veya sitogenetik bilgilerinin değişmesiyle ortaya çıkabilir. Buna karşılık tıpta hem tanı hem de tedavi için gerek hastalar gerek sağlık çalışanları iyonize radyasyona maruz kalabilmektedir. En büyük endokrin bez olan tiroid bezi, vücudumuzda ki radyosensitif olan organlardan biridir. Bu çalışmada, düşük dozlarda iyonlaştırıcı radyasyona uzun süreli maruz kalan sağlık çalışanlarının tiroit bezi yapısında ve fonksiyonunda gözlenen değişikliklerin incelenmesi amaçlandı.

## MATERYAL VE METOT

Düşük dozlarda iyonlaştırıcı radyasyona uzun süreli maruz kalan sağlık çalışanlarının tiroit bezi yapısında ve fonksiyonunda gözlenen değişikliklerin daha iyi anlaşılmasını sağlamak amacıyla PubMed, Scopus, Web of Science ve Google Scholar veri tabanlarını kullanarak literatür taraması yapıldı. Anahtar kelime olarak "radyasyon", "tiroid", "triiodotironin", "tiroksin", "sağlık çalışanı" ve radyasyonun tiroit bezinde oluşturduğu

en çok gözlenen sağlık sorunu “hipotiroidizm” kelimeleri kullanıldı. Alıntılama sayıları ve yayın tarihleri dikkate alınarak 30 makale seçildi.

Literatür taramasında öncelikle iyonlaştırıcı radyasyonun tıpta kullanıldıkları alanlara değinildi. Buna ek olarak iyonlaştırıcı radyasyon ve tiroid fonksiyon ve yapısı ile ilişkili bir başlık da oluşturuldu. Referans olarak değerlendirmeye alınan çalışmalarda özellikle sağlık çalışanları ile ilgili çalışmalara yer verildi.

## **İYONLAŞTIRICI RADYASYONUN TIPTA KULLANIM ALANLARI**

İnsanların maruz kaldığı yapay radyasyon kaynaklarının çoğunluğunu tıbbi uygulamalar oluşturur (Tuncel, 2008). Bunların başında radyolojik görüntüleme prosedürleri gelmektedir. İyonlaştırıcı ışınları radyografi, floroskopi, anjiyografi ve bilgisayarlı tomografide (BT) kullanılır. İyonlaştırıcı radyasyon kullanan görüntüleme yöntemleri, radyoloji görüntüleme teknolojisindeki gelişmelerle birlikte çeşitli tıbbi alanlarda sıklıkla kullanılır (Divrik Gökçe ve ark., 2012). Son yıllarda çok dedektörlü BT gibi yüksek teknoloji cihazların geliştirilmesine paralel olarak BT anjiyografi, kardiyak BT ve sanal BT kolonoskopi gibi dinamik kontrastlı daha hızlı ve daha yüksek çözünürlüklü çalışmalar mümkün hale gelmiştir (Flohr ve ark., 2005). Bu durum, tanı yaklaşımlarını ve tedavi planlarını yeniden tasarlamak amacıyla klinisyenlerin radyolojik çalışmalara yönelik taleplerinin artmasına yol açmış ve bu da hastaların iyonlaştırıcı radyasyona maruz kalma oranında artışa yol açmıştır (Divrik Gökçe ve ark., 2012). İngiltere’de BT, 1990 yılında radyolojik uygulamaların %4’ünü oluştururken, 2000 yılında BT’nin radyolojik uygulamaların %10’unu oluşturduğu Amerikaya kıyasla, hastaların iyonlaştırıcı radyasyona maruz kalmasının büyük çoğunluğundan bu prosedürlerin sorumlu olduğu bulunmuştur. (UNSCEAR 2000). Kontrol edilebilir yapay radyasyon kaynaklarından alınan iyonize radyasyon miktarının giderek artması, yaşam boyu kansere yakalanma riskini doğurmakta ve dolayısıyla halk sağlığı açısından tehdit oluşturmaktadır (Hall ve Brenner 2008).

Tümörler normal dokulara göre radyasyon hasarına daha yatkındır (Minniti ve ark., 2012). Bundan dolayı radyoterapi en etkili kanser tedavilerinden biri olmaya devam etmektedir. Bununla birlikte, bireysel tümörlerin ve normal dokuların biyolojik özelliklerine göre tedaviyi mümkün kılan biyoloji odaklı kişiselleştirilmiş radyoterapi klinikte hala uygulanması gerekmektedir (Domina ve ark., 2018). İyonlaştırıcı radyasyonun sadece lokal etkisinin olmadığı, aynı zamanda birçok moleküler sinyal yolunu tetikleyerek sistemik etkilerinin de olduğu uzun yıllardan beri iyi bilinmektedir (Carvalho ve Villar, 2018). Kanser radyoterapisi sırasında her ne kadar lokal ışınlama uygulansa da, iyonize radyasyon, kan proteom ve metabolom düzeylerinde gözlemlenebilen tüm vücut tepkilerine neden olur. Radyoterapide ışınlanmış dokular radyasyonun dozundan ve hacminden etkilenirken kanın moleküler bileşimi, doz değerlendirmesi ve radyasyona sistemik tepkilerin tahmini ve izlenmesi için varsayımsal bir biyobelirteç kaynağıdır (Jelonek ve ark., 2017). Kanser hastaları için etkili bir geleneksel tedavi yöntemi olmaya devam eden radyoterapide klinik etkinlik, tedavi sırasında tümör hücrelerin radyorezistans gelişmesi nedeniyle tehlikeye girebilmektedir (Lu ve ark., 2022).

Nükleer tıp, biyolojik olayların görüntülenmesi için radyoaktif maddelere güvenen ve bu maddeleri alan dokulara iyonlaştırıcı radyasyon sağlayan en büyük teranostik kahramanıdır. Konsept, kişiselleştirilmiş tıbbın gelişmesiyle birlikte, hastalıkların kişiselleştirilmiş yönetimine izin verilmesi, hasta seçiminin iyileştirilmesi, yanıtların daha iyi tahmin edilmesi, toksisitenin azaltılması ve prognozun tahmin edilmesiyle önem kazanmıştır (Nunes ve ark., 2021). Standart radyografik incelemelerde, 0,01-10 mSv arasında değişen ortalama etkili dozlarla sahip iken, çoğu nükleer tıp prosedürü için ortalama etkili doz 0,3 ile 20 mSv arasında değişmektedir (Mettler ve ark., 2008). İyonlaştırıcı radyasyonun tıpta kullanım alanlarından bir başkası olan girişimsel radyoloji çalışanlarının en yüksek dozlarda iyonlaştırıcı radyasyona maruz kalması ile birlikte nükleer tıp çalışanlarının iyonlaştırıcı radyasyona maruziyetinin izlenmesi göz ardı edilemez bir gerçektir (Liu ve ark. 2022).

## **İYONLAŞTIRICI RADYASYON VE TİROİD**

Radyasyon esas olarak ışınlanmış dokulardaki molekülleri iyonize ederek DNA hasarına neden olur. Radyasyon enerjisi ya DNA, organeller ve membranlar gibi kritik hücresel yapılarda doğrudan emilir ya da sulu sitozolde oldukça reaktif serbest radikallerin indüksiyonu yoluyla dolaylı olarak emilir. Moleküler oksijenin varlığında geçici serbest radikallerin moleküler hasar oluşturma olasılığı artar, bu da biyokimyasal hasarın stabilizasyonuna yardımcı olur (Minniti ve ark., 2012). Radyasyonun neden olduğu hasar, apoptoz, hücre döngüsünün durması, DNA onarımı ve kanserle sonuçlanabilecek, birbirine bağlı sinyal yollarından oluşan karmaşık bir ağdır. Nükleer felaketlerden kemoterapiye kadar radyasyona yanıt olarak tiroid kanserinin gelişimi uzun süredir bir araştırma konusu olmuştur. Tiroid bezinin duyarlılığının radyasyon ve kanser gelişimi

üzerindeki iyonlaştırıcı ve iyonlaştırıcı olmayan radyasyonun etkilerine ilişkin temel bir genel bakış sağlanmıştır (Albi ve ark., 2017). İyonlaştırıcı radyasyon, papiller tiroid kanseri için iyi bilinen bir risk faktörüdür ve tiroid karsinogenezi için önemli olan mikroRNA ekspresyonunu serbest bıraktığı rapor edilmiştir. İyonlaştırıcı radyasyonun mikroRNA ekspresyonunu serbest bıraktığını, çift sarmallı DNA'yı etkileyerek ışınlanmış tiroid hücrelerinin onarım etkinliğini bozduğunu göstermektedir (Penha ve ark., 2018).

Cioffi ve arkadaşları (2020) sağlık çalışanlarında düşük doz iyonize radyasyona maruz kalma ile tiroid fonksiyonel değişiklik üzerine bir çalışma yapmışlardır. Cioffi ve arkadaşlarının (2020) yaptıkları çalışmada, düşük dozda iyonize radyasyona maruz kalmanın serbest triiyodotironin, serbest tiroksin ve tiroid uyarıcı hormon (TSH) düzeylerini önemli ölçüde etkilediği sonucuna ulaşmışlardır. Buna ek olarak iyonlaştırıcı radyasyona maruz kalma kategorisi ile herhangi bir ilişki belirlenemese de sağlık çalışanlarında hipotiroidizm riskinin olası bir artışını akla getirdiği belirtilmektedir (Cioffi ve ark., 2020). Luna-Sánchez ve arkadaşlarının 2019 yılında yaptıkları çalışmada da, benzer bir sonuç olarak, radyasyon dozlarına bağlı olarak subklinik hipotiroidizm riskinin arttığını gözlemişlerdir (Luna-Sánchez ve ark., 2019). Mesleki olarak iyonlaştırıcı radyasyona maruz kalan sağlık personelleri ile yapılan yakın tarihli bir çalışmada, düşük dozlarda mesleki iyonlaştırıcı radyasyona maruz kalmanın tiroid hormonlarını etkilediği ve tiroid immün hastalıklarının gelişme olasılığının daha yüksek olmasıyla bağlantılı olduğu saptanmıştır (El-Benhawy ve ark., 2022). 1039 sağlık çalışanı ile yapılan başka bir çalışmada, iyonlaştırıcı radyasyonun yıllık kümülatif dozu, total T4 ve serbest T4 düzeyleri ile pozitif, total T3 ve TSH düzeyleri ile negatif korelasyon gösterdiği sonucuna ulaşılmıştır. Buna ek olarak yaş ve yıllık kümülatif doz arttıkça tiroid fonksiyon bozukluğu riski arttığı sonucuna varılmıştır (Lu ve ark., 2022).

Düşük doz iyonize radyasyona uzun süreli maruz kalma, tıbbi meslek mensuplarının tiroid hasarına neden olabilir; bu daha geniş bir endişe kaynağı olmalıdır (Tu ve ark., 2018). Örneklem büyüklüğü 4308 radyasyon çalışanı olan bir çalışmada, radyasyon sağlık çalışanlarının %14,3'ünde anormal tiroid bezi saptanmıştır. Ayrıca tiroid bezi anormalliğinin ana semptomu olan anormal tiroid nodülü radyasyon sağlık çalışanlarının %5,1'inde ve anormal tiroid uyarıcı hormon düzeyi radyasyon sağlık çalışanlarının %7,1'inde saptanmıştır. Kadın radyasyon sağlık çalışanlarında anormal tiroid nodülleri, T3 ve TSH düzeyleri, erkek radyasyon sağlık çalışanlarına göre daha yüksek bulunmuştur. Ayrıca çalışma yaşı arttıkça anormal tiroid nodülleri, T3 ve T4 düzeylerinin arttığı belirtilmiştir. Radyasyon sağlık çalışanlarında iyonlaştırıcı radyasyonun tiroid hasarına neden olabileceği sonucuna varılmıştır. Bu nedenle radyasyon çalışanlarının sağlığını korumak için radyasyondan korunma yönetimine daha fazla önem verilmelidir (Yang ve ark., 2022). Sağlık çalışanlarının 37 yıllık kişisel dozimetrelerinin değerlendirildiği bir çalışmada tiroid bezine uzun süreli, düşük ila orta dozda iyonize radyasyona maruz kalma, tiroid kanseri riskinde artışla ilişkili olmadığı belirtilmiştir (Kitahara ve ark., 2018).

## SONUÇ

Sonuç olarak iyonlaştırıcı radyasyonun düşük dozlarda uzun süreli maruz kalmanın radyosensitif bir organ olan tiroit bezinin fonksiyonlarında ve yapısında önemli bir değişikliğe neden olabilmektedir. İnsan vücudunda en büyük endokrin bez olan tiroit organının fonksiyonlarında ve yapısında sağlık açısından bir sorun oluşmaması amacıyla iyonlaştırıcı radyasyona maruz kalan sağlık çalışanlarının kişisel korunma yöntemlerini mümkün oldukça titizlikle uygulamalıdır. Buna ek olarak radyasyonlu ortamlarda az süre kalınmalıdır.

## Özet

Bireylerin günlük hayatta hastalık, kaza, yaralanma ve afetlerle karşılaşmaları durumunda, sakatlıkların/ölümlerin önlenmesi veya azaltılabilmesi için temel ilk yardım ve KBRN konusunda bilgi sahibi olmaları gerekmektedir. Her bireyin bu durumlarla karşılaşma riski bulunmasına rağmen özellikle lise öğrencileri hem yaş hem de uygulama alanları nedeniyle daha risklidirler. Ayrıca bu öğrenciler, aldıkları eğitimleri sayesinde çalışma alanları veya afet gibi durumlarda ilk yardım ve KBRN ile ilgili müdahalelerde bulunacak kişilerdir. Bu çalışma daha önce ilk yardım kursu almamış 9. Sınıf lise öğrencilerinin İlk Yardım ve KBRN bilgi düzeylerinin değerlendirilmesi, verilen eğitimin bilgi düzeylerine etkisinin belirlenmesi amacıyla yapılmıştır. Çalışma, Mesleki ve Teknik Anadolu Lisesi (MTAL) 9. sınıf öğrencilerine ön test- son test şeklinde yarı deneysel olarak uygulanmıştır. Çalışma, eğitim öğretime devam eden, eğitim programına gönüllü olarak katılan, verilen 16 saatlik ilkyardım ve 2 saatlik KBRN eğitimi tamamlayan ve ön test-son test anketlerini dolduran 109 öğrenci ile tamamlanmıştır. Veriler, "Tanıtıcı Bilgi Formu", "İlk Yardım Eğitimi ve KBRN Eğitimi Bilgi Değerlendirme Formu" kullanılarak toplanmıştır. SPSS 22.0 analiz paket programı kullanılarak analiz edilen araştırma verilerinin değerlendirilmesinde tanımlayıcı istatistikler kullanılmıştır. Öğrencilerin %72.5'i kız olup, yaş ortalaması 14.46±0.58'dir. Öğrencilere verilen eğitimin etkisini göstermek adına eğitim öncesi ve sonrası bazı değerleri karşılaştırmak gerekirse; Öğrencilerin ilk yardımla ilgili Soluk ve göğüs basısı sayısı sorusuna verdikleri doğru cevaplar; ön test %8.3, son test %81.7 ve 2 ay sonrası için ise %55'dir. KBRN için ulusal zehir merkezi telefon numarasını doğru yanıtlama oranları ise; ön test %18.3, son test %87.2 ve 2 ay sonrası için ise %52.3 olduğu tespit edilmiştir. Öğrencilere verilen 16 saatlik ilk yardım ve 2 saatlik KBRN eğitiminin bu konudaki farkındalıkları ve bilgi düzeyleri üzerinde olumlu etkileri olduğu görülmüştür. Ön test ve son test verileri değerlendirildiğinde, uygulanan eğitimin öğrencilerin bilgi düzeylerini anlamlı olarak artırdığı gözlenmiştir. İlk yardım ve KBRN eğitimin bu yaş grubunda yaygınlaştırılması ve buna uygun eğitim programlarının düzenlenmesi önerilmektedir.

**Anahtar Kelimeler:**Öğrenciler, eğitim, ilk yardım, KBRN, bilgi düzeyi

### The effect of first aid and CBRN training given to high school 9th grade students on students' knowledge levels

#### Abstract

In case individuals encounter diseases, accidents, injuries and disasters in daily life, they need to have knowledge about basic first aid and CBRN in order to prevent or reduce disabilities / deaths. Although every individual has the risk of encountering these situations, especially high school students constitute more risky groups due to both age and application areas. In addition, these students are the people who will intervene in first aid and CBRN-related interventions in situations where large masses are affected, such as work areas or disasters, thanks to the training they receive. This study was conducted to evaluate the level of First Aid and CBRN knowledge of 9th grade high school students and to determine the effect of the training given on their level of knowledge. The study was applied quasi-experimentally to 9th grade students of Vocational and Technical Anatolian High School (MTAL) in the form of pre-test and post-test. The study was completed with 109 students who were continuing their education, voluntarily participated in the training programme, completed 16 hours of first aid and 2 hours of CBRN training and completed the pre-test and post-test questionnaires. Data were collected using the "Introductory Information Form", "First Aid Training and CBRN Training Knowledge Assessment Form". Descriptive statistics were used in the evaluation of the research data analysed using SPSS 22.0 analysis package programme. 72.5% of the students were female and the mean age was 14.46±0.58 years.. The correct answers given by the students to the question of number of breaths and

chest compressions related to the first aid were 8.3% in the pre-test, 81.7% in the post-test and 89% 2 months later. The rate of correctly answering the phone number of the national poison centre for CBRN was found to be 18.3% in the pre-test, 87.2% in the post-test and 52.3% 2 months later. It was evaluated that the 16-hour first aid and 2-hour CBRN training given to the students had positive effects on their awareness and knowledge levels on this subject. When the pre-test and post-test data were evaluated, it is thought that the applied training significantly increased the knowledge levels of the students. It is recommended that first aid and CBRN training should be extended in this age group and appropriate training programmes should be organised.

**Keywords:** Students, education, first aid, CBRN, knowledge level

## GİRİŞ

DSÖ, sağlığı yalnızca hastalık ve sakatlığın olmayışı değil fiziksel sosyal refah durumu olarak tanımlamıştır. (DSÖ, 1986).Sağlıklı toplumlar, sağlıklı bireyler hedefine ulaşabilmek için bireylerin bilinçlendirilmesi gerekmektedir.Bireylerin bilinçlendirilmesinde sağlık eğitimi anahtar rol oynamaktadır. DSÖ tanımına göre sağlık eğitimi bilginin artırılması, birey ve toplum sağlığına yardımcı yaşam becerilerinin geliştirilmesi ve sağlık okuryazarlığını iyileştirmek için tasarlanmış bir iletişim şeklini içermektedir(Sağlığın teşviki ve geliştirilmesi sözlüğü, 2011). Günlük hayatımızda her an hastalık, kaza, yaralanma ve afetlerle karşılaşma ihtimalimiz vardır. Bu nedenle sağlık eğitimi içinde yer alan ilk yardım ve KBRN eğitiminin önemi her geçen gün önem kazanmaktadır. İlk yardımı tanımlamak gerekirse; herhangi bir kaza durumunda hayatı tehlikeye düşüren bir durumda, profesyonel yardım sağlanıncaya kadar, hayatın kurtarılması veya durumun kötüleşmesini engelleyecek, tıbbi araç gereç aranmaksızın, mevcut araç ve gereçlerle yapılan ilaçsızuygulamalardır(İnan, 2011). Kazalara bağlı ölümlerin en aza indirilmesi, sakatlıkların azaltılması ve önlenmesi toplumun temel ilk yardım konusunda bilgi sahibi olması ile mümkündür. Toplumun ilk yardım konusunda bilgilendirmenin en etkin ve en önemli yollarından biri, temel ilk yardım eğitiminin yaygınlaştırılmasıdır. Kazalar ve ani yaralanmalar beklenmedik anlarda gerçekleştiği için, yerinde ve zamanında yapılan basit ama etkili bir ilkyardımla, yaralının hayatını kurtarmak, sakat kalmasını önlemek veya sakatlık derecesini azaltmak mümkündür. Kazalar ve kazalara bağlı ölümlerin oranı ülkeler arasında farklılık göstermekle birlikte, ülkemizde kazalara bağlı ölüm oranlarının yüksek olmasının temel nedeni, kaza sonrası bilinçli ilkyardım hizmetlerinin olmamasıdır (Aytaç, 2010). Temel ilkyardım eğitimi almış kişilerin zamanında, doğru ve etkin yapacağı uygulamalarla kaza, yaralanma ve afet gibi durumlarda ölüm ve sakatlanma sayıları azalacaktır.

Bu konuda gerçekleştirilen çalışmalarla ilgili literatür incelendiğinde gelişim evrelerinden kaynaklanan dikkat eksikliğininadolesan döneminde, kaza ve yaralanma olasılığını artıran faktörler arasında, geldiği görülmektedir. (Aylaz ve ark. 2009). Adolesan dönem, genel olarak birey ve onun çevresi açısından karmaşık, fırtınalı ve zor bir dönemdir (Güler ve Akın,2006). Genel olarak, 13-17 yaşlar arası bireyler kendini ölümsüz, kudretli, karşı konulamaz gördükleri için riskli davranışlarda bulunma eğilimi fazladır(Ercan,2005). Bu dönem yapılan riskli davranışlar hastalık, ölüm ve sakatlıkların önemli bir bölümüne neden olmaktadır.(Feldman,2000). Adolesan dönemde meydana gelen ölümlerin en başta gelen nedenlerinden olan kazalar ve intiharlar da riskli davranışlarla yakından ilişkilidir (Tenore ve Lipsky,2001). Kara ve arkadaşları tarafından yapılan çalışmada şiddete bağlı davranışlar sergileme, silah taşıma, tehdit etme-edilme, kavgaya karışma, yaralanma ve intihar oranları oldukça yüksek bulunmuştur (Kara ve ark.,2003). Yine Aras ve arkadaşları tarafından yapılan bir çalışmada bahsedilen riskli davranış oranları oldukça yüksek bulunmuştur (Aras ve ark.,2007). Amerika Birleşik Devletleri 2000 yılı istatistiklerine göre 10-15 yaş arası çocuklarda ve 15-19 yaş arası ve ayrıca 11-18 yaş grubu için spor, Avrupa ve Kuzey Amerika'da önemli yaralanma nedenleri arasındadır. Yaralanmaların; % 62'si organize spor sırasında, % 20'si beden eğitimi sınıflarında, %18'i organize olmayan denetimsiz spor sonucu meydana gelmektedir. Raporlar okulda bütün yaralanmaların dörtte birinin (1/4) ciddi olduğunu göstermektedir. Spor aktivitelerine bağlı ölümler nadir ancak Amerika'da 6 yıllık bir periyotta 15-19 yaş grubunu içeren ölümle ilişkili 30 spor aktivitesi belirlenmiştir (Abernethyve ark., 2008). Ayrıca ergenler arasında, önde gelen ölüm nedenlerini temsil eden bir halk sağlığı sorunudur (Reveruzzi, Buckley, ve Sheehan, 2016).

KBRN (CBRN), Kimyasal Biyolojik Radyasyon ve Nükleer kelimelerinin baş harflerinden oluşmaktadır. Günümüzde yaşanan savaş, sanayi ve endüstri sahasında yaşanan gelişmeler KBRN risklerini artırmıştır. Bütün bu riskler, geniş halk kitlelerin yaşamını olumsuz yönde etkiler. Ayrıca çok sayıda insanın yaşamını yitirmesine ve canlı hayatın sona ermesine/değişimine neden olur (MEGEP 2011 ). Bu nedenlerden dolayı KBRN artık dünya için büyük bir tehlike unsuru olmaktadır.

Özellikle yukarıda değinilen adolesan dönemdeki öğrenciler için yapılan çalışmalar tarandığında yaygın olarak ilkyardım eğitimi almamış bireylerin bilgi, tutum düzeylerinin tarandığı, farklı okullardaki öğrencilerin

İlk yardım bilgi düzeylerinin karşılaştırıldığı, 2 saatlik ilk yardım farkındalık eğitimlerinin bilgi düzeylerine etkisinin değerlendirildiği görülmüştür. Adolesan dönemindeki öğrenciler kaza ve yaralanmalar açısından riskli dönemde oldukları için bu yaş grubuna verilecek eğitim ve akran desteği ile ilk yardım ve KBRN’de erken müdahalelerin sağlanmasının, sakatlık ve komplikasyonların gelişmesini önemli oranda azaltılacağı düşünülmektedir. Bu araştırma, Mesleki ve Teknik Anadolu Lisesi 9. Sınıf öğrencilerine verilen İlk Yardım ve KBRN eğitiminin öğrencilerin bilgi düzeylerine etkisinin belirlenmesi amacıyla planlanmıştır.

## **MATERYAL VE METOT**

### **Evren ve Örneklem**

Bu araştırma, Niğde ili merkezinde bulunan Mesleki ve Teknik Eğitim veren Atatürk Mesleki ve Teknik Anadolu Lisesinde gerçekleştirilmiştir. Niğde ili genelinde 15 tane Mesleki ve Teknik Anadolu Lisesi mevcut olup bu okullardan iki tanesi eski adıyla sağlık meslek lisesidir. Yapılan kura sonucunda Atatürk Mesleki ve Teknik Anadolu Lisesi bu çalışma için seçilmiştir. Bu lisede 2021-2022 eğitim öğretim döneminde öğrenim görmekte olan toplam 417 öğrenciden 100 tane 9. Sınıf öğrencisi ve 2022-2023 eğitim öğretim döneminde öğrenim görmesi planlanan toplam 420 öğrenciden 100 tane 9. sınıf öğrencisi araştırmanın evrenini oluşturmaktadır. Örneklem alınma kriterleri olarak; 2021-2023 eğitim öğretim dönemlerinde eğitim öğretime devam eden, eğitim programına gönüllü olarak katılan, verilecek olan 16 saatlik ilk yardım +2 saatlik KBRN eğitimi tamamlayan ve ön test-son test ve 2 ay sonraki son testleri dolduran öğrenciler olarak belirlenmiştir.

Yapılan bu çalışmada kaza ve yaralanmalarda risk grubu oluşturan adolesan dönemdeki 9. Sınıf öğrencilerine 16 saatlik kapsamlı ilk yardım eğitimi +2 saatlik KBRN tehdit ve ilk yardım eğitimi verilmiştir.

### **Veri Toplama Araçları**

Veriler, literatür bilgisi doğrultusunda araştırmacı tarafından hazırlanan “Tanıtıcı Bilgi Formu”, “İlk Yardım Eğitimi Bilgi Değerlendirme Formu” ve KBRN Eğitimi Bilgi Değerlendirme Formu kullanılarak toplanmıştır. Tanıtıcı Bilgi Formu öğrencinin demografik özelliklerini içeren 4 soru, İlk Yardım Eğitimi Bilgi Değerlendirme formu temel ilk yardım bilgilerini içeren 33 soru, KBRN Eğitimi Bilgi Değerlendirme Formu temel düzeyde KBRN bilgilerini içeren 13 soru olmak üzere toplam 50 sorudan oluşmaktadır.

### **Yöntemin Uygulanması**

Eğitim Atatürk Mesleki ve Teknik Anadolu Lisesi toplantı salonu ve sınıflarında düzenlenmiş olup 4+4+4+6 saat teorik ve uygulamalı olarak tamamlanmıştır. Eğitim esnasında akıllı tahta, Kızılay eğitim sunumları, yetişkin, çocuk, bebek maketleri, sargı bezleri, tespit malzemeleri, OED cihazı kullanılmıştır. 16 saatlik Temel İlk Yardım Eğitimi İçeriğinde Türk Kızılay’ı tarafından hazırlanan sunumlardan faydalanılarak materyaller hazırlanmıştır. İçerik olarak genel ilk yardım bilgileri, hasta ve yaralı ve olay yerinin değerlendirilmesi, temel yaşam desteği ve hava yolu tıkanıklığı, kanamalar ve şok, yaralanmalar, yanık sıcak –soğuk çarpması ve donmalar, kırık-çıkık ve burkulmalar, bilinç bozuklukları, zehirlenmeler-böcek sokmaları –hayvan ısırılmaları, göz-kulak ve buruna yabancı cisim kaçması, boğulmalar, acil taşıma teknikleri anlatılmıştır. Ayrıca 2 saatlik KBRN eğitiminde temel düzeyde kimyasal, biyolojik ve nükleer tehditler ve bu tehditlere maruz kalındığında yapılması gerekenlerin neler olduğu konusunda bilgilendirme yapılmıştır. Verilerin ön testi eğitim öncesi, son testi ise eğitimden hemen sonra ve iki ay sonra olacak şekilde iki kez toplanmıştır.

### **Verilerin Değerlendirilmesi**

Bu çalışmada veriler, bilgisayar ortamında SPSS 22.0 analiz paket programı kullanılarak analiz edilmiştir. Verilerin değerlendirilmesinde sayı, yüzdeler, aritmetik ortalama ve standart sapma gibi tanımlayıcı istatistiklerden yararlanılmıştır. Öğrencilerin ön test -son test bilgi düzeylerinin değerlendirilmesinde elde edilen veriler bağımlı gruplara uygulanan uygun analiz yöntemleri kullanılmıştır. Grupların karşılaştırılmasında sonuçların istatistiksel anlamlılığı  $p < 0.05$  düzeyinde değerlendirilmiştir.

### **Etik İzinler**

Araştırmaya başlamadan önce Niğde Ömer Halisdemir Üniversitesi Etik Kurulu’nda 28.04.2022 tarihte ve 2022/05-48 etik numarası ile etik izin ve Niğde İl Milli Eğitim Müdürlüğünden 26.05.2022 tarihinde 50436403 sayılı yazılı izin alınmıştır. Ayrıca öğrencilere ve velilerine araştırma hakkında bilgi verilerek yazılı ve sözlü izinleri alınmıştır.

## BULGULAR ve TARTIŞMA

Araştırmaya 19 öğrenci katılmış olup, katılan öğrencilerin %72.5'i kız , %27.5i erkek olup yaş ortalaması  $14.46 \pm 0.58$ 'dir. Öğrencilerin ilk değerlendirmede kontrol edileni bilme oranları ön testte %40.4 son testte %83.5 2 ay sonrası için %71.6 dır. Temel yaşam desteği sırasında uygulanan soluk ve göğüs basısı sayısını ön testte %8.3, son testte 81.7 iki ay sonraki son testte ise %55 oranında öğrenci doğru bilmıştır. Öğrencilerin ilk yardımla ilgili solunumun nasıl değerlendirildiğine verdikleri doğru cevaplar; ön test %57.8, son test %91.7 ve 2 ay sonrası için ise %89'dur. Temel yaşam desteğine ne zaman son verileceği sorusunu ise ön testte %72.5, son testte %92.7 oranında öğrenci doğru yanıtlamış olup iki ay sonrası son testte oran değişmeyerek %92.7 olarak kalmıştır (Tablo 1).

**Tablo1: Öğrencilerin sosyodemografik özellikleri**

<b>Değişkenler</b>			
Yaş (X±SD)	<b>14.46±0.58</b>		
Cinsiyet	<b>Kız</b>	<b>n</b>	<b>%</b>
	<b>Erkek</b>	79	72.5
		30	27.5
İlk yardım ve KBRN öğrenmenin gerekliliği	<b>Evet</b>	106	97.2
	<b>Hayır</b>	3	2.8

Hava yolunda tam tıkanıklık olması durumunda yapılması gereken müdahaleyi ön testte %27.5, son testte %78.9 oranında, iki ay sonraki son testte ise %57.8 oranında öğrenci doğru bilmıştır. Şok pozisyonunun nasıl verileceği sorusuna verilen doğru yanıtlar değerlendirildiğinde ön testte %45.9, son testte 75.2 iki ay sonraki son testte ise 60.6 oranında olduğu görülmüştür. KBRN için ulusal zehir merkezi telefon numarasını doğru yanıtlama oranları ise; ön test %18.3, son test %87.2 ve 2 ay sonrası için ise %52.3 olduğu tespit edilmiştir. Son olarak KBRN ikaz ve alarm işaretlerinden olmayan ikazı doğru bilen öğrenci sayısı ön testte %30.3 son testte %56.iki ay sonraki son testte %46.8 oranında olduğu görülmüştür (Tablo 2).

**Tablo 2. Öğrencilerin İlk Yardım ve KBRN sorularına verdikleri yanıtlarının dağılımı**

Araştırma bulgularımız değerlendirildiğinde ön test, son test ve 2 ay sonrası verileri arasında istatistiksel açıdan anlamlı farkın olduğu gözlenmiştir.

## SONUÇ

Sağlık eğitimi yoluyla kalıcı sakatlık ve yaralanmaların önlenmesi için 9. Sınıf öğrencilerinin İlk Yardım ve KBRN konusundaki bilgilerin belirlenmesi önem taşımaktadır. Standart ilk yardım eğitimine ek olarak KBRN tehditleri ve KBRN tehditlerinde ilkyardım eğitimi ve bu eğitim öncesi ve sonrası gerçekleştirilecek ön test-son test uygulaması ilk kez bu çalışma ile ortaya konulmuştur. İstatistiksel analizler ile ön test son test sonuçları değerlendirildiğinde öğrencilerin İlk Yardım ve KBRN konusundaki bilgi düzeylerinin belirlenmesi konusunda verilen eğitim neticesinde eğitim programına katılan öğrencilerde eğitim öncesi ve eğitim sonrası istatistiksel açıdan anlamlı farklılığın olduğu tespit edilmiştir. Bu nedenle ilk yardım ve KBRN eğitiminin bu yaş grubunda yaygınlaştırılması ve buna uygun eğitim programlarının düzenlenmesi önerilmektedir.

## TEŞEKKÜR

Çalışmamıza katılan öğrencilerimize teşekkür ederiz.

#### Abstract

This study explores the sensory effects of enriching hamburger patties with psyllium, intending to increase the dietary fiber content of this widely consumed fast-food item. Hamburger patties were enriched with psyllium at concentrations of 5% and 7.5%, and their sensory attributes, including taste, smell, appearance, mouthfeel, juiciness, and texture/consistency, were evaluated with comparison to control patties. Additionally, overall preference based on sensory factors and hedonic scale scores were assessed. A randomized controlled triple-blind sensory analysis panel comprising twelve dietitians, organized into two blocks respectively, was employed for the evaluation. Although the results revealed that in the first block, the control patty received higher scores for taste compared to the 7.5% psyllium-enriched patty, this difference was not observed in the second block. For other sensory factors, overall preference, and hedonic scale scores, the patties exhibited similarity. In summary, this study demonstrates that the sensory characteristics of hamburger patties remain largely unaffected when enriched with psyllium up to a concentration of 7.5%. These findings suggest that psyllium enrichment can be a viable strategy to increase the dietary fiber content of fast-food items without compromising their sensory appeal, potentially promoting healthier dietary choices among consumers.

**Keywords:** Psyllium, Dietary fiber, Hamburger, Sensory analysis, Hedonic scale, Fast food.

#### INTRODUCTION

Psyllium, also known as *Plantago psyllium* or ispaghula, and locally referred to as "karnıyarık otu" in Türkiye, belongs to the *Plantago* plant family. Due to specific climate requirements, it is primarily grown in India but is also found in regions such as Pakistan, Bangladesh, and Iran (Khaliq et al., 2015). Psyllium is primarily cultivated for its seed husk, which is rich in soluble fiber. Psyllium seed husk can absorb up to 80 times its weight in water, making it a valuable ingredient in the food industry, especially as a thickening and gelling agent (Phan et al., 2020). This mucilage does not ferment in the intestine and passes through the gastrointestinal system without alteration (Fischer et al., 2004).

The viscous gel formed by psyllium delays the interaction of complex carbohydrates with digestive enzymes by increasing the viscosity of chyme. This slows down digestion and glucose absorption, reducing postprandial blood glucose concentrations (Gibb et al., 2015). As a result of this delay, nutrients that reach the distal ileum stimulate the release of glucagon-like peptide-1 (GLP-1) into the bloodstream. GLP-1 has effects on metabolism, including reduced appetite and increased glucose-dependent insulin secretion (McRorie, 2015). Increased viscosity prevents effective bile absorption from the distal ileum, leading to a decrease in the bile acid pool, which stimulates hepatocytes to produce more bile. This, in turn, increases the number of LDL cholesterol receptors on hepatocytes, resulting in decreased blood LDL and total cholesterol concentrations, while HDL cholesterol levels remain unaffected (Narayanan et al., 2020). The U.S. Food and Drug Administration (FDA) has reported that adding 7 grams or more of psyllium to a diet low in saturated fat and cholesterol may reduce the risk of coronary heart disease (FDA, 1998).

When consumed with a meal or before a meal, psyllium expands in the stomach, helping to activate stretch receptors early. It delays gastric emptying and plays a role in allowing food to reach the distal regions of the small intestine, contributing to a prolonged feeling of fullness. Additionally, the reduction in postprandial glycemic peak levels and, consequently, insulin requirements suggest that psyllium may play a role in promoting prolonged satiety (Wanders et al., 2011). Due to these effects on digestion and appetite, psyllium consumption is thought to reduce daily energy intake, potentially contributing to weight loss (Howarth et al., 2001).

Because of its gelling properties, psyllium is commonly used in the food industry. Today, it is most commonly used in the production of baked goods, especially bread, as a gluten substitute for its binding and elasticity-enhancing properties (Roman et al., 2019). Psyllium can be an important source of dietary fiber for those who need to follow a gluten-free diet, such as individuals with celiac disease or other reasons (Fratelli et al., 2018). Examples of psyllium use as a fat replacer can also be found in foods like cakes and mayonnaise (Belorio et al., 2019; Amiri Aghdaei et al., 2014). In meat products, limited examples of psyllium usage include increasing water-holding capacity, improving product stability, reducing the fat content by using it as a fat replacer, enhancing production efficiency, improving texture, preventing volume loss during cooking, and extending shelf life (Zinina et al., 2019).

Considering its potential benefits in the food industry and metabolic effects, psyllium is an important source of soluble fiber. The Turkish Dietary Guidelines (TÜBER) classify dietary fiber as one of the "Foods and Nutrients That Should Be Consumed More" and recommend an intake of 25 grams per day for adult men and women. It is noted that 64.2% of the population does not meet this fiber intake requirement (TÜBER, 2022). The National Academies of Sciences, Engineering, and Medicine in the United States recommends daily fiber intakes of 25 grams for adult women and 38 grams for adult men, with a practical guideline of 14 grams of fiber per 1,000 calories (Trumbo et al., 2001).

Fast food products, which have seen a significant increase in consumption today, are generally characterized by high energy density, heterogeneous high-fat content favoring saturated and omega-6 fatty acids, high glycemic index, and significant carbohydrate content. Additionally, they tend to be rich in sodium while lacking in other micronutrients and dietary fiber (Varlamov, 2017). On average, fast food items have been found to have an energy density of 236 kcal/100g, with a typical meal containing around 1400 kcal (Jaworowska et al., 2013). A study analyzing menus available in 35 countries, observed that fast food meals typically contain 41-74 grams of total fat per meal (Stender et al., 2007). Another study found that per 100 grams, these foods contain 10-13 grams of total fat and 3.9-4.9 grams of saturated fat (Dunford et al., 2010). Fast food products often use refined flours separated from bran and germ. Additionally, side items like french fries and commonly consumed soft drinks are known for their high glycemic index, primarily due to the presence of sucrose or more frequently, high-fructose corn syrup (HFCS). The increased portion sizes in these menus also contribute to a higher glycemic load. Because these meals are typically low in vegetables and fruits and high in processed refined grains, they are also deficient in dietary fiber (Isganaitis and Lustig, 2005).

Globally, one of the most frequently consumed fast-food items is the hamburger. The objective of this research is to enrich hamburger patties with psyllium while preserving their sensory attributes.

## MATERIALS AND METHODS

This research received ethical approval in accordance with the Helsinki Declaration, from the Acibadem Mehmet Ali Aydınlar University Medical Research Evaluation Board (ATADEK), during its meeting held on December 17, 2021, under decision number 2021-24/31. Following the approval of the Ethics Committee, the study was conducted between December 2021 and January 2022 at the Istanbul Okan University Nutrition Principles Laboratory, involving participants who met the inclusion criteria and volunteered to participate. Participation in the research was based on a voluntary basis. The sensory analysis panel consisted of 12 trained panelists, including 2 expert dietitians and 10 dietitians, and was structured into two blocks to enhance the reliability of the panel. Besides, it was designed in a triple-blind fashion. Prior to their involvement in the study, panelists were informed and provided written informed consent.

The data collection form used in the sensory analysis panel consists of two sections. The first section utilizes a sensory analysis form for rating six factors on a scale from 1 to 9 (1: very poor, 5: neither good nor bad, 9:

very good). These factors include taste, smell, appearance, mouthfeel, juiciness, and texture. The researcher calculated an overall liking score by averaging the ratings for each of these six factors. The second section employs a five-point Likert hedonic scale of subjective evaluation by panelists to assess overall liking (1: definitely disliked, 3: neither liked nor disliked, 5: definitely liked).

### Product Enrichment

In the preparation of the meatball mixture, a composition consisting of 20% fatty ground beef, 0.8% salt, and 0.2% black pepper was utilized (Özvural, 2016). To produce hamburger patties, 3 kg of ground beef labeled with 20% fat content, available in 500-gram sealed packages at a retail chain, was purchased. The 2880 grams of ground beef were divided into three equal portions of 960 grams each. To each portion, 0.8% (7.68 grams) salt and 0.2% (1.92 grams) black pepper were added. Subsequently, to one portion, 5% (48 grams) of psyllium powder was added, while to the other, 7.5% (72 grams) psyllium powder was added. Each mixture was kneaded for 15 minutes until achieving homogeneity. Certified psyllium powder, produced through organic farming in India and imported by the Güzel Ada Gıda company, was employed as the source of psyllium powder. The weights of the ground beef and hamburger patties were measured using a Sinbo brand kitchen scale, model SKS-4524, with a sensitivity of 1 gram, available at the Istanbul Okan University Nutrition Principles Laboratory. Salt, black pepper, and psyllium were measured using a Kern brand precision scale, model PNS-600, with a sensitivity of 0.001 grams, located in the Biochemistry Laboratory. The exact amounts can be seen in Table 1.

**Table 1.** Content and Weights of Meatball Mixtures Prepared for Sensory Analysis Panel

	<b>Control</b>	<b>%5</b>	<b>%7.50</b>
<b>Ground Beef (g)</b>	960	960	960
<b>Salt (g)</b>	7.68	7.68	7.68
<b>Black Pepper (g)</b>	1.92	1.92	1.92
<b>Psyllium (g)</b>	0	48	72
<b>Total (g)</b>	969.6	1017.6	1041.6
<b>g/Hamburger Patty</b>	161.6	169.6	173.6

To ensure uniformity in shape, Plastlife brand KFTPRS model hamburger patty molds were employed while forming the patties from the prepared mixtures. After the hamburger patties were prepared, they were placed in three identical storage containers and then stored in the refrigerator. The following day, all patties were cooked uniformly and divided into quarters to prevent the analysis of satiety factors from affecting the panelists during the sensory evaluation.

### Blinding of the Sensory Analysis Panel

To ensure the triple-blind nature of the panel, an independent academician was tasked with using the Google Random Number Generator tool to randomly select six numbers between 100 and 999 (156, 371, 527, 699, 852, and 897). Subsequently, the academician encoded these numbers in pairs, assigning two numbers to each storage container.

### Sensory Analysis Panel

The sensory analysis panel consisted of 12 trained panelists, comprising 10 dietitians and 2 dietitians with master's degrees. To enhance the reliability of the panel, it was structured into two blocks. The panelists were selected from a pool of non-smoking females aged between 22 and 31 years, without any recent illnesses such as colds or congestion that could affect their taste and smell senses. They were instructed to arrive at the panel neither hungry nor full and to abstain from consuming any food or beverages (except water) one hour prior to the start of the session.

Before commencing the sensory analysis, the panelists were provided with information about the research, obtained written consent, and were reminded of specific guidelines for sensory evaluations, including rinsing their mouths with water before and after each taste and thoroughly chewing the samples.

The sensory analysis panel was conducted at the Istanbul Okan University Nutrition Principles Laboratory. The laboratory was designed with non-fatiguing grey color tones and intermittent blue accents. Both natural daylight and white artificial light were used for illumination, and the temperature and humidity of the environment were maintained stable throughout the panel session. After each taste, the area was ventilated to prevent the mingling of odors. Water was offered to panelists to rinse their mouths before each tasting, and they were advised not to consume anything except water during the breaks between blocks.

The sensory analysis panel was conducted in two parallel blocks with a one-hour interval between them. In each block, participants tasted samples labeled with three-digit random numbers. Although each of the six codes used was different, all panelists tasted the same three types of hamburgers: classic, 5% psyllium enriched, and 7.5% psyllium enriched. This was done to make panelists believe they were tasting six different products. Panelists were given products one by one and were asked to rate six factors: taste, smell, appearance, mouthfeel, juiciness, and texture on a scale from 1 to 9 (1: very poor, 5: neither good nor bad, 9: very good). The researcher calculated an overall liking score by averaging the ratings for each factor. Additionally, a five-point Likert scale (1: definitely disliked, 3: neither liked nor disliked, 5: definitely liked) hedonic scale assessment was used. The form also provided space for panelists to record notes for each code if desired. The panel was conducted in a triple-blind manner, and after the analysis results were documented, the independent academician revealed which pair of codes corresponded to each product.

## Data Analysis

The analysis of the data was conducted using MS Excel 16 and SPSS 22.0 software packages. Descriptive statistics were employed, including frequency, percentage, standard deviation, standard error, minimum and maximum values, median, and quartiles. Cronbach's Alpha was utilized for internal consistency analysis. For inferential statistics, various tests were employed, including independent samples t-test, paired samples t-test, Wilcoxon signed-rank test, two-way analysis of variance (ANOVA), and the Kruskal-Wallis H test. Post-hoc analysis was performed using the Duncan test. Assumptions were checked using skewness and Mardia's multivariate normality analysis for normal distribution, Levene's test for homogeneity of variances, and Box's M test for covariance equality. All data were interpreted at a 95% confidence level.

## RESULTS

In the sensory analysis panel, a distinction in taste among the patties was observed within the first block, indicating that non-fortified patties received higher scores compared to those fortified with 7.5% psyllium ( $p=0.023$ ). However, no significant differences were detected among the average scores for taste, smell, appearance, mouthfeel, juiciness, texture/consistency, and overall liking of the patties ( $p>0.05$ ). In the second block, all factors and overall liking averages were found to be similar ( $p>0.05$ ) (Table 2).

Values are represented as Mean±SD; F: Two-Way Analysis of Variance;  $\chi^2$ : Kruskal Wallis H Test Statistic; \*:  $p<0.05$ ; \*\*: Duncan Post-Hoc, Control > %7.5 Enriched.

When participants conducted a re-evaluation without prior knowledge that they were consuming the same patty again, they awarded a higher score in terms of mouthfeel to the non-fortified patty during the second tasting ( $z=-2.360$ ;  $p=0.018$ ). However, no significant differences were observed among evaluations conducted for other patties and factors ( $p>0.05$ ). The internal consistency of the data was examined using Cronbach Alpha

values, revealing high reliability for both the non-fortified (Control) and 5% fortified patties ( $\alpha > 0.8$ ), while the 7.5% fortified patty exhibited a considerably reliable level of consistency ( $\alpha > 0.6$ ) (Table 3).

When comparing the hedonic liking scores given by the participants between the patties, it was found that they were similar in both the first and second blocks of evaluation ( $p > 0.05$ ). Furthermore, when the hedonic scale scores given by the participants for the same patties were compared between the blocks, it was statistically determined that there was no significant difference ( $p > 0.05$ ) (Table 4).

## DISCUSSION

In the present study, an evaluation was conducted comparing 5% and 7.5% psyllium-enriched hamburger patties with control patties, focusing on sensory attributes, overall liking, and hedonic scale scores. It is noteworthy that previous research has explored the impact of psyllium enrichment on the sensory properties of various food products. For instance, Ferjančič et al. (2021) conducted a study involving low-fat chicken bologna sausages enriched with inulin, oat fiber, and psyllium at levels of 3% and 6%. Interestingly, their findings indicated a decrease in scores for both sensory attributes and overall appreciation when psyllium was added to the sausages. Mehta et al. (2013) investigated the enrichment of chicken nuggets with psyllium (2%, 4%, and 6%) in addition to 10% rice bran. They observed a decrease in sensory analysis scores as the fiber ratio increased, although the nuggets enriched with 10% rice bran and 4% psyllium were found to be organoleptically acceptable. Furthermore, Zhou et al. (2019) explored the sensory characteristics of pork sausages enriched with varying levels of psyllium (0.5-1%, 1%, and 2-3%) in comparison to control sausages without enrichment. Their study revealed that the desired sensory attributes increased in the sausages enriched with 0.5-1% and 1% psyllium when compared to control sausages. However, this trend reversed when the psyllium enrichment level reached 2-3%. Similarly, Danyliv et al. (2019) examined the impact of psyllium addition to a pork and beef mixture sausage at levels of 2%, 4%, 6%, and 8%. Their findings suggested that the organoleptic properties of the final product could be enriched by 2% psyllium without any noticeable alteration. In another study, products resembling meat patties, produced using chicken meat paste, were evaluated for characteristics such as texture and appearance. These products were obtained by incorporating water in the range of 0% to 40% and psyllium in the range of 0% to 3%. It was noted that the addition of 40% water and 3% psyllium was suitable for increasing product volume and yield without compromising

characteristic attributes. However, due to the absence of a sensory analysis panel in the study, it does not provide a clear insight into overall preference (Zajac et al., 2020). In an effort to enhance the texture and consistency of a plant-based sausage product, psyllium enrichment was carried out at concentrations of 3%, 4%, 5%, and 6%. These enriched sausages were compared to non-enriched sausages in terms of sensory attributes, with a focus on evaluating their overall acceptability. Despite the observation of a darker color in the high-concentration control sausages, all concentrations were deemed suitable in terms of texture/consistency and overall acceptability. The authors have suggested that the utilization of psyllium in plant-based meat analog products can improve their texture and consistency, potentially making them palatable for omnivorous individuals as well (Noguerol et al., 2022).

In the context of the current study, it is worth noting that while the control hamburger patty initially received higher scores in terms of taste during the first block of the sensory analysis panel, no significant difference was observed in the second block. Furthermore, the comparison between the two blocks revealed that the hamburger patties exhibited similarity in terms of sensory attributes, overall preference, and hedonic appreciation. These findings contribute to the understanding of the sensory impact of psyllium enrichment in hamburger patties, aligning with previous research in the field.

## CONCLUSION

This research investigates the effects of enriching hamburger patties with psyllium on sensory factors, aiming to increase the dietary fiber content of one of the most consumed fast-food items worldwide. In this study, hamburger patties were enriched with psyllium at concentrations of 5% and 7.5%, and compared with control patties that underwent no intervention in terms of sensory attributes, including taste, smell, appearance, mouthfeel, juiciness, and texture/consistency. Additionally, overall preference derived from these sensory factors and hedonic scale scores were compared.

A randomized controlled triple-blind sensory analysis panel consisting of twelve dietitians, organized in two blocks, was employed. According to the panel results, while the control patty received higher scores for the taste factor compared to the 7.5% psyllium-enriched patty in the first block, this difference was not observed in the second block. Regarding other factors, overall preference, and hedonic scale scores, the patties were found to be similar. The panel results indicate that the sensory characteristics of hamburger patties remain unaffected when enriched with psyllium up to a concentration of 7.5%.

## ACKNOWLEDGEMENTS

This study is articulated from the corresponding author's doctoral dissertation. Other authors were advisors of the corresponding author's thesis. The study did not receive any external funding. The authors declare there are no conflicts of interest.

Necmettin Erbakan Üniversitesi, Ereğli Ziraat Fakültesi, Tarla Bitkileri Bölümü, Konya, Türkiye  
metinarmagan@erbakan.edu.tr

#### Özet

Türkiye florasında en fazla türe sahip familyalardan biri olan Caryophyllaceae (Karanfilgiller) dünya genelinde yaklaşık 100 cins ve 3000 tür içermektedir. Yapılan çalışmalarla, *Arenaria Ruppis ex L.*'nin *Eremogone* Fenzl alt cinsi (yaklaşık 70 tür) ve *Eremogoneastrum Williams* alt cinsi (22 tür) ile *Minuartia Loefl.*'nin *Spergella* (Fenzl) McNeill alt cinsi (3 tür) altında sınıflandırılan taksonlar *Eremogone* cinsi altına taşınmışlardır. *Eremogone* cinsi, genellikle yoğun şekilde yastık oluşturan, genellikle dallı, odunsu tabanlı çok yıllık bitkilerdir. Yapraklar genellikle çiçekli sapların tabanında veya yakınında kümelenmiştir. *Eremogone* cinsi dünyada 100 taksonla kuzey ılıman bölgelerde, özellikle Kuzeybatı Amerika'da, Avrasya Dağları'nda, Asya'da ve Küçük Asya'da yayılış göstermektedir. Türkiye'de ise 1 alt tür ile birlikte toplam 19 taksondan oluşur ve bunlardan 12 tanesi endemiktir. Bu çalışmada, Türkiye'de yayılış gösteren *Eremogone* taksonlarının morfolojiye dayalı revizyonu hedeflenmiştir. Yurtiçi ve yurtdışı herbarium örnekleri stereo mikroskop altında incelenmiş, arazi çalışmaları ile toplanan canlı materyaller üzerinde çalışılmıştır. Taksonların teşhisinde kullanılabilecek karakterler ve türlerin ayrımı netleştirilmiştir. Çalışmalar sonucunda tür ayrımında glandular tüylerin ve çiçek durumundaki çiçek sayılarının değişkenlik gösterebildiği saptanmıştır. Kullanılacak tür teşhis anahtarlarında türlerin ayrımında sepallerin, petallerin, staminal glandların, gövdedeki yaprak çifti sayısının, yaprakların büyüklüğünün önemli değişmez karakterler olduğu tespit edilmiştir. Fakat özellikle sepallerin kenar kısımlarındaki içe katlanmalar tür ayrımında karışıklıklara neden olmaktadır. Bu çalışmada, taksonların teşhis karakterleri, birbiriyle morfolojik olarak benzer olan taksonların farklılıkları, habitat fotoğrafları ve yayılışları hakkında bilgiler verilmektedir.

#### Taxonomic studies on the genus *Eremogone* Fenzl (Caryophyllaceae)

#### Abstract

One of the families with the most species in the flora of Turkey, Caryophyllaceae includes about 100 genera and 3000 species worldwide. As a result of the studies, taxa classified under the subgenus *Eremogone* Fenzl (about 70 species) and *Eremogoneastrum Williams* (22 species) of *Arenaria Ruppis ex L.* and subgenus *Spergella* (Fenzl) McNeill (3 species) of *Minuartia Loefl.* were moved to the genus *Eremogone*. The genus *Eremogone* is perennial plants with a woody base, usually densely cushion-forming and branched. Leaves are usually clustered at or near the base of flowering stems. The genus *Eremogone* is distributed in north temperate regions, especially in Northwest America, Eurasian Mountains, Asia and Asia Minor with 100 taxa worldwide. In Turkey, it consists of a total of 19 taxa including 1 subspecies and 12 of them are endemic. The aim of this study was to revise the *Eremogone* taxa distributed in Turkey based on morphology. National and international herbarium specimens were examined by stereo microscope and living material collected through field studies were examined. Characters that can be used in the identification of taxa and species distinguishing were clarified. As a result of the investigations, it was determined that glandular hairs and the number of flowers in the inflorescence can be variable in species classification. It was determined that sepals, petals, staminal glands, the number of leaf pairs on the stem and the size of the leaves are important stable characters in the species identification keys to be used. However, especially the inward folds on the margins of the sepals cause confusion in species determination. In this study, the diagnostic characters of the taxa, the differences of the morphologically related taxa, habitat photographs and information about their distribution are given.

## GİRİŞ

*Eremogone* cinsinin ait olduğu Caryophyllaceae (Karanfilgiller) familyası Dünya florasında en fazla türe sahip familyalarından biridir (Hernández-Ledesma ve ark., 2015; Govaerts, 2022). Bittrich (1993) tarafından familya Alsinoideae Burnett, Caryophylloideae Arn., ve Paronychioideae A.St. olmak üzere 3 alt familya ve 5 tribusa ayrılmıştır. Caryophyllaceae familyası taksonlarının farklı gen bölgeleri üzerinde yapılan moleküler çalışmalar ile familya monofiletik gruplar temelinde 11 tribusa ayrılmıştır (Harbaugh ve ark., 2010; Fior ve ark., 2006). *Arenaria* alt cinsi olarak sınıflandırılan *Eremogone* Fenzl cinsi moleküler analizler sonucunda ayrı bir cins olarak kabul edilmiş, *Arenaria* Ruppis ex L.'nin *Eremogone* Fenzl alt cinsi (yaklaşık 70 tür) ve *Eremogoneastrum* Williams alt cinsi (22 tür) ile *Minuartia* Loefl.'nin *Spergella* (Fenzl) McNeill alt cinsi (3 tür) altında sınıflandırılan taksonlar *Eremogone* cinsi altına taşınmışlardır (McNeill, 1962, 1967; Rabeler ve Wagner, 2015; Dillenberger ve Kadereit, 2014; Sadeghian ve ark., 2015).

*Eremogone* ilk kez Eduard Fenzl (1833) tarafından tanıtılmış. *Eremogone* Avrupa, Arktik, Küçük Asya, Kuzeybatı Amerika'da ve Kuzeydoğu Afrika'da bulunur. Başlıca çeşitlilik merkezleri, Orta ve Güney-Batı Asya ve Kuzeybatı Amerika'nın dağlarıdır (POWO, 2022). Ülkemizde yayılış gösteren 19 *Eremogone* taksonunun 12 tanesi endemiktir (Dinç, 2012).

*Eremogone* cinsi üyeleri, çok yıllık, tabanda odunsu, yastıksız formda bitkilerdir. Gövdeler yatık ya da yükselici, basit ya da dallanmıştır. Yapraklar genelde çiçekli gövdenin tabanında kümelenmiş, bir damarlı, ipliksi, iğnemsiz, darca lineardır. Çiçek durumu bir veya daha fazla terminal talkımdan oluşur. Sepaller ince kenarlı genellikle geniştir. Çiçeksapları dik veya çiçekler sapsız. Çanak yapraklar 5, belirgindir. Taç yapraklar 5, beyaz, sarımsı beyaz veya bazen pembe veya kahverengimsi, pençeli veya değil, ayanın tepesi tam, aşınmış, girintili veya nadiren 2 parçalı; nektarlar genellikle 5 adet, çanak yaprakların karşısındaki filamentlerin tabanında belirgin. Stil 3, ipliksi. Tohumlar 1-10, koyu kırmızımsı veya yeşilimsi kahverengi, ten rengi, siyahımsı mor, siyah veya gri, tohum şekli oval, yanal olarak sıkıştırılmış, tohum yüzeyi pürüzsüz, ruguloz veya tuberkulat, kenarlarında kanatları yoktur (Harbaugh vd., 2010; Rabeler ve Hartman, 2005; Rechinger, 1964, 1988; Schischkin, 1995).

Bu çalışmanın amacı *Eremogone* cinsinin Türkiye taksonlarının morfolojilerinin incelenmesi, morfolojiye dayalı türler arasındaki farklılıkların ortaya konması, taksonların ayırımındaki kullanılacak varyasyon göstermeyen teşhis karakterlerinin belirlenmesidir.

## MATERYAL VE METOT

2018 – 2023 yılları arasında gerçekleştirilen arazi çalışmalarıyla toplanan canlı materyaller bu çalışmanın ana materyalini oluşturmaktadır. Ayrıca yurtiçi ANK, AEF, ESSE, GAZI, ISTO, KNYA, VANF ve yurtdışı E, G, K ve P herbaryumlarında (Herbaryum kodları Thiers (2023)'e göre yazılmıştır) bulunan örnekler stereo mikroskop altında incelenmiştir. Her taksonun morfolojisi mikroskop altında ölçülmüş, özellikle tayin karakterlerinin fotoğrafları çekilerek takson ayırımında kullanılmak üzere depolanmıştır.

## BULGULAR ve TARTIŞMA

Örnekler üzerinde çiçek karakterleri, yaprak formları, tüylülük durumları, çiçek durumları incelenmiştir. Flora çalışmalarında sepallerin şekilleri, sepallerin uç kısımları, petallerin sepallere oranı, petallerin uzunluğu ve şekli tür teşhislerinde belirleyici karakterler olarak kullanılmıştır. Sepaller genişçe akut ila aküminat veya kuspilat, uzun akut, oblong-lanseolat, hemen hemen tamamen zarsız, salgı tüylü veya tamamen tüysüz olabilir (şekil 1). Inflorescence kimöz panikula veya kümelenmiş salkımlardan oluşan korimboz veya tek olabilmektedir.

Şekil 1. *Eremogone*'de görülen bazı sepal şekilleri; **a**) geniş akut, **b**) uzun akut, **c**) akut-akuminat, **d**) zarsı.

Staminal glandlar (nektaryum) kanat benzeri (belirsiz) veya parmaklı olabilir (şekil 2). Yapraklar çimensi ya da batıcı olup dikensi, belirgin tek damarlı, gövde tabanında demetler halinde olur. Gövdede ki yaprak çift sayısı ise türler içinde sabittir. Yaprakların birleşme yerlerinde oluşturdukları kınlar (şekil 3) tür ayırımında önemlidir.

Şekil 2. *Eremogone* cinsinde görülen staminal glandlar: a) kanatsı, b) parmaklı.

Şekil 3. *Eremogone* gövde yapraklarının tabanı; a) serbest, b) kın oluşturmuş.

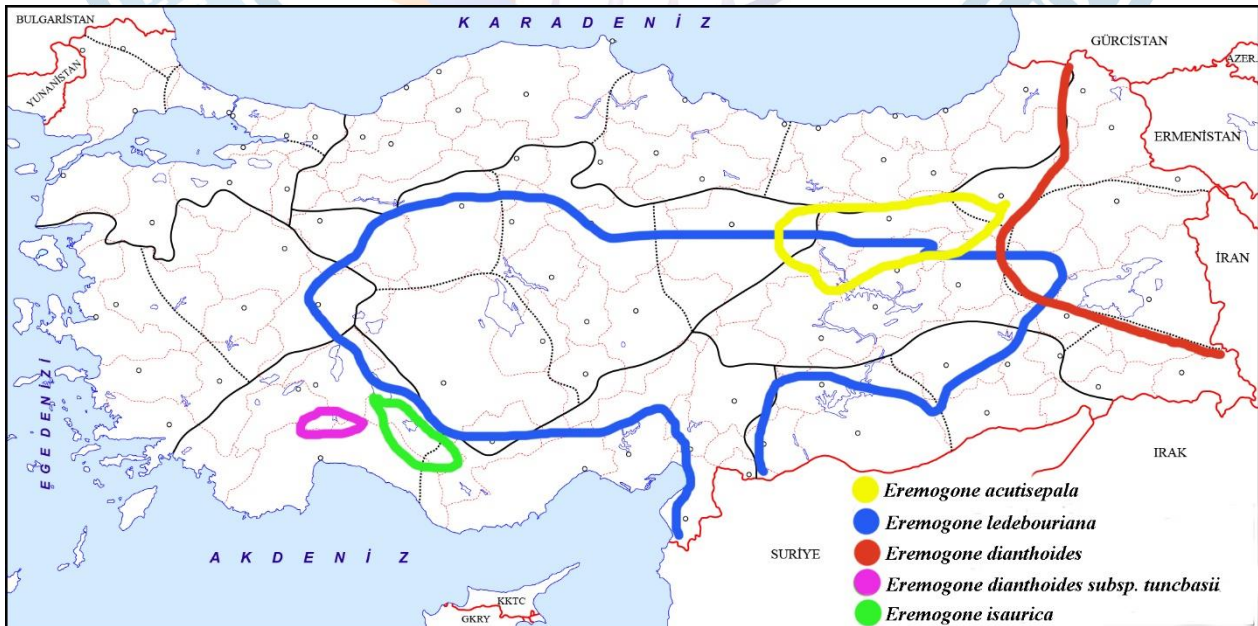

Türkiye’de 13’ü endemik toplam 19 takson yayılış göstermektedir (Tablo 1).

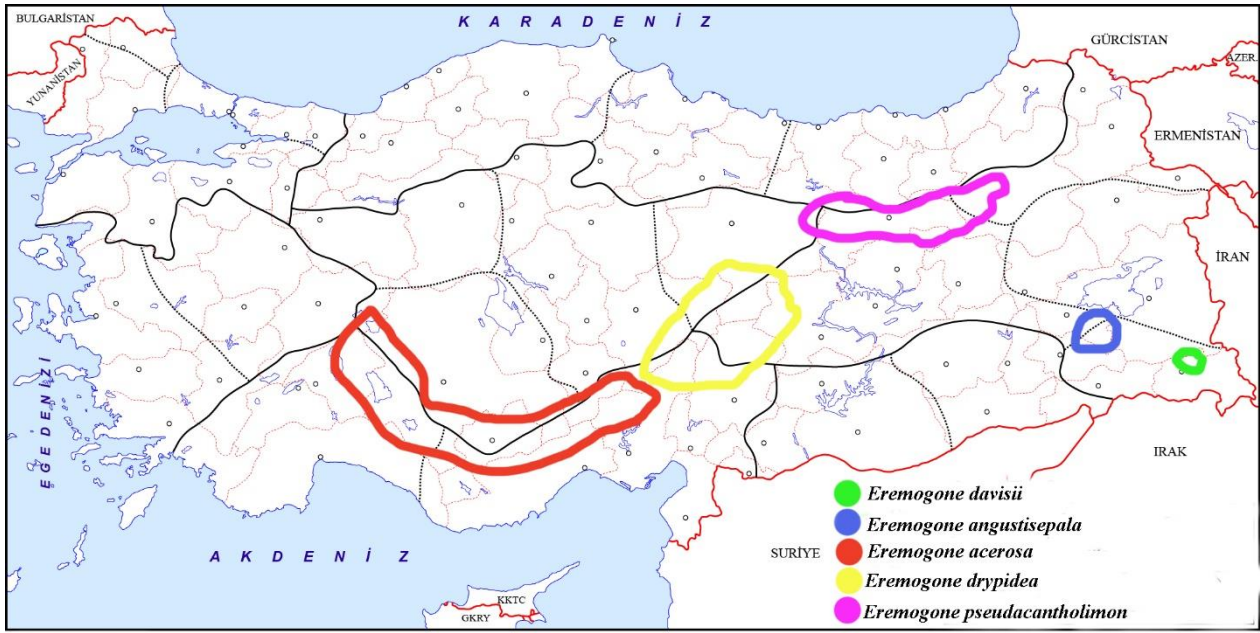

**Tablo 1.** Türkiye’de bulunan *Eremogone* taksonlarının yayılış bölgeleri ve endemizm durumları

<i>E. scariosa</i> (Boiss.) Holub	İç Doğu Anadolu	Endemik

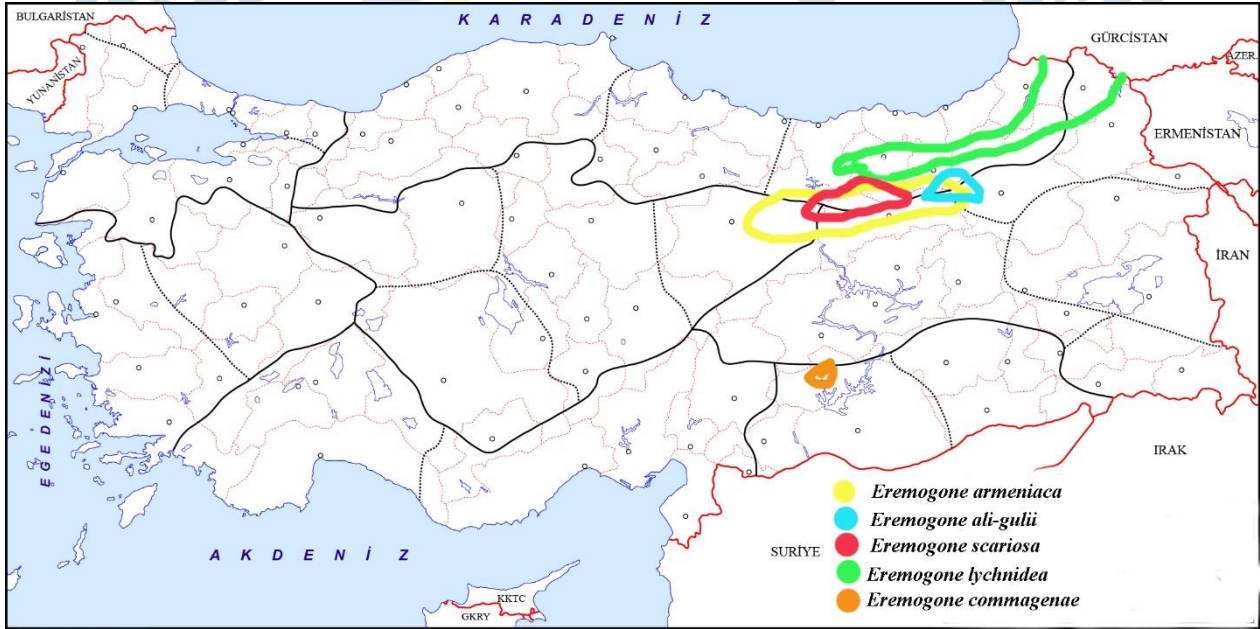

Türkiye’deki 12 endemik *Eremogone* taksonundan 6 tanesi lokal endemiktir (*E. isaurica*, *E. dianthoides* ssp. *tuncbasii*, *E. ali-gulii*, *E. davisii*, *E. angustisepala*, *E. commagenae*). Batı Ege, Marmara ve Karadeniz’in büyük bir kesiminde *Eremogone* kaydı bulunmamaktadır. Türkiye’de en geniş yayılış alanına *E. ledebouriana* sahiptir. Genelde türlerin çoğunluğu doğu illerinde toplanmıştır (Şekil 4, 5, 6, 7).

**Şekil 4.** *Eremogone* taksonlarının yayılışları (haritalar cografyaharita.com’ dan alınarak düzenlenmiştir).

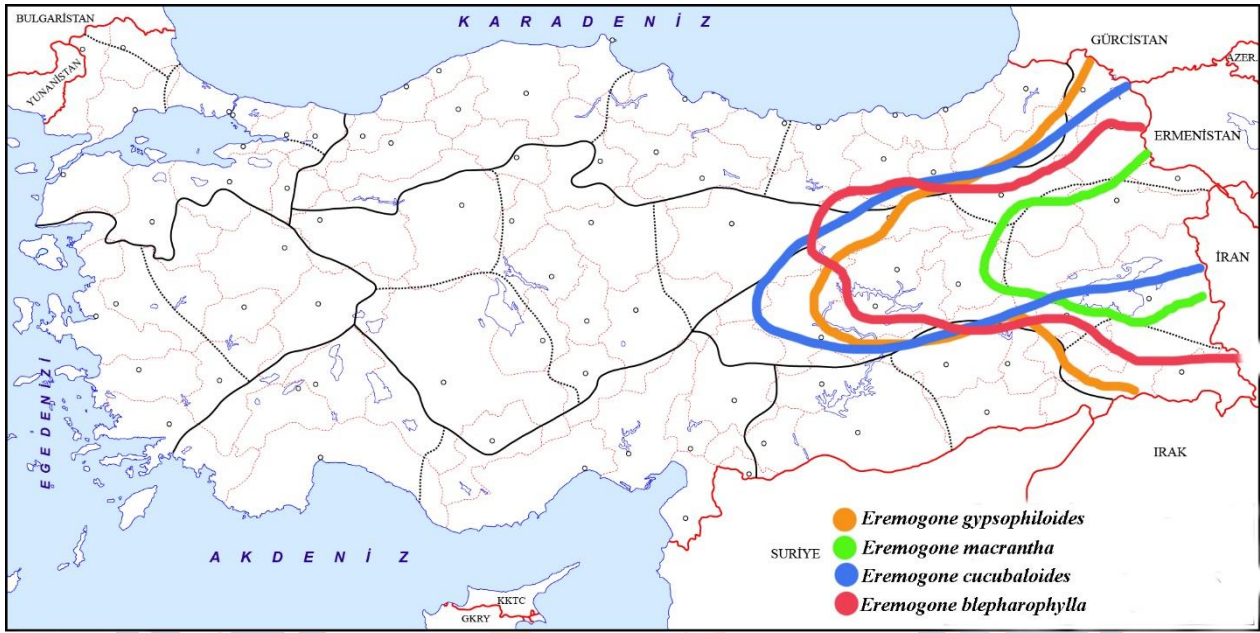

Şekil 5. *Eremogone* taksonlarının yayılışları (haritalar cografyaharita.com'dan alınarak düzenlenmiştir).

Şekil 6. *Eremogone* taksonlarının yayılışları (haritalar cografyaharita.com'dan alınarak düzenlenmiştir).

Şekil 7. *Eremogone* taksonlarının yayılışları (haritalar cografyaharita.com'dan alınarak düzenlenmiştir).

Türkiye'de bulunan bazı *Eremogone* taksonlarının teşhislerinde karışıklık yapılmaktadır. Genelde *E. ledebouriana*, *E. acerosa*, *E. drypidea* ve *E. commagenae* birbiriyle zaman zaman karıştırılabilmektedir. Bunun sebebi *E. ledebouriana*'nın çok fazla varyasyon aralığına sahip olmasıdır. Gövdede bulunan yaprak çift sayısı ve sepal şekilleri ile ayırt etmek daha kolaydır. *E. acutisepala*, *E. scariosa*, *E. ali-gulii* ve *E. armeniaca*'da teşhisinde karıştırılabilen bir gruptur (Şekil 8). Bu dört türün yayılış alanları da örtüşmektedir. Türkiye'deki tek alttür *E. dianthoides* subsp. *tuncbasii*'dir. Gövdenin tepesinde sıkı bir şekilde kümelenmiş çiçek durumu sadece *E. dianthoides* türünde görülmektedir (Şekil 8). Yaprak özellikleriyle *E. gypsophiloides*, *E. lychnidea*, *E. isaurica*, *E. macrantha* ve *E. cucubaloides* birbirine benzer yapıdadır. Taksonlar içinde *E. angustisepala*, *E. davisii* ve *E. pseudacantholimon* çok kolay ayrılabilen net türlerdir. Sadece *E. cucubaloides* ve *E. dianthoides* türlerinin gövde yaprak çiftlerinin tabanında 3 mm'den uzun kın vardır.

Şekil 8. Bazı *Eremogone* taksonlarının çiçekleri; a) *E. dianthoides* subsp. *tuncbsii*, b) *E. dianthoides*, c) *E. scariosa*, d) *E. ali-gulii*, e) *E. armeniaca*, f) *E. acutisepala*.

Sadece *Eremogone armeniaca*, *E. blepharophylla*, *E. scariosa*, *E. ali-gulii* türleri parmaklı staminal gland (nektaryum)lara sahiptirler. Bu özellikleri ile diğer türlerden rahatlıkla ayırt edilebilirler. Bu grupta *E. armeniaca*'da çiçek durumu kabuksu bir brakte ile çevrelenmiştir. Bu yönüyle kolayca ayırt edilebilmektedir.

Zaman zaman arazi çalışmalarında *E. gypsophiloides* ile *E. blepharophylla* karıştırılabilmektedir. Fakat bu iki türün arasında çiçeklenme zamanında farklılık mevcuttur. Önce *E. blepharophylla* çiçeklenir ve meyveye geçme zamanından sonra *E. gypsophiloides* çiçeklenir. Ayrıca staminal glandları ve sepal şekilleri ile de net ayrılabilir.

## SONUÇ

Çalışma sonunda Türkiye’de 12’si endemik toplam 19 takson değerlendirilmiştir (tablo 1). Yapılan morfolojik incelemelerde *E. scariosa*, *E. armeniaca* ve *E. ali-gulii* türlerinin birbiriyle çok yakın oldukları ve bunların evrimsel akrabalıklarının belirlenmesi için moleküler, polen, anatomi ve tohum mikromorfolojisi analizlerine ihtiyaç olduğu kanısına varılmıştır. Bu üç tür yayılış alanları iç içe olmakla birlikte, habitatları da benzerlik göstermektedir. Türkiye’de geniş bir bölgede bulunan *E. ledebouriana*’nın birbirinden farklı gövde yapıları ve çiçek durumları göze çarpmıştır. Bu türün deskripsiyonu daraltılarak sinonim olan bazı taksonların canlandırılması yapılabilir. *E. gypsophiloides* örnekleri üzerinde yaptığımız incelemelerde bir bireyin bir dalının salgı tüylü başka bir dalının ise tüysüz olduğu görülmüştür. Bu inceleme sonucunda çiçek durumundaki salgı tüylerinin tür teşhislerinde yanıltıcı olabileceği sonucuna varılmıştır.

Ayrıca yapılan herbaryum ve arazi çalışmaları sonucunda, Türkiye’de *E. szowitsii* (Boiss.) Ikonn.’nin bulunmadığı anlaşılmıştır. Herbaryumlarda *E. szowitsii* olarak teşhis edilen örneklerin *E. macrantha*’ya ait olduğu teşhisle kesinleştirilmiştir. Böylece Türkiye’de toplam takson sayısı 19 olarak belirlenmiştir.

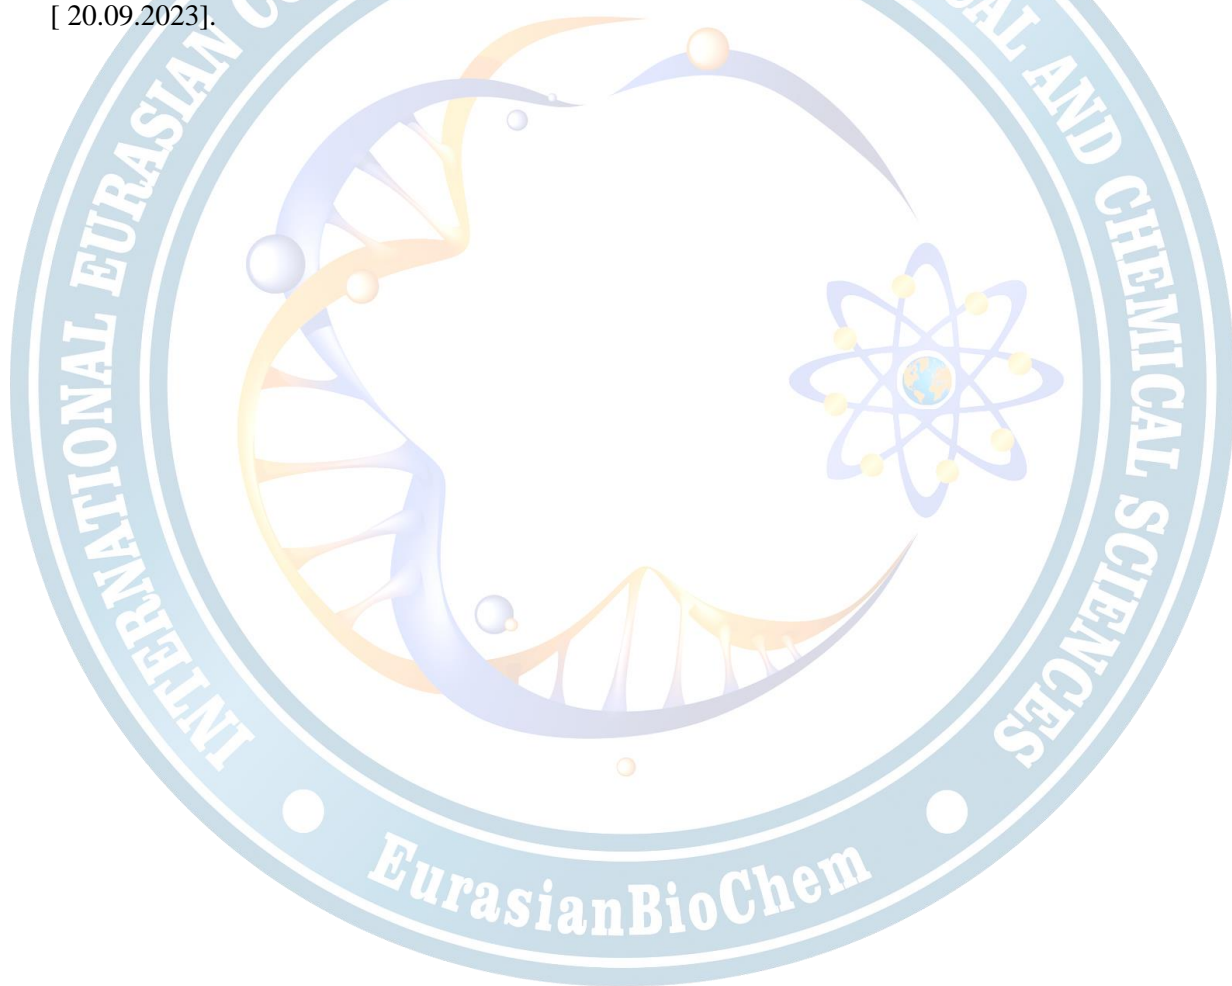

## TEŞEKKÜR

Resimli Türkiye Florası’ndaki *Gypsophila* ve *Eremogone* cinslerinin revize edilmesine maddi destek sağlayan Ali Nihat Gökyiğit (ANG) Vakfı’na teşekkür ederim. Ayrıca Türkiye Bilimsel ve Teknik Araştırma Kurumu (TÜBİTAK)’a (221Z314 nolu proje) teşekkür ederim.

## Özet

Akdeniz midyesi (*Mytilus galloprovincialis*) besleyici değeri ve lezzeti nedeniyle ekonomik öneme sahip çift kabuklu yumuşakça türüdür. Midyelerin alternatif ürün yelpazesinin sınırlı olmasının yanında ürün üretimleri sırasında sıklıkla kayıplar yaşanabilmektedir. Diğer taraftan, tüketicilerin son yıllarda sağlıklı ve fonksiyonel özelliğe sahip gıda ürünlerini tüketme eğilimi artmış, bu özelliklere sahip ürünlerin iç ve dış pazarda yer edinmesine yönelik çalışmalar önem kazanmıştır. Yapılan bu çalışmada, mevcut midye ürünlerine alternatif olarak midye sosu üretimi gerçekleştirilmiş, elde edilen midye soslarının biyoaktif potansiyeli belirlenmiştir. Taze olarak toplanan midyelerden pilot çalışmalarda belirlenen formülasyonlara göre sos kurulumu yapıldıktan sonra fermantasyona tabi tutulmuştur. Üç ay süren fermantasyon işlemi sonrasında, soslar filtre edilmiş ve elde edilen filtratların DPPH radikallerini, referans antioksidan maddeler olan bütil hidroksi tolüen (BHT) ve Troloks (suda çözünebilen E vitamini analogu) karşısında, süpürme etkisi belirlenmiştir. Elde edilen bulgulara göre, 2,5 – 40 mg/ml konsantrasyonları arasında BHT, trolox ve midye sosunun DPPH radikallerini süpürme kapasitesi sırasıyla, %19,5 – 94,2, % 18,1 - %93,1 ve %1,8 – 69,5 olarak tespit edilmiştir. Midye soslarının DPPH süpürme kapasitesinin 10 mg/ml konsantrasyondan sonra neredeyse sabit kaldığı belirlenmiştir. Sonuç olarak, alternatif ürün olarak midye sosunun biyoaktif özellikleri potansiyel olarak taşıyabileceği, DPPH radikallerini 10 mg/ml konsantrasyonlara kadar referans antioksidan maddelere benzer oranlarda süpürmesi özelliğinden anlaşılmıştır. Farklı fermantasyon koşullarının denenerek, midye soslarının biyoaktif özelliklerinin artırılabilceği bunun yanı sıra, iç ve dış pazarda yer edebilecek değerli ürünler olabileceği düşünülmektedir.

**Anahtar Kelimeler:** Akdeniz midyesi, *Mytilus galloprovincialis*, midye sosu, antioksidan aktivite, DPPH

### Determination of microbiological quality of stews produced from Mediterranean mussels (*Mytilus galloprovincialis*)

## Abstract

Mediterranean mussel (*Mytilus galloprovincialis*) is an economically important bivalve mollusc species due to its nutritive value and flavour. In addition to the limited range of alternative products of mussels, losses can often occur during product production. On the other hand, the tendency of consumers to consume food products with healthy and functional properties has increased in recent years, and studies to place products with these properties in the domestic and foreign markets have gained importance. In this study, mussel sauce production was carried out as an alternative to existing mussel products and the bioactive potential of the obtained mussel sauces was determined. Freshly collected mussels were subjected to fermentation after the sauce was made according to the formulations determined in pilot studies. After three months of fermentation, the sauces were filtered and the scavenging effect of the obtained filtrates on DPPH radicals against the reference antioxidants butyl hydroxy toluene (BHT) and Trolox (water-soluble vitamin E analogue) was determined. According to the results obtained, the DPPH radical scavenging capacity of BHT, trolox and mussel sauce at concentrations of 2.5 - 40 mg/ml was 19.5 - 94.2%, 18.1% - 93.1% and 1.8 - 69.5%, respectively. It was determined that the DPPH scavenging capacity of mussel sauces remained almost constant after 10 mg/ml concentration. As a result, it was concluded that mussel sauces as an alternative product could potentially carry bioactive

properties, as they scavenged DPPH radicals at similar rates to reference antioxidant substances up to 10 mg/ml concentrations. It is thought that by experimenting different fermentation conditions, bioactive properties of mussel sauces can be increased and they can be valuable products that can take place in domestic and foreign markets.

**Keywords:** Mediterranean mussel, *Mytilus galloprovincialis*, mussel stew, Sous-vide, shelf life

## Giriş

Akdeniz midyesi (*Mytilus galloprovincialis*), farklı mutfak kültürlerinde yer edinmiş, besleyici özellikleri ve lezzet bakımından rağbet gören ekonomik çift kabuklu yumuşakça türüdür. Üretimleri avcılık ve yetiştiricilik yoluyla gerçekleştirilmektedir. Pazarlık boy için kabul edilebilir kabuk uzunluğu olan 5 cm üzerinde midyeler toplandıktan sonra gerek görüldüğü durumlarda kendi kendilerini arındırmaları işlemi olan depurasyon uygulamasına tabi tutularak veya direkt olarak canlı ticaretleri yapılabilmektedir. Bunun yanında, midye eti çıkarma işlemleri de uygulanabilmekte ve koruyucu özelliklere sahip farklı aroma ve lezzet kazandıran işleme teknikleri ile işlenerek ticareti yapılmaktadır. Midye üretiminde, hasat, boylama, nakliye ve işleme aşamalarında çoğunlukla kabuk kırılmalarına dayanan kayıplar gerçekleşebilmekte yanı sıra, mikrobiyolojik açıdan da riskli üretimin olduğu durumlarda hem zaman hem de ekonomik açıdan kayıplar da görülebilmektedir. Bununla birlikte midye üretiminde alternatif ürün işlemeciliği genellikle tüketici talebi doğrultusunda şekillenmekte, iç ve dış pazarda bu türe ait fonksiyonel ürün çeşitliliği ve bulunabilirliği sınırlı kalmaktadır.

Son yıllarda tüketici gruplarının doğal gıda ürünlerine yönelmesi yanı sıra, güvenli ve biyolojik olarak fayda gösteren fonksiyonel ürünlere talepleri artmıştır. Bu talebe karşılık, gıda üretim firmaları ise, ürünlerinde fonksiyonel özellik gösteren bileşenlerin doğal formlarını veya gıda derecesinde güvenli olan sentetik formlarını ürettikleri ürünlere sonradan ilave ederek fonksiyonellik katmaya çalışmaktadır. Diğer taraftan, doğal gıda üretim metotlarından olan fermantasyon teknolojisi ile üretilen ürünlerin önemi arzu edilen doğallık ve fonksiyonelliğin aynı anda bulunması nedeniyle tüketici tarafından rağbet görmesine neden olmaktadır. Dolayısıyla, midye gibi deniz ürünlerinin farklı üretim metotları kullanılarak doğal ve fonksiyonel özellik gösteren ürünlere dönüştürülmesi hem mevcut zaman için, hem de gelecekte önemli bir potansiyel taşımaktadır. Yapılan bu çalışma ile Akdeniz midyesi (*Mytilus galloprovincialis*) kullanılarak fermantasyon yöntemi ile midye sosu üretimi gerçekleştirilmiş, ürünlerin fonksiyonel özelliği ise potansiyel antioksidan aktivite varlığı araştırılarak tespit edilmiştir.

## Materyal ve Metot

Araştırma materyali olarak Akdeniz midyesi (*Mytilus galloprovincialis*) kullanılmıştır (Şekil 1a-c). Toplam ağırlığı yaklaşık 3 kg olan ve her birinin boyu 4-6 cm aralığında bulunan örnekler bir yetiştiricilik çiftliğinden temin edilmiştir. Örnekler daha sonra Çanakkale Onsekiz Mart Üniversitesi laboratuvarlarına 4 saat içinde buz aküleri ile soğutulmuş yalıtımlı polietilen kutularda taşınmıştır. Laboratuvara getirilen örneklerin canlılık kontrolleri yapıldıktan sonra kabuklarından etleri ve kabuklar arası sıvısı alınarak fermantasyon için kullanılmıştır.

Şekil 1 – Akdeniz midyesi örnekleri (a), midye etleri (b), midye sosu üretimi için hazırlanan harç (c), fermantasyon için kavanoza alınmış midye sosu harcı (d)

### Midye sosu üretimi

Midye sosları için ayrılan et ve kabuklar arası sıvı, tuz, şeker, karabiber, kırmızı biber harmanlandıktan sonra el blenderi ile iyice homojenize edilmiştir. Homojenize edilen harç, 200 ml cam kavanozlara 150 olarak şekilde yerleştirilmiş ve fermantasyon işlemi için inkübatörde 30 °C’de üç ay bekletilmiştir. İkinci aydan sonra kavanozların renklerine göre her hafta bir kavanozdan ürün kontrolü yapılarak titrasyon asitliği, pH ölçümü, mikrobiyolojik analizler ve duyu özelliklere göre kabul edilebilir duruma geldiğinde (üç ay) fermantasyon işlemi sonlandırılmıştır. Fermantasyon işlemi sonrasında olgunlaşmış ürünler nemlendirilmiş filtre kağıdı ile süzülüş ve elde edilen süzüntü antioksidan analizlerde kullanılmıştır.

### DPPH Süpürme Kapasitesi

Antioksidan aktivite için, bütil hidroksi tolüen (BHT), trolox ve midye sosu örneklerinden 2,5 mg/ml ila 40 mg/ml konsantrasyonlarında alt numuneleri hazırlanmıştır. Hazırlanan farklı konsantrasyonlardaki numunelerden 1ml alınarak, 3 ml hacmindeki 4 mg / 100 ml konsantrasyonunda hazırlanmış 2,2-diphenyl-1-picrylhydrazyl (DPPH) ile karıştırılmıştır. Reaksiyon tüpleri ise karanlık ortamda 30 dk bekletilmiş daha sonra santrifüj edilen örnekler 517 nm dalga boyunda absorban değerleri ölçülmüştür. Ölçümleri yapılan absorban değerlerinin yanında, metanol negatif kontrol, BHT ve Trolox pozitif kontrol olarak ölçülmüştür. Elde edilen sonuçlar aşağıdaki formül kullanılarak %DPPH süpürme etkisi olarak ifade edilmiştir.

$$\%DPPH \text{ Süpürme Etkisi} = \frac{(A_0 - (A - A_b))}{A_0} * 100$$

$A_0$  = DPPH Absorbansı

A = Örnek/Trolox/BHT Absorbansı

$A_b$  = Kör (methanol) Absorbansı

## Bulgular ve Tartışma

Midye dinamik deniz ortamlarında yaşayan ve oksidatif strese yol açan çeşitli serbest radikallere maruz kalan bir canlıdır. Dolayısıyla bu organizmalar kendi doğal ortamlarında antioksidan ve antioksidan enzim üretimi gibi savunma stratejileri geliştirme eğilimindedir. Bu çift kabuklular insan tüketimi ve biyoaktif bileşikler için mükemmel bir kaynak olduğundan son yıllarda üretim ve tüketimi üzerine yapılan araştırmaların çeşitliliği artmıştır. Bu çalışmada porsiyonluk boyalarda bulunan midyelerden fermantasyon yöntemiyle midye sosu üretimi gerçekleştirilmiş, elde edilen ürünlerin ise antioksidan aktivitesi DPPH radikallerini süpürme yeteneği ile belirlenmeye çalışılmıştır. Çalışmada midye sosunun, referans antioksidanlar olan BHT ve trolox karşısındaki antioksidan aktivitesi Şekil 2’de özetlenmiştir.

BHT: Butylated Hydroxy Toluene, DPPH: 2,2-diphenyl-1-picrylhydrazyl.

Şekil 2: Akdeniz midyesinden üretilen sosların BHT ve trolox referans antioksidan maddelere göre DPPH radikallerini süpürme kapasitesi (%).

Elde edilen bulgulara göre, 2,5 – 40 mg/ml konsantrasyonları arasında BHT ve trolox referans bileşiklerinin DPPH radikallerini süpürme etkisi sırasıyla, %19,5 – 94,2 ve % 18,1 - %93,1 aralığında tespit edilmiştir. Midye sosunda ise bu aktivite %1,8 – 69,5 aralığında seyretmiştir. Ayrıca midye soslarının DPPH süpürme etkisinin 10 mg/ml konsantrasyondan sonra neredeyse sabit kaldığı belirlenmiştir. Dolayısıyla alternatif ürün olarak midye sosunun biyoaktif özellikleri potansiyel olarak taşıyabileceği, DPPH radikallerini 10 mg/ml konsantrasyonlara kadar referans antioksidan maddelere benzer oranlarda süpürmesi özelliğinden anlaşılmıştır.

Son yıllarda midye eti üzerine yapılan çalışmalarda tür, mevsim, çevresel yapı gibi faktörlere de bağlı olarak antioksidan, antimikrobiyal ve antiinflamatuvar özellikler gibi birçok biyoaktivite belirlenmiştir (Coulson ve ark.,2015; Jayaprakash ve Perera 2020; Peralta ve ark., 2021). Chakraborty ve ark (2016) yeşil midyelerin (*Perna viridis L.*) DPPH radikallerini süpürme etkisini %24-32 aralığında belirlemiştir. Yapılan bir başka çalışmada ise yeşil midyelerin (*Perna viridis L.*) farklı ekstraktlarının DPPH radikalini süpürme aktiviteleri belirlenmiş ve %100 metanol ekstraktının %79,86'lık maksimum DPPH radikal süpürme aktivitesi gösterdiği bildirilmiştir (Shanmugam ve ark. 2020).

Bununla birlikte yapılan çalışmalar sonuçlarımıza benzer şekilde fermente edilen midyelerin biyoaktif özelliklerinin iyileştiğini bildirmiştir (Je ve ark. 2005; Jung ve ark. 2005; Rajapakse ve ark. 2005; Peralta ve ark., 2021). Je ve ark. (2005), mavi midyenin %25 tuzlu ortamda 12 ay fermente edilmesi ile elde edilen midye sosundan saflaştırılan biyoaktif peptidlerin %89,5 oranında hidroksil radikalini temizleyebilme kapasitesine sahip olduğunu tespit etmiştir. 1:3,1:5, 1:7 ve 1:9 oranında farklı tuzlulukta 30 gün fermente edilen yeşil

midyelerin ise farklı oranlarda DPPH süpürme aktivitesi gösterdiği belirlenmiş ve tuzluluğun 1:9 oranında kullanılması ile yaklaşık %80 oranında aktivite belirlenmiştir (Peralta ve ark., 2021).

### Sonuç

Sonuç olarak bu çalışma ile doğası gereği hem besleyici ürün profile açısından hem de biyoaktif bileşikler açısından zengin olan midyenin fermente edilmesi ile midye sosu üretilmiştir. Fermantasyon ile üretimin sonucunda oluşan midye soslarında potansiyel antioksidan aktivite varlığı araştırılarak tespit edilmiştir. Farklı fermantasyon koşullarının denenerek, midye soslarının biyoaktif özelliklerinin artırılacağı bunun yanı sıra, iç ve dış pazarda yer edebilecek değerli ürünler olabileceği düşünülmektedir.

#### Özet

Doğal veya sentetik kaynaklı monomerlerin, farklı çapraz bağlanma yöntemleri ve sentez metotlarıyla çapraz bağlanması sonucu elde edilen hidrojeller, biyomedikal alanda ilk kez Wichterle ve Lim'in poli(2-hidroksietil metakrilat) / p(HEMA) hidrojelleriyle gerçekleştirdikleri çalışmada kontak lens olarak incelenmiştir. Biyomateryal üretiminde kontak lens kullanımıyla başlayan uygulamalar kontrollü ilaç salım ajanları, akıllı yara örtüleri, implantlar, diş dolguları, doku mühendisliğinde hücre ve doku iskeleleri, yapay organ üretimi gibi birçok alanda kullanılarak oldukça geniş bir kullanıma ulaşmıştır.

Hidrojellerin biyomedikal alandaki kullanım çeşitliliğinin artmasında en önemli faktör olarak hidrofilik içeriği ve yumuşak mekanik yapısıyla biyolojik dokulara benzer bir ortam sunması ve biyoyumluluğunun diğer sert ve sentetik materyallerden daha üstün özellikte olması gösterilebilir.

**Anahtar Kelimeler:** hidrojel, biyomedikal, biyoyumlu, doku mühendisliği, kontrollü ilaç salımı, biyomateryal

#### Uses of hydrogels in the biomedical field

#### Abstract

Hydrogels obtained as a result of cross-linking of natural or synthetic monomers with different cross-linking methods and synthesis methods were used as contact lenses for the first time in the biomedical field in the study carried out by Wichterle and Lim with poly(2-hydroxyethyl methacrylate) / p(HEMA) hydrogels. Applications that started with contact lens usage in biomaterial production have reached comprehensive uses in many areas, such as controlled drug release agents, smart wound dressings, implants, dental fillings, cell and tissue scaffolds in tissue engineering, and artificial organ production.

The most crucial factor in increasing the variety of uses of hydrogels in the biomedical field is that they provide an environment similar to biological tissues with their hydrophilic content and soft mechanical structure, and their biocompatibility is superior to other harsh and synthetic materials.

**Keywords:** hydrogel, biomedical, biocompatible, tissue engineering, controlled drug release, biomaterial

#### GİRİŞ

##### Biyomedikal Alanının Gelişim Süreci

Antik çağlardan bu yana ameliyat ve tedavilerde kullanılmak üzere birçok materyal ve yöntem örneğine rastlanmaktadır (Aljamali ve Almuhan, 2021). Biyomateryaller, deniz hayvanlarından hazırlanan farmasötikler, süngerlere uyku verici bitkilerin emdirilmesiyle elde edilen ve ilk anestezi cihazı olarak tanımlanan ilk uygulama örneklerinden hassas ve hayati organların takip ve tedavisini sağlayacak hassaslıkta materyallerin üretimine kadar büyük bir gelişme göstermiştir. Günümüze tıp ve mühendislik alanını bir araya getiren biyomedikal mühendisliğin bir çalışma alanı olarak gelişimini ve varlığını sürdürmektedir (Aljamali ve Almuhan, 2021; Müller ve ark., 2004).

Ağrılı artritlik eklemlerin tedavisindeki eklemin hareketini ve işlevini yeniden sağlamak için korozyona dayanıklı metaller kullanılırken vücut ortamında daha stabil özellik sergileyen seramiklere

yönelim gerçekleşmiştir. Biyouyumluluk, biyobozunurluk, mekanik dayanım, maaliyet gibi birçok faktörün göz önünde bulundurulması metal ve seramikler dışında daha kullanışlı materyal arayışlarını doğurmuştur. Kompozit malzemeler, polimerler, polimerik bir yapı olan hidrojeller, bu arayışların sonucu olarak biyomateryal üretiminde kullanılmaya başlanmıştır.

## Hidrojel Tarihinin Genel Bir Bakışı

“Hidrojel” terimi ilk kez 1894’te inorganik tuzlardan oluşan kolloidal jeli tanımlamak için kullanılmıştır. 1960’lardan günümüze ise fiziksel veya kimyasal çapraz bağlanma metotlarıyla elde edilen üç boyutlu polimerik yapıları tanımlamak için kullanılmaktadır. Keşfedildiği günden bu yana sağlıktan teknolojik aletlere, tekstilden tarıma birçok alanda kullanılabilirliği araştırma konusu olmuştur (Şekil 1).

Şekil 1. Hidrojellerin uygulama alanlarına genel bir bakış

Üç boyutlu yumuşak ve ağsı yapısı doku benzeri bir yapı sergilediğinden özellikle biyoloji ve tıp alanında dikkat çeken bir materyal olmuştur. Biyouyumlu ve biyobozunur özelliklere sahip örneklerinin de üretilebiliyor oluşu sağlık alanında sıkça araştırma konusu olmasını sağlayan bir diğer unsurdur.

**Tablo 1.** Hidrojellerin biyomateryal olarak kullanımında sahip olduğu avantaj ve dezavantajlar (Patel ve Mequanint, 2011, Rajen ve ark., 2022).

Avantajları	Dezavantajları
Biyouyumluluk	Zayıf mekanik dayanım
Ayarlanabilir biyobozunurluk	Enfeksiyon riski
Su absorplayabilme ve tutabilme	Sık kullanımda maliyet yüksekliği
Gözenekli yapı	Üretim zorluğu
Fonksiyonel kullanım	Toksosite varlığı (Sentetik kaynaklı hidrojellerde)

## HİDROJELLERİN BIYOMEDİKAL ALANDA KULLANIMLARI

Hidrojellerin biyomedikal alanda başlıca kullanım alanlarını şu şekilde sınıflandırmak mümkündür.

- 1- Kontak lens kullanımı
- 2- Kontrollü salım ajanı
- 3- Tıbbi pansuman materyali
- 4- Doku mühendisliği
- 5- İmplantlar
- 6- Biyosensörler

### 1-Kontak Lens Kullanımı

Hidrojeller biyomedikal alanda ilk kez Wichterle ve Lim'in 1960 yılında gerçekleştirdikleri çalışmada poli(2-hidroksietil metakrilat) / p(HEMA) hidrojellerinin kontak lens olarak kullanılma potansiyeli araştırılmasıyla kullanılmıştır (Wichterle ve Lim, 1960). İlk çalışmalarda poli(metil metakrilat) (PMMA) hidrofilik poli(2-hidroksietil metakrilat (HEMA)) (PHEMA) baz olarak kullanılırken daha sonra oksijen geçirgenliğini arttırmak için silikon hidrojeller geliştirilmiştir.(Shao ve ark., 2016).

### 2- Kontrollü Salım Ajanı Olarak Kullanımı

Kontrollü ilaç salımı yapan sistemler geleneksel ilaç kullanımının aksine sadece hedef organda istenilen dozaj ve sürede ilacın salımını gerçekleştirerek oluşabilecek yan etkileri azaltacak ve gereksiz ilaç yükünü önleyecek bir imkan sunmaktadır (Adepu ve Ramakrishna, 2021). Antibiyotik, analjezik türde ilaçların yanı sıra hormon, üsülin, kök hücre gibi biyoaktif moleküllerinde kontrollü salımını gerçekleştiren hidrojel sistemin araştırıldığı birçok çalışma mevcuttur (Szwed-Georgiou ve ark., 2023).

### 3- Tıbbi Pansuman Materyali

Hidrojeller, su ve vücut sıvısı gibi biyolojik sıvıları absorplayabilen gözenekli yapısıyla tıbbi uygulamalar için kullanışlı bir zemin sunmaktadır. Hidrojellerin tıbbi alanda kullanılacak materyallerden istenilen biyoyumluluk, oksijen geçirgenliği, antibakteriyel yüzey gibi özellikleri bünyesinde barındırabiliyor oluşu bu alanda birçok hidrojel sistemin üretilip araştırılmasını sağlamıştır. Yara iyileşme sürecini destekleyen akıllı yara örtüsü kullanımının dışında, özellikle baskı uygulanamayacak organlardaki kanamalara müdahale de iyi bir hemostatik materyal olma potansiyeline sahip olduğu yapılan çalışmalarla kanıtlanmıştır (Cheng ve ark., 2021; Dong ve ark., 2022).

### 4- Doku Mühendisliği

Doku mühendisliği örneklerine 1933 yıllarında Bisceglie'nin fare tümör hücrelerini bir polimer membranla kaplayıp bunları bir domuzun karın boşluğuna yerleştirdiği çalışmasıyla rastlansa da multidisipliner bir mühendislik dalı olarak anılmaya 1980'lerin ortalarında başlamıştır. bu alanda yapılan ilk çalışma olarak bilinen ve popülerliğini koruyan çalışma Dr. Joseph Vacanti ve Dr. Robert Langer'ın dokuya benzer işlevler gösteren ağ yapılı, biyoyumlu /biyobozunur, polimer temelli iskeleler üzerine, yaşayabilen hücreleri ekerek gerçekleştirdikleri çalışmadır (Bisceglie, 1934; C. Vacanti ve Vacanti, 1991; Vacanti, 2006).

Hidrojellerin biyoyumlu ve biyobozunur yapıları, yüksek su içeriğine sahip oluşu ve ağsı yapısı hücrelerin çoğalması için uygun bir ortamın oluşmasının önünü açarak doku mühendisliğinde başarılı doku iskelelerinin üretilmesini sağlamaktadır (Ansar ve ark., 2022). Hidrojellerin enjekte edilip yerinde jelleşebilen formları ise nakli hedeflenen hücreler için daha uygun bir ortam sunarak (kalp, kemik, kıkırdak, sinir gibi) doku onarımında önemli bir ajan olarak yer edinmeye başlamıştır. Ayrıca hücre dışı matris özelliklerini taklit eden hidrojellerle elde edilen üç boyutlu hücre kültürleri ileri düzey tıbbi ve biyolojik araştırmaları destekleyen verimli çalışma ortamların eldesini sağlamaktadır ( Lee, 2018, Vacanti, 2006).

### 5- İmplantlar

İmplantlar, kalp pilleri, eklem protezleri, göğüs implantları, ventriküler şantlar ve yapay kalp kapakçıkları gibi vücutta geçici veya kalıcı olarak kullanıldığında tedavi ve yaşam kalitesini artırmayı hedefleyen tıbbi cihazlardır (Ramon ve ark., 2021).

Hidrojeller metal, seramik, alaşım bazlı implantlara göre biyoyumluluğu yüksek bir materyaldir. Bu özelliğinden faydalanmak için implant yüzeyleri elektrokimyasal yöntem, sol-jel yöntemi gibi genel modifikasyon yöntemleri kullanılarak hidrojel filmlerle kaplanabilmektedir (Alavi ve ark., 2022). Hidrojellerin yumuşak ve esnek yapıları sayesinde beyin ve kalp gibi hassas dokulara sahip organların tedavi ve takibinde kullanılabilir soft hidrojel elektrotlar üretilmiştir (Tringides ve ark., 2021) Geliştirilmekte olan bir kullanım alanı da üç boyutlu yazdırılabilir hidrojeller ile insan dokusuna en yakın doku ve organların üretilmesidir (Panja ve ark., 2022, Xie ve ark., 2023).

### 6-Biyosensörler

İlk kez 1977 yılında Carl Kamman tarafından kullanılan “Biyosensör” terimi, reaksiyondaki analitin konsantrasyonuyla orantılı sinyaller üreterek biyolojik veya kimyasal reaksiyonları ölçen bir cihazı tanımlamaktadır. Hidrojeller biyosensör uygulamalarında kaplama malzemesi, substrat veya biyomoleküllerin ağ içinde hapsedileceği kapsülleme matrisi olarak üç farklı işlevsellikte kullanılabilir. (Bhalla ve Singh, 2016; Herrmann ve ark., 2021).

## TARTIŞMA VE SONUÇ

Keşfedildiği günden günümüze biyolojik sistemlere benzerliği ve uyumluluğuyla dikkatleri üzerine çeken hidrojel sınıfı, yapılan çalışmalarla biyomedikal alandaki ihtiyaçlara cevap verebilecek potansiyele sahip olduğunu gösterse de mekanik dayanım, toksisite ve sterilizasyon zorluğu gibi konularda aşılması gereken problemlere sahiptir.

#### Özet

Hidrojeller, yapısındaki hidrofilik gruplar sayesinde kuru kütlelerinin binlerce katı sıvıyı (su, vücut sıvıları vb.) absorplayabilen üç boyutlu polimerik yapılardır. Biyomedikal alanda kullanımı 1960'lı yıllarda HEMA hidrojellerinin kontak lens olarak kullanımının araştırılmasıyla başlamıştır. Kontak lens olarak kullanımıyla başlayan uygulamaları, kontrollü ilaç salımı, sensör kullanımı, akıllı tekstil ürünleri, su arıtım sistemleri, doku hücre iskelesi, akıllı yara örtüleri ve yapay damar üretimine kadar birçok alana yayılarak günümüzde en çok araştırılan malzemeler sınıfına eriştiği söylenebilir.

Biyolojik alanda kullanılan materyallerin antibakteriyel özellikte olması ve biyoyumlu olmaları istenilen en önemli özelliklerdendir. Hidrojellerin sentezinde kullanılan polimerik yapıların karakteristik özelliğiyle biyoyumluluk özelliği kazandırılabilirken hidrojel yapısına katılan veya yüklenen ilaçlarla ise tedavi edici materyal olarak kullanımı sağlanabilir.

Yara bakım süreci yaranın iyileşmesi için gerekli optimum şartların oluşmasında önemli bir faktördür. Bu şartların oluşmasında en önemli etkenlerden biri yara tedavi ve pansumanında kullanılacak materyal türüdür. Çalışmamız hidrojellerin yara teşhis ve bakımında ne gibi avantaj ve dezavantajlara sahip olduğuna dair bir bakış açısı kazandırmayı hedeflemektedir.

**Anahtar Kelimeler:** hidrojel, yara bakımı, biyomateryal, akıllı yara örtüsü

#### Hydrogels in wound diagnosis and care

#### Abstract

Hydrogels are three-dimensional polymeric structures that can absorb thousands of times more liquid (water, body fluids, etc.) than their dry mass, thanks to the hydrophilic groups in their structure. Its use in the biomedical field began in the 1960s with the investigation of the use of HEMA hydrogels as contact lenses. It can be said that its applications, which started with its use as contact lenses, have spread to many areas such as controlled drug release, sensor use, smart textile products, water purification systems, tissue cell scaffolds, smart wound dressings and artificial vein production, and have reached the most researched materials class today.

The most important desired features of the materials used in the biological field are that they have antibacterial properties and are biocompatible. While biocompatibility can be achieved with the characteristic feature of the polymeric structures used in the synthesis of hydrogels, it can be used as a therapeutic material with drugs added or loaded into the hydrogel structure.

The wound care process is an important factor in creating the optimum conditions for wound healing. One of the most important factors in the formation of these conditions is the type of material to be used in wound treatment and dressing. Our study aims to provide a perspective on what advantages and disadvantages hydrogels have in wound diagnosis and care.

**Keywords:** hydrogel, wound care, biomaterial, smart wound dressing

## GİRİŞ

### Yara Bakım Sürecine Genel Bakış

Yaralanma, çeşitli fiziksel travmalar veya hastalıklar sebebiyle bir hücrenin, dokunun veya organizmanın bütünlüğünün zarar görerek yaşayabilirliğinin veya temel fonksiyonlarının bozulmasına sebep olan değişiklik olarak tanımlanabilir (Eming ve ark., 2014; Baktır, 2020, Velnar, 2009).

Literatürde yara tedavisinde kullanılan yöntemlere ait ilk bilgilerin en eski tıbbi el yazmalarından M.Ö. 2200 yıllarına dayanan kil tabletlerde “üç iyileştirme hareketi” olarak geçen ‘yaraları yıkamak, alçıyı yapmak ve yarayı sarmak’ ifadeler olduğu bildirilmiştir (Shah, J. B. 2011). Bu ifadelerden de anlaşılacağı üzere eski çağlardan itibaren yarayı korumak ve yara sıvısını emmesi amacıyla çeşitli pansuman materyallerin kullanımı süregelmiştir (Sood, A. ve ark., 2014). Bu materyaller zamanla yarayı korumak dışında daha fonksiyonel, yara iyileşme sürecini de destekleyecek biyoaktif malzemelere dönüştürülmüştür (Ovington, L. G. 2007).

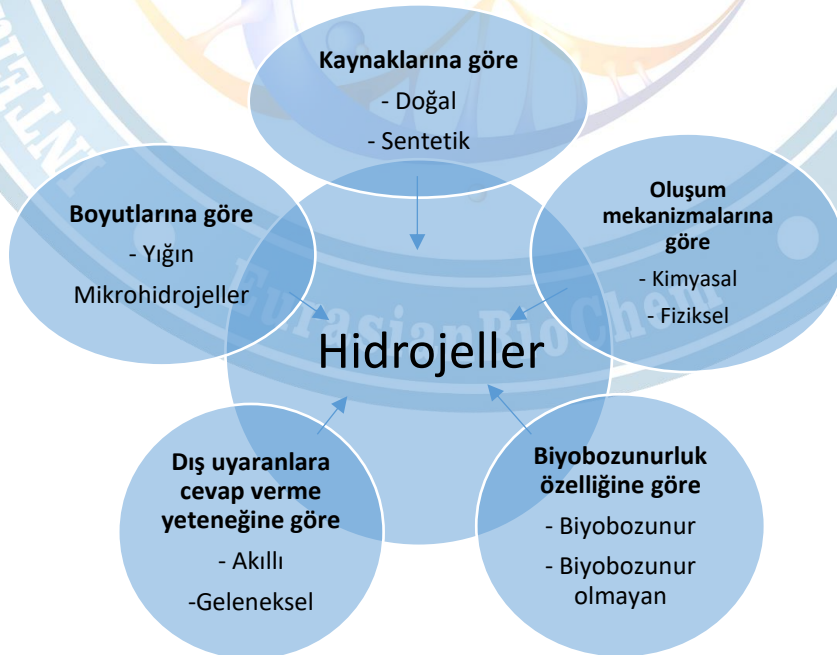

Yaranın iyileşme süreci genellikle aşağıda maddeler halinde belirtilmiş olan dört aşamaya ayrılır (Velnar ve ark., 2009; Raziyeve ark. 2021).

- (i) Pıhtılaşma ve hemostaz
- (ii) İltihaplanma
- (iii) Çoğalma ve
- (iv) Skar (yara izi) dokusu oluşumu ile yaranın yeniden şekillenmesi olarak

### HİDROJELLER

Hidrojeller, farklı şekillerde sınıflandırılabilen, üç boyutlu polimerik yapılardır (Şekil 1) (Peppas ve ark. 2012)). Birbirinden farklı birçok alanda kullanılacak potansiyel ve fonksiyonellikte olması popüler bir çalışma alanı olmasını sağlamıştır (Ahmed, 2015).

Bünyesinde kütesinin binlerce katı suyu tutabiliyor oluşu, doku benzeri yumuşak ve ağsı yapısının yanı sıra biyoyumlu ve biyobozunur özelliğe sahip örneklerinin üretilmesi, daha çok tıp ve biyoloji uygulamalarına yönelik çalışmaların gerçekleştirilmesine sebep olmuştur (Lei ve ark. 2022).

Şekil 1. Hidrojellerin sınıflandırılması

Hidrojellerin tıbbi pansuman materyali olarak kullanılmasında hidrofilik yapıları, hücre dışı matriks (ECM) gibi üç boyutlu (3D) gözenekli bir yapıyla dokulara benzer bir ortam oluşturması ve biyouyumlulukları etkin rol oynamaktadır (Mohammad ve ark., 2023, Abasalizadeh ve ark. 2020). Ayrıca kontrollü salım sistemlerinde de kullanılabilir olmaları, yaranın iyileşme sürecini destekleyen daha etkili yara örtülerinin üretilmesini sağlamaktadır (Fan ve ark. 2021).

### **1-Kontrollü Salım Yapan Hidrojellerin Yara Örtüsü Olarak Kullanimleri**

Antibakteriyel hidrojel yara örtüsü üzerine yapılan çalışmalarda amoksisilin, ampicilin, tetrasiklin, gentamisin, siprofloksasin, moksifloksasin, kloramfenikol, sülfadiazin, linezolid gibi birçok antibakteriyel ilacın kullanımının yanı sıra gümüş, altın, bakır, çinko gibi inorganik metallerin antibakteriyel etkisi incelenmiştir (Liang ve ark., 2021, Shi ve ark., 2018). Hidrojeller sadece antibiyotik ilaç salımında değil, iyileşme sürecini olumlu yönde etkileyip hızlandıracak kök hücre, büyüme faktörü gibi biyoaktif moleküllerin salımında da kullanılarak, doku onarımını teşvik eden yara örtüsü olarak birçok çalışmada incelenmiştir (Shin ve ark., 2019, Catoira ve ark., 2019). Kronik yaralar ve yanıklar gibi ciddi enfeksiyon riski taşıyan yaralar için gümüş gibi antibakteriyel öğeler içeren hidrojellerin kullanımına dair çalışmalarda mevcuttur (Rybka ve ark., 2022; Yao ve ark., 2021; Liang ve ark. 2021).

### **2- Hemostatik Malzeme Olarak Kullanimleri**

Hidrojeller ayrıca iyi birer hemostatik malzeme olmakta da büyük bir potansiyele sahiptir. Açık yaralarda sıklıkla tercih edilen geleneksel malzemeler, iç kanamalı, baskı uygulanamayacak dokular için elverişsizdirler (Cheng ve ark.; 2021). Hidrojellerin enjekte edildiği yerde jelleşebilen örnekleri iç kanamalar ve baskı uygulanamayan yaralar için büyük bir avantaj sunmaktadır (Han ve ark.,2022; Bertsch ve ark., 2022).

### **3- Yara Takip Süreci**

Sağlıklı bir cildin pH değeri pH=4-6 aralığında iken cilt hasar aldıktan sonra oluşan fizyolojik sıvılar ve enfeksiyon etkeni pH=9'a kadar yükselmesine sebep olur (Arafa ve ark., 2021). yaralardaki bu pH değişimi göz önüne alındığında, pH değişimine kolorimetrik olarak cevap verme yeteneğine sahip hidrojel sınıfı kullanılarak yara takibini de sağlayabilecek akıllı bir yara örtüsü üretilbileceği düşünülmektedir (Arafa ve ark., 2021; Güngör, Z., ve Ozay, H. 2022; Liu ve ark., 2017).

### **TARTIŞMA VE SONUÇ**

Hidrojel pansuman materyaller, biyouyumlulukları, esnek yapıları, antibakteriyel özellikleri ve iyileştirici faktör olarakta kullanılabilir olmalarıyla üstün özelliklere sahiptir. Bu üstün özelliklerinin yanı sıra ıslak yüzeyde yapışkanlıklarının düşük oluşu, mekanik dayanımları, aşırı drenajlı yaralar için uygun olmamaları ise kullanımlarını sınırlayan ve geliştirilmesi gereken yönleridir. Sonuçta bu alanda gerçekleştirilen birçok çalışma mevcut olsa da yara iyileşme süreci gibi karışık ve dinamik bir sürecin daha etkili yönetilmesini sağlamak için in vivo ortamda daha kapsamlı ve derinlemesine çalışmalara ihtiyaç olduğu söylenebilir. Yara takip sürecinde kullanılması hedeflenen kolorimetrik hidrojellerle ilgili ise henüz sınırlı sayıda araştırma mevcuttur.

#### Özet

Günümüzde sağlık bilincine sahip tüketicilerin sayısının artmasıyla birlikte fonksiyonel ve sağlıklı gıda ürünlerine olan talep artmaktadır. Kuşburnu meyvesinin içermiş olduğu biyoaktif bileşenlerin fazla olması nedeniyle katma değeri yüksek ürünlere işleme potansiyeli bulunmaktadır. Bu derlemenin amacı, kuşburnunun besin değeri, kimyasal bileşimi, gıda endüstrisindeki potansiyel uygulamaları ve sağlık açısından faydaları ile ilgili kapsamlı genel bir bakış sunmaktır. Kuşburnu, başta doğal antioksidanlar (C vitamini, polifenoller, karotenoidler ve tokoferoller) olmak üzere, benzersiz antioksidan, antiinflamatuvar, antimikrobiyal, antidiyabetik ve osteoprotektif aktivitelere sahip değerli bir biyoaktif bileşik kaynağıdır. Kuşburnu ve ürünlerinin sağlık yararlarına ilişkin daha kapsamlı çalışmalar yapılmasına ihtiyaç vardır. Benzer şekilde biyoaktif bileşenler içeren ve sağlığa fayda sağlayacak doğal gıda kaynakları belirlenmeli ve elde edilecek ürün çeşitliliği artırılmalıdır.

#### Bioactive Components of Rosehip and Their Effects on Health

#### Abstract

Today, with the increasing number of health-conscious consumers, the demand for functional and healthy food products has been increased. Due to the excess of bioactive components in rosehip fruit, there is a potential for processing into products with high added values. The purpose of this review is to provide a comprehensive overview of the nutritional value, chemical composition, potential applications in the food industry and health benefits of rosehip. Rosehip is a valuable source of bioactive compounds with unique antioxidant, antiinflammatory, antimicrobial and osteoprotective activities, mainly natural antioxidants (vitamin C, polyphenols, carotenoids, and tocopherols). More comprehensive studies are needed to reach the health benefits of rosehip and its products. Similarly, natural food sources with bioactive components providing health benefits should be identified and the variety of obtained products should be increased.

**Keywords:** Rosehip, *Rosa canina* L., health

#### GİRİŞ

Kuşburnu Avrupa, Batı Asya ve kuzeybatı Afrika'da yetişen çalı formunda yabani bir bitkidir. Kuşburnu meyveleri vitamin ve mineral bakımından oldukça zengin olup, C vitamini miktarı diğer meyve ve sebze türlerine göre nispeten daha yüksektir. Kuşburnu meyveleri karotenoidler ve fenolik bileşikler gibi antioksidan özellik gösteren bileşenleri de içermektedir. Kuşburnu meyveleri halk hekimliğinde uzun süreden beri kullanılmaktadır. Kuşburnu soğuk algınlığı, bulaşıcı hastalıklar, mide-bağırsak rahatsızlıkları, idrar yolu hastalıkları ve inflamatuvar hastalıklara karşı profilaktik ve tedavi edici etkilere sahiptir. Kuşburnu yüksek miktarda askorbik asit içermesi nedeniyle Avrupa'da bitki çayı ve vitamin takviyesi olarak kullanılmaktadır. Kuşburnu reçel, marmelat, nektar ve sirke gibi ürünlere de işlenmektedir. Kuşburnu çekirdeği yağı, cilt üzerindeki tedavi edici etkisinden dolayı kozmetikte kullanılmaktadır (İlyasoglu, 2014, Zhou 2023).

Kuşburnunun önemi dikkate alınarak bu derlemede kuşburnunun besin değeri, kimyasal bileşimi, gıda endüstrisindeki potansiyel uygulamaları ve sağlık açısından faydaları üzerinde durulacaktır.

## KUŞBURNU

Kuşburnu *Rosaceae* familyasından *Rosa* cinsine ait, kışın yaprağını döken çalı formunda yabani bir bitkidir. *Rosa* cinsi 200'den fazla tür ve 40.000 çeşitten oluşur ve ılıman bölgelerden subtropikal bölgelere kadar geniş bir dağılım göstermektedir. Avrupa, Batı Asya ve Kuzeybatı Afrika'da yetişmektedir. *Rosa* cinsi bitkiler süs bitkisi olarak da yetiştirilmektedir (Zhou ve ark., 2023). Ülkemizde de pek çok yörede yetişen kuşburnu halk dilinde Yabangülü, Deligül, Gül burnu ve Gül elması olarak da bilinmektedir. *Rosa canina* L. ülkemizde yetişen kuşburnu türleri arasında meyve özellikleri bakımından işlenmeye en uygun türlerden birisidir. Orman açıklıklarında ve kayalık yamaçlarda yetişmektedir (Öz ve ark., 2018). Kuşburnu meyveleri; sağlık üzerine olumlu etkileri olduğu bilinen biyoaktif bileşenler içermesi nedeniyle büyük ilgi görmektedir. *R. canina* L.'nin meyveleri 2000 yılı aşkın bir süredir tıbbi bir bitki olarak kullanılmaktadır (Zhou ve ark., 2023).

Kuşburnu meyvesi makro besin ögesi olarak karbonhidrat açısından zengindir. Portekiz'de yapılan bir çalışmada *Rosa canina* L.'nin karbonhidrat içeriği % 93,16, protein içeriği % 2,72, yağ içeriği % 0,65 ve kül içeriği % 3,47 olarak bulunmuştur. Şeker olarak % 12,89 oranında fruktoz, % 12,17 oranında glukoz ve % 1,83 oranında sakaroz içerdiği belirlenmiştir (Barros ve ark., 2010). Türkiye'de yapılan bir çalışmada ise fruktoz miktarı % 18,84 ve glukoz miktarı % 17,11 olarak bulunmuştur (Demir ve ark., 2014). Kuşburnu meyveleri selüloz ve nişasta gibi polisakaritleri de içermektedir (Baros ve ark., 2010).

Kuşburnu meyvesi mikro besin ögesi olarak askorbik asit açısından zengindir. Kuşburnunun askorbik asit içeriği meyve çeşidi, hasat yılı ve iklim koşullarına bağlı olarak değişkenlik göstermektedir. Türkiye'de yapılan bir çalışmada *R. canina* L.'nin askorbik asit içeriği 101 mg/100 g, Portekiz'de yapılan bir çalışmada ise 68 mg/100 g olarak bulunmuştur (Baros ve ark., 2010; Demir ve ark., 2014).

Kuşburnu A, C ve E vitaminlerinin yanısıra kalsiyum, potasyum, sodyum, fosfor, magnezyum, manganez, demir, çinko ve bakır gibi mineralleri içermektedir (Fan ve ark., 2014). Kuşburnu meyveleri potasyum ve kalsiyum açısından zengin bir meyvedir. *R. canina* L.'nin 4 genotipinin mineral madde içeriğinin belirlendiği bir çalışmada potasyum miktarı 8964-10450 mg/kg, kalsiyum miktarı 4988-17617 mg/kg, fosfor miktarı 1144-1769 mg/kg, magnezyum miktarı 1415-3135 mg/kg, demir miktarı 53-193 mg/kg, manganez miktarı 33-128 mg/kg, bakır miktarı 4,3-5,8 mg/kg ve çinko miktarı 5,1-12,5 mg/kg olarak bulunmuştur (Koç, 2020).

Meyvelerin tadını meyvelerdeki şeker ve organik asit oranı belirlemektedir. Kuşburnu meyvelerinde sitrik, malik, tartarik, süksinik, okzalik ve fumarik asit gibi organik asitler tespit edilmiştir (Murathan ve ark., 2016a).

Kuşburnu biyoaktif bileşenler içermektedir (Tablo 1). Kuşburnu meyvelerinin içerdiği biyoaktif bileşenlerden birisi karoteonoidlerdir. Barros ve ark. (2010) tarafından yapılan çalışmada  $\beta$ -karoten ve likopen tespit edilmiştir. Bir başka çalışmada ise  $\beta$ -karoten ve likopenin yanısıra lutein ve zeaksantin tespit edilmiştir (Fan ve ark., 2014).

Kuşburnu biyoaktif bileşikler açısından zengin olup biyoaktif bileşiklerin önemli bir bölümünü fenolik bileşikler oluşturmaktadır. Demir ve ark. (2014) tarafından yapılan çalışmada *Rosa canina* L.'de 12 tane bileşik tespit edilmiştir. Bu bileşikler: gallik asit, 4-hidroksi benzoik asit, ferulik asit, kafeik asit, p-kumarik asit, sinapik asit, kaftarik asit, klorojenik asit, kateşin, prosiyandinin-B2, 4-metil kateşol ve 2,5-dihidroksibenzoik asittir. Odriozola-Serrano ve ark. (2023) tarafından yapılan bir çalışmada ise fenolik ekstrakt üç fraksiyona ayrılıp analiz edilmiş ve fenolik bileşiklerin çoğunun esterleşmiş formda olduğu belirlenmiştir. Esterleşmiş ve konjuge formdaki bileşikler içinde başlıca fenolik bileşiklerin fenolik asitler olduğu tespit edilmiştir. Serbest formda ise flavonoller ve flavan-3-oller tespit edilmiştir. Fenolik asitlerin fenolik bileşiklerin % 92'lik kısmını oluşturduğu ve en yüksek miktarda bulunan fenolik asidin gallik asit olduğu belirlenmiştir. Çalışmada gallik asidin yanı sıra p-kumarik asit, protokateşik asit, p-salisilik asit, elajik asit, vanilik asit, kafeik asit ve ferulik asit de tespit edilmiştir. Ekstraktlarda tespit edilen başlıca flavonolün kuersetin ve türevleri olduğu ve fenolik bileşiklerin %5'lik kısmını oluşturduğu belirlenmiştir. Çalışmada flavonollerden izokuersetin, kuersetin, kaempferol, hiperoside ve rutin, flavan-3-ollerden kateşin ve prosiyanidin-B ve flavonlardan luteolin ve lutein-7-O-glukozit de tespit edilmiştir.

**Tablo 1.** *Rosa canina* L. : Biyoaktif bileşenler

Bileşen	Miktar	Kaynak

Km: kuru maddede

Kuşburnu meyvelerinin çeşitli ürünleri işlenmesi sırasında atık ürün olarak kuşburnu çekirdeği elde edilmektedir. Kuşburnu çekirdeği yağının doymamış yağ asit içeriği yüksektir (>%80). Kuşburnu çekirdeği yağında bulunan başlıca tekli doymamış yağ asidi oleik asit, başlıca doymamış yağ asitleri ise linoleik ve linolenik asittir. Sırbistan'da yapılan bir çalışmada farklı bölgelerde yetişen *R. canina* L. çekirdeklerinden elde edilen yağların yağ asidi kompozisyonu belirlenmiş ve yağların oleik asit içeriği %3,89-13,82; linoleik asit içeriği % 24,53-46,68 ve linolenik asit içeriği %4,73-12,39 olarak bulunmuştur (Popovic-Djordjevic ve ark., 2023). Türkiye'de yapılan bir çalışmada ise oleik asit içeriği % 44,63, linoleik asit içeriği % 27,97 ve linolenik asit içeriği % 11,48 olarak bulunmuştur (Murathan ve ark., 2016b).

## KUŞBURNU ÜRÜNLERİ

Ülkemizde kuşburnu meyvesi, taze meyvesinin hafif ekşi tadı nedeniyle genellikle kurutulmuş halde tüketilmektedir. Kuşburnu meyvesi, bitki çayı, reçel, marmelat, nektar, pestil gibi ürünlere işlenerek de tüketilmektedir (Ilyasoglu, 2014). Bunların dışında sirke, yağ ve toz içecek formu olarak da işlenmektedir.

### Kuşburnu Sirkesi

Sirke, dünya genelinde baharat veya gıda koruyucusu olarak kullanılan, sos, mayonez ve salata sosu gibi gıdaların duysal özelliklerine katkıda bulunmak için kullanılan fermente bir üründür (Ho ve ark., 2017). Sirke, çok sayıda meyve ve sebzedden üretilebildiğinden amino asitler, organik asitler, fenolik bileşikler, vitaminler, mineraller ve antioksidan maddeler bakımından zengindir. Son yıllarda geleneksel olarak üretilen bazı sirkelerinin ekonomiye kazandırılabilmesi için daha işlevsel ve duysal özellikleri iyileştirilmiş olarak üretilmesi popülerlik kazanmıştır. Bu anlamda kuşburnu meyvesinden sirke üretimi ekonomik katma değeri ve işlevselliği yüksek bir ürün üretmek için iyi bir fırsat olarak görülmüştür. Özdemir ve ark. (2022), yapmış oldukları çalışmada kuşburnu sirkesinin toplam fenolik madde, toplam flavonoid ve antioksidan aktivitesini yüksek bulmuşlardır. Kuşburnu sirkesinin C vitamini miktarı fermentasyon boyunca artmış ve 60. günde en yüksek seviyeye ulaşmıştır (5,31-71,49 mg/ml). Aynı çalışmada kuşburnu sirkesinde 27 adet aroma bileşiği tespit etmiş ve bu sirkesinin sağlıklı ve aromatik bir alternatif olacağını bildirmişlerdir.

### Kuşburnu Yağı

Kuşburnu, fonksiyonel gıda ve kozmo-nutrasötik ürünler için kullanılabilir potansiyel bir meyve ürünüdür. Cilt iyileştirme potansiyeli nedeniyle çoğunlukla *R. canina* ve *R. moschata* gibi yabancı gül çalı türlerinin tohumlarından elde edilen kuşburnu yağı, bitkisel kozmetiklerin, losyon ve krem gibi cilt bakım ürünlerinin geliştirilmesi için değerli bir malzemedir. Yağ içeriği bakımından en zengin (% 70-80) esansiyel yağ asitleri (EYA) kaynaklarından (linoleik asit ve linolenik asit) birisidir. Kuşburnu yağı, yara izleri, dermatit, akne, egzama ve yanıklar gibi cilt problemlerinin tedavi edilmesinde ve iyileştirilmesinde kullanılmaktadır. Cildi gençleştirici özelliklere sahip EYA'leri, karotenoidler ve A vitamini (retinol) içeriği nedeniyle kuşburnu tohum

yağı, doğal bir cilt bakım ürünü, nemlendirici ve yaşlanma karşıtı ajan görevi göstermektedir. Tohum yağı ayrıca yara izlerini iyileştirmek, yaşlanmayı azaltmak ve cilde pürüzsüzlük kazandırmak için de faydalıdır (Concha ve ark., 2006; Ahmad ve Anwar, 2016).

### **Kuşburnu Marmelatı**

Marmelat, meyve pulpu, püre, meyve suyu ve sulu ekstraktlarının veya bitkilerin kök, yaprak ve çiçek gibi yenilebilir kısımlarına gerektiğinde şeker ve su ilave edilerek sürülme kıvamına getirilmesiyle elde edilen karışım olarak tanımlanmıştır (Anonim, 2006). Kuşburnu marmelatı Türkiye’de kahvaltıda yaygın olarak tüketilen bir üründür. Daha bilinçli hale gelen tüketici bu tarz ürünlerde aroma ve lezzetin yanı sıra vitamin, mineral, fenolik bileşik ve antioksidan aktivitesi yüksek ürünleri tercih etmektedir. Kuşburnu meyvesi yüksek oranda içerdiği vitamin, mineral ve fenolik bileşiklerle ön plana çıkmaktadır. Şengül ve ark., (2018) yılında yapmış oldukları çalışmada geleneksel olarak üretilen kuşburnu, kızılıçık, çakal eriği ve ahlat armudu marmelatlarını karşılaştırmış ve en yüksek toplam fenolik madde içeren marmelatın kuşburnu marmelatı olduğunu (581,89 µg/GAE g) bildirmişlerdir.

### **Kuşburnu Çayı**

Bitki çayları, pratik bir şekilde hazırlanan, hoş tada sahip, kalorisiz ve kafeinsiz içeceklerdir. İçerdiği antioksidan bileşikler ile sağlık üzerine olumlu etkileri vardır ve tüm dünyada sıklıkla tercih edilmektedirler (Alarcón ve ark., 2008; Yılmaz ve ark., 2021). Kuşburnu çayı, içerdiği yüksek C vitamini sayesinde iyi bir antioksidan kaynağıdır (Nojavan ve ark., 2008). Taze ve kuru halde çay olarak tüketilmektedir (Wenzig ve ark., 2008). İlyasoğlu ve Arpa (2017), tarafından yapılan çalışmada kuşburnu çayı için 84–86°C derecede 6-8 dk demleme işleminin C vitamini ve toplam fenolik madde miktarı açısından en iyi koşullar olduğu belirlenmiştir.

### **KUŞBURNUNUN SAĞLIK ÜZERİNE ETKİLERİ**

Genel olarak kuşburnunun beslenmedeki önemi, vitamin ve mineraller açısından zengin olmasına atfedilir. Aynı miktarda kuşburnu portakaldan 30-40 kat daha fazla C vitamini içerir (Yoruk ve ark., 2008). C vitamini kolajen sentezinde önemli olup soğuk algınlığı ve gribe karşı bağışıklık sistemini güçlendirir, polifenol içeriği ve antioksidan özellikleri sayesinde de potansiyel olarak kanser riskini azaltır. C vitamini demirin emilmesine yardımcı olur, kan basıncını ve kolesterolü düşürür (Çınar ve Çolakoğlu, 2004).

Kuşburnu içerdiği fenolik asitler, tanenler ve flavonoidlerle fitokimyasalların iyi bir kaynağıdır. Bu sayede kulak, burun ve boğaz sorunları dahil olmak üzere birçok hastalığın tedavisinde geleneksel olarak kullanılmaktadır. Avrupa halk hekimliğinde kuşburnu müshil, idrar söktürücü, gut önleyici ve romatizma önleyici ilaç olarak kullanılmaktadır (Ayati ve ark., 2018). Türk halk hekimliğinde ise meyve ve yaprakları soğuk algınlığı, öksürük, gastrit, ülser, anemi, anoreksi ve diyabet gibi hastalıkların geleneksel tedavisinde kullanılmaktadır. Ayrıca bitkinin kökleri ve yaprakları bronşite karşı da kullanılmaktadır (Sarıkaya ve ark., 2010; Orhan ve ark., 2009).

Amerikan Botanik Konseyi tarafından yayımlanmış olan “Bitkisel İlaçlar Terapötik Rehberi”nde *R. canina* meyvelerinin, artrit, romatizma, gut ve siyatik gibi inflamatuvar bozukluklarda; soğuk algınlığı ve grip gibi ateşli bulaşıcı hastalıklarda, mide-bağırsak rahatsızlıklarında, safra taşı şikayetlerinde, böbrek ve idrar yolu rahatsızlıkları dahil olmak üzere çeşitli hastalıklarda profilaktik ve tedavi edici aktivitelere sahip olduğu bildirilmiştir (Blumenthal, 1998). Ayrıca *R. canina*’nın antioksidan, antiinflamatuvar, antiülser, antimikrobiyal, antimutagenik etkilerinin yanında anksiyete, osteoartrit, diyabet ve hipertansiyon gibi hastalıkların tedavisinde iyileştirici etkilerine ilişkin raporlar mevcuttur (Orhan ve ark., 2009; Ögüt, 2022).

### **Kuşburnu ve Osteoartrit İlişkisi**

Osteoartrit, yaşlılarda önemli bir bozulma nedeni olan kronik ilerleyici bir hastalıktır. Ağrı, azalmış hareket açıklığı, fiziksel fonksiyonda azalma, eklem sertliği ve şişmesi, kas zayıflığı vb. ile karakterizedir. Tüm bu koşullar, bireylerde günlük aktivitelerin kötüleşmesine ve sakatlığa yol açarak yaşam kalitesinin bozulmasına yol açmaktadır. Osteoartritten yaygın olarak diz ve kalça etkilenir (Zampogna ve ark., 2020). Farmakolojik tedavisinde steroid olmayan anti-inflamatuvar ilaçların (NSAID) kullanımı ciddi gastrointestinal komplikasyonlara neden olabilir (Lazzaroni ve Bianchi Porro, 2004). Ayrıca ağrıyı dindirmek için kullanılan parasetamolün de son zamanlarda gastrointestinal problem riskini artırdığı rapor edilmiştir. Bu nedenlerle, bahsedilen yan etkiler olmadan ağrıyı ve sertliği en aza indirebilecek yeni bileşikler arayışına girilmiştir. Çeşitli bitkisel ilaçlar denenmiş ve umut verici sonuçlara ulaşılmıştır. Bunlardan biri de kuşburnundan elde edilen özütlere ve nutrasötiklerdir. Bir çalışma kapsamında *R. canina* (kuşburnu), *Boswellia serrata* ve

*Harpagophytum procumbens* özütlerinin karışımından TriNyros kapsülü geliştirilmiştir. Bu karışımın antiinflamatuvar, antioksidan ve kondroprotektif bir ajan olarak etkili olduğu bulunmuştur. Bu sayede eklem ağrılarını azaltarak osteoartrit hastalarının fiziksel fonksiyonel yeteneğini geliştirdiği rapor edilmiştir (Tapasvi, 2022). Yapılan bir başka çalışmada, kuşburnundan yapılan bitkisel bir ilaç, kalça ve diz osteoartriti olan hastalarda 3 aylık bir süre boyunca kullanılmış, ilacın osteoartrit semptomlarını hafifletebildiği görülmüştür (Winther ve ark., 2005).

### **Kuşburnu ve Kanseri İlişkisi**

Kanser, sinyalizasyon ve metabolizmanın değiştiği, kontrolsüz bölünmeye ve dönüştürülmüş hücrelerin hayatta kalmasına neden olan bir hastalıktır. Kanseler, her yıl milyonlarca ölüme yol açar (Upadhyay, 2021). 2020 yılında dünya çapında tahminen 19,3 milyon yeni kanser vakası ve neredeyse 10,0 milyon kanser ölümü meydana gelmiştir. Akciğer kanseri, tahmini 1,8 milyon ölüm (%18) ile kanserden ölümlerin önde gelen nedeni olmaya devam ederken, onu kolorektal, karaciğer, mide ve meme kanserleri takip etmektedir. Küresel kanser yükünün 2040 yılında %47'lik bir artışla 28,4 milyon vaka olması beklenmektedir (Sung ve ark., 2021). En acil patolojik durumlardan biri olan bu hastalık hakkında muazzam bir literatür bulunmasına rağmen, hastalığın başarılı bir şekilde tedavi edilmesi belirsiz görünmektedir (Upadhyay, 2021). Günümüzde kullanılan kemoterapötik ajanların neredeyse tamamı oldukça toksiktir ve normal hücrelerde de ciddi yan etkilere neden olur. Bu nedenle yüksek etkinliğe ve düşük toksisiteye sahip doğal kaynaklı yeni antikanser ilaçlarının geliştirilmesine yönelik çalışmalar yapılmaktadır. Son yıllarda bitki kaynaklı bileşiklerin kanser hücreleri üzerinde sentetik kemoterapi ilaçlarına göre nispeten daha etkili olduğu ve normal hücrelere çok daha az zarar verdiği gösterilmiştir (Shukla ve Mehta, 2015). Bu bağlamda literatürde kuşburnu ve özütlerine ilişkin de antikanser çalışmalar mevcuttur.

Prostat kanseri dünyada akciğer kanserinden sonra en sık görülen kanser türüdür. Her ne kadar hastalık kemoterapötiklerle tedavi edilse de ölüm oranı nispeten yüksektir (Russo ve ark., 2017; Özgönül ve ark., 2020). Son çalışmalar fenolik asit içeren diyetin daha düşük prostat kanseri riski ile ilişkili olduğunu göstermiştir. Buna yönelik yapılan bir çalışmada, kuşburnu çayında bulunan fenolik bileşiklerin prostat kanseri hücre hatlarındaki antiproliferatif etkisi araştırılmıştır. Çalışmada öncelikle kuşburnu çayının flavonol içeriği belirlenmiş ve daha sonra çay örneklerinin prostat kanseri hücre hattına (VCaP ve LNCaP) eklenmesiyle antiproliferatif etkisine bakılmıştır. Sonuç olarak, doğal bir flavonol kaynağı olan kuşburnu çayının androjenlere duyarlı prostat kanseri hücreleri hattında büyümeyi ve hücre çoğalmasını azalttığı görülmüştür (Özgönül ve ark., 2020). *R. canina*'nın sitotoksik etkisini belirlemek üzere yapılmış bir çalışmada, *R. canina*'nın insan akciğer (A549) ve prostat (PC-3) kanseri hücreleri üzerindeki sitotoksik etkileriyle birlikte ve antioksidan özellikleri ve ilgili olası mekanizmalar değerlendirilmiştir. Sonuçlar *R. canina* özütünün akciğer ve prostat kanseri hücrelerinin çoğalmasını engellemek için iyi bir aday olabileceğini göstermiştir (Kilinc ve ark., 2020). Literatürde mevcut bir başka çalışmada *R. canina* özütünün insan kolon kanseri (WiDr) hücrelerinde hücre canlılığı, hücre döngüsü, apoptoz ve telomeraz ekspresyonu üzerindeki potansiyel etkisini incelenmiştir. Özütün sitotoksik etkisinde yer alan mekanizma apoptoz ve hücre döngüsü açısından değerlendirilmiştir. Sonuç olarak *R. canina* özütünün WiDr hücreleri üzerinde seçici bir sitotoksik etki gösterdiği bulunmuştur. Özütün WiDr hücrelerinde apoptozu tetiklediği rapor edilmiştir. Böylece *R. canina*'nın kolon kanserinde de doğal ürün bazlı etkili bir antikanser ajan olabileceği görülmüştür (Turan ve ark., 2018).

### **Kuşburnu ve Diyabet İlişkisi**

Diyabet dünya çapında yaygın bir metabolik hastalıktır. Hiperglisemi, lipid ve protein metabolizma anormallikleri ile karakterizedir. Retinopati, nöropati, nefropati vb. klinik komplikasyonlara eşlik eder. Diyabet tedavisinde birçok geleneksel bitki kullanılmaktadır. Bu bitkilerin biyoaktif bileşenleri antidiyabetik özelliklerine katkıda bulunur. Ayrıca, kullanılan kimyasal antidiyabetik ilaçlara doğal ve güvenli bir alternatif olarak düşünülebilir (Matalqah ve Al-Tawalbeh, 2019). Kuşburnu dünyanın birçok yerinde ve Anadolu'da geleneksel diyabet tedavisinde kullanılan bitkilerden biridir (Sarıkaya ve ark., 2010). Yapılan bir çalışmada, *R. canina* meyvelerinin etanol özütlerinin antioksidan, hipoglisemik ve antidiyabetik aktiviteleri araştırılmıştır. 7 gün boyunca uygulanan etanol özütünün diyabetik sıçanlarda hipoglisemik etkisi olduğu saptanmıştır (Orhan ve ark., 2009). Obez farelerde yapılan bir çalışmada, kuşburnu tozunun yüksek yağlı diyetin neden olduğu obeziteyi ve glikoz intoleransını önlediği ve tersine çevirdiği, ayrıca plazma kolesterol seviyelerini düşürdüğü gösterilmiştir. 6 hafta boyunca günlük kuşburnu tozu alan obez farelerde faydalı metabolik etkiler gözlenmiştir. Kuşburnu tozu içeceğinin tüketimi sistolik kan basıncında ve toplam plazma kolesterolünde önemli bir azalmayla sonuçlanmıştır (Andersson ve ark., 2012).

## SONUÇ

Tüm dünyayı etkileyen COVID-19 salgını, sağlığa daha fazla vurgu yapılmasına ve biyoaktif bileşiklere sahip fonksiyonel gıdaların araştırılması, geliştirilmesi ve kullanılmasına hız kazandırmıştır. Kuşburnu meyvesi dünya genelinde büyük bir coğrafyada yetişebilmesi, askorbik asit, doymamış yağ asidi, polifenoller, karotenoidler ve polisakkaritler dahil olmak üzere insan sağlığına fayda sağlayan çeşitli fonksiyonel bileşikleri içermesi dolayısıyla dikkatleri üzerine çekmiştir. Doğal bir antioksidan kaynağı olan kuşburnu gıda, kozmetik, ilaç ve kimya gibi çeşitli alanlarda ilgi uyandırmaktadır. İşlenmeyen birçok alt türü olan kuşburnunun kaynakları belirlenmeli, araştırmalar yapılmalı ve ekimi yapılan bir bitki haline gelmesi teşvik edilmelidir.

\*ferda.mindivan@bilecik.edu.tr

#### Özet

Bu çalışmada polikaprolakton (PCL) filmler ve fiberler sırasıyla solvent döküm (D-PCL) ve elektrospinning (E-PCL) yöntemleriyle üretilmiştir. E-PCL ve D-PCL örneklerinin morfolojisini ve moleküler etkileşimlerini karakterize etmek için X-ışını kırınımı (XRD), optik mikroskop (OM), Taramalı elektron mikroskobu (SEM), Fourier dönüşümü kızılötesi spektroskopisi (FTIR) ve temas açısı ölçümleri yapılmıştır. Solvent döküm yöntemiyle üretilen D-PCL'nin moleküller arası etkileşimleri elektroęirme yöntemiyle üretilen E-PCL örneğinden daha fazla, kristal boyut değerleri ise daha büyük olduğu FTIR ve XRD analiz sonuçlarından tespit edilmiştir. D-PCL örneğinin OM yüzey görüntüsü PCL'nin karakteristik tane yapısını, E-PCL örneğinin SEM yüzey görüntüsü ise homojen boyutta üretilen nanofiberleri göstermiştir. D-PCL ve E-PCL örneklerinin temas açısı sonuçları PCL'nin hidrofobik yapısını yansıtmıştır. Bu çalışma PCL esaslı kompozit veya nanokompozit çalışmalarında solvent döküm yönteminin elektroęirme yöntemine göre tercih edilebilir olduğunu önermektedir.

**Anahtar Kelimeler:** Polikaprolakton, Solvent Döküm, Elektroęirme, yapısal karakterizasyon

#### Properties of Polycaprolactone (PCL) Fiber and Film Product by Electrospinning and Solvent Casting Process

#### Abstract

In this study, the polycaprolactone(PCL) films and fibers were fabricated by solvent casting (D-PCL) and electrospinning (E-PCL), respectively. X-ray diffraction (XRD), optical microscope (OM), Scanning electron microscopy (SEM), Fourier transform infrared spectroscopy (FTIR) and water contact angle measurements were performed to characterize the morphology and molecular interactions of the E-PCL and D-PCL samples. It was determined from the results of XRD and FTIR analyses that the intermolecular interactions of the D-PCL sample produced by the solvent casting method were higher than the E-PCL sample produced by the electrospinning method, and the crystal size values were larger. The OM surface image of the D-PCL sample showed the characteristic grain structure of PCL, and the SEM surface image of the E-PCL sample showed the nanofibers produced in homogeneous size. The contact angle results of the D-PCL and E-PCL samples reflected the hydrophobic structure of PCL. This study suggests that the solvent casting method is preferable to the electrospinning method in PCL-based composite or nanocomposite studies.

**Keywords:** Polycaprolactone, Solvent Casting, Electrospinning, structural characterization

#### GİRİŞ

Nanomalzemelerin geniş bir uygulama alanına sahip olması son yıllarda kullanım alanlarını artırmıştır. Bunun bir sonucu olarak nanomalzemelerin üretilmesi için çeşitli teknikler ve yöntemler geliştirilmiştir. Bu teknikler arasında, basitliği ve çeşitli malzemelerden mikro/nano ölçekli fiberler üretebilme yeteneğine sahip elektroęirme yöntemi kullanılmaktadır (Alharbi ve ark., 2023). Elektroęirme, polimerik bir çözeltiliye yüksek voltaj uygulanarak, hedef bir levha üzerinde toplanabilen nanolif üretim tekniğidir (Armentano ve ark., 2009). Nanolifler yüksek yüzey/hacim oranı, yüksek gözeneklilik ve ayarlanabilir mekanik özellikleri sayesinde çok sayıda biyomedikal uygulamalarda kullanılmaktadır (Alharbi ve ark., 2023). Aktif ve yenilebilir filmler için kullanılan basit ve özel ekipman gerektirmeyen bir diğer nanomalzeme üretim yöntemi de solvent döküm yöntemidir. Aktif bileşiklerin film oluşturucu bir çözeltiliye doğrudan dahil edilmesinin ardından çözeltilinin düz

bir plaka üzerine yayılması ve ardından kontrollü koşullar altında kurutulurken, çözücünün uzaklaştırılıp film oluşumunun sağlanmasını içermektedir (Salević ve ark., 2022). Yeni araştırmaların bu tekniğe ilgi duyması zaman ve enerji tüketimi bakımından avantaj sunmasından kaynaklanmaktadır (Salević ve ark., 2022). Nanomalzeme olarak en çok tercih edilen Polikaprolakton (PCL); polyester grubundan, sentetik ve biyolojik olarak parçalanabilen bir polimerdir (Ghosal ve ark., 2021). Ayrıca PCL, yüksek mekanik özelliğinin yanında zayıf hücre yapışma özellikleri sergileyen, biyolojik olarak uyumlu ve hidrofobik bir polimerdir (Gautam ve ark., 2023). PCL' nin mekanik, fiziksel ve kimyasal özelliklerin değiştirilmesi, kontrol edilebilirliğinin de kolay olmasından dolayı fiber üretiminde kullanılmaktadır (Alharbi ve ark., 2023). Literatürde PCL' ye farklı dolgu maddelerinin ilavesiyle hem solvent döküm hem de elektroçirime yöntemiyle üretilen fiber ve filmler üzerine yapılan birkaç çalışma mevcuttur. Ghosal ve ark., (2021), hem elektroçirime hem de solvent döküm yöntemiyle ürettikleri PCL bazlı, karbon kuantum nokta (hCQDs) katkılı hidrofobik nanokompozitin film ve fiberleri karakterize etmişlerdir. Filmlerin daha düşük temas açısına sahip oldukları ve ürettikleri bu filmlerin yara örtüsü olarak etkin bir şekilde kullanılabileceğini önermişlerdir. Del Gaudio ve ark., (2011) PCL ve poli(3-hidroksibutirat-ko-3-hidroksivalerat) (PHBV) fiber ve filmler solvent döküm ve elektroçirime yöntemleriyle üretilmiştir. Yapılan karakterizasyon çalışmaları sonucunda elektroçirime yöntemiyle üretilen fiberlerin daha homojen yapıda olduğu, solvent döküm yöntemiyle üretilen filmlerin ise mekanik dayanımının daha yüksek olduğu belirlenmiştir. Armentano ve ark., (2009) PCL matrisi içerisine karbon nanolif (CNF'ler) katkılı kompozit malzemeleri solvent döküm ve elektroçirime yöntemleriyle üretmişlerdir. Kompozit filmler, saf PCL fiberine göre artan bir kristalizasyon sıcaklığı ortaya çıkarmıştır. Filmlerin ve fiberlerin mekanik özellikleri CNF içeriğine bağlı olarak iyileşirken, fiberlerin mekanik özellikleri CNF'nin eklenmesinden daha az etkilendiğini rapor etmişlerdir. Literatürde yer alan çalışmalar solvent döküm yöntemiyle elektroçirime yönteminin üretilen örneklerin birçok özelliği üzerinde etkisi olduğunu göstermiştir. Bu çalışmada da elektroçirime ve solvent döküm yöntemleriyle PCL fiber ve filmleri üretilmiştir. Üretilen PCL fiber ve filmlerin yapısal özellikleri karşılaştırılmıştır.

## MATERYAL VE METOT

80.000 molekül ağırlıklı PCL kullanılarak, PCL filmleri solvent döküm, PCL fiberleri ise elektroçirime yöntemleriyle üretilmiştir. Bu çalışmada elektroçirime ve solvent döküm için kullanılacak polimer çözeltisi DMF/Kloroform (1/4) (v/v) çözücülerinde PCL konsantrasyonu %15 (w/v) olacak şekilde 3 saat karıştırılarak hazırlanmıştır. Çözünme sırasında sıcaklık 25-35°C arasında tutulmuştur. Üretilen polimer çözeltisi solvent döküm yöntemine göre üretilen PCL film için bir kalıba dökülüp etüvde 35-40°C arasında 1 saat kurutulmuştur. Elektroçirime işlemi ile polimer çözeltisinin 19,86 mm çapındaki iğne içerisine doldurularak, elektroçirime cihazının pompa haznesine yerleştirilip, akış hızı 1,5 mL/saat, voltaj 10 kV, şırınga ucu ile toplayıcı levha arasındaki uzaklık 12 cm, oda sıcaklığı ve nem %34-47 arasında tutularak nanofiber üretimi gerçekleştirilmiştir. Solvent döküm yöntemiyle üretilen PCL film D-PCL ve elektroçirime yöntemiyle üretilen PCL nanofiber E-PCL şeklinde kodlanmıştır. Şekil 1'de D-PCL ve E-PCL örneklerinin görüntüleri verilmiştir.

Şekil 1. E-PCL ve D-PCL örneklerinin görüntüleri

## KARAKTERİZASYON

İki farklı yöntem ile üretilen PCL fiber ve filmlerin yapısal özelliklerini belirlemek için Fourier dönüşümlü infrared spektroskopisi (FTIR) analizleri Perkin Elmer spektrum 100 FTIR ile yapılmıştır. PCL fiberlerin

görüntüleri taramalı elektron mikroskobu (SEM) ZEISS SUPRA 40 VP cihazı kullanılarak alınmıştır. Filmlerin ise optik mikroskopla (OM) yüzey görüntüsü alınmıştır. Kullanılan optik mikroskop Nikon marka ECLIPSE LV 150 modeldir. Örneklerin temas açısı ölçümleri Biolin Scientific, Theta Lite temas açısı ölçüm cihazı ile oda sıcaklığında gerçekleştirilmiştir. Fiber ve filmlerin XRD analizleri  $2\theta^\circ = 5-50^\circ$  açı aralığında ve  $2^\circ/\text{dk.}$ lık tarama hızında yapılmıştır. Cu  $K\alpha$  ( $\lambda:1,5404$ ) radyasyon kaynaklı PAN analitik, Emphyrean marka XRD cihazı kullanılmıştır. Filmlerin ve fiberlerin kristalit boyut değerleri, Denklem 1 Scherrer Denklemi ile (Danilchenko ve ark., 2002), Mikro gerilme değerleri ( $\epsilon$ ) ise Denklem 2 (Monshi ve ark., 2012) kullanılarak hesaplanmıştır. Denklem 1’de yer alan L kristal boyut, k kristal şekille ilgili bir sabit,  $\beta$  analiz cihazı tarafından verilen FWHM değeri,  $\lambda$  dalga boyu ve  $\theta$  Bragg açısıdır.

$$L = \frac{k \cdot \lambda}{\beta \cdot \cos\theta} \quad (1)$$

$$\epsilon = \frac{\beta}{4 \cdot \tan\theta} \quad (2)$$

## BULGULAR VE TARTIŞMA

### E-PCL ve D-PCL Örneklerinin XRD Analizi

PCL örneklerinin XRD analizinden elde edilen  $2\theta^\circ$ , kristal boyut ( $\text{Å}^\circ$ ), mikro gerilme (%) ve tabakalar arası mesafe ( $\text{Å}^\circ$ ) değerleri Tablo 1’de, XRD difraktogramları ise Şekil 2’de verilmiştir. Şekil 2’de D-PCL’ye ait XRD difraktogramına bakıldığında  $2\theta^\circ = 21,27^\circ$ ,  $21,88^\circ$  ve  $24,17^\circ$  karşılık gelen PCL’nin karakteristik ortorombik kristal yapısını yansıtan (110), (111) ve (200) düzlemlerine ait pikler tespit edilmiştir. Bu sonuç literatürde daha önce yapılan PCL çalışma sonuçlarıyla uyumludur (Del Gaudio ve ark., 2011). Yine Şekil 2’den görüldüğü gibi E-PCL’nin yarı kristal yapısını yansıtan  $2\theta^\circ = 21.41^\circ$  ve  $23.79^\circ$ ’de (110) ve (200) düzlemlerine ait pikler tespit edilmiştir (Gautam ve ark., 2023). Tablo 1 incelendiğinde E-PCL ve D-PCL örneklerinin (110) düzlemine denk gelen değerleri karşılaştırıldığında D-PCL’nin tabakalar arası mesafe ve kristal boyut değerlerinin E-PCL’den daha yüksek olduğu görülmektedir. (200) düzlemine ait değerler karşılaştırıldığında ise tabakalar arası mesafe değerlerinin hemen hemen yakın ancak kristal boyut değerinin yine D-PCL’de yüksek olduğu, kristal boyut değerine bağlı olarak mikro gerilme değerinin de düşük olduğu belirlenmiştir. Tablo 1’den tespit edilen yüksek kristal boyut sonuçları solvent döküm yönteminin çekirdekleştirici etkisine atfedilmiştir (Uflyand ve ark., 2019).

Şekil 2.E-PCL ve D-PCL örneklerinin XRD difraktogramları

**Tablo 1.** E-PCL ve D-PCL örneklerinin XRD analizinden elde edilen  $2\theta^\circ$ , kristal boyut ( $A^\circ$ ), mikro gerilme (%) ve tabakalar arası mesafe ( $A^\circ$ ) değerleri.

ÖRNEKLER	$2\theta^\circ$	Tabakalar arası mesafe ( $A^\circ$ )	Kristal boyut ( $A^\circ$ )	Mikro gerilme (%)
E-PCL	21,4140	4,14958	297,6124	0,697145
	23,7906	3,74016	125,8231	1,486279
D-PCL	21,2701	4,17733	360,5816	0,579249
	21,8816	4,06195	221,2491	0,917958
	24,1790	3,68096	147,1053	1,251132

### E-PCL ve D-PCL Örneklerinin FTIR Analizi

Şekil 3 E-PCL ve D-PCL örneklerinin FTIR spektrumunu göstermektedir. Şekil 3'ten görüldüğü gibi E-PCL ve D-PCL örneklerinin;  $2934,41\text{ cm}^{-1}$  ve  $2841,83\text{ cm}^{-1}$  dalga sayılarında sırasıyla  $-\text{CH}_2$  grubunun asimetric ve simetric gerilme titreşimi,  $1045,94\text{ cm}^{-1}$  'de C-O-C epoksi,  $731,83\text{ cm}^{-1}$  'de  $\text{CH}_2$  bükülme ve  $711,23\text{ cm}^{-1}$  'de ise C-C sallanma titreşimlerine ait bantlar tespit edilmiştir. Bu bantlar literatürde PCL'nin sahip olduğu fonksiyonel gruplara atfedilmektedir (Ishwarchand ve ark., 2021). Şekil 3 incelendiğinde D-PCL'nin fonksiyonel gruplarına denk gelen bantların E-PCL'nin sahip olduğu bant şiddetlerinden daha düşük olduğu görülmektedir. Literatürde bant şiddetinin düşüklüğü moleküler etkileşimin büyüklüğüne atfedilmiştir (Deng ve ark., 2018). Bu yüzden solvent döküm yöntemiyle üretilen D-PCL filminde tüm fonksiyonel gruplara ait moleküler etkileşimlerin E-PCL fiberine göre daha fazla olduğu anlaşılmıştır.

**Şekil 3.** E-PCL ve D-PCL örneklerinin FTIR spektrumları

### E-PCL ve D-PCL Örneklerinin OM ve SEM Analizi

PCL örneğinin OM ve E-PCL örneğinin SEM görüntüsü Şekil 4'te verilmiştir. Şekil 4'te D-PCL örneğinin OM görüntüsünde çekirdeklenme noktaları ve PCL'nin karakteristik tane yapısı görülmektedir. Literatürde PCL'nin yüzey görüntüsü Şekil 4'te verilen görüntüyle benzer şekildedir (Castilla-Cortázar ve ark., 2019). E-PCL örneğinin SEM görüntüsünden ortalama fiber çapı  $191,86\text{ nm}$  değerinde olduğu tespit edilmiştir. E-PCL örneğinin SEM görüntüsünde homojen boyutta nanofiberler ve bu nanofiberler üzerinde kısmen boncuk oluşumu görülmüştür. Fiberler üzerinde görülen boncuk oluşumu literatürde PCL'nin elektroçirme çözeltisi içerisindeki Ağ.% miktarına atfedilmektedir (Fujihara ve ark., 2005).

Şekil 4. E-PCL ve D-PCL örneklerinin yüzey görüntüleri

### E-PCL ve D-PCL Örneklerinin Temas Açısı Ölçüm Sonuçları

D-PCL ve E-PCL örneklerinin temas açısı ölçüm sonuçları Şekil 5'te verilmiştir. Şekil 5'te görüldüğü gibi D-PCL örneğinin temas açısı  $75,00^\circ$  ve E-PCL örneğinin temas açısı  $84,14^\circ$  olarak ölçülmüştür. Temas açısı ölçüm sonuçlarına göre solvent döküm ve elektroçirime yöntemleriyle üretilen film ve nanofiber örneklerinin temas açıları birbirine yakın sonuçlar vermiştir. Literatürde elektroçirime yöntemiyle üretilmiş PCL nanofiberin temas açısı sonucu  $85,00^\circ$  olarak ölçülmüştür (Joseph ve ark., 2023). PCL filmlerin literatürde hidrofobik özellikte olduğu, temas açısının ise  $74-78^\circ$  arasında tespit edildiği rapor edilmiştir (Gümüşderelioğlu ve ark., 2011). Bu çalışmada hem E-PCL hem de D-PCL için bulunan temas açısı sonuçları literatürle birebir benzer olduğu belirlenmiştir.

Şekil 5. D-PCL ve E-PCL örneklerinin temas açısı ölçümleri

### SONUÇ

Bu çalışmada solvent döküm ve elektroçirime yöntemleriyle üretilen PCL film ve nanofiberlerin yapısal özellikleri karşılaştırılmıştır. XRD analiz sonuçlarına göre her iki yöntemle de üretilen E-PCL ve D-PCL'nin kristal yapılarının benzer olduğu ancak D-PCL'nin kristal boyut değerlerinin daha yüksek olduğu belirlenmiştir. Bu sonuç solvent döküm yönteminin çekirdeklenme etkisi üzerinde daha etkin olduğunu ortaya çıkarmıştır. FTIR analiz sonuçları da D-PCL'nin moleküler arası etkileşimlerinin daha fazla olduğunu göstermiştir. D-PCL ve E-PCL örneklerinin yüzey görüntülerinde D-PCL örneğinin karakteristik tane yapısı, E-PCL örneğinin ise homojen boyutta nanofiberleri görüntülenmiştir. Temas açısı ölçüm sonuçları D-PCL ve E-PCL örneklerinin hidrofobik özellik sergilediklerini göstermiştir.

## Özet

Akdeniz midyesi (*Mytilus galloprovincialis*) ekonomik öneme sahip çift kabuklu türüdür. Dünyada birçok mutfakta yer edinmiş bu türün, ülkemizde tüketimi midye dolma ve midye tava şeklinde yaygındır. Ancak mikroorganizma bakımından risk içerebilen bu ürünlerin güvenli tüketimleri için alternatif ürün üretim modellerine ihtiyaç duyulmaktadır. Bu çalışmada, ülkemiz mutfağında yer edinmiş pilakinin Akdeniz midyesinden üretimi amaçlanmış, üretilen ürünlerin ise önemli bozulma parametrelerinden olan mikrobiyolojik kalitesinin değişimi incelenmiştir. Midye pilakiler sous-vide metodu kullanılarak, çiğ midye etlerinden sade ve sebze olarak üretilmiştir. Elde edilen bulgulara göre, çiğ midye etinde tespit edilen toplam aerobik mezofilik bakteri (TAMB) 4,47 log kob/g, maya ve küf (MK) 2,95 log kob/g, *Bacillus* sp. 1,65 log kob/g, *Staphylococcus* ve *Micrococcus* (S&M) 1,21 log kob/g seviyelerinde tespit edilmiş, diğer mikroorganizmalara ise rastlanamamıştır. Taze midye örneklerinde tespit edilen mikroorganizma seviyeleri ise ürünlerin ilk üretildiği gün de yaklaşık 2,0 – 3,0 log kob/g azalmış sırasıyla SM ve PM ürünleri için TAMB 2,37 – 1,34 log kob/g, MK 1,48 – 1,15 log kob/g olarak tespit edilmiş olup, diğer mikroorganizmalar belirlenmemiştir. Midye pilaki ürünlerinin raf ömürleri ise mikrobiyolojik açıdan 17 gün olarak tespit edilmiştir.

Sonuç olarak, Akdeniz midyesinden elde edilen pilaki ürünlerin hem görünüm hem de lezzet olarak tüketicinin ilgisini çekebileceği, ancak mikrobiyolojik açıdan ürün ticarileşebilmesi için, raf ömrünü uzatmak amacıyla ek yöntemlerin araştırılması ve uygulanmasının gerekebileceği düşünülmektedir.

### Determination of microbiological quality of stews produced from Mediterranean mussels (*Mytilus galloprovincialis*)

## Abstract

Mediterranean mussel (*Mytilus galloprovincialis*) is a bivalve species of economic importance. This species, which has gained a place in many cuisines in the world, is widely consumed in our country in the form of stuffed mussels and fried mussels. However, alternative product production models are needed for the safe consumption of these products, which may contain risks in terms of microorganisms. In this study, it was aimed to produce mussel stew, which has a place in the cuisine of our country, from Mediterranean mussels, and the change in microbiological quality of the produced products, which is one of the important spoilage parameters, was examined. Mussel stews were produced plain and with vegetables from raw mussel meat using sous-vide method. According to the results obtained, total aerobic mesophilic bacteria (TAMB) 4.47 log cfu/g, yeast and mould (MK) 2.95 log cfu/g, *Bacillus* sp. 1.65 log cfu/g, *Staphylococcus* and *Micrococcus* (S&M) 1.21 log cfu/g and other microorganisms were not detected in raw mussel meat. The levels of microorganisms detected in fresh mussel samples decreased approximately 2.0 - 3.0 log cfu/g on the first day of production and TAMB 2.37 - 1.34 log cfu/g, MK 1.48 - 1.15 log cfu/g for SM and PM products, respectively, and other microorganisms were not detected. The shelf life of mussel stewed products was determined as 17 days from microbiological point of view. In conclusion, it is thought that stewed products obtained from Mediterranean mussels may attract the attention of consumers both in terms of appearance and taste, but additional methods

may need to be investigated and applied to extend the shelf life to commercialise the product from a microbiologically.

## Giriş

Akdeniz midyesi (*Mytilus galloprovincialis*), dünyada hem lezzeti hem de besleyici özellikleri nedeniyle birçok geleneksel mutfakta yer edinmiş deniz ürünüdür. Ülkemizde yaygın olarak, midye dolma ve midye tava olarak tüketimi bulunan bu türün, alternatif ve güvenli ürünlere dönüştürülmesi, midyelerin yaşam şekillerinden ve üretim aşmalarında ekstra maliyet ile zaman kaybindan dolayı önem taşımaktadır. Bununla birlikte, tüketici kitlesine alternatif ürün sunulması ve ürün yelpazesinin genişletilmesi de bu noktada alternatif ürünlerin üretimi ile mümkün olabilmektedir.

Pilaki, genel olarak et ürünlerinin, çeşitli sebzeler ile hammadde türüne göre değişiklik gösteren süre ve sıcaklıklarda pişirilmesi işlemidir. Uygun süre ve sıcaklık uygulamaları ile hammadde içeriğinde yer alan mikroorganizma sayı ve türlerinin azaltılması da mümkün olacağından hem yeni ürünlerin üretimi hem de hammaddelerin bozulmasını geciktirerek tüketim süresinin uzatılması mümkün olabilmektedir. Ancak, midye gibi çift kabuklu yumuşakça türlerinde, yaşam şekillerinin aslımı oluşturan buldukları suyu süzerek beslenmelerinden dolayı başta mikroorganizmalar olmak üzere, birçok riski barındırabilmektedirler. Dolayısıyla, iç ve dış pazarda potansiyel sorun olabilecek bu durumlarda hem tüketiciye alternatif ürün sunumu hem de mikrobiyolojik açıdan standartlara uygun güvenli ürünlerin üretimine yönelik araştırmalar önem taşımaktadır. Yapılan bu çalışmada, Akdeniz midyesinden sous-vide metodu kullanılarak pilaki üretimi gerçekleştirilmiş, elde edilen ürünlerin çiğ ürünlerdeki mikrobiyolojik kaliteleri ile raf ömrü süresince değişimleri belirlenerek, potansiyel yeni ürün üretimi için bir ön çalışma gerçekleştirilmiştir.

## Materyal ve Metot

Araştırma materyali olarak Akdeniz midyesi (*Mytilus galloprovincialis*) kullanılmıştır (Şekil 1a-c). Toplam ağırlığı yaklaşık 6 kg olan ve her birinin boyu 5 cm üzerinde olan porsiyonluk örnekler (Şekil 1b) Çanakkale Boğazı'ndan 2023 Temmuz ayında SCUBA donanımlı dalış sırasında el ile toplanmıştır. Toplanan örnekler Çanakkale Onsekiz Mart Üniversitesi laboratuvarlarına 2 saat içinde buz aküleri ile soğutulmuş yalıtımlı polietilen kutularda taşınmıştır. Laboratuvara getirilen örneklerin kırık kabuk ve canlılık kontrolleri yapıldıktan sonra ayrılan canlı ve sağlam örneklerden pilaki üretimi gerçekleştirilmiştir (Şekil 1d-f).

Şekil 1 – Akdeniz midyesi örnekleri (a), örneklerin mikrobiyolojik ekim öncesi hazırlığı (b), midye eti ölçümü (c), sous-vide metodunda uygulanan vakum paketlenme (d), üretilen sade (e) ve sebzeli (f) pilakilerin görüntüsü

## Midye Pilaki Üretimi

Pilaki üretimi için sous-vide metodu kullanılmış olup, haşlanmamış midye etleri sade (SM) ve sebzeli (PM) olarak vakum paketleme yapılmış ve 80°C'de 15 dk vakum paket ile su banyosunda pişirilmiştir. Haşlama ile midye eti çıkarma işleminin sıcaklık ve süresi ise 95°C'de 2 dk olarak uygulanmıştır. Sebzeli pilaki uygulaması için kullanılan sebzeler, domates, sarımsak, mısır, biber ve soğandan oluşmaktadır. Baharatlar ise yalnızca tuz ve karabiberdir. Üretilen her iki grup pilaki ürün mikrobiyolojik açıdan raf ömürleri süresince +4 °C'de depolanmıştır.

## Mikrobiyolojik Analizler

Midyelerin kabukları kum, çamur ve mikroorganizmalardan arındırıldıktan sonra, alkollü pamuk ile temizlenmiştir. Steril bıçak yardımıyla açılan canlı midyelerin içinde bulunan kabuklar arası sıvı ve midye etlerinden toplam 10 g homojen örnek alınarak, 90 ml bakteriyolojik pepton (%0,1 Pepton + % 1NaCl) içerisine tartılmıştır. Tartım sonrasında örnekler Stomacher (Seward, 400) cihazında, 2 dk süre ile 2300 rpm'de homojen edilmiştir. Homojen edilen örneklerin yine peptonlu su kullanılarak 10<sup>-6</sup>'ya kadar desimal seyreltme yapılmıştır. Yapılan her seyreltmeden yayma plak yöntemi ile plate count agar (PCA-Merck), malt extract agar (MAE), mannitol egg yolk polymyxine (MYP-Merck), Baird-Parker agar (BP), thio citrate bile sucrose (TCBS-Merck) agar tryptose sulfite cyclocerine (TSC-Merck) agar, Endo Agar (Merck) ve D-coccosel (Biomeriux) besiyerlerine ekimleri yapılmıştır (FDA/BAM, 1998). Midye pilaki örneklerinden, ekim yapılan tüm petri ler üreticilerin verdiği süre ve sıcaklıkta inkübasyona tabi tutulmuş, inkübasyon sonunda üreyen koloniler seçilerek biyokimyasal testler ile ön tanımlama yapılmıştır.

## Bulgular ve Tartışma

Bu çalışmada Çanakkale Boğazı'ndan toplanan porsiyonluk Akdeniz midyelerinden, mikrobiyolojik kontrolün sağlanması ve farklı tüketim şekillerinin aynı anda araştırılması amacıyla midye pilaki ürün üretimi gerçekleştirilmiştir. Sous-vide metodu esas alınarak üretilen ürünlerin görüntüleri Şekil 1e ve Şekil 1f'de gösterilmiş, elde edilen bu ürünlerin hammadde ve kontrol grubuna göre mikrobiyolojik kaliteleri ise Şekil 2'de özetlenmiştir.

ÇM: Çiğ midye eti, SM: Sade midye pilaki, PM: sebzeli midye pilaki, Kob: koloni oluşturan birim, TAMB: Toplam aerobik mezofilik bakteri, MK: maya ve küf, Bac.: Bacillus sp., S&M: Staphylococcus & Micrococcus, Entb.: Enterobacteriaceae, TSIB: Toplam sülfid indirgeyen bakteri, Entc.: Enterococcus sp.

Şekil 2: Taze midye eti, sade midye pilaki ve midye pilaki ürünlerinin raf ömrü süresince mikroorganizma seviyelerinin (log N kob/g) günlere göre değişimi.

Araştırma kapsamında kullanılan taze midye örneklerinin mikroorganizma seviyeleri sırasıyla toplam aerobik mezofilik bakteri (TAMB) 4,47 log kob/g, maya ve küf (MK) 2,95 log kob/g, *Bacillus* 1,65 log kob/g, *Staphylococcus* ve *Micrococcus* (S&M) 1,21 log kob/g tespit edilmiş, diğer mikroorganizmalara ise rastlanamamıştır. Taze midye örneklerinde tespit edilen mikroorganizma seviyeleri ise ürünlerin ilk üretildiği gün de yaklaşık 2,0 – 3,0 log kob/g azalmış sırasıyla SM ve PM ürünleri için TAMB 2,37 – 1,34 log kob/g, MK 1,48 – 1,15 log kob/g olarak tespit edilmiş olup, diğer mikroorganizmalar belirlenememiştir (Şekil 2). Ürünler depolandığı +4 °C koşullarında 0, 5, 10, 15 ve 17 günlerde mikrobiyolojik analizleri yapılmış ve raf ömürleri benzer ürünler için belirtilen kriterlerde de geçerli olan log 6,0-7,0 kob/g (ICMSF, 1986; Anonim, 2011) seviyesine ulaşmaya kadar bu analizler sürdürülmüştür. TAMB sayısı log 7.0 sayısına ulaşan ilk mikroorganizma grubu olarak belirlenmiş, 17. Günde her SM ve PM gruplarında sırasıyla 7,3 ve 7,1 olarak tespit edilmiştir. Bununla birlikte, taze örneklerde ve depolamanın ilk günlerinde pilaki ürünlerde az sayılarda tespit edilen *Staphylococcus – Micrococcus* (0 – 1,2 log kob/g) depolamanın ilerleyen günlerinde SM grubunda 5,93 log kob/g, PM grubunda ise 3,48 log kob/g seviyelerine kadar yükselmiştir. Diğer taraftan taze ürünlerde 1,65 log kob/g seviyelerinde olan *Bacillus* sp. pilaki ürünlerde tespit edilebilir değerlerin altında bulunmuştur. Genel olarak midye pilaki ürünlerde tespit edilen mikrofloranın TAMB, MK ve S&M mikroorganizma grupları ile şekillendiği belirlenmiştir. Midyelerin buzdolabı koşullarında raf ömürleri ancak haşlama sonrası elde edilen etler üzerinden yapılan analizler aracılığıyla belirlenebilmektedir. Midyeler öldükleri andan itibaren tüketim için uygunluğunu kaybetmektedirler. Dolayısıyla, ürünler ya canlı olarak tüketime kadar soğuk koşullarda bekletilir ya da pişirilerek veya etleri ayıklandıktan sonra işlenerek depolanabilmektedir.

Yapılan çalışmalar arasında ısı işlem uygulanmış ve soğukta depolanmış midyelerin raf ömürleri paketleme türüne bağlı olarak oldukça değişken olabilmektedir. Turan ve ark., (2013) yaptıkları çalışmada çiğ midye etlerinde (*Mytilus galloprovincialis*) başlangıçta, 3,94 log kob/g tespit ettikleri TAMB sayısını raf ömrü sonu olarak belirledikleri dördüncü gün sonunda 7,54 log kob/g olarak tespit etmişlerdir. Kaba ve Erkoyuncu (2011) çiğ midye eti örneklerinde TAMB sayısını 5,28 log kob/g, raf ömrü sonu olan altıncı günde ise %0,2 potasyum sorbat katkılı çiğ etlerin 6,60 log kob/g ve haşlanmış katkılı etlerin ise 6,49 log kob/g olarak rapor etmişlerdir. Bildirilen bu iki çalışmada taze midye eti örnekleri için rapor edilen değerler benzer bulunmuş ancak katkı kullanarak haşlandıktan sonra paketlenmiş midye etleri için rapor edilen altı gün raf ömründen, çalışmamızdaki her iki üründe tespit edilen raf ömrü daha uzun bulunmuştur. Ayrıca, ilk uygulama sonrasında mikroorganizma yüklerindeki düşüş yine çalışmamızda daha yüksek seviyede bulunmuştur.

### Sonuç

Sonuç olarak bu çalışma ile porsiyonluk Akdeniz midyelerinin geleneksel tüketim şekli olan midye dolma ve midye tava ürünlerine alternatif olarak midye pilaki ürün üretilmiştir. Sous-vide metoduna dayalı üretim metodu ile aynı zamanda başlangıç mikroorganizma yüklerinde önemli düşüşler gerçekleşerek raf ömürlerinin de uzatılması sağlanmıştır. Alternatif üretim metodlarının ayrı ayrı veya kombine olarak, bu şekilde denemesi, ürün yelpazesinin artırılmasına olanak sağlarken, ürün zayıtı, ekstra iş gücü ve zaman kaybının önüne geçme potansiyeli taşıyacağı düşünülmektedir.

#### Abstract

Animals designated for slaughter undergo various stressors that can adversely impact their physiological functions and the quality of their meat. This study aimed to assess these stress factors during the pre-slaughter and slaughter processes in camels. A survey was conducted in Casablanca, Tit-Mellil Mediouna, Settat, and Mers Lkhir Skiratt-Temara slaughterhouses in Morocco, involving the evaluation of 246 camels from loading onto vehicles to the bleeding process. The findings revealed that a significant number of camels were transported in non-ventilated vehicles with covered roofs and dark floors. During transport, these camels were not mixed with other animal species, loaded using pushes and pulls with ropes due to the absence of ramps. They were transported in vehicles with slippery floors without any bedding and were led to the lairage area and slaughter room using ropes attached to their forelimbs. Many camels experienced longer transport distances and higher loading densities.

Furthermore, all camels were slaughtered according to halal practices without stunning. Most of the animals endured extended waiting times before loading and required a prolonged duration for the entire process, including loading, transport, unloading, lairage, water and food deprivation, escort to the slaughter room, slaughtering, and bleeding. During their journey to the lairage area and the slaughter room, the animals exhibited frequent falls, urination, defecation, and vocalizations. In our country, the animal welfare standards set by the World Organization for Animal Health are not consistently upheld. Often, the vehicles are multi-purpose and not specifically designed or equipped for camel transportation, lacking proper loading and unloading facilities and offering no protection from the sun. The camels were handled roughly by untrained and inexperienced handlers and were transported without any bedding in excessively high ambient temperatures.

In conclusion, in the municipal slaughterhouses examined, all the activities and procedures preceding slaughter could negatively impact the well-being of camels and compromise the quality of their carcasses and meat. Therefore, it is imperative for managers to adhere to internationally recognized standards for the appropriate welfare of camels in various slaughterhouses across Morocco.

**Keywords:** Preslaughter stress, Camels, Slaughterhouses, Survey, Morocco.

#### INTRODUCTION

The management of camels on farms, at markets, and in slaughterhouses, as well as their loading into trucks, transportation, unloading, and stabling at slaughterhouses, can potentially induce stress, leading to what is referred to as "pre-slaughter stress" (El Khasmi et al., 2015; Lemrhamed et al., 2018; Lemrhamed et al., 2019). Despite the longstanding attention of scientific researchers in developed countries to the welfare of farmed animals and its impact on product quality, this area of research remains relatively underexplored in underdeveloped regions, particularly concerning camels. Conversely, farm animals often encounter various welfare challenges during and after transport, including prolonged periods of water and food deprivation, fatigue, injuries, diseases, handling, intermingling with different species, and exposure to diverse environmental conditions (Roadknight et al., 2021). Additionally, animals face additional potential stressors during transport, such as climatic conditions, accelerations, vibrations, noise, space limitations, road conditions, vehicle design, and air pollutants (Padalino and Raidal, 2020). The objective of this study was to

conduct a survey on the pre-slaughter stress conditions experienced by camels, encompassing their loading into vehicles up to the slaughtering process, in Moroccan slaughterhouses.

## MATERIALS AND METHODS

A survey was carried out on 246 male and female camels (*Camelus dromedarius*) to evaluate the stress conditions before slaughter and during the slaughtering process, spanning from loading to bleeding, in slaughterhouses located in Casablanca (63 camels), Tit-Mellil (59 camels), Settat (64 camels), and Mers Lkhir Skiratt-Temara (60 camels) in Morocco. This survey focused on various aspects, including animal and transport vehicle identification, camel positioning in the vehicles, loading density, co-mingling with different species, loading and unloading procedures, the process of guiding camels to the lairage area and slaughter room, and the slaughtering process. It also considered factors such as transport distance and duration, as well as loading, unloading, lairage, water and food deprivation, accompaniment to the slaughter room, slaughtering, and bleeding times. Additionally, the survey documented the frequencies of falls, urination, defecation, and vocalizations during the guidance of camels to the lairage area and slaughter room, as well as the presence of bruises on the carcasses. For each parameter, proportions were calculated by dividing the observed events by the total number of animals in the respective group. Descriptive analysis was performed using the statistical software SPSS version 19 to identify variables of interest.

The study examined variations among different groups of camels. The Chi-square test was employed to identify significant factors related to slaughterhouse conditions. Variations were deemed statistically noteworthy at a significance level of  $P < 0.05$ .

## RESULTS

The majority of the camels included in the study were male (60.98%), aged between 3 and 9 years, weighing between 300 and 400 kg. They were predominantly intensively bred, sourced from markets, and individually valued between 15,500 and 24,000 DH. A significant portion of the camels (58.54%) were transported to the slaughterhouses in vans. For 72.36% of the animals, the transport vehicles lacked ventilation, had a covered roof, and had a dark floor. During transportation, 86.99% of the camels were not mixed with other species. All camels (100%) were loaded using pushes and pulls with ropes due to the absence of ramps. They were transported in vehicles with slippery floors without any bedding. Upon arrival at the lairage area and slaughter room, they were guided using pushing and pulling techniques with ropes while being restrained by a rope attached to the forelimb. Additionally, all camels were slaughtered in accordance with Islamic methods, without stunning.

The study's findings indicate that a significant number of camels waited between 25 and 36 hours before being loaded onto vehicles (78.86%). Loading required between 16 and 25 minutes for 57.52% of the camels. Transport and unloading times were, respectively, 10 to 11 hours for 68.29% of the camels and 11 to 20 minutes for 51.22% of the animals ( $P < 0.05$ ). The durations of stay in the lairage and deprivation of water and food were between 8 and 12 hours for 71.54% of the camels and 25 to 72 hours for 69.11% ( $P < 0.05$ ). The time taken for the animals to be guided to the slaughter room, slaughtered, and bled out were, respectively, between 11 and 20 minutes for 41.47%, 11 and 20 minutes for 45.53%, and 8 to 9 minutes for 54.47% of the camels ( $P < 0.05$ ).

According to the same study, the transport distances and loading densities were, respectively, 120 to 350 km for 60.98% and less than 2.75 m<sup>2</sup>/animal for 51.22% of the camels. During the guidance of the animals to the lairage area and slaughter room, the frequencies of falls, urination, defecation, and vocalizations were, respectively, 5 to 10 times for 69.11%, 3 to 5 times for 65.85%, 2 to 4 times for 64.23%, and 15 to 40 times for 87.80% of the camels ( $P < 0.05$ ).

## DISCUSSION

The camels under examination experienced both psychological and physical stressors. Psychological stress arose from disruptions in social interactions, unforeseen events, and a lack of familiarity with various situations encountered by the animals. Physical stress resulted from factors such as water and food deprivation, exhaustion, collisions with enclosure elements or other animals, human interventions, and inter-animal conflicts during transportation and housing. The prolonged durations of loading, unloading, guiding to the slaughter room, slaughter, as well as increased instances of urination, defecation, and vocalizations, can be attributed, at least in part, to the animals' reluctance to move forward, attempts to walk backward, immobility, resistance despite operator interventions, escape efforts, slips, and/or falls. These observed reactions indicate a state of fear and a disruption in the well-being of the camels (Grandin and Shivley, 2015).

In this study, the camels were loaded and unloaded without the use of specialized facilities, transported in vehicles not designed for camel transport, and guided by ropes with forelimb restraint, potentially leading to depletion of muscle glycogen and elevated postmortem meat pH (Mounier et al., 2006). Furthermore, the slaughter process itself introduced a stress element, as it was performed in accordance with the halal procedure without prior stunning, rendering the animals conscious and sensitive. Consequently, prolonging this procedure could be significantly more stressful for camels that haven't undergone prior stunning. Specifically, the dromedaries were positioned in a squatting stance, with their front legs secured using a rope at the knees. The head was held in a caudal position (i.e., facing the tail). The animals were in visual and olfactory proximity to the operator responsible for the halal bleeding, the knife, and the dromedaries already slaughtered on the ground, potentially causing physical and psychological stress due to the release of volatile compounds from urine, blood, and feces (Terlouw and Bourguet, 2022).

## CONCLUSION

In the four Moroccan municipal slaughterhouses examined in this study, camels face stressful conditions from the point of loading until slaughter. These conditions have the potential to disrupt the physiological balance of these animals and impact the quality of their meat. As a result, it is imperative for managers to take action and adhere to internationally recognized standards for the proper welfare of camels within these slaughterhouses.

## Özet

Kauçuk esaslı malzemelerin özelliklerini iyileştirmek veya maliyeti ucuzlatmak gibi amaçlarla hamur bileşiminde çeşitli dolgu maddelerine yer verilmektedir. Karbon siyahı, kauçuk hamurlarında en yaygın olarak kullanılan dolgu maddesi olmasına rağmen üretimi sırasında yüksek enerji tüketimi ve CO<sub>2</sub> emisyonuna neden olması gibi dezavantajlara sahiptir. Bunun yanı sıra, petrol kökenli kaynaklardan üretilmesi dolayısıyla uzun vadede sürdürülebilir olmaması, statik elektriklenmeye yatkınlığı ve malzemelerde aglomere eğiliminde olmasından dolayı bu dolgu malzemesine alternatif bir malzeme arayışı devam etmektedir. Bu ihtiyaç doğrultusunda başlatılan bu çalışmada, alternatif dolgu maddesi olarak wollastonit kullanılmış ve karbon siyahı ile wollastonit dolgulu yedi farklı reçete oluşturulmuştur. Beyaz renkli, doğal bir mineral olan wollastonit, üstün fiziksel ve kimyasal özellikleri nedeniyle seramiklerde, plastiklerde, metalurjik uygulamalarda, boya ve kaplamalarda sıkça kullanılan bir maddedir. Bu çalışmada ham wollastonit (aktif olmayan, modifiye edilmemiş) ile epoksi wollastonit (aktif, modifiye edilmiş) doğal kauçuğa (NR) belirli miktarlarda eklenmiş ve karışımın özelliklerine etkisi araştırılmıştır. Hazırlanan kauçuk karışımlarında reolojik, fiziksel, mekanik, ısı ve yapışma özellikleri açısından değerlendirmeler yapılmıştır. Ayrıca tüm vulkanizatlar, 70°C'de 72 saat boyunca etüvde yaşlandırılmış ve wollastonitin yaşlanma sürecindeki etkisi aydınlatılmaya çalışılmıştır. Yapılan analizler sonucunda, aktif wollastonit içeren karışımların yapışma ve mekanik özelliklerinde olumlu değişimler saptanmıştır.

**Anahtar Kelimeler:** Doğal Kauçuk, Dolgu Maddesi, Karbon Karası, Wollastonit, Doğal Dolgu Maddesi

**The effect of wollastonite on adhesive and mechanical properties in natural rubber compounds**

## Abstract

In order to improve the properties of NR-based materials or to reduce the cost, various fillers are included in the compound composition. Although carbon black is the most commonly used filler in rubber compounds, it has disadvantages such as high energy consumption and causing CO<sub>2</sub> emissions during its production. In addition, the search for an alternative material to this filling material continues due to the fact that it is not sustainable in the long term due to its production from petroleum-based resources, its tendency to static electrification and its tendency to agglomerate in materials. In this study, which was initiated in line with this need, wollastonite was used as an alternative filler and seven different recipes with carbon black and wollastonite filling were created. Wollastonite, a natural mineral of white color, is a substance frequently used in ceramics, plastics, metallurgical applications, paints and coatings due to its superior physical and chemical properties. In this study, raw wollastonite (inactive, unmodified) and epoxy wollastonite (active, modified) were added to natural rubber (NR) in certain quantities and the effect of the mixture on its properties was investigated. Evaluations were made in terms of rheological, physical, mechanical, thermal and adhesion properties in the prepared rubber mixtures. In addition, all vulcanizates were aged in the oven for 72 hours at 70°C and the effect of wollastonite on the aging process was tried to be elucidated. As a result of the analyzes,

positive changes in the adhesion and mechanical properties of mixtures containing active wollastonite were detected.

**Keywords:** Natural Rubber, Filler, Carbon Black, Wollastonite, Natural Filler

## GİRİŞ

Kauçuk esaslı malzemeler, Charles Goodyear'ın vulkanizasyonu keşfetmesinden bu yana hayatımızın birçok alanında yer almaktadır (De and Jim R. White 2001). Doğal kauçuğun yenilenebilir bitkisel kaynaklardan elde edilebilmesi ve görece üstün özelliklere sahip olması, sentetik kauçuklara göre daha fazla ilgi görmesini sağlamaktadır. NR, sahip olduğu iyi mekanik özellikleri, yüksek aşınma ve yırtılma direnci, dinamik çalışma koşullarına uygunluğu ve titreşim sönümleme özelliği sebebiyle tüm dünyada sayısız uygulama alanı bulmaktadır (Öncel and Karaağaç 2016). NR, yaygın olarak otomotiv, medikal gibi sektörlerin yanında; hortumlar, konveyör bantları, dayanıklı yük taşıyıcılar, titreşim sönümleyici parçalar, spor malzemeleri gibi birçok endüstriyel ürünün hammaddesi olarak kullanılmaktadır. NR esaslı malzemelerin özelliklerini iyileştirmek veya maliyeti ucuzlatmak amacıyla hamur bileşiminde çeşitli dolgu maddelerine yer verilmektedir. Kauçuk karışımların özellikleri; dolgunun dağılma derecesi, dolgu-polimer etkileşimi gibi özelliklere doğrudan bağlıdır. Kauçuk endüstrisinde en çok tercih edilen dolgu olan karbon siyahı (CB), doğalgaz veya ham petrolün kimyasal olarak bozundurulması yoluyla üretilmekte ve %90-95 oranında elementel karbondan (hidrojen ve oksijen ile birlikte) oluşmaktadır (Simpson 2002). En yaygın olarak kullanılan dolgu maddesi olmasına rağmen üretimi sırasında yüksek enerji tüketimi ve karbondioksit (CO<sub>2</sub>) emisyonuna neden olması, petrol kökenli kaynaklardan üretilmesi sebebiyle uzun vadede sürdürülebilir olmaması, statik elektriklenmeye yatkınlığı ve karışım içinde aglomera eğiliminde olmasından dolayı karbon siyahına alternatif dolgu maddesi arayışı doğmuştur. Bu kapsamda alternatif dolgu malzemesi olarak doğal maddelerin kullanıldığı çalışmalar incelenmiş ve birçok doğal maddenin kauçuk hamur karışımı içinde kullanılabilirliğinin araştırıldığı görülmüştür; muz kabukları, mısır, şeker kamışı, pirinç çeltiği, nişasta, odun, bambu, palm yağı, hindistan cevizi kabuğu gibi selülozik (lignin, selüloz, hemiselüloz) içerikli kaynaklar ile mürrekkep balığının iç kabuğu gibi doğal malzemeler (Akbar and Güngör 2018; Shebeer A. Rahim, G. Unnikrishnan, M. A. Joseph, Mubarak Ali 2021). Ayrıca doğal dolgu olarak; nano/mikro partiküllü haloysit, bentonit ve kalsiyum karbonatın da kullanıldığı çalışmalar da literatürde mevcuttur (Dintcheva et al. 2020; Rooj, Das, and Stöckelhuber 2013).

Doğal bir mineral olan wollastonit (Kalsiyum metasilikat, CaSiO<sub>3</sub>), klivaj yapısı dolayısıyla öğütülmesi esnasında iğnemsı kırılım göstermektedir. Düşük su absorpsiyonu, aşınma ve sürtünme direnci, ısı ve boyutsal kararlılık, ısı iletkenlik, düşük elektrik iletkenliği, mukavemeti artırma gibi özellikleri sebebiyle plastik sektöründe fonksiyonel bir dolgu malzemesi olarak değerlendirilmiştir. İğnemsı tanecik morfolojisi sebebiyle bulunduğu ürünlere yüksek mukavemet sağlamakta olan wollastonit, kanserojen etkisinin olmaması sebebiyle 1980'li yıllardan itibaren asbestin yerini almıştır. Sonrasında ise beton boru dökümünde, yer karolarında, contalarda ve fren balatası gibi sürtünmeli ürünlere alternatif bir malzeme olarak önem kazanmıştır. Ayrıca seramik, inşaat, plastik, kauçuk, boya, kaplama, sağlık gereçleri (kemik implantında), sanatsal ürünler gibi alanlarda kullanımı yaygınlaşmıştır (HANER and ÇUHADAROĞLU 2013). Wollastonit takviyeli polimer kompozitler, biyo uyumlu oluşu ve takviye edici özellikleri sebebiyle ilgi çekmektedir. Wollastonitin termoplastik kompozitlerde cam fiber gibi pahalı ürünlerin alternatifi olarak kullanılabilirliğinin araştırıldığı bir çalışmada, fonksiyonel bir dolgu potansiyeline sahip olduğu bulunmuştur. Ayrıca görece yüksek en-boy oranı ve sertliği sayesinde kompozitlerin kopma-eğilme dayanımını arttırabildiği saptanmıştır (Chan et al. 2020). 2018 yılında yapılan bir çalışmada, wollastonit içeren termoplastik elastomerde mineralin etkisi, uyumlaştırıcı ilavesi ile karşılaştırılmalı olarak incelenmiştir (Abdul Karim and Ismail 2018). Uyumlaştırıcı olarak kullanılan maleik anhidrit (MAH) sayesinde dolgu ve matris arasındaki etkileşim artmış ve bunun sonucunda da kopma dayanımı artmıştır. Ayrıca MAH ilavesi, dolgunun aglomerasyonunu azalttığından kompozitin Young modülünde de pozitif bir etkiye yol açmıştır. İnorganik bir dolgu olan wollastonitin modifiye edilerek kauçuk karışımında kullanılması, dolgu etkileşimini arttırmaktadır. Bu amaçla potasyum oleat (PO) ile de yüzey modifikasyonu gerçekleştirilebilmektedir. Modifikasyon sonucunda wollastonitin polarlığı azaldığı ve kauçuk-dolgu etkileşiminin arttığı tespit edilmiştir (Xiao et al. 2022). Modifikasyon yapılmadan 0, 10, 20, 30, 40 phr oranlarında karışıma eklenen wollastonitin etkilerinin araştırıldığı bir çalışmada; wollastonit dolgulu NR karışımlarının pişme karakteristiği, mekanik dayanımı ve morfolojik özellikleri araştırılmıştır. Artan dolgu miktarı ile kopma dayanımı, kopmada uzama ve pişme sürelerinin düştüğü; fakat maksimum tork (MH) ve modül değerlerinin arttığı tespit edilmiştir (Diep et al. 2014).

Bu çalışmada, doğal bir mineral olan vollastonitin doğal kauçuk karışımdaki mekanik ve yapışma özelliklerine dayanımına etkisinin araştırılması hedeflenmiştir. Kauçuk esaslı malzemelerde kullanılan CB yerine vollastonit mineralinin alternatif olarak kullanımı ve ayrıca vollastonitin yapışma mekanizmasına etkisi araştırılmıştır. Reçeteler hazırlanırken hamurda kullanılan CB miktarı sabit tutulmuştur. Hamur içinde vollastonitin hiç olmadığı karışım (NR-REF), referans karışım olarak değerlendirilmiştir. İlk grupta (NR-W3, NR-W6, NR-W9) aktive edilmemiş vollastonit, ikinci grupta (NR-WA3, NR-WA6, NR-WA9) ise aktive edilmiş (aktif, modifiye) vollastonit alternatif dolgu malzemesi olarak kullanılmıştır. Reçete uyarınca hazırlanan örnekler, reolojik, fiziko-mekanik, ısıl analizlere tabi tutulmuştur. Ayrıca vollastonitin yapışma üzerine etkisini incelemek için H-yapışma testi uygulanmıştır.

## MATERYAL VE METOT

Kauçuk hamurunun ana matrisi olarak seçilen NR (SIR10) Elkim Kauçuk firmasından satın alınmıştır. Takviye edici dolgu malzemesi olarak kullanılan karbon karası HAF N550, OMSK firmasından tedarik edilmiştir. Alternatif dolgu malzemesi olarak seçilen vollastonit hem aktive edilmiş hem de aktive edilmemiş durumda iken karışıma eklenmiştir. Vollastonit, Quarzwerke firmasından satın alınmıştır. Çinko oksit, stearik asit, TMQ (2,2,4-trimetil-1,2-dihidrokinolin), IPPD (N-izopropil-N'-fenil-1,4-fenilendiamin), TMTD (tetrametiltiuram disulfid), CBS (N-siklohegzil-2-benzotiazol sulfenamid) ve kükürt Rubber Chem firmasından satın alınmıştır. Kauçuk hamurları 2 litrelik laboratuvar tipi dahili karıştırıcı (Banbury) ve çift silindirli mil peş peşe kullanılarak hazırlanmıştır. Karışımlara ait reçeteler, Tablo 1'de verilmiştir.

**Tablo 1.** Kauçuk hamur formülasyonları

	NR-REF	NR-W3	NR-W6	NR-W9	NR-WA3	NR-WA6	NR-WA9
<b>Bileşim (phr)</b>							
NR	100	100	100	100	100	100	100
CB	50	50	50	50	50	50	50
Vollastonit	-	3	6	9	-	-	-
Vollastonit (Aktif)	-	-	-	-	3	6	9
Yağ	10	10	10	10	10	10	10
ZnO	5	5	5	5	5	5	5
Stearik asit	2	2	2	2	2	2	2
TMQ	1	1	1	1	1	1	1
IPPD	1	1	1	1	1	1	1
CBS	2	2	2	2	2	2	2
TMTD	0.5	0.5	0.5	0.5	0.5	0.5	0.5
Kükürt	1.5	1.5	1.5	1.5	1.5	1.5	1.5

Hazırlanan reçetelerde, CB miktarı sabit tutulmuştur. Hamur içerisinde vollastonitin hiç olmadığı referans örnekler NR-REF; aktive edilmemiş vollastonitin kullanıldığı karışımlar NR-W3, NR-W6, NR-W9 (sırasıyla 3, 6, 9 phr oranında), aktive edilmiş (modifiye) vollastonitin kullanıldığı karışımlar NR-WA3, NR-WA6, NR-WA9 (sırasıyla 3, 6, 9 phr oranında) kısaltmaları ile temsil edilmiştir. Tüm örnekler, reolojik, fiziko-mekanik, ısıl analizler uygulanmıştır. Ayrıca vollastonitin yapışma üzerine etkisini incelemek için H-yapışma testi uygulanmıştır. Endüstriyel bir mineral olan vollastonitin imalat sırasındaki birleştirici rolü hem literatürden, hem de daha önce çalışma grubumuzun yaptığı çalışmalardan bilinmektedir ve bu çalışma kapsamında da yapışmada olumlu etki yaratacağı düşünülmüştür. Bu amaçla reçetede alternatif bir dolgu maddesi olarak yüzeyi epoksi silan ile modifiye edilmiş ticari bir vollastonit kullanılmıştır.

Reolojik özellikler, ASTM D5289 standardı uyarınca, döner kalıp reometresi (MDR, Alpha Technologies MDR 2000) kullanılarak 150°C'de incelenmiştir. Kauçuk hamurları, reometre eğrilerinden elde edilen optimum pişme süreleri esas alınarak, 150°C sıcaklık ve 150 bar basınç koşullarında, hidrolik sıcak pres kullanılarak vulkanize edilmiştir. Vulkanizatların mekanik özellikleri ASTM D412 standardı uyarınca universal test cihazı (Zwick/Roell 2.5 kN) kullanılarak, aşınma kayıpları ise ASTM D5963 standardına göre aşındırıcı döner tambur kullanılarak ölçülmüştür. Sertlik değerleri, ASTM D2240 standartına göre Zwick Roell durometre ile Shore A cinsinden ölçülmüştür. ASTM D395 standardına göre, tüm vulkanizatlar iki plaka arasına yerleştirilmiş ve baskı uygulanarak kalıcı deformasyon testleri gerçekleştirilmiştir. Vulkanizatların yaşlandırma işlemi sonrası özellikleri de incelenmiştir. ASTM D573 standardına göre vulkanizatlara 70°C

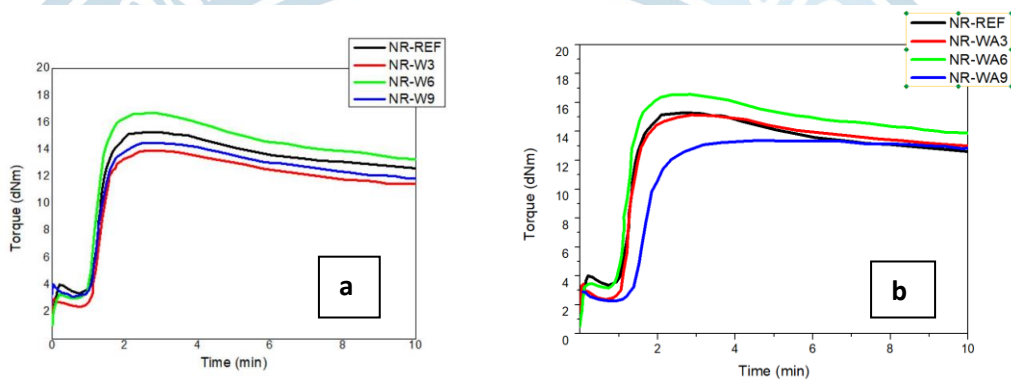

sıcaklıkta 72 saat boyunca, hava sirkülasyonlu etüvde ısıy yaşlandırma işlemi uygulanmıştır. Deneysel aşamada tüm karışımların termogravimetrik analizi (TGA, Mettler Toledo marka) ASTM E1131'e uygun olarak gerçekleştirilmiştir. Bu analizde malzeme, belirlenen sabit bir hızda ve seçilen atmosferik koşulda (azot), 25°C-600°C sıcaklıkları arasında ısıtılırken kütlesinde gerçekleşen değişim izlenmiştir. Son olarak, H-yapışma testi ile vollastonitin yapışma kuvvetine etkisi incelenmiştir. ASTM D4776 standardı uyarınca hazırlanan düzenekte özel bir kalıp kullanılmış ve kullanılan ağırlıklar ile ön germe uygulanmıştır. Belirlenen sürelerde karışımlar kalıp içinde pişirilmiştir ve içinde elyaf bulunan karışımlar H şeklinde kesilerek çekme testine tabi tutulmuştur.

## BULGULAR ve TARTIŞMA

### Reolojik Özellikler

Şekil 1'de aktive edilmemiş (a) ve aktive edilmiş (b) vollastonit kullanılarak hazırlanan kauçuk hamurlarının reometre eğrileri sunulmuştur. Eğrilerden elde edilen minimum tork değeri (ML), maksimum tork değeri (MH), pişme genliği (CE) ve pişme hız indeksi (CRI) değerleri Tablo 2'de sunulmuştur.

Şekil 1. Reometre eğrileri (a) aktive edilmemiş vollastonit içeren karışımlara ait (b) aktive edilmiş vollastonit içeren karışımlara ait

Tablo 2. Kauçuk hamurlarının önemli reolojik özellikleri

	ML (dNm)	MH (dNm)	CE (dNm)	CRI (min <sup>-1</sup> )
NR-REF	3.41	15.55	12.14	161
NR-W3	2.31	14.24	11.93	160
NR-W6	2.84	17.05	14.21	172
NR-W9	2.98	13.83	10.86	132
NR-WA3	2.33	15.24	12.91	152
NR-WA6	3.06	16.79	13.73	167
NR-WA9	2.30	13.84	11.54	116

Kauçuk hamurlarının önemli reolojik özelliklerini sunan Tablo 2'de sunulan pişme genliği (CE) değerleri ile çaprazbağ yoğunluğu ilişkilendirilmiştir. 6 phr vollastonit içeren karışımlar, kendi grupları içerisinde (aktif olmayan vollastonit içeren grup ve aktif vollastonit içeren grup) çapraz bağlanma düzeyinin en yüksek olduğu karışımlardır. ML değerleri incelendiğinde hamura vollastonit eklenmesinin işlenebilirliği kolaylaştırdığı söylenebilmektedir. Ayrıca vollastonit ilavesi ile viskozitenin referansa göre düştüğü de izlenmiştir.

### Mekanik Özellikler

Şekil 2'de vulkanizatların yaşlanma öncesi ve sonrasında kopma dayanımı değerlerindeki değişimler sunulmaktadır. Yaşlanma öncesindeki Referans ile karşılaştırıldığında vollastonit ilavesi ile tüm vulkanizatların kopma dayanımı değerlerinde bir iyileşme olmuş, özellikle aktive edilmiş vollastonit ilavesinin kopma dayanımında önemli bir artış sağladığı görülmektedir. Hem aktif hem de aktif olmayan vollastonit grubu incelendiğinde, 3 phr vollastonit ilavesinin en iyi kopma dayanımı sağlamaktadır. 70°C sıcaklıkta 72

saat boyunca yaşlandırma işlemine maruz bırakılan vulkanizatların kopma dayanımı değerlerinde bir düşüş gerçekleşmiştir.

Şekil 2. Yaşlanma öncesi ve sonrasında vulkanizatların kopma dayanımı

Şekil 3'te vulkanizatların yaşlanma öncesi ve sonrasındaki %100 modül değerlerinin değişimi gösterilmektedir. Yaşlanma sonrasında, tüm vulkanizatların modül değerlerinde hafif bir artış izlenmiştir.

Şekil 3. Yaşlanma öncesi ve sonrasında vulkanizatların %100 modül değerleri

Şekil 4'te vulkanizatların yaşlanma öncesi ve sonrasındaki kopmada uzama değerlerinin değişimi gösterilmektedir. Karışımlara eklenen vollastonit, kopmada uzama değerlerinde bir artışa sebep olmuştur. Hem aktif hem de aktif olmayan vollastonit grubunu içeren sonuçlar incelendiğinde, 3 phr vollastonit ilavesinin en iyi kopmada uzama sağladığı anlaşılmaktadır. Yaşlandırma işlemi sonucunda tüm vulkanizatların kopmada uzama değerleri düşmüştür.

Şekil 4. Yaşlanma öncesi ve sonrasında vulkanizatların kopmada uzama değerleri

Şekil 5'te vulkanizatların yaşlanma öncesi ve sonrasındaki sertlik değerleri sunulmaktadır. Artan vollastonit miktarı ile sertlik değerlerinin arttığı görülmektedir. Vollastonitin tanecik yapısı sebebiyle oluşan bu durum doğaldır.

Şekil 5. Yaşlanma öncesi ve sonrasında vulkanizatların sertlik değerleri (Shore A)

Şekil 6'da vulkanizatlara 40 metre boyunca aşındırma işleminin uygulandığı teste ait sonuçlar sunulmuştur. Karışımlara uygulanan vollastonit ilavesinin aşınma kaybını azalttığı tespit edilmiş ve bu durum vollastonitin tanecik yapısı ile ilişkilendirilmiştir. Vollastonitin fren balataları gibi aşınma direncinin önemli olduğu alanlarda zaten kullanılıyor olması dolayısıyla, bu beklenen bir sonuçtur. Özellikle aktif vollastonitin matris ile yaptığı kuvvetli etkileşim, aşınma kaybı değerlerinde de izlenmiştir.

Şekil 6. Vulkanizatların aşınma kaybı (%)

Şekil 7’de baskı altında kalıcı deformasyon testi sonuçları yer almaktadır. 6 phr aktif vollastonit ilavesinin en az kalıcı deformasyona yol açtığı, en fazla deformasyonun ise 9 phr oranında vollastonit içeren karışımlarda gerçekleştiği tespit edilmiştir. Bir başka deyişle, 6 phr vollastonit içeren hamurların çaprazbağ yoğunluğu daha yüksek olduğu görülmektedir.

Şekil 7. Baskı altında kalıcı deformasyon

### H-yapışma Testi

Takviye edici elyaf ile birlikte özel bir kalıpta pişirme ve ardından çekme testi uygulanması sonucunda elde edilen maksimum kuvvet, H-yapışma kuvveti Newton cinsinden kaydedilmiştir. Bu değerlerde meydana gelen değişimler, diğer bir deyişle vollastonitin aktif olduğu ve olmadığı durumlar arasındaki farklılık Şekil 8’de gösterilmektedir. Aktif yani yüzeyi epoksi silan ile modifiye edilmiş vollastonitin dolgu olarak kullanıldığı durumda yapışma kuvvetinin en yüksek olduğu ve bu durumun beklenildiği gibi artan ara yüzey etkileşiminden kaynaklandığı düşünülmektedir.

Şekil 8. H-yapışma kuvveti (N)

### Termogravimetrik Analiz

Termogravimetrik analiz, 25°C-600°C sıcaklıkları arasında ve azot ortamında gerçekleştirilmiştir. Malzemelerin ısıl kararlılığının tespit edildiği bu teknikte; %5 ve %10 kütle kaybının gerçekleştiği sıcaklıklar  $T_5$ ,  $T_{10}$  olarak Şekil 9'da sunulmuştur. Ayrıca bozunmanın en fazla olduğu sıcaklık da  $T_{max}$  ile ifade edilerek grafikte yer almıştır.  $T_5$  değerleri incelendiğinde, vollastonit ilavesinin bozunmayı geciktirme etkisi olduğu söylenebilir. Aktif olmayan vollastonit içeren grubu kendi içinde değerlendirdiğimizde, dolgu miktarı artışı ile  $t_5$  ve  $t_{10}$  sıcaklıklarındaki artışın doğru orantılı olduğu; Aktif vollastonit içeren grubu kendi içinde değerlendirdiğimizde ise en yüksek  $t_5$  ve  $t_{10}$  sıcaklığının 9 phr ilave yapıldığı durumda olduğu tespit edilmiştir.

### SONUÇ

Yapılan bu çalışmada, doğal kauçuk karışımlarında vollastonitin alternatif bir dolgu olarak kullanılabilirliği araştırılmıştır. Bu amaçla hazırlanan 7 karışımda hem aktif hem de aktif olmayan vollastonit kullanılmıştır. Referans amacıyla kullanılan karışımda ise hiç vollastonit kullanılmamıştır. Hamurdaki vollastonit miktarı ve dolgunun aktif olup olmaması test sonuçlarını değiştirmektedir. Özellikle aktif vollastonitin 9 phr kullanımı durumunda, kopma dayanımı ve yapışmanın olumlu anlamda değişmesi çalışmanın önemli bir sonucudur. Ayrıca vollastonit kullanımının aşınma direncine katkısı dolayısıyla, sürtünmenin önem kazandığı uygulamalarda kullanımı malzemelere katkı sağlamaktadır. Tüm sonuçlar değerlendirildiğinde, doğal dolgu maddesi olan vollastonitin karbon karasına sürdürülebilir bir alternatif dolgu maddesi olabileceği ve vollastonitin doğal kauçuk karışımlarındaki yapışma ve mekanik özellikleri olumlu yönde değiştirdiği tespit edilmiştir.

## ORAL PRESENTATION

### ZnO-poli(indol-4-aminokinaldin) elektrodun H<sub>2</sub>O<sub>2</sub> tayininde sensör olarak performansının incelenmesi

Rukan SUNA KARATEKİN\* (ORCID: <https://orcid.org/0000-0003-3052-1539>),

\*Mersin Üniversitesi, Fen Fakültesi, Kimya Bölümü, Mersin, Türkiye

\*rukansuna@mersin.edu.tr

#### Özet

Bu çalışmada hidrojen peroksitin elektrokimyasal tayini için ZnO ile modifiye edilmiş poli(indol-4-aminokinaldin) iki aşamada sentezlenerek sensör performansı incelenmiştir. Bu çalışma ile ilk kez yeni sentezlenip literatüre sunulmuş bir kopolimerin sensör alanındaki performansı incelenmiştir. Hazırlanan kopolimerin farklı pH'larda dahi aktif olması sensör uygulamaları için alışılmadık bir şekilde diğer iletken polimerlerden daha üstün bir özelliğe sahip olduğunu göstermektedir. Hazırlanan katalizörlerin karakterizasyonu alan emisyonlu taramalı elektron mikroskobu (FESEM), X-ışını kırınım spektroskopisi (XRD) ile gerçekleştirilmiştir. Diğer taraftan katalizörlerin elektrokimyasal özellikleri ve sensör performansı dönüşümlü voltametri (CV) ve amperometrik ölçüm ile incelenmiştir. Kopolimer ve kopolimersiz ZnO-ITO elektrotların H<sub>2</sub>O<sub>2</sub> indirgenmesindeki performansları incelendiğinde kopolimerin varlığı ile birlikte H<sub>2</sub>O<sub>2</sub>'ye ait indirgenmenin daha yüksek akım ile gerçekleştiği gözlenmiştir. Amperometrik ölçüm ile birlikte hazırlanan elektrodun H<sub>2</sub>O<sub>2</sub> algılamasında sensör olarak kullanılabilmesi sonucuna varılmıştır.

**Anahtar Kelimeler:** poli(indol-4-aminokinaldin), sensör, ZnO

#### Investigation of the performance of ZnO@poly(indole-4-aminoquinoline) electrode as a sensor for the determination of H<sub>2</sub>O<sub>2</sub>

#### Abstract

In this study, for electrochemical determination of hydrogen peroxide and investigation of its sensor performance, ZnO doped poly(indole-4-aminoquinoline) was synthesized in a two-step. In this study, the performance of a newly synthesized and presented copolymer in the field of sensors was examined for the first time. The fact that the prepared copolymer is active even at different pHs shows that it has superior properties than other conventional conductive polymers for sensor applications. To characterize synthesized catalysts field emission microscopy (FESEM), X-ray Powder Diffraction (XRD), measurements were performed. On the other hand, the electrochemical properties of catalysts were investigated by cyclic voltammetry (CV) and amperometric measurement. When the performances of copolymer and copolymer-free ZnO-ITO electrodes in H<sub>2</sub>O<sub>2</sub> reduction were examined, it was observed that the reduction of H<sub>2</sub>O<sub>2</sub> performed with a higher current with the presence of copolymer. According to the amperometric measurement, it was concluded that fabricated electrode can be used as a sensor to determine H<sub>2</sub>O<sub>2</sub>

**Keywords:** poly(indole-4-aminoquinoline), sensor, ZnO

#### GİRİŞ

Hidrojen peroksit çevre, endüstri ve biyomedikal alanlarında kullanılan önemli bir kimyasal maddedir (Stanković vd., 2020). Bununla birlikte birçok klinik, farmakoloji ve yiyecek endüstrisinde oksitleyici ajan olarak da kullanılmaktadır. Ancak hidrojen peroksitin fazlası merkezi sinir sistemine etki ederek Parkinson ve Alzheimer gibi hastalıklara neden olmaktadır (Yuvashree ve Balavijayalakshmi, 2019). Aynı zamanda kanser hücrelerinin normal hücrelere kıyasla daha fazla miktarda H<sub>2</sub>O<sub>2</sub> ihtiva ettiği çeşitli çalışmalar ile kanıtlanmıştır. Bu durum kanser ile H<sub>2</sub>O<sub>2</sub> miktarı arasında doğrudan bir ilişki olduğunu düşündürmektedir (Qian vd., 2021). Bu gibi ciddi ve yaygın hastalıklar ile H<sub>2</sub>O<sub>2</sub> miktarı arasında doğrusal bir ilişki olması nedeniyle H<sub>2</sub>O<sub>2</sub>'nin doğru ve hızlı tespiti büyük önem taşımaktadır. H<sub>2</sub>O<sub>2</sub>'nin tayininde kromotografik, spektroskopik ve titrimetri gibi yöntemler kullanılsa da bunlar karmaşık ve maliyeti yüksektir (Wang ve Wang, 2004). H<sub>2</sub>O<sub>2</sub> miktar tayininde yaygın olarak kullanılan diğer bir yöntem ise elektrokimyasal yöntemdir. Bu yöntemin basit ve maliyeti düşük olması sebebiyle günümüzde sıklıkla tercih edilmektedir. Bu yöntemde hidrojen peroksitin

yükseltgenmesi veya indirgenmesine cevap veren ve sensör olarak seçiciliği ve hassasiyeti yüksek bir elektrot tasarımı büyük önem taşımaktadır. Sensör uygulamalarında kullanılmak üzere hazırlanan elektrotların seçiciliği ve hassasiyeti kullanılan elektrotun iletkenliğine ve hedef moleküle olan ilgisine bağlı olarak değişmektedir (Palanisamy vd., 2012). Stanković vd., arkadaşları (2020) hazırladıkları Ag nanopartikül kaplı polianilin grafen kompozit elektrotun askorbik asit ve glukozu karşı hassasiyetinin olmadığını ancak hidrojen peroksit karşı hassasiyeti olduğu belirtilmiştir. Hazırlanan elektrotun hedef moleküle hızlı cevap vermesi sensörün kullanılabilirliğini arttırmaktadır. Bunun için kullanılacak elektrotun hızlı ve tersinir adsorpsiyon/desorpsiyon kinetiğine sahip olması son derece önemlidir. Bahsedilen özelliğin iletken polimerlerde olmasından dolayı, sensör uygulamalarında kullanılan elektrotlara iletken polimerlerin modifiye edilmesi söz konusudur. Bunun dışında iletken polimerler iletkenlikleri, kararlılıkları ve modifiye edildikleri elektrotların aktif yüzey alanlarını arttırması sebebiyle de yaygın olarak kullanılmaktadır (Sudhakara vd., 2021).

Sensör uygulamalarında sensörün analite cevabının ortam şartlarından etkilenmemesi ve dolayısıyla ortamın pH değerinin değişmemesi için tampon çözeltiler (pH:7-7,5) kullanılmaktadır (Nor vd., 2019). Ancak tampon çözeltilerinin sahip olduğu pH aralığında kullanılan polimerin aktivitesini yitirmemesi, kararlılığını devam ettiriyor olabilmesi son derece önemlidir. Bilindiği üzere polianilin, polipirol gibi iletken polimerler düşük pH değerlerinde sentezlendiklerinden iletkenliklerini yine düşük pH ortamlarında koruyabilmektedir (Kim vd., 2020). Özellikle polianilin yüksek pH'larda elektroaktivitesi azalmaktadır (Gicevicius, M. vd. 2018). Yapılan çalışmalarda bu problemi çözmek için polianilin yapısına sülfü veya karboksil grupları gibi asidik grupların eklendiği belirtilmiştir. Bu durum elektrot hazırlanmasında fazladan işlem uygulanmasını gerektirdiği için hem maliyet hem de zaman kaybı yaratmaktadır. Bu nedenle iletkenliğinin yüksek olması dışında iletkenlik değerini yüksek pH ortamlarında koruyan bir polimerin H<sub>2</sub>O<sub>2</sub> tayininde sensör olarak hazırlanacak elektrotta kullanımı son derece önemlidir (Pundir vd., 2011). Özellikle metal ve metal oksitlerin iletken polimer yüzeyine depolanması ile partiküllerin kümeleşme sorunun ortadan kalktığını yüzeyde daha homojen bir yapı olduğu belirtilmektedir (Kim vd., 2020). Aynı zamanda polimerler inorganik metal oksit ile kaplandığında elektriksel ve mekaniksel özelliklerinin iyileştiği gözlenmiştir (Zhang vd., 2009). Literatürde bu metal oksitler arasında bulunan ZnO'nun sensör uygulamalarında yüksek katalitik etki göstermesi, biyoyumlu olması, kolay hazırlanması, toksik olmaması, yüksek termal ve kimyasal kararlılığının yüksek olması en çok tercih edilen elektrot malzemelerden biri olmasına neden olmuştur (Al-Hadran vd., 2016). ZnO hidrotermal, sol-jel, kimyasal depolama, termal bozunma ve elektrokimyasal yöntemler ile bir destek materyali üzerine sentezlenebilmektedir. Bu yöntemler arasında elektrokimyasal yöntem sentez kolaylığı, düşük sıcaklıklarda ve daha az toksik malzemeler ile çalışılabilme gibi avantajları ile ilgi görmektedir (Valatka ve Şulçüt, 2012).

Bu çalışmada tarafımızca sentezlenip literatüre kazandırılmış bir kopolimer olan poli(indol-4-aminokinaldin) kullanılmıştır. Yeni olan bu kopolimerlerin farklı metal/metal oksitlerle modifiyesi ve bir alanda kullanılabilmesi son derece önemlidir. Bu çalışma ile birlikte ZnO ile modifiye edilmiş kopolimerin H<sub>2</sub>O<sub>2</sub>'nin dedeksiyonundaki performansı incelenmiştir.

## MATERYAL VE METOT

### *ITO elektrotlarının hazırlanması:*

ITO camlar 2x1 cm<sup>2</sup> olacak şekilde kesilmiş ve sırası ile sonik banyado alkol, aseton ve su içerisinde 5 dakika bekletilerek yüzeyinin temizlenmesi sağlanmıştır.

### *Poli(indol-4aminokinaldin)' in elektrokimyasal sentezi:*

Önceki çalışmamızda da belirttiğimiz gibi, 16 mM indol ve 16 mM 4-aminokinaldin (4-aq) 1:4 oranında karıştırılan asetonitril ve 1 M HClO<sub>4</sub> çözelti ortamına eklenmiş homojen bir karışım haline geldiğinde potansiyodinamik olarak indiyum kalay oksit (ITO) üzerinde sentezlenmiştir (Karatekin, 2022). Polimerizasyonda çalışma elektrotu olarak ITO, karşı elektrot olarak 2 cm<sup>2</sup> yüzey alanına sahip Pt levha, referans elektrot olarak ise Ag/AgCl (3,5 M KCl) kullanılmıştır.

### *ZnO' in elektrokimyasal olarak kaplanması*

Bu çalışmada ZnO'nun kopolimer yüzeyine depolanması için öncelikle 0.1 M Zn(NO<sub>3</sub>)<sub>2</sub>.4H<sub>2</sub>O çözeltisi 20 dakika boyunca Ar gazından geçirilmiş ve sıcaklık 70 °C' de sabit tutulmuştur. Çözeltinin pH' sını NH<sub>3</sub> ile 9-10 arasına sabitlemiştir. 0.8 mA sabit akımda yapılan deneylerde 25 saniyeden sonra yüzeyde ZnO tabakasının elde edildiği gözlenmiştir.

### Kullanılan Cihazlar

Hazırlanan elektrotların morfolojik yapılarını incelemek üzere Zeiss marka SEM cihazı kullanıldı. XRD spektrumu Empyrean, Panalytical cihazı kullanılarak kaydedildi. Tüm elektrokimyasal ölçümler için CHI-660C marka elektrokimyasal unite tercih edildi.

### BULGULAR ve TARTIŞMA

#### SEM sonuçları

Şekil. 1 a ve b 'da verilen görüntüler ZnO' in ITO yüzeyindeki SEM görüntüsüne ait iken c ve d' de ki görüntüler kopolimer kaplı ITO yüzeyindeki ZnO' nun SEM görüntüsüne aittir. Şekilde görüldüğü üzere ZnO, ITO yüzeyine kaplandığında çubuk şeklini aldığı ancak kopolimer yüzeyine kaplandığında plate şeklini aldığı gözlenmiştir. Şekil 1c ve d' de oval şeklinde olan partiküllerin kopolimere ait olduğu ZnO partiküllerinin de bu oval şekillerin arasına depolandığı görülmüştür. Şekil 1c ve d' de elde edilen ZnO plate şeklinin yaklaşık 600 nm boyutunda olduğu SEM analizi sonucu ile belirlenmiştir.

Şekil 1. SEM görüntüleri a) - b) ZnO-ITO c) ve d) -e)Kopolimer-ZnO-ITO

#### XRD sonuçları

Şekil 2' de kopolimer-ZnO-ITO elektroduna ait XRD spektrumu verilmiştir. Yaklaşık  $2\theta=30^\circ$  da görülen yayvan pikin kopolimere ait olduğu, diğer keskin piklerinde ITO ve ZnO' e ait olduğu belirlenmiştir (Karatekin, 2022). Buna göre hazırlanan elektrodun kopolimer, ZnO ve ITO dan oluştuğu bunların dışında herhangi bir pikin gözlenmemesi safsızlık içermediğinin göstergesidir.

Şekil 2. Kopolimer-ZnO-ITO elektroda ait XRD spektrumu

#### Elektrokimyasal Ölçümler

Poli(indol-4aq) kopolimerinin farklı pH ortamlarında alınan dönüşümlü voltamogramları Şekil 3' de görülmektedir. Yukarıda belirtildiği gibi kopolimerin iletkenliği sadece asidik ortamda değil nötr ortamda da korunmaktadır. Bu sonuçla birlikte aktivitesini çalışılan pH aralığında koruyan yeni bir kopolimer sentezi ve bir uygulamada kullanımı son derece önemlidir.

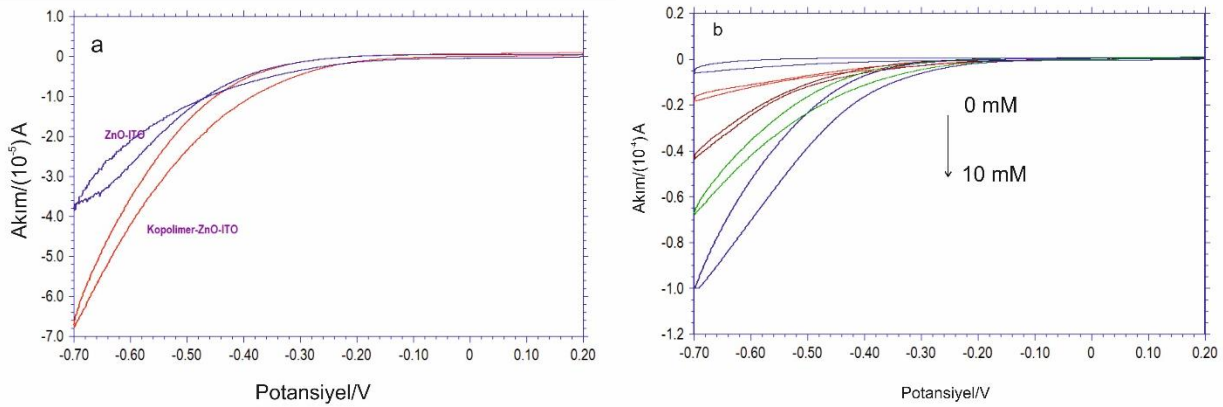

Şekil 3. Poli(indol-4aq)' ün farklı ortamlarda (KOH, PBS( fosfat tampounu), H2SO4 ve KCl) kaydedilmiş dönüşümlü voltamogramları (tarama hızı: 10 mV/s)

100 sn boyunca ITO ve kopolimer kaplı ITO elektroda ZnO kaplanması sonucu elde edilen ZnO-ITO ve kopolimer-ZnO-ITO elektrotların 5 mM hidrojen peroksit içeren çözelti ortamında (PBS, pH=7-7.5) voltamogramları alınmıştır. Elde edilen voltamogram incelendiğinde katodik bölgede bir akım artışının

olduğu, kopolimer kaplı ZnO modifiyeli elektrotun aynı derişimdeki hidrojen peroksit'e karşı ZnO-ITO elektrottan daha hassas olduđu gözlenmiştir. Bunun üzerine kopolimer-ZnO-ITO elektrotun farklı derişimlerde (0, 2.5, 5, 7.5, 10 mM) H<sub>2</sub>O<sub>2</sub> içeren çözeltilerde de ölçümleri alınmış, hidrojen peroksit derişiminin artmasına bağılı olarak akımda artış olduđu gözlenmiştir (Şekil 4).

Şekil 4. a) ZnO-ITO ve kopolimer-ZnO-ITO elektrotlarının 5 mM H<sub>2</sub>O<sub>2</sub> ihtiva eden 0.1 M PBS ortamında kaydedilen voltamogramları b) Kopolimer-ZnO-ITO elektrodunun farklı derişimdeki H<sub>2</sub>O<sub>2</sub> ihtiva eden 0.1 M PBS ortamında kaydedilen voltamogramları (tarama hızı: 10 mV/s)

Şekil 5' de ) ZnO-ITO ve kopolimer-ZnO-ITO elektrotlarının -0.5 V' da kaydedilen akım-zaman grafiğı gösterilmiştir. Kopolimer varlığında elektrodun ortama eklenen H<sub>2</sub>O<sub>2</sub>' ye karşı hassasiyetinin arttığı gözlenmiştir. Bu durum kopolimer-ZnO-ITO elektrodunun H<sub>2</sub>O<sub>2</sub> tayininde bir sensör olarak kullanılabileceğini göstermektedir. Diğer taraftan elektrodun cevap verme süresinde sensör performansında önemli bir parametredir. Kopolimer-ZnO-ITO elektroduna ait amperometrik ölçüm incelendiğinde 5 saniyeden daha kısa bir sürede cevap verdiği anlaşılmıştır.

Şekil 5. ZnO-ITO ve kopolimer-ZnO-ITO elektrotlarının farklı sürelerde ard arda H<sub>2</sub>O<sub>2</sub>' nin ortama eklenmesi sonucu kaydedilen akım-zaman grafiğı

## SONUÇ

Bu çalışmada farklı pH'larda aktivitesini koruyan yüksek iletkenliğe sahip kopolimerin ZnO ile modifiyesi sonucu H<sub>2</sub>O<sub>2</sub> indirgenmesindeki performansı incelenmiştir. Yapılan karakterizasyon ölçümleri ile birlikte ZnO' nun kopolimer yüzeyine tabaka şeklinde kaplandığı, kopolimer olmadığı durumda çubuk şeklinde depolandığı gözlenmiştir. Yapılan araştırmalar tabaka şeklindeki ZnO' in sensör performansının kristal yapısından dolayı daha iyi olduđu belirtilmiştir. Öyleki H<sub>2</sub>O<sub>2</sub> içeren ortamda kopolimer-ZnO-ITO

elektrodundan elde edilen akım ZnO-ITO elektrodundan elde edilen akımdan daha fazladır. Bu da kopolimerin etkisi ile birlikte ZnO' in H<sub>2</sub>O<sub>2</sub>' nin indirgenmesine daha fazla katalizlediği sonucuna varılmıştır. Bu sonuç H<sub>2</sub>O<sub>2</sub> derişimin artması ile birlikte elde edilen katodik akım değerlerinin artması ile de anlaşılmıştır. Diğer taraftan yapılan amperometrik ölçüm ile elektrodun sensör olarak kullanılabileceği sonucuna varılmıştır.

## Özet

Bu çalışmada tatlı su salyangozu *Melanopsis praemorsa*, İmidaklopridin sublethal konsantrasyonlarına (4.016µg /L<sup>-1</sup>, 40.32 µg/L<sup>-1</sup> ve 80.32 µg/L<sup>-1</sup>) maruz bırakıldı. Deneyde 7, 14 ve 21 günlük periyotlar sonunda *M. praemorsa* ayak dokuları alınarak histolojik preparatları hazırlandı. İmidaklopridin farklı konsantrasyonlarında *M. praemorsa* ayaklarında meydana gelen histopatolojik değişiklikler ışık mikroskopunda incelendi. İmidakloprid intoksikasyonuna bağlı olarak ayak dokularında; mukus, pigment ve protein hücreleri ile lipid vakuollerinin sayısında artış, kas fibrillerinde atrofi ve nekroz, epitel tabakasında bozulma ve deskuamasyon gibi histopatolojik lezyonlar gözlemlendi. Ayaklarda lezyonların şiddeti, artan imidakloprid konsantrasyonuna ve imidaklopride maruz kalma süresine bağlı olarak paralel artış gösterdi. Çalışmamız için seçtiğimiz salyangoz bir kirleticinin etkisinin belirlenmesinde uygun biyobelirteçler olarak önerilir.

**Anahtar Kelimeler:** *Melanopsis praemorsa*, Histopatoloji, Neonikotinoid, İmidakloprid.

### Histopathological changes in the foot tissue of *Melanopsis praemorsa* (Gastropoda: Prosobranchia) exposed to imidacloprid

## Abstract

In this study, the freshwater snail *Melanopsis praemorsa* was exposed to sublethal concentrations of Imidacloprid (4.016 µg /L<sup>-1</sup>, 40.32 µg/L<sup>-1</sup> and 80.32 µg/L<sup>-1</sup>). In the experiment, *M. praemorsa* foot tissues were taken at the end of 7, 14 and 21 day periods and histological preparations were prepared. Histopathological changes occurring in *M. praemorsa* feet at different concentrations of imidacloprid were examined under a light microscope. In foot tissues due to imidacloprid intoxication; Histopathological lesions such as an increase in the number of mucus, pigment and protein cells and lipid vacuoles, atrophy and necrosis in muscle fibers, deterioration and desquamation in the epithelial layer were observed. The severity of lesions on the feet increased in parallel with increasing imidacloprid concentration and duration of exposure to imidacloprid. The snails we chose for our study are recommended as suitable biomarkers to determine the impact of a pollutant.

**Key Words:** *Melanopsis praemorsa*, Histopathology, Neonicotinoid, Imidacloprid.

## GİRİŞ

Günümüzde kentleşme, sanayileşme ve teknolojiye gelişmelerle birlikte hızla artan insan nüfusu beraberinde ihtiyaçları da arttırmakta ve bunun sonucu olarak da tarımsal verimi artıracak bir takım çalışmalar yapılmasını gerektirmektedir. Bu çalışmalardan en önemlisi zararlı organizmaların zararlarını azaltarak kontrol altına almak için kullanılan pestisitlerdir.

Pestisitler, gıda üretimi verimliliğini artırarak, gıda kaynaklı ve vektörle bulaşan hastalıkların azaltılmasıyla halk sağlığı yararına sahip olan geniş heterojen kimyasal grubudur (Blacquièr ve ark., 2012). Önemli bir pestisit olan neonikotinoit insektisitler, tahıl, sebze, çay ve pamuğun delici emici böceklerine ve pirelerin zararlı etkilerine karşı ekin koruma amacıyla bitkileri ve canlıları çok çeşitli zararlılara karşı tedavi etmek için yaygın olarak kullanılan etkili bir böcek öldürücü sınıfıdır (Bolboacă ve Jaentschi, 2005). Birçok ürünün korunmasında yaygın olarak kullanılmaktadır (Van Duyn 2004).

Tarımda yaygın ve aşırı kullanımları sonucunda; bitki, toprak ve su ortamında yıllarca bozulmadan kalarak bir takım toksikolojik ve çevresel sorunlara yol açmaktadırlar (Li ve Randak, 2009; Qadir ve ark., 2014). Su kaynaklarına doğrudan uygulamalar veya yer altı sularına karışma yoluyla sucul ekosistemlere geçiş ortamdaki canlı organizmada histolojik, fizyolojik ve davranışsal değişikliklere neden olmakta, aynı zamanda sucul ekosistemde yaşayan bütün organizmaların canlı yaşamını tehdit edebilmektedirler (Widdows ve Donkin, 1992; Walsh ve ark., 1994; Uno ve ark., 2001; Usheva ve ark., 2006). Çevrenin ve doğal kaynakların kirlenmesi sonucu biriktirilen insektisitler besin zinciri yoluyla biyolojik olarak biriktirilerek hayvan ve insan sağlığına olumsuz etkilere neden olmaktadır (Preston, 2002; Qadir ve ark., 2016).

Molluska grubundan *Melanopsis praemorsa*, toksik kimyasalların güvenilirliğini saptamak ve değerlendirmek için sucul ekosistemlerde yaygın bir şekilde kullanılan deneysel modellerden biridir (Melo ve ark., 2000; Mandauzio ve ark., 2004; Kılıçaslan ve Özbek, 2010). Tatlı su kirliliğinin potansiyel biyoindikatörlerinden biri olan *M. praemorsa*, imidaklopridin subletal etkilerini incelemek için umut verici bir türdür.

Histolojik inceleme, kirleticilere maruz kalmanın bir indikatörü olarak, özellikle subletal ve kronik etkiler için kirlilik derecesini değerlendirmede yararlı bir yöntemdir.

Bu çalışmanın amacı, tatlı su salyangozu *Melanopsis praemorsa*'nın neonikotinoit insektisit imidaklopridin subletal konsantrasyonlarına maruziyeti sonucunda, ayak dokularında ortaya çıkabilecek değişiklikleri saptamaktır.

## MATERYAL VE METOD

*M. praemorsa* örnekleri, iklimlendirme odasındaki akvaryumlara bırakılarak, 30 gün boyunca laboratuvar şartlarına aklimasyonları sağlanmıştır. Aydınlatma, 16 saat aydınlık ve 8 saat karanlık olacak şekilde ayarlanmıştır. Adaptasyon ve deneysel çalışmalarda laboratuvar 22±1 °C sabit sıcaklıkta tutulmuştur. 30 günlük adaptasyon süreci boyunca salyangozlar günde bir kez marul ile beslenmiştir (Otludil ve ark., 2004, Otludil ve Ayaz 2020, Bürçün Karakaş ve Otludil 2020).

*M. praemorsa* örneklerinin 96 saatlik LC<sub>50</sub> değeri 401.6 µg/l olarak belirlenmiştir. Bu çalışma için seçilen subletal konsantrasyonlar 80.32 µg/l, 40.16 µg/l ve 4.016 µg/l (96 saatlik LC<sub>50</sub> değerinin 1/5, 1/10 ve 1/100)'dir. Örnekler, biri kontrol grubu diğerleri de farklı konsantrasyonlardaki imidakloprid grupları olmak üzere 4 deney grubuna ayrılmış ve ayrı kavanozlara yerleştirilmiştir. Deneyin 7., 14. ve 21. günlerinde her bir maruz kalma ve kontrol grubundan rastgele 5 salyangoz alınmıştır. Salyangozlar dissekte edilerek ayak örnekleri alınmış, %10 formalin çözeltisi ile tespit edilmiştir. Formalinden alınan numuneler, musluk suyu altında 1 gece yıkanmıştır. Numuneler artan etanol serisi (%30, 50, 70, 80, 90, 96 ve 100) ile dehidre edilmiş, ksilen ile şeffaflaştırılmış ve parafin içine gömülerek 5µm kesitleri mikrotom (LEICA) ile alınmıştır. Kesitler, Hematoksilin-Eosin ile boyanmış ve ışık mikroskobu (Nikon NIS-Elements ECLIPS SE80i) ile incelenmiştir. Histopatolojik değişiklikler mikroskopta kamera (Nikon Digital SIGHT-DS2MV) ile fotoğraflanmıştır.

## BULGULAR VE TARTIŞMA

### Kontrol Grubu

Ayak, vücudun ventralinde uzanan, geniş tabanlı, kaslı bir organdır. Tabanın kaslı ve geniş yüzeyinin yerle temas etmesi sonucu kolumnar kas fibrilleri nedeniyle hareket gerçekleştirilir. Suprapedal bez tarafından salgılanan mukus, ayağın zemine tutunmasını sağlar. Ayak dokusunda kolumnar kas fibrillerinin yanı sıra mukus hücreleri, protein hücreleri, pigment hücreleri, epitel hücreleri ve lipid vakuolleri de bulunur. 21 gün boyunca kontrol (Grup I) grubunda bulunan *M. praemorsa* bireylerinin ayak dokusunda herhangi bir histopatolojik değişikliğe rastlanmamıştır (Şekil 1).

### Deney Grupları

Deneyin 7 günlük tedavisi sonunda 4.016 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup II); ayak dokularında önemli bir değişiklik gözlenmemiştir (Şekil 2a). 40.16 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup III); epitelde bozulmalar başlamış, mukus hücresi, pigment hücresi ve lipid vakuolü sayısında artış görülmüştür (Şekil 2b). 80.32 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup IV); epitelde deskuamasyon, mukus hücresi, pigment hücresi, lipid vakuolü sayısında artış ve nekroz alanı gözlenmiştir (Şekil 2c).

Şekil 1. *M. praemorsa*'nın 21. gün kontrol grubu (Grup I) ayak dokuları. E. Epitel, MH. Mukus hücresi. H&E.

Şekil 2. (a) 7. günde 4.016 µg/l İmidakloprid'e maruz kalan salyangozlar, (b) 7. günde 40.16 µg/l İmidakloprid'e maruz kalan salyangozlar, (c) 7. günde 80.32 µg/l İmidakloprid'e maruz kalan salyangozlar. (E. Epitel, MH. Mukus hücresi, LV. Lipid vakuölü, PH. Pigment hücresi, N. Nekroz). H&E.

Deneyin 14 günlük tedavisi sonunda 4.016 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup II); ayak dokularında epitel tabakasında bozulmalar, mukus hücresi, pigment hücresi ve lipid vakuölü sayısında artış saptanmıştır (Şekil 3a). 40.16 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup III); epitelde deskuamasyon ve kas fibrillerinde atrofi ilerlemiş, pigment hücresi, protein hücresi ve lipid vakuölü sayısı artış göstermiştir (Şekil 3b). 80.32 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup IV); epitel deskuamasyonu aşırı ilerlemiş, mukus hücresi, protein hücresi ve lipid vakuollerinde aşırı artış görülmüştür (Şekil 3c).

Şekil 3. (a) 14. günde 4.016 µg/l İmidakloprid'e maruz kalan salyangozlar, (b) 14. günde 40.16 µg/l İmidakloprid'e maruz kalan salyangozlar, (c) 14. günde 80.32 µg/l İmidakloprid'e maruz kalan salyangozlar. (E. Epitel, MH. Mukus hücresi, LV. Lipid vakuölü, PH. Pigment hücresi, N. Nekroz). H&E.

Deneyin 21 günlük tedavisi sonunda 4.016 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup II); epitel tabakasında deskuamasyon, lipid vakuölü sayısında artış ve kas fibrillerinde atrofi oluşmuştur (Şekil 4a). 40.16 µg/l İmidakloprid konsantrasyonuna maruz bırakılan salyangoz grubunda (Grup III); epitel deskuamasyonu ve kas fibrilleri atrofsi devam etmiştir, Lipid vakuölü sayısı aşırı derecede artmış ve içlerinde bol miktarda koyu granüller birikmiştir (Şekil 4b). 80.32 µg/l İmidakloprid konsantrasyonuna

maruz bırakılan salyangoz grubunda (Grup IV); epitel tabakasında aşırı derecede deskuamasyon gözlenmiştir. Kas fibrillerinde aşırı derecede atrofi oluşmuş, kas doku yerini bağ dokuya bırakmıştır. Mukus hücresi ve lipid vakuolü sayısında aşırı artış gözlenmiş ayrıca nekroz tespit edilmiştir (Şekil 4c).

**Şekil 4.** (a) 21. günde 4.016 µg/l İmidakloprid'e maruz kalan salyangozlar, (b) 21. günde 40.16 µg/l İmidakloprid'e maruz kalan salyangozlar, (c) 21. günde 80.32 µg/l İmidakloprid'e maruz kalan salyangozlar. (E. Epitel, PN. Piknotik nukleus, N. Nekroz, LV. Lipid vakuolü, KG. Koyu granül, MH. Mukus hücresi) H&E.

*M. praemorsa* ayak dokularının histolojik incelemesi, İmidakloprid'in test edilen en düşük konsantrasyondan itibaren belirgin yapısal bozulmaya neden olduğunu gösterdi. Toksik etkilerin gözlemlenen dokularda belirgin olduğu ve bunların farklı salyangoz türleri üzerinde yapılan ağır metal ve pestisit çalışmaları ile uyumlu olduğu görülmüştür (Otludil ve ark., 2004; El-Feky ve ark., 2009; Otludil ve Ayaz, 2020; Bürçün Karakaş ve Otludil, 2020).

*M. praemorsa* örneklerinde mukus hücreleri, pigment hücreleri, protein hücreleri ve lipit vakuollerinde artış görüldü. Ayak dokusunda epitelde deskuamasyon ve kas fibrillerinde atrofi meydana geldiği gözlemlendi. Artan mukus üretiminin ardından artan mukus salgısı, gastropodların, mekanik uyarılardan veya yumuşakça öldürücü kimyasallardan kaynaklanan tahriş dahil olmak üzere birçok stres türüne karşı ilk reaksiyonlarından biridir (El-Feky ve ark., 2009). Çalışmamızda ayak dokusunda görülen histopatolojik değişiklikler daha önce yapılan pestisit ve CuSO<sub>4</sub> ve Cd çalışmaları ile uyumludur.

## SONUÇ

Bu çalışmanın histopatolojik gözlemleri İmidakloprid'in ölümcül olmayan konsantrasyonlarına maruz kalmanın tatlı su salyangozu *Melanopsis praemorsa*'nın vücut dokularında yıkıcı etkilere neden olduğunu göstermiştir. Bu değişiklikler, kirlenmiş maddelere maruz kalmanın biyolojik son noktasını temsil etmektedir ve bu nedenle bu çalışma, sucul ortamların antropojenik kirlenmesini izlemek için histopatolojinin güçlü bir araç olarak uygulanmasını desteklemektedir. Bu çalışma, tatlı su salyangozu *Melanopsis praemorsa*'nın, dokularına ciddi zarar vermesi nedeniyle İmidakloprid gibi ağır metaller için bir biyoindeksör olarak hizmet edebileceğini ve su ortamında İmidakloprid kirliliğinin izlenmesi için bir biyobelirteç olabileceğini göstermiştir.

Salyangozlar üzerinde yapılan histopatolojik çalışma, çevresel kirlenmelerin etkisinin değerlendirilmesinde oldukça hassas bir parametre olarak görülmektedir.

#### Abstract

Metabolic disorders are thought to play a role in neurodegenerative disorders including Multiple Sclerosis (MS), Alzheimer's disease (AD), Huntington's disease (HD) and Parkinson's disease (PD). Research on the contribution of corrupted glucose metabolism to disease pathology in demyelinating diseases, particularly MS, is limited. The current study was designed to reveal changes in mRNA expression and activity levels of important pentose phosphate pathway energy metabolism enzymes in normal and diseased states using an MS mouse model of experimental autoimmune encephalomyelitis (EAE). First, EAE was elicited in C57BL/6 female mice by immunization with MOG<sub>35-55</sub>/CFA Emulsion and PTX. Following immunization, mice were monitored daily for the development of EAE and clinically rated on a scale ranging from 0 to 5 for symptoms of the disease. The onset of EAE occurred on day 13.0±1.5, with a maximal clinical score of 3.8±0.2. Biochemical and molecular analyses were performed on the brain tissues of EAE and control mice to measure changes in energy metabolism. In the EAE group, the brain tissue transaldolase (TALDO) mRNA expression level and glucose 6-phosphate dehydrogenase (G6PD) enzyme activity decreased significantly compared to those in the control. These data revealed that there are impairments in brain energy metabolism in mice with experimental MS.

**Keywords:** Multiple sclerosis, experimental autoimmune encephalomyelitis, energy metabolism, glucose-6-phosphate dehydrogenase, transaldolase.

#### INTRODUCTION

Multiple sclerosis (MS) is a chronic, demyelinating neurological disease that affects over 2.8 million people worldwide (Raphael et al., 2015, Wallin et al., 2019). Most studies have focused on the abnormal functions of diverse immune cells, especially T cells, which play critical roles in MS pathogenesis (McFarland and Martin 2007; Compston and Coles 2008). Recent evidence indicates a new aspect of MS pathogenesis, namely, energy failure in the central nervous system (CNS) (Andersen et al. 2019; Podlecka-Pietowska et al. 2019). Metabolomic studies have demonstrated metabolic fluctuations in MS and have suggested that impaired metabolism may be associated with MS pathogenesis (Kim et al. 2017). In addition, the disruption of metabolism disrupts the brain nicotinamide adenine dinucleotide phosphate (NADPH) balance, which increases axonal oxidative damage. Protection against oxidative damage relies largely on the reducing power of NADPH, which is produced by glucose-6-phosphate dehydrogenase (G6PD) in the pentose phosphate pathway (Diaz-Vivancos et al., 2015, Kim et al., 2015, Nobrega-Pereira et al., 2016).

Experimental autoimmune encephalomyelitis (EAE) is a commonly employed animal model for multiple sclerosis (MS). EAE is induced by myelin antigens, including myelin oligodendrocyte glycoprotein (MOG), myelin basic protein (MBP), or proteolipid protein (PLP) (Steinman et al., 2015).

The objective of this work was to collect initial data regarding the alterations in brain energy metabolism in mouse brain tissue that had developed experimental autoimmune encephalomyelitis (EAE), which serves as an animal model for multiple sclerosis (MS).

## MATERIALS AND METHODS

### Immunization of Experimental Autoimmune Encephalomyelitis (EAE)

Healthy 8- to 10-week-old female C57BL/6 mice were purchased from the The Bilkent University Animal House (Ankara, Turkey). They were housed in small cages at the animal care facility of the University of Pamukkale (Denizli, Turkey) at an ambient temperature of  $22 \pm 1$  °C and a 12-h light/dark cycle. All experimental procedures and appropriate regimes for veterinary services within licensed projects were approved by the Institutional Experimental Animal Ethics Committee (PAUHADYEK-2021/51). After acclimatization for one-week, experimental allergic encephalomyelitis (EAE) was induced in mice by immunization with the Hooke Kit MOG<sub>35-55</sub>/CFA Emulsion and PTX. Each mouse received 0.1 mL MOG<sub>35-55</sub>/CFA Emulsion subcutaneously at two sites. Following immunization, 400 ng of pertussis toxin in 100 µL of PBS was intraperitoneally injected into mice on days 0 and 1 (Senol et al., 2023). Followed by the development of EAE and graded clinically on a scale of 0 to 5 by a blinded observer for disease symptoms [0 = no symptoms; 1 = loss of tail tonicity; 2 = hind limb weakness; 3 = ataxia and/or paresis of hind limbs; 4 = complete paralysis of hind limbs; 5 = moribund or dead] (Ozgun-Acar et al., 2016). At the end of the study, which included 16 hours of fasting, the animals were euthanized. The brains were then extracted, frozen in liquid nitrogen, and stored at  $-80^{\circ}\text{C}$  until use.

### Reverse Transcription-Polymerase Chain Reaction (RT-PCR) and Real-Time Quantitative PCR for Gene Expression Analysis at mRNA Levels

Real-time PCR was performed as previously optimized (Senol et al., 2023). Total RNA was extracted from mouse brains by using NucleoSpinTriPrep (Macherey-Nagel), Mini kit for RNA, DNA, and protein purification" according to the manufacturer's instruction with slight modifications. The RNA concentration was determined using a Nanodrop (MaestroNano micro-volume Spectrophotometer, USA) and the RNA was reverse transcribed using Easy Script cDNA Synthesis Kit (ABM). The reaction mixture was incubated for 45 min at 50°C, followed by termination by heating at 5 min 85 °C. Quantitative Real-Time PCR (qRT-PCR) analysis was performed using BlasTaq 2X qPCR Mastermix (GM, Taiwan) in an Bio-Rad CFX Connect Real Time System for G6PD, 6-phosphogluconate dehydrogenase (6-PGD), TALDO and transketolase (TKT) genes. Beta-actin (ACTB) gene was used as a control housekeeping gene.

### Determination of the Glucose-6-Phosphate Dehydrogenase (G6PD) Activity

Brain G6PD activity was detected using the G6PD Colorimetric Assay Kit (Elabscience), according to the manufacturer's instructions.

### Statistical Analysis

Statistical analyses were performed using the Minitab 13 statistical software package (Minitab Inc. State College, PA, USA). Comparisons between groups were performed using Student's t-test, and  $P < 0.05$  was selected as the level required for statistical significance.

## RESULTS

### Induction of Experimental Autoimmune Encephalomyelitis in C57BL6 Mice

EAE induction was performed in C57BL6 mice using the Hooke Kit MOG<sub>35-55</sub>/CFA Emulsion and PTX. After the injection, the animals were checked daily, and the behavior of the mice was determined using a 5-step scale (Ozgun-Acar et al., 2016) (Figure 1).

**Figure 1.** The graph indicates the changes in mice during the experimental period. Results are expressed as mean clinical scores  $\pm$  standard deviation (SD).

The first disease symptoms appeared on the 13th day following immunization, and the disease score reached  $3.8 \pm 0.2$  on the 21st day.

### mRNA Expression of Major Energy Metabolism Genes in EAE Mice

The mRNA expression levels of energy metabolism genes were determined in the brain tissues of the EAE and control groups mice. TALDO mRNA expression level was observed to decrease 2.7-fold in the EAE group compared to the control group. However, no significant difference was observed in the G6PD, 6-PGD TALDO and TKT mRNA expression levels between the EAE group and the control group (Figure 2).

**Figure 2.** mRNA expression levels of selected genes (fold regulation) in the brain tissues of EAE mice.  
\*Significantly different from the respective control value  $p < 0.05$ . Control values were taken as 1.

We found that the expression of TALDO mRNA level decreased by 2.7-fold in the EAE group, while the mRNA levels of G6PD, 6-PGD, and TKT were not significantly different from those in the control group.

### Glucose-6-Phosphate Dehydrogenase (G6PD) Activity in EAE Mice

The G6PD activity was measured in the brain tissue of EAE-induced mice. The G6PD activity was determined in the control and EAE groups mice brain tissues. As shown in Figure 3, G6PD activity decreased by 51 % ( $p < 0.05$ ) in the EAE group compared to the control group.

**Figure 3.** Changes in G6PD activity in the mouse brain control and EAE groups. \*Significantly different from the respective control value  $p < 0.05$ . Control values were taken as 1.

## DISCUSSION

In recent times, there has been a significant amount of research conducted on the association between diseases and energy metabolism, with a particular focus on glucose metabolism, as seen by the growing interest in this area (Vazquez et al., 2016). The pentose phosphate pathway (PPP) is a significant metabolic pathway that is closely linked to glucose metabolism. The PPP plays a significant role in various biological processes, including oxidative stress, immunity, embryogenesis, morphogenesis, myelination, inflammation, lymphocyte activation, radiation resistance, proliferation, and growth (Jacobson, 1963; Kelso et al., 1989). Furthermore, it has been observed that several metabolic, neurological, and neurodegenerative disorders are linked to abnormalities in the genes associated with the pentose phosphate pathway (Perl, 2011; Rahman and Hasan, 2014). Glucose-6-phosphate dehydrogenase (G6PD) is an enzymatic protein that is ubiquitously distributed throughout several tissues, with particularly elevated levels of activity inside the brain. The enzyme G6PD plays a crucial role in the regulation of inflammation through its production of nicotinamide adenine dinucleotide phosphate (NADPH) (Perl, 2017). While there was a considerable decrease in the activity of the G6PD enzyme, no changes were observed in the mRNA level. The findings of this study indicate a significant involvement of post-translational changes of G6PD in the regulation of its structure, enzyme activity, and function.

Another enzyme TALDO, which plays a significant role in the PPP, exhibits selective overexpression specifically in oligodendrocytes within the brain, as demonstrated by Banki et al. in 1994. The topic under consideration is of particular relevance due to the prevalence of demyelinating diseases in the central nervous system (CNS), with multiple sclerosis (MS) being the most frequently encountered. In MS, the primary focus of autoimmune activity is directed against the myelin layer, which is formed by oligodendrocytes. These cells are characterized by the loss of both cell integrity and myelin, as observed in previous studies (Martin et al., 1992). In the present investigation, it is probable that the observed reduction in TALDO mRNA expression might be attributed to the deleterious effects on the myelin sheath in mice with experimental autoimmune encephalomyelitis (EAE).

## CONCLUSION

In summary, the available evidence clearly indicates that there is a notable impairment in the energy metabolism of PPP in mice with experimental autoimmune encephalomyelitis (EAE), therefore implying a potential involvement in the pathophysiology of the disease. Based on the available data, ongoing research is being conducted in our laboratory to identify metabolic variability resulting from energy metabolism abnormalities in multiple sclerosis (MS).

## ACKNOWLEDGEMENTS

This work was supported by the Scientific and Technological Research Council of Turkey [TUBITAK-221Z131].

#### Özet

Günümüzde, sentetik kimyasalların insan vücudu üzerindeki potansiyel zararlı etkilerine ilişkin kamuoyunun endişeleri ve doğal ürünlerin güvenli ve sağlıklı olduğuna dair genel bir inanç nedeniyle, kozmetik endüstrisi de sürekli olarak doğal kaynaklardan içerik arayışındadır. Mantarlar besin olarak ve tıbbi amaçlarla yüzlerce yıldan beri insanlar tarafından yaygın bir şekilde kullanılmaktadırlar. Mantarların sahip oldukları polisakkaritler, fenolik bileşikler, terpenoidler poliketidler, seramidler, vitaminler, selenyum ve L-ergotionin, gibi biyoaktif içerikler antioksidan, anti-tirozinaz, anti-inflamatuar, anti-hiyaluronidaz, anti-kollajenaz, anti-elastaz ve antimikrobiyal aktivitelere sahiptirler. Bu özellikler onları kozmetik endüstrisinde UV ışınlarına karşı koruyucu, yaşlanma karşıtı, nemlendirici ve cilt beyazlatıcı ürünlerin üretiminde kullanılmak üzere ideal adaylar haline getirir. Bu derlemede, doğadan gelen muhteşem hediyeler olarak potansiyel kozmetik uygulamalara sahip bazı mantar türlerinin içerdiği biyoaktif maddeleri ve kozmetik özellikleri gözden geçirilmiştir.

**Anahtar Kelimeler:** kozmesötikler, nutrikozmetikler, antiaging, cilt sağlığı

#### Possibilities of using macrofungus in the cosmetics industry

#### Abstract

Nowadays, due to public concerns about the potential harmful effects of synthetic chemicals on the human body and a general belief that natural products are safe and healthy, the cosmetics industry is constantly seeking ingredients from natural sources. Mushrooms have been widely used by humans for hundreds of years as food and for medicinal purposes. Mushrooms contain bioactive ingredients such as polysaccharides, phenolic compounds, terpenoids, polyketides, ceramides, vitamins, selenium and L-ergothionein, which have antioxidant, anti-tyrosinase, anti-inflammatory, anti-hyaluronidase, anti-collagenase, anti-elastase and antimicrobial activities. These properties make them ideal candidates for use in the cosmetics industry for the production of UV protection, anti-aging, moisturizing and skin whitening products. In this review, the bioactive substances and cosmetic properties of some mushroom species with potential cosmetic applications as wonderful gifts from nature are reviewed.

**Keywords:** cosmeceuticals, nutricosmetics, antiaging, skin health

#### GİRİŞ

Kozmetik, cildi temizlemek, güzelleştirmek, korumak, görünümünü değiştirmek veya durumunu iyileştirmek için kullanılan bir grup sağlık ve güzellik ürünü olarak tanımlanabilir (Luque de Castro, 2011). Kozmetiklerin “kozmesötikler” ve “nutrikozmetikler” olmak üzere iki ana kategorisi vardır: kozmesötikler, direkt olarak cilde uygulanan kremler, losyonlar, merhemleri kapsarken (Epstein, 2009; Taofiq ve ark., 2016), nutrikozmetikler ise görsel görünüm düzeltmek ve cilt sağlığını iyileştirmek için diyet ve besin takviyelerinin tüketimini içerir (Luque de Castro, 2011). Bu ürünlerin, cilt görünümünü, parlaklığını, dokusunu iyileştirip, yaşlanma karşıtı aktivite gösteren çeşitli bileşenleri içerdiği bilinmektedir (Hyde ve ark., 2010). Bu nedenle formülasyonları genellikle saf moleküller (karotenoidler, polifenolikler, vitaminler, amino asitler, poliglukanlar, çoklu doymamış yağ asitleri) içeren karışımlara veya bir bütün olarak alınan ekstraktlara dayanır (Barel ve ark., 2014).

Küresel kozmetik pazarı yüz milyarlarca ABD doları değerinde bir endüstridir ve ürün çeşitlendirmesine yönelik sürekli talebe yanıt vermek için küresel kozmetik pazarının sürekli büyümesi gerekmektedir. Günümüzde kimyasalların insan sağlığı üzerinde yarattıkları olumsuz etkiler artık toplumun tüm fertleri tarafından açık bir şekilde anlaşılmıştır. Bu durum tüketicilerin kozmetik ürün satın alırken de doğal kaynaklardan elde edilen ürünleri tercih etmesine sebep olmaktadır (Wang ve ark., 2015).

Birçok bitki özü (aloe vera, yaban mersini, hindistancevizi, salatalık, ginseng, limon, nar, pirinç) ve deniz kulağı, arı zehiri, koza, keçi sütü ve plasenta, bal, inci gibi hayvanların özleri, arı sütü ve salyangoz salgıları kozmetik mağazalarının raflarında sıradan hale gelmiştir (Taofiq ve ark., 2016; De Wet ve ark., 2013; Keller ve ark., 2014; Rodrigues ve ark., 2015). Yeni ortaya çıkan bir trend ise, mantarların sağlık ve güzellik ürünlerinde kullanılmasıdır. Günümüzde mantarlar genellikle ciltle ilişkili çeşitli hastalıkların tedavisinde ham madde veya saf bileşikler olarak yaygın şekilde kullanılmaktadır (Hyde ve ark., 2010). Örneğin *Grifola frondosa* (maitake) mantar ekstraktları cilt hastalıklarına karşı bağışıklık sisteminin uyarımında ve *Sparassis crispa* (Wulfen) Fr. mantarından ise diyabet yaralarına karşı kollajen I sentezi ve epitelizasyon amaçlı faydalanılır (Xu ve ark., 2010; Thi Ngoc ve ark., 2018).

Mantarlar amino asitler, karbonhidratlar, yağlar, diyet lifleri, proteinler, fenolik bileşikler ve diğer temel mineraller ve vitaminlerden oluşan yüksek besin içeriğine sahiptir. Bu besleyici özelliklerin yanı sıra mantar türevi maddeler günümüzde birçok hastalığın tedavisinde kullanılmaktadır. Mantar bileşenleri ve bunların sekonder metabolitleri, antimikrobiyal, antiviral, anti-kanser, anti-inflamatuar, anti-aging, antioksidan, kırışıklık önleyici, nemlendirici, cilt beyazlatıcı ve immünomodülatör etkiler dahil olmak üzere çok sayıda biyolojik aktivite içerir (Taofiq ve ark., 2019; Taofiq ve ark., 2020; Nitthikan ve ark., 2022). Mantar kozmesötik içerikleri yavaş yavaş kozmetik pazarına girmektedir ve bu, mantar özleri ve/veya bunların biyoaktif bileşenlerini içeren, ince çizgilere, kırışıklıklara, yaşlanmaya, cilt dokusuna, ışıktan koruma ve pigmentasyona karşı faydalı etkiler iddia eden ticari kozmetik formülasyonlarının sayının arttığı açıkça görülmektedir (Taofiq et ark., 2016; Wu ve ark., 2016). Bu derlemede, mantarların yapısında yer alan ve cilde faydaları olduğu bildirilen bazı biyoaktif bileşikler özetlenmiş ve kozmetik endüstrisinde faydalanılabilecek bazı mantar türlerinin kozmetik özellikleri gözden geçirilmiştir.

## **MANTARLARIN YAPISINDA YER ALAN VE KOZMETİK ÖZELLİKLERİ OLDUĞU BELİRLENEN BAZI BİYOAKTİF BİLEŞENLER**

Mantar ekstraktları ve misellerden, sporelerden ve mantar şapkalarından elde edilebilir. Bu nedenle bunlar, harici (kozmesötik) veya oral kullanım (nutrikozmetik) için toz, sıvı veya yarı katı olarak depolanan birincil ve ikincil metabolitlerin oldukça karmaşık karışımlarıdır (Badalyan, 2014). Mantarların en önemli avantajları, vegan doğaları nedeniyle kozmetik içerik maddeleri olarak popüler olmaları ve kimyasal maddelere göre uzun vadeli olumsuz etkilerinin daha az olmasıdır (Sujarit ve ark., 2021). Mantar günümüzde çeşitli kozmetik firmaları tarafından losyonlar, aydınlatıcı kremler, serumlar, nemlendiriciler, temizleme jelleri, astar kremler ve yüz maskeleri gibi cilt bakım ürünlerinde bileşen olarak kullanılmaktadır.

Mantar türleri yetiştirme şartlarına ve genetik özelliklerine göre büyük oranda değişiklik gösteren besin ve biyoaktif bileşik içeriklerine sahiptirler. Polisakkaritler mantarların yapısında yer alan önemli bir bileşendir ve bunu proteinler, antioksidanlar, mineraller ve vitaminler takip etmektedir (Rosdan Bushra, ve Nurul, 2022). Mantarlardaki biyoaktif bileşenler, bir besin kaynağı olmasının yanı sıra birçok hastalık için terapötik ve cilt yaşlanmasının belirtilerini geciktirmek için kozmetik ajanlar olarak birçok çalışmada yoğun bir şekilde incelenmiş ve bu bileşenlerin yeni doğal kozmesötik bileşenler olarak büyük bir potansiyele sahip olduklarına dair birçok kanıt elde edilmiştir.

### **Polisakkaritler**

Polisakkaritler, mantar kuru ağırlığının büyük bir kısmını kapsayan yapısal birincil metabolitler oldukları için şu anda farmasötik pazarında yaygın şekilde faydalanılan bileşiklerdir. Lentinan, bağışıklık tepkisini güçlendirmesinin yanı sıra harici olarak kullanılan kremlerin bileşiminde de yer alabilen bir fungal polisakkarittir (Bisen ve ark. 2010). *Pleurotus ostreatus*'tan Pleuran, *Schizophyllum commune*'dan şizofillan, *Ganoderma lucidum*'dan Ganoderan, *Grifola frondosa*'dan grifolan ve galaktomannan, *Trametes versicolor*'dan krestin (polisakkarit-K) gibi birçok polisakkarit, mantar şapkalarından ve misel kültürlerinden

ekstrakte edilmiştir ve bu polisakkaritler yaşlanma karşıtı anti-oksidatif, antiterapötik ve immünomodülatör aktivitelere sahip oldukları belirlenmiştir (Zhao ve ark. 2020).

Mantar polisakkaritlerinin yüksek konsantrasyonu, epidermis ve stratum korneumun nem içeriğini artırarak, cildin nem tutma kapasitesini artırır ve cildin daha yumuşak olmasını sağlar (Yang ve ark., 2021). Bu polisakkaritler, topikal kozmetik ürünlerde kullanıldığında hyaluronik asit gibi güçlü nemlendiriciler olarak görev yapar. Mantar hücre duvarında, glukanlar sıklıkla kitine bağlanarak kitin-glukanları üretir. Bu kopolimer, özellikle nemlendirici özelliklerinden dolayı yaşlanma karşıtı losyonlarda kullanılır (Gautier ve ark. 2008).

Mantarlar, kuruluk ve pul pul dökülme durumunda cildi nemlendirmek ve pürüzsüzleştirmek için kullanılan laktik asit ve seramidlerin üretimi için iyi bir biyofabrikadır. *Tremella fuciformis*'ten elde edilen ekstraktlar, nörodermatit ve sklerodermatite karşı kullanılan harici ürünlerin yapısında sıklıkla kullanılır (Wu ve ark. 2019).

## Fenoller

Besin takviyeleri ve yaşlanma karşıtı kremler veya losyonların üretimi için aday olarak çeşitli mantar türlerinden fenolik bileşiklerin miktarını belirlemeye ve hatta saflaştırmaya yönelik birçok çalışma yapılmıştır.

Mantar özleri içeren kozmetik formülasyonlar, cilde zarar veren bakteri türlerinin büyümesini baskılar. Mantarlardan elde edilen bazı kremdeki bazı biyoaktif bileşikler güzelliği artırır ve iltihaplanma, cilt yaşlanması ve hiper-pigmentasyona karşı önemli bir rol oynar (Taofiq ve ark., 2016a)

Kafeik, ferulik, gallik, p-hidroksibenzoik, homojentisik, protokatekuik asit ve mirisetin, mantarlarda bulunan, melanin içeriğini azaltarak ve tirozinaz aktivitesini inhibe ederek cildin parlaklaşmasına yardımcı olduğu ve antoksidant potansiyele sahip olduğu bildirilen ticari fenolik bileşiklerdir (Abdelshafy, ve ark., 2022). Bu bileşikler ve bunların türevlerinin, *P. ostreatus*, *Pleurotus eryngii*, *A. bisporus* gibi bir çok mantar türünün içeriğinde yer aldığı rapor edilmiştir (Liu ve ark., 2013; Gąsicka ve ark., 2016). *A. bisporus* ekstraktından hazırlanan bazı kremler, bazı bakteri türlerine karşı önemli bir antioksidan potansiyel ve antibakteriyel etki göstermiştir (Taofiq ve ark., 2016b). *Fomitopsis officinalis* mantarından elde edilen kumarinler, Herpes virüsünün kutanöz semptomlarına karşı bile uygulanabilen antimikrobiyal etkileri gösterirler (Girometta 2019).

## Terpenoidler

Birçok terpenoid, kozmetik ve beslenme ürünlerinde önemli rol oynayan vitaminler, hormonlar ve ilaçları içeren biyolojik olarak aktif maddelerdir. Mantarlar birçok kozmetik amaç için topikal olarak uygulanabilen önemli bir terpenoid kaynağıdır.

Karotenoidler, serbest radikal temizleme ve UV koruma aktivitelerine sahip en yaygın tetraterpenoidlerdir. Karotenoidler uzun süredir cilt sağlığı ve kozmetik ürünlerin (Vahlquist ve Duvic 2007; Lademann ve ark., 2011), ve nutrikozmetik ve kozmesötik ürünlerin (Anunciato ve da Rocha Filho 2012) temel dayanak noktası olmuştur. Karotenoidler mantarlarda yaygındır. Yenilebilir mantar *Cantharellus cinnabarinus*'ta bulunan kırmızımsı-turuncu bir keto-karotenoid pigment olan Canthaxanthin, güçlü bir yaşlanma karşıtı gençleştiricidir ve cildi güçlendirir (Gharibzadeh ve ark., 2013). Sağlık ve renkle ilgili özellikleri nedeniyle karotenoidler geleneksel olarak doğal kozmetik bileşenler, gıda renklendiriciler, nutrasötikler ve hayvan yemi takviyeleri olarak kullanılır (Sujarid ve ark., 2021).

Mantar hücre zarındaki temel sterol olan ergosterol, kozmesötik bir bileşen olarak kullanılan lanostan tipi bir triterpenoiddir (Taofiq ve ark. 2019).

Makromantarların çoğunun neredeyse yalnızca  $\beta$ -karoten ürettiği görülmektedir (Ribeiro ve ark., 2011), oysa karotenoid sentezi mantar elisitörleri tarafından daha da artırılabilen *Cordyceps militaris* tarafından daha çeşitli bir spektrum sağlanmaktadır (Ribeiro ve ark. 2011; Tang ve ark., 2019).

## Protein ve Aminoasitler

Kozmetikler, cilt kırışıklıklarına ve fotoyaşlanma dahil diğer yaşlanma semptomlarına karşı topikal kullanım için L-ergothioneine'i başarıyla denenmiştir. L-Ergotionin aslında cilt hücrelerini UV kaynaklı hasara karşı korur (Bazela ve ark. 2014) ve cilt hücreleri ve dokusu onu bir koruyucu madde olarak kullanabildiği için UVB'nin keratinositlere verdiği zararın neden olduğu fibroblastların yaşlanmasını hafifletir (Ko ve ark. 2021). antioksidan savunma sistemlerinin ayrılmaz bir bileşenidir (Markova ve ark. 2009). Daha yakın zamanlarda *Boletus edulis* Bull. (porcino mantarı) bu alanda en dikkate değer tür olarak vurgulanmıştır (Kalaras ve ark. 2017).

Kollajen ve elastin cilt sağlığı için gerekli olan ancak sağlıklı bir cilt matrisi için yeterli olmayan yapısal proteinlerdir. Cildin ayrıca dermal yenilenmeyi, çoğalmayı ve göçü desteklemek için uygun bileşenlere ihtiyacı vardır (Ito, 2014). Hyaluronik asit (HA), cilt gençleştirici olarak önemli bir rol oynayan, nemi tutan, viskoziteyi artıran ve hücre dışı sıvının geçirgenliğini azaltan, doğal olarak oluşan glikoz bazlı bir polimerdir (Saranraj ve Naidu, 2013). HA hem prokaryotik hem de ökaryotik hücrelerde eşit olarak dağılmıştır. İnsanlarda en çok deride bulunur, bunu göz vitreusu, göbük kordonu, sinoviyal sıvı, iskelet dokuları, kalp kapakçıkları, akciğer, aort ve penisin ereksiyon dokuları takip eder (Papakonstantinou ve ark., 2012).

## Vitaminler ve mineraller

Mantarlar, B<sub>1</sub> vitamini (tiyamin), B<sub>2</sub> vitamini (riboflavin), B<sub>3</sub> vitamini (niasin), B<sub>7</sub> vitamini (biyotin), B<sub>9</sub> vitamini (folik asit veya folat), B<sub>12</sub> vitamini (kobalaminler) C (askorbik asit) ve D vitamini (kalsiferoller) de dahil olmak üzere birçok vitamin türünü içerir (Çağlaırnak ve ark., 2002). *A. bisporus*, *L. edodes* ve *P. ostreatus*, cildin bağışıklık sisteminin desteklenmesinde önemli bir rol oynayan D<sub>2</sub> vitamini (ergokalsiferol) açısından zengindir (Cardwell ve ark., 2018). Mantarlar güneş ışığına maruz kaldıklarında yüzeylerindeki ergosterolü D<sub>2</sub> vitaminine dönüştürebilmektedirler. D vitamini sağlıklı dişler ve kemiklerle ilişkilidir ve nem içeriğini ve cildin nemlenmesini etkili bir şekilde artırır (Moyad, 2009). B vitaminleri tüm mantarlarda bulunur ve nemlendirici ve yaşlanma karşıtı yararları nedeniyle en yaygın olarak cilt, saç ve tırnaklara yönelik güzellik ürünlerinde kullanılır. Siyah trompet (*Craterellus cornucopioides*), altın Chanterelle (*Cantharellus cibarius*) (Watanabe ve ark., 2012) ve *L. edodes* (Watanabe ve ark., 2014) şapkalarında yüksek düzeyde B<sub>12</sub> vitamini tespit edilmiştir. *Coprinus comatus*'un tokoferoller (E vitamini) açısından zengin yenilebilir bir mantar olduğu, *Clitocybe odora*'nın ise askorbik asit (C vitamini) açısından zengin olduğu rapor edilmiştir (Vaz ve ark., 2011).

Hem üretimi yapılan mantar türleri hem de doğadan toplanan türler selenyum bakımından zengindir (Falandysz, 2008). Selenyum, birincil insan keratinositlerini UV radyasyonunun neden olduğu apoptozdan korur, dolayısıyla cilt, saç ve tırnak sağlığıyla ilişkilidir. Şampuanda bir bileşen olarak yaygın şekilde uygulanır (Rafferty ve ark. 2003).

## MANTAR TÜRLERİNİN KOZMETİK ÖZELLİKLERİ

Mantar bazlı ürünlere olan ilgi, mevcut başarılı uygulama örneklerinin ışığında çok büyük ve henüz yeterince araştırılmamış bir potansiyele sahip olduğu varsayıldığından ilgi artmaktadır (Taofiq ve ark. 2016).

### *Lentinula edodes*

*L. edodes* kayda değer bir antioksidan güç gösterir, yani serbest radikalleri temizler (Nam ve ark. 2021). Bu, bitkilerde de olduğu gibi, zengin fenolik içerikleriyle ilgilidir (Zhu ve ark., 2023). *L. edodes* antioksidan özellikleri sayesinde cilt beyazlatma ve canlanmayı iyileştirmek için kullanılır. Bu mantarlardan elde edilen ticari ürünler arasında sıkılaştırıcı krem, serum ve yüz kremi bulunmaktadır (Hyde ve ark., 2010).

Ayrıca *L. edodes*'in, oksidatif strese karşı yanıtta rol oynayan süperoksit dismutazları (SOD'ler) ve glutatyon peroksidazı (GPx) indüklediği rapor edilmiştir (Cheung ve ark. 2003).

L-ergotionin amino asidi bir histidin türevidir; mitokondriyal membranın oksidasyonunu azalttığı ve mitokondriyal fonksiyonları koruduğuna dair kanıtlar nedeniyle popülerlik kazanmaktadır (Paul ve Snyder 2010). Bugüne kadar *L. edodes*, *P. ostreatus*, *P. eryngii*, *G. frondosa* ve *A. bisporus* dahil olmak üzere birçok mantar türünde yüksek konsantrasyonlarda L-ergothioneine keşfedilmiştir (Dubost ve ark. 2006).

### **Ganoderma lucidum**

Yaşlanma karşıtı aktiviteyi destekleyen önde gelen doğal içerik reishi mantarı (*G. lucidum*) ekstraktlarıdır. *G. lucidum* özleri, krem, serum ve misel temizleyici içeren yaşlanma karşıtı cilt ürünlerinde temel bir bileşen olarak yaygın şekilde kullanılmaktadır. Son farmakolojik çalışmalar, *G. lucidum* özlerinin antioksidan, antimikrobiyal, anti-tirozinaz ve antiinflamatuvar özellikler için potansiyel gösterdiğini bildirmiştir (Chien ve ark., 2008; Joseph ve ark., 2009; Cör ve ark., 2018). Anti-aging, *G. lucidum*'un çok sayıda özelliğinin bir sonucu olarak kabul edilen ana etkisidir; bu türün hem topikal hem de oral kullanıma özellikle uygun olmasının nedeni budur (Wang ve ark. 2017). Diğer basidiomisetlerle karşılaştırıldığında, *G. lucidum* daha yüksek tirozinaz inhibisyonu göstermiştir ve şu anda birçok yüz maskesi kozmetiklerinde bir bileşen olarak kullanılmaktadır (Chien ve ark. 2008).

Japon şirketi Menard, 1980'li yıllarda *G. lucidum*'u cildin yaşlanmasını önleyici ürünlerde kullanmıştır. Bu tür aynı zamanda batı pazarlarında da yaklaşık yirmi yıldır popülerlik kazanmış ve kapsül, ekstrakt ve yağ olarak kullanılmaktadır (Taofiq ve ark. 2016a, b).

*G. lucidum*, cilt bakım ürünlerinin yanı sıra, saç nemlendirmek, saç kaybını önlemek ve güneşin zararlarına karşı koruma sağlamak için saç şekillendirici krem ve şampuanı da saç uyarıcısı olarak kullanılabilir (Hyde ve ark., 2010; Lourith ve ark., 2013; Wu ve ark., 2016)

### **Tremella fuciformis**

*Tremella fuciformis*, cilt özü ve temizleme jeli gibi ticari ürünlerde cilt elastikiyetini arttırmak ve cilt sıklığını arttırmak için kullanılır. *T. fuciformis*'in, antioksidan (Li ve ark., 2014), anti-elastisite ve anti-inflamatuvar aktiviteye sahip polisakaritler gibi biyoaktif bileşenler içerdiği rapor edilmiştir (Jo ve ark., 2021). *T. fuciformis* şapka ekstraktlarının, cilt dokusunu ve esnekliğini artırarak kırışıklık önleyici etkiler sergiler (Lai ve ark., 2010). *T. fuciformis* ekstraktından elde edilen suda çözünür bir polisakarit, melanin oluşumunu engelleyebilir ve böylece topikal uygulamayla melanin bazlı cilt lekelerinin temizlenmesine katkıda bulunabilir (Zhang ve ark. 2013). Ayrıca *T. fuciformis* polisakariti içeren kozmetiklerin hidrasyon etkisinin hyaluronik asit içeren kozmetiklere göre daha yüksek olduğu ve *T. fuciformis* polisakaritlerinin maliyetinin hyaluronik asite göre çok daha düşük olduğu bildirilmiştir (González-Laredo ve ark., 2021). *T. fuciformis*'den izole edilen bir polisakarit türünün nem tutma özelliğinin çok yüksek olduğu ayrıca başka bir çalışmada da rapor edilmiştir (Wang ve ark. 2015b).

### **Cordyceps spp.**

*Cordyceps* türleri, yaşlanma karşıtı özelliğe sahip benzersiz bir biyoaktif kordisepin kaynağıdır ve kozmesötik için potansiyel bir bileşeni temsil eder (Zhou ve ark. 2021). *Cordyceps sinensis*'in yaşlanma karşıtı etkisi özellikle ilgi çekicidir (Ji ve ark., 2009).

Tang ve ark. (2019) yenilebilir mantar *Cordyceps militaris*'ten izole edilen yeni bir doğal pigment olan kordisepini bildirmişlerdir. Bu pigment sarı renklidir ve karotenoid olarak nitelendirilmiştir. Cordycepene ayrıca yeni bir doğal kozmetik renk olma potansiyeline sahip antioksidan aktivite gösterir.

Diğer bir *Cordyceps* türü olan *Cordyceps bassiana*'nın ise deri kaynaklı dermatit üzerinde antiinflamatuvar potansiyele sahip olduğu bildirilmiştir (Wu ve ark., 2011)

### **Grifolia frondosa**

*Grifolia frondosa* mantarından izole edilen bir polisakaritin, NC/Nga farelerinde 2,4-dinitroklorobenzen kaynaklı atopik dermatit benzeri cilt lezyonunu önemli ölçüde baskıladığı bulunmuş ve antiinflamatuvar bir ilaç olan deksametazon ile birlikte uygulandığında serum IgE ve sitokin ekspresyonunun azalmasına bağlı AD benzeri cilt lezyonunda sinerjistik bir etki gözlemlendiği rapor edilmiştir (Park ark ve ark., 2015),

Kim ve ark. (2007), *G. frondosa*'nın misel ekstraktının ve ayrıca bundan izole edilen bir ekzopolisakaritin (EPS) antioksidan, anti-tirozinaz ve anti-kollajenaz aktivitesini araştırdı. Elde edilen sonuçlar, izole edilmiş polisakaritlerin yanı sıra mantarların da cilt yaşlanmasını ve hiperpigmentasyonu azaltan potansiyel bileşenler olduğunu göstermiştir.

### ***Pleurotus spp.***

*Pleurotus* türleri dünyada en çok yetiştirilen yenilebilir mantarlar arasındadır. Yüksek besin değeri sunarlar ve antiinflamatuvar etki, antioksidan, immünomodülatör ve antimikrobiyal aktivite gibi tıbbi özellikler gösterdikleri rapor edilmiştir (Patel, 2012). Bu tıbbi özellikler bilim adamlarını olası kozmetik içeriklerin geleceği konusunda iyimser olmaya yöneltmiştir.

Meng ve ark.. (2011), *Pleurotus citrinopileatus* mantarının şapkalarından elde edilen ekstraktların, tirozinaz inhibisyon potansiyellerinin çok yüksek olduğunu ve melanin üretiminin önemli oranda inhibe ettiğini rapor etmişlerdir. Anti-tirozinaz aktivitesi rapor edilen diğer *Pleurotus* türleri *Pleurotus eryngii* (Alam ve ark., 2011a); *Pleurotus nebrodensis* (Alam ve ark., 2011b); *Pleurotus ostreatus* (Banlangsawan ve ark.,2019)'tur.

*P. eryngii* mantarının etanol ekstraktları deri kaynaklı dermatit üzerinde antiinflamatuvar potansiyele sahiptir (Choi ve ark., 2013). *P. citrinopileatus* mantarının, anti-atopik dermatit ve antioksidan aktivitesi birçok çalışmada rapor edilmiştir (Meng ve ark., 2011). *P. citrinopileatus*'un anti-hyaluronidaz aktivitesine sahip olması onu kozmetik ürünler için önemli bir malzeme haline getirmektedir (Abd Razak ve ark., 2020).

### ***Agaricus bisporus***

Tirozinaz inhibitörlerinin cilt beyazlatıcı ve önleyici etkileri nedeniyle kozmetik endüstrisinde kullanımı giderek önem kazanmaktadır. *A. bisporus* mantarında tirozinaz inhibisyonu rapor edilmiştir (Parvez ve ark., 2007; Pillaiyar ve ark., 2017). Mantar özlerinden hazırlanan baz kozmetik krem, tirozinaz aktivitesini baskılayarak nitrik oksit ve melanin üretimine karşı antiinflamatuvar ve antioksidan potansiyel sergilemiştir (Taofiq ve ark., 2016b).

Mantar özleri içeren kozmetik formülasyonlar, cilde zarar veren bakteri türlerinin büyümesini baskılar. *A. bisporus*'tan elde edilen ekstraktlar, metisiline dirençli ve metisiline duyarlı *Staphylococcus aureus* dahil olmak üzere zararlı mikroorganizmalara karşı antibakteriyel aktiviteye sahiptir (Taofiq ve ark., 2016b). Bu bakterilerin yaralanma ve iltihaplanma sırasında deride kolonize olduğu bilinmektedir.

*A. bisporus*, meyve veren gövdelerinde çoğunlukla Se'yi eser mineral olarak biriktiren yenilebilir bir mantardır (Maseko ve ark., 2013). Kepek, yağlı saç, saç dökülmesi gibi saç sorunlarının çözümünde *A. bisporus* özütü kullanılarak şampuanlar formüle edilebilir. Saçların daha iyi büyümesi için saç ve saç derisini temizlemek için de kullanılabilir (Usman ve ark., 2021).

*A. bisporus*, saçların sağlıklı ve güçlü olmasında önemli rol oynayan, böylece saç dökülmesini ve kepeği önleyen D vitamini ve bakır, demir ve Se gibi çeşitli mineralleri içerir (Wu ve ark., 2016).

### **MANTAR BAZLI İÇERİKLİ TİCARİ OLARAK SATILAN KOZMETİKLER**

Günümüzde, birçok mantar ticari kozmetik ürünlerinde kullanılmaktadır. Origins™ Mega-Mushroom için Dr. Andrew Weil (<https://www.origins.com/dr-weil-mega-mushroom>), cilt bakımında mantarlardan yararlanan ilk premium Batılı markalar arasındaydı. 2006 yılında piyasaya sürülen ürün, cildi sakınlaştırmak, yumuşatmak ve gözle görülür yaşlanma belirtilerine karşı korumak için kullanılan, cildi rahatlatan bir yüz maskesidir. Formülasyonunda *Hypsizygus ulmarius*, *Ganoderma lucidum* ve *Cordyceps sinensis* (Berk.) Sacc misel özleri içerir. Yakın zamanda Dr. Weil For Origins ürün kataloğuna eklenen Plantidote Mega-Mantar Vücut Kremi, üç mantar kompleksinin yanı sıra zencefil, zerdeçal ve kutsal fesleğen (*Ocimum sanctum* L.) gibi diğer bileşenleri içeren nemlendirici bir kremdir.

Menard, mantar içerikli bir kozmetik ürün markasıdır ([www.menard-cosmetic.com](http://www.menard-cosmetic.com)). Toksinleri ortadan kaldırmak ve UV radyasyonuna ve serbest radikallere aşırı maruz kalma sonucu ortaya çıkan cilt hasarını onarmaya yardımcı olmak için Embellir serisindeki *Ganoderma lucidum* ekstraktını kullanmıştır.

Aveeno Positively Ageless, cildin doğal yenilenme süreciyle birlikte çalıştığı klinik olarak kanıtlanmış bir antioksidan olan doğal Shiitake Kompleksi içeren nemlendirici bir göz kremidir (<http://www.aveeno.com>). Bu formül, göz çevresindeki cildin görünümünü aydınlatmayı ve koyu halkaların görünümünü azaltmayı amaçlamaktadır.

Estée Lauder, yeni bir Re-Nutriv güneş bakım ürünüde (www.esteelauder.com), kurt üzümü ve ginsengin yanısıra *G. lucidum* ekstraktı kullanmıştır. Bu ürünün, cilt parlaklığını koruduğunu, canlandırdığını ve yaşlılık lekeleri, düzensiz cilt tonu ve diğer kusurların oluşumu da dahil olmak üzere günlük UV radyasyonuna maruz kalmanın yaşlanma etkilerini azaltmaya yardımcı olduğu belirtilmiştir.

Dr. Patricia Wexler, New York City'de Wexler Dermatoloji'nin sahibidir (www.wexlerdermatoloji.com). Instant De-Puff Göz Jeli, *Agaricus bisporus* L. ve diğer önemli bileşenlerle yeniden formüle edildi. Bu yaşlanma karşıtı ürün, cilt yüzeyini iyileştiren ve kırışıklığın önlenmesi için gerekli olan ciltteki elastin seviyesini artıran bileşenler içerir. Murad's Age Diffusing Serum, hormonal yaşlanmanın belirti ve semptomlarını hedef alan yaşlanma karşıtı bir serumdur ve *L. edodes* içerir. Mushroom Wisdom Inc. Firmesi daha çok mantar içeren besin takviyeleri pazarlamaktadır. Firmanın ayrıca *T. fuciformis* özleri içeren cilt bakımına yönelik Aquamella Krem adlı ürünü de mevcuttur.

Formülasyonlarında mantar özleri ve mantar moleküllerini kullanan diğer kozmetik markaları arasında Bliss (Hut.com Ltd., Cheshire, İngiltere), La Roche (F. Hoffmann-La Roche Ltd., Basel, İsviçre), Nu-Derm (Obagi Medical Products Inc., Irvine, CA, ABD), SensiClear (Mission Scientific Skincare Inc., Gold River, CA, ABD) yer almaktadır (Choi ve Berson 2006).

## SONUÇ VE ÖNERİLER

Mantarların muazzam bir biyoaktif molekül kaynağı olduğu iyi bilinmektedir ve günümüzde milyarlarca dolarlık kozmetik pazarında, çeşitli özelliklere sahip farklı mantar türevli kozmetikler ve nutrakozmetikler mevcuttur. Antioksidan, yaşlanma karşıtı, kırışıklık önleyici, temizleyici ve nemlendirici ajanlar olarak kozmetikte başarılı uygulamaları nedeniyle çeşitli mantar ürünleri ve ekstraktlarının patenti alınmıştır.

Mantar ekstraktlarının antioksidan, antiinflamatuvar ve antimikrobiyal aktiviteleri birçok makalede rapor edilmiş olsada, bu aktivitelerden sorumlu biyoaktif metabolitler ve bunların etki mekanizmaları ile ilgili daha fazla çalışmanın yapılması gerekmektedir. Diğer taraftan mantarlar çok sayıda biyokimyasal madde içermelerine rağmen uygun olmayan çözücüler veya ekstraksiyon koşulları nedeniyle henüz karakterize edilememiş birçok içerik mevcuttur. Teknoloji ve bilimdeki ilerlemeler yeni biyoaktif maddelerin keşfine olanak sağlayacak, bu da kozmetik ürünlerin gelişimine önemli katkı sağlayacaktır. Ayrıca klinik çalışmalara ağırlık verilmesi, yüksek kaliteli ve kalitede standart sağlanmış ürünlerin üretilmesi bu tür kozmetiklerin sürdürülebilir üretiminde etkili olacaktır.

#### Özet

Çalışmada, *Hypsizygus ulmarius* mantarı üretiminde yetiştirme ortamı olarak yerfıstığı kabuğu kullanımının mantarın üretim döngüsü, verim ve şapka boyutları üzerindeki etkisini karşılaştırmak için yerfıstığı kabuğu (FK) ve buğday samanının (S) farklı oranlarda karıştırılması ile hazırlanan beş farklı yetiştirme ortamı kullanılmıştır. En hızlı misel gelişimi (20 gün), taslak oluşumu (29.6 gün) ve hasat aşaması (37 gün) tamamen yerfıstığı kabuğu ile hazırlanan FK100 ortamında gerçekleşmiştir. Misel gelişim süresi ile N ( $r^2 = -0.953$ ) ve C:N oranları ( $r^2 = -0.955$ ) ile negatif, hemiselüloz içeriği ( $r^2 = 0.939$ ) ile pozitif bir korelasyon olduğu belirlenmiştir. Farklı yetiştirme ortamlarında üretilen *H. ulmarius* için verim 207.45 g/kg-266.98 g/kg ve BE %59.27-%78.52 arasında değişmiştir. En yüksek verim S25:FK75 ortamında elde edilmiştir. Genel olarak, samana eklenen fıstık kabuğu miktarı arttıkça BE (%) yükselirken, yerfıstığı kabuğunun tek başına kullanıldığı yetiştirme ortamı FK100'de en düşük BE (%) elde edilmiştir. Mantarların şapka çapları, 78.1 mm-98.3 mm, sap uzunluğu 45.8 mm-87.0 mm, sap çapları ise 17.5 mm-23.5 mm arasında değişmiştir. En büyük şapka çapı ve sap uzunluğuna sahip mantarlar, en yüksek veriminde elde edildiği S25:FK75 ortamından hasat edilmiştir. En kalın saplara sahip olan şapkaların ise kontrol ortamında geliştiği gözlenmiştir. Çalışmada elde edilen veriler yerfıstığı kabuğunun ticari olarak *H. ulmarius* yetiştiriciliği için umut verici bir alternatif substrat olduğunu göstermektedir.

**Anahtar Kelimeler:** karaağaç istiridyesi mantarı, lignoselülozik materyaller, tarımsal atık

#### **Effect of using groundnut shells as substrate on mushroom yield and fruitbody size in cultivation of *Hypsizygus ulmarius* mushroom**

#### Abstract

In this study, five different growing media prepared by mixing different proportions of groundnut shell (FK) and wheat straw (S) were used to compare the effect of using groundnut shell as substrate on the cultivation cycle, yield and fruitbody size of *Hypsizygus ulmarius* mushroom. The fastest mycelial growth (20 days), pinhead formation (29.6 days) and time to first harvest (37 days) occurred on FK100 medium prepared entirely with groundnut shells. There was a negative correlation with N ( $r^2 = -0.953$ ) and C:N ratios ( $r^2 = -0.955$ ) and a positive correlation with hemicellulose content ( $r^2 = 0.939$ ). The yields ranged between 207.45 g/kg-266.98 g/kg and BE between 59.27% and 78.52% For *H. ulmarius* produced in different growing media, The highest yield was obtained in S25:FK75 medium. In general, BE (%) increased as the amount of groundnut shell added to the straw increased, while the lowest BE (%) was obtained in the growing medium FK100 where groundnut shell was used alone. The fruitbody diameters of the mushrooms varied between 78.1 mm-98.3 mm, stem length 45.8 mm-87.0 mm and stem diameters 17.5 mm-23.5 mm. The mushrooms with the largest fruitbody diameter and stem length were harvested from the S25:FK75 medium, where the highest yield was obtained. It was observed that the fruitbody with the thickest stems developed in the control medium. The data obtained in this study indicate that groundnut shell is a promising alternative substrate for commercial cultivation of *H. ulmarius*.

**Key words:** elm oyster, lignocellulosic materials, agricultural waste

## GİRİŞ

Dünya nüfusunun sürekli artması, doğal kaynakların bozulması ve iklim değişikliğinin etkileri nedeniyle insanoğlunun hâlâ karşı karşıya olduğu ve karşılaşmaya devam edeceği en büyük sorunlar gıda üretiminin azalması, insan sağlığının bozulması ve çevre kirliliğidir (Oseni ve ark. 2012).

Mantar yetiştiriciliği tüm bu sorunların çözümüne katkı sağlayabilecek bazı özelliklere sahiptir. Mantar üretimi, güçlü bir enzim sistemine sahip mantarların lignoselülozik materyali parçalama yeteneklerini kullanarak düşük değerli ve kullanım alanları sınırlı olan tarım ve orman atıklarından besin değeri yüksek ve tıbbi özelliklere sahip gıda üretilmektedir. Mantar yetiştiriciliği lignoselülozik atıkları gıda maddesine dönüştürmekle kalmaz, aynı zamanda sağlıklı ve besleyici bir ürün sunar. Mantardaki esansiyel amino asitlerin içeriği yüksektir, sindirimi kolaydır ve kolesterol içermez (Gonzalez ve ark., 2020). Yenilebilir mantarlar oldukça besleyicidir ve besin değerleri yumurta, süt ve etle karşılaştırılabilir düzeydedir (Okoro ve Achuba, 2012). Tıbbi mantarlardan elde edilen ekstrakte edilebilir biyoaktif bileşikler, bağışıklık sistemini güçlendirecek ve yaşam kalitesini artırabilecek özelliklere sahiptirler (Waktola ve Temesgen, 2018). Mantar hasadından arda kalan ve yoğun miktarda mantar miseli ve mantar kalıntıları içeren atık mantar yetiştirme ortamları, aynı zamanda hayvan yemi olarak, toprak verimliliğinin zenginleştirilmesi için biyo-gübre olarak ve biyogaz üretiminde kullanılabilir (Leong ve ark., 2022). Mantar yetiştiriciliği, özellikle gelişmekte olan ülkelerdeki kadınlar ve gençler için gelir ve istihdam yaratılmasına yardımcı olabilir (Thakur, 2014).

Tarımsal atıkların çoğu, kimyasal yapıları ve ayrışma özellikleri nedeniyle işlenmesi ve bertaraf edilmesi genellikle sorunlu olan lignoselülozik bileşikler açısından zengindir. Türkiye önemli bir tarım ülkesidir. Buğday ülkemizin hemen her bölgesinde yaygın olarak üretilen en önemli tarımsal ürünlerden bir tanesidir ve bu üretim sonucunda bol miktarda buğday samanı ortaya çıkar. TÜİK (2022) verilerine göre 2022 yılında ülkemizde 19.8 milyon tonluk buğday üretimi gerçekleşmiş olup ortaya çıkan saman miktarı yaklaşık 25 milyon tondur. Yerfıstığı ise ülkemizde en fazla Akdeniz bölgesinde üretilmekle birlikte Ege, Marmara ve Güneydoğu Anadolu Bölgelerinde de yerfıstığı plantasyonlarına rastlanmaktadır (Şahin, 2014). Yerfıstığı dünyada yağlı tohumlar kategorisinden önemli bir yağ bitkisi olmasına karşın ülkemizde elde edilen mahsulün tamamı yakını çerez olarak tüketilir ve buğday da olduğu gibi bu ürünün işlenmesi sonucunda da büyük miktarda yer fıstığı kabuğu ortaya çıkar.

Bazı araştırmacılar, yerfıstığı kabuklarının mahsul gübrelemesi için bir karbon kaynağı olarak, kirli sudaki süzülmesinde bir substrat olarak, kompozit materyali olarak ve biyoetanol üretiminde kullanımını araştırmışlardır (Çelik ve Gürdal, 2010; Taşar ve ark., 2014; Li ve ark., 2018; Ganguly ve ark., 2020). Yerfıstığı kabukları gibi lignoselülozik atıklar her ne bazı amaçlarla kullanılsa da büyük oranda yakılarak, toprağa gömülerek ya da farklı şekillerde bertaraf edilmektedirler. Kullanım alanları sınırlı olan bu atıkları yüksek pazar değeri olan gıdalara dönüştürmek ve mantar yetiştiricisi için ucuz bir substrat kaynağı olarak kullanmak bu atıkların ortadan kaldırılmasında çözüm yöntemlerinden biri olabilir (Sa'nchez, 2010).

Mantar üretimi ve tüketiminden elde edilen potansiyel faydalara rağmen Türkiye, mantar üretimi ve ticaretinde son derece geridedir. 2021 yılı Dünya mantar üretimi 44.207.117 ton olarak kaydedilmiştir (FAOSTAT, 2023) ve aynı dönem için Türkiye mantar üretimi ise 61.460 ton'dur (FAOSTAT, 2023). Zengin bir tarımsal çeşitliliğe sahip olan ve her yıl milyonlarca ton tarımsal atığın ortaya çıktığı Türkiye'nin dünya mantar üretimine katkısı %0.13 civarındadır. Ancak yine de 2000 yılında 7000 ton olan mantar üretimimizin 21 yılda gösterdiği artış oldukça umut verici boyutlardadır. Türkiye'de *Agaricus bisporus* türü hala en fazla üretilen mantar türü olduğu halde son yıllarda *Pleurotus ostreatus* ve *Lentinula edodes* gibi türlerinde üretiminin yaygınlaştığı gözlenmektedir (Eren ve Pekşen, 2019). Ülkemizde son yıllarda mantar üretimi ve tüketimine artan ilgi, *Ganoderma lucidum*, *Hericium erinaceus*, *Hypsizyguus ulmarius* gibi dünya'da ticari değere sahip egzotik mantar türleri için bir pazarın bulunduğunu göstermektedir.

*H. ulmarius*, düşük maliyetli üretim teknolojisi ve daha yüksek biyolojik verimliliği sebebi ile özellikle Asya ve Avrupa'da ticari olarak popüler bir türdür (Kumar ve ark., 2019). Bu mantar büyük ve açık beyaz renkli şapmaya, mükemmel bir tada ve çekici bir şekle sahiptir (Baghel ve ark., 2019). *H. ulmarius* görünüş olarak istiridye mantarına benzer, ancak yetiştirme döngüsü ve biyolojik verimlilik açısından farklılık gösterir. *H. ulmarus* mantarı protein (%13.5-18.7), yağ (%2.6-4.3), kül (%7.6-10.3), karbonhidrat (%69.6-73.5) açısından yüksek besin değerlerine sahip olup, enerji değeri ise 372.2–391.1 kcal/100 g km'dir (Atila, 2023). Bu tür aynı zamanda niasin, riboflavin, D vitamini, C, B1, B5 ve B6 gibi vitaminler açısından da zengindir (Munna ve ark., 2018).

*H. ulmarius* mantarı talaş, buğday samanı, fasulye samanı, mısır silajı, atık mantar kompostu vb. dahil olmak üzere çeşitli substratlarda yetiştirilebilir (Ozturk ve Atila, 2019). Saman gibi substratların azot içeriği yüksek bir materyal ile desteklenmesinin verimi artırdığı rapor edilmiştir (Malayil ve ark., 2017).

Mantar yetiştiriciliği, Akdeniz ülkelerindeki tarımsal faaliyetlerin geniş bir yelpazesindeki ligno-selülozik kalıntıların ve tarımsal faaliyetlerin yan ürünlerinin değerlendirilmesi için mükemmel bir fırsat sunsa da, tarımsal atıkların mantar üretiminde kullanımları söz konusu olduğunda buğday samanı bazlı substratlar hakimdir. Bu nedenle, yerel olarak bol miktarda bulunan tarımsal atıkların alternatif substratlar olarak değerlendirilmesi ihtiyacı ortadadır.

Mevcut çalışma, başta Akdeniz bölgesi olmak üzere, ülkemizin diğer bazı bölgelerinde de bol miktarda bulunması mümkün olan yerfistığı kabuklarının mantar üretiminde kullanılarak değerlendirilmesine ve ülkemizde henüz ticari olarak üretimi yapılmayan bir tür olan *H. ulmarius* mantarının tanıtılarak Türkiye mantar sektöründeki mantar çeşitliliğinin artırılmasına katkıda bulunmayı amaçlamaktadır. Bu mantıkla, yerfistığı kabuklarının *H. ulmarius* mantarı üretiminde substrat olarak kullanımının mantarının büyüme performansı ve verimine etkileri araştırılmıştır. Ayrıca yerfistığı kabuklarının kullanımının *H. ulmarius* mantarının şapka boyutları üzerindeki etkisi değerlendirilmiştir.

## MATERYAL VE METOT

### Mantar ırkı

*H. ulmarius* suşu Hollanda'da faaliyet gösteren Homegreen Spawn Company'den temin edilmiştir. Saf kültürden çoğaltılan misel kültürleri Malt ekstrakt agarda (MAE) muhafaza edilmiş ve kullanılıncaya kadar 4°C'de sbuzdolabında saklanmıştır.

### Substratlar

Çalışma, 2022 yılında Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Mantar üretim laboratuvarında gerçekleştirilmiştir. Buğday samanı (BS) ve yerfistığı kabukları (FK) farklı oranlarda karıştırılması ile yetiştirme ortamları hazırlanmıştır (Tablo 1).

Tablo 1. Çalışmada yetiştirme ortamı hazırlığında kullanılan materyaller ve oranları

Kod	Substrat	Oran (%)	Substrat	Oran (%)
<b>Kontrol</b>	Saman	100	-	
<b>S75:FK25</b>	Saman	75	Yerfistığı Kabuğu	25
<b>S50:FK50</b>	Saman	50	Yerfistığı Kabuğu	50
<b>S25:FK75</b>	Saman	25	Yerfistığı Kabuğu	75
<b>FK100</b>	Saman	-	Yerfistığı Kabuğu	100

### Tohumluk misel hazırlığı

Tohumluk miseller buğday tanelerinden hazırlanmıştır. Buğday taneleri 15 dakika boyunca kaynatılmış, daha sonra suyu süzülüş %2 alçı eklenerek karıştırılmış ve 500 ml'lik kavanozlara doldurularak otoklavda 121°C'de 90 dakika boyunca sterilize edilmiştir. Soğuyan kavanozlar laminar flow (steril kabinde) misel kültürleri ile aşılansmış ve 25°C'de inkübe edilmiştir.

### Yetiştirme ortamı hazırlığı

BS ve FK substrat hazırlığı öncesinde ayrı ayrı küvetlerde bir gece suda bekletildi. Substralardaki fazla su drene edildikten sonra farklı oranlarda karıştırılarak Tablo 1'de verilmiş olan 5 farklı yetiştirme ortamı hazırlanmıştır. Yetiştirme ortamı hazırlığında kullanılan substratlar homojen bir şekilde karıştırılarak polipropilen torbalara 1 kg gelecek şekilde doldurulmuştur. Hazırlanan torbalar otoklavda 121°C'de 90 dakika boyunca sterilize edilmiş, soğuduktan sonra laminar flow (steril masa)'da her bir torbaya %3 (w/w) oranında tohumluk misel gelecek şekilde tohumluk misel aşılması yapılmıştır.

İnkübasyon periyodunda üretim odasının sıcaklığı 25±2°C'ye, oransal nemi %70-80'e ayarlanmıştır. Misel gelişim periyodu tamamlandıktan sonra torbalar, taslak oluşumunun tetiklenmesi için 18±2°C sıcaklık ve %80-90 bağıl nemdeki üretim odasına aktarılmış ve polipropilen torbaların ağız kısmındaki pamuk tıkaçlar çıkarılmıştır. Üretim odalarında florasan lambalar kullanılarak 12 saat boyunca ışık sağlanmış, havalandırma, CO2 konsantrasyonunu 1000 ppm'in altında tutacak şekilde yapılmıştır. Mantarlar tam olarak olgunlaştıklarında hasat edilerek tartım ve ölçüm işleri tamamlanmıştır.

Deneme, her yetiştirme ortamı için on tekrarlı olarak, tesadüf parselleri tasarımında gerçekleştirilmiştir.

### Yetiştirme ortamı analizleri

Sterilizasyondan sonra test edilen substrat numuneleri, 60°C'de sabit bir ağırlığa kadar kurutulmuş, ardından bir değirmen kullanılarak kaba bir toz halinde öğütülmüştür. Substratların kül içeriği standart prosedür (AOAC, 2019) takip edilerek belirlenmiştir. Toplam karbon, Tiqia ve Tam (2000) formülüne göre kül içeriğinden tahmin edilmiş, toplam azot (N), Kjeldahl yöntemiyle belirlenmiş ve yetiştirme ortamlarının C:N oranları hesaplanmıştır. Selüloz, hemiselüloz ve lignin içerikleri Van Soest ve ark. (1991)'in yöntemi kullanılarak ölçülmüştür. Numunelerin selüloz, lignin ve hemiselüloz içerikleri denklemlerde gösterildiği gibi hesaplanmıştır;

(1) Selüloz = ADF-ADL;(2) Lignin = ADL; (3) Hemiselüloz=NDF-ADF (Zadrazil ve Brunnert, 1982).

### Değerlendirilen üretim parametreleri

Çalışmada şu parametreler üzerinde gözlemler yapılmıştır: (I) misel gelişiminin tamamlanması için geçen gün sayısı, (II) misel ekiminden sonra primordia oluşumuna kadar geçen gün sayısı,(III) misel ekiminden sonra ilk hasada kadar geçen gün sayısı (IV) verim (g/kg) (V) Biyolojik etkinlik (%) (VI) şapka boyutları (şapka çapı, sap boyu ve sap çapı)

Biyolojik etkinliği hesaplamak için şu formül kullanılmıştır;

$$BE (\%) = (\text{taze mantar ağırlığı} / \text{kuru substrat ağırlığı}) \times 100$$

### İstatistiksel analiz

Sonuçlar varyans analizi (ANOVA) kullanılarak istatistiksel olarak analiz edildi. Ortalamalar arasındaki bireysel farklılıkları belirlemek için Tukey'in post-hoc karşılaştırması (%5 anlamlılık düzeyinde) uygulandı. Tüm analizler SPSS 16.0 versiyonu kullanılarak yapıldı.

## BULGULAR ve TARTIŞMA

### Yetiştirme ortamlarının kimyasal özellikleri

Yetiştirme ortamlarının kül, karbon, azot içerikleri, C:N oranları, selüloz, hemiselüloz ve lignin içerikleri bakımından istatistiksel olarak önemli farklar mevcut iken ( $p < 0.001$ ), yetiştirme ortamlarının pH değerleri arasında önemli bir fark bulunmamıştır ( $p > 0.05$ ).

Tablo 2. Çalışmada kullanılan mantar yetiştirme ortamlarının bazı kimyasal özellikleri

Yetiştirme ortamı	pH	Kül (%)	C	N (%)	C:N	Selüloz (%)	Lignin (%)	Hemiselüloz (%)
Kontrol	6.93±0.23	7.83±0.21 a	53.46±0.12 d	0.59±0.01 d	90.13±1.69 a	36.66±1.38 b	14.50±0.51 e	23.64±1.31 a
S75:FK25	7.25±0.06	6.74±0.14 b	54.09±0.08 c	0.74±0.03 c	72.92±3.30 b	37.27±0.44 b	16.39±0.44 d	19.44±0.55 b
S50:FK50	7.06±0.18	6.24±0.05 b	54.38±0.03 c	0.78±0.02 bc	70.09±2.23 bc	40.57±0.50 a	20.71±0.45 c	17.29±0.13 c
S25:FK75	7.18±0.21	4.77±0.25 c	55.23±0.15 b	0.84±0.02 ab	66.06±1.65 c	41.33±0.33 a	22.75±0.37 b	14.96±0.19 d
FK100	7.26±0.04	4.13±0.17 d	55.60±0.10 a	0.91±0.02 a	61.36±1.36 c	42.10±0.28 a	25.33±0.73 a	10.17±0.22 e
P değeri	0.307	<0.001	<0.001	<0.001	<0.001	<0.001	<0.001	<0.001

Her değer ortalama ± standart sapma olarak ifade edilmiştir (n=3). Sütunlarında yer alan aynı harf ile adlandırılmış değerler arasında Tukey testine göre istatistiksel olarak fark yoktur

Yetiştirme ortamlarının pH değerleri 6.93 ile 7.26 arasında değişmiştir.  $\text{CaCO}_3$  ya da  $\text{CaSO}_4$  gibi alkali bir ortamın yetiştirme ortamı hazırlığında kullanılması genellikle rakip mikroorganizmaları azaltmak için önerilir (Stölzer ve Grabbe 1991). Ancak bu çalışmada yetiştirme ortamlarının pH değerleri hafif alkali olduğundan dolayı yetiştirme ortamı hazırlığı sırasında  $\text{CaCO}_3$  veya benzeri bileşik eklenmemiştir.

Çalışmada değerlendirilen yetiştirme ortamları ortalama %4.13-7.83 oranında kül içerirken, substratların C içeriği %53.46 ile %55.60 arasında değişmiştir (Tablo 2). Substratların kimyasal analizi, yetiştirme ortamlarının azot içeriğinin %0.59-%0.91 arasında değiştiğini göstermiştir. FK eklenen yetiştirme ortamlarının azot içeriğinin kontrol ortamına göre yüksektir. Ancak çalışmada incelenen tüm yetiştirme ortamlarının N içeriği Azizi ve ark. (1990) tarafından önerilen aralıkta veya çok yakındır. Kontrol ortamının C:N oranı 90.13 ile diğer substratlardan daha yüksekti. Hemiselüloz, selüloz ve lignin oranları da sırasıyla %10.17–23.64, %36.66–42.10 ve %14.50–25.33 gibi geniş bir değişkenlik gösterdi. Lignoselülozik bileşenler açısından kontrol ortamı hemiselüloz için en yüksek değerleri ve lignin için en düşük değerleri sergilerken, FK100 ortamı, selüloz ve lignin için en yüksek değerleri ve hemiselüloz içerikleri için en düşük değerleri sergiledi. Benzer şekilde yetiştirme ortamlarında FK içeriği arttıkça ortamdaki selüloz ve lignin içeriği artarken, hemiselüloz içerikleri ise düşmüştür.

### Farklı yetiştirme ortamlarının *Hypsizygus ulmarius* mantarının üretim periyoduna etkileri

Farklı yetiştirme ortamlarının *H. ulmarius* mantarının misel gelişim süresi, taslak oluşumuna kadar geçen gün sayısı ve ilk hasada kadar geçen gün sayısı üzerindeki etkileri belirlemek üzere yapılan varyans analizi, yetiştirme ortamları arasında önemli farklılıklar olduğunu göstermiştir ( $p<0.001$ ) (Tablo 3).

Tablo 3. Farklı yetiştirme ortamlarının *Hypsizygus ulmarius* mantarının üretim sürecine etkileri

Yetiştirme ortamı	Misel Gelişim Dönemi (gün)	Taslak oluşumuna kadar geçen süre (gün)	İlk hasada kadar geçen süre (gün)
Kontrol	21,4±0.5 a	34,10±0.7 a	39,80±0.4 b
S75:FK25	20,6±0.5 b	33,90±0.7 a	41,80±0.8 a
S50:FK50	20,6±0.5 b	34,00±0.8 a	40,10±0.7 b
S25:FK75	20,6±0.5 b	33,80±0.8 a	41,70±0.8 a
FK100	20,0±0.0 c	29,60±1.0 b	37,00±0.6 c
P değeri	<0.001	<0.001	<0.001

Her değer ortalama  $\pm$  standart sapma olarak ifade edilmiştir (n=10). Sütunlarında yer alan aynı harf ile adlandırılmış değerler arasında Tukey testine göre istatistiksel olarak fark yoktur

*H. ulmarius*, incelenen yetiştirme ortamlarında misel gelişim sürecini 20.0–21.4 gün içinde tamamlamıştır. FK100 ortamı test edilen diğer ortamlara göre daha kısa bir misel gelişim süreci sergilemiştir. Yetiştirme sürecinin başlangıcında yüksek kontaminasyon riski bulunduğu kolonizasyon aşamasının süresinin kısaltılması büyük önem taşımaktadır. Bu çalışmada elde edilen misel gelişim süreleri Munna ve ark. (2018) ve Eswaran ve ark. (2019) 'nın bulguları benzerdi.

Taslaklar, ortalama olarak 29.6 güne ihtiyaç duyan FK100 ortamı hariç, diğer tüm yetiştirme ortamlarında yaklaşık 34 günde meydana geldi. İlk hasada kadar geçen gün sayısı 37 gün ile FK100 ortamında en kısa iken, en uzun süre 41.7 ve 41.8 gün ile sırası ile S75:FK25 ve S25:FK75 ortamlarında belirlenmiştir. Bu çalışmada elde edilen taslak oluşumu için geçen gün sayısı ve ilk hasada kadar geçen gün sayısı ile ilgili veriler, *H. ulmarius* taslaklarının ortaya çıkmasının 21.33-27.33 gün sürdüğünü ve ilk hasatın 24.67-31.33 gün sonra başladığını bildiren Munna ve ark. (2019) çalışmasına göre çok uzun olsa da, bu sürelerin sırası ile 44.2 -55.3 gün ve 49.5-63.0 gün sürdüğünü bildiren Atila (2022) 'nin verilerinden daha kısa zaman almıştır. Çalışmalar arasındaki bu farklılıklar farklı yetiştirme ortamları ve farklı ırkların kullanılmasından kaynaklanmaktadır.

Sadece yerfıstığı kabuğu kullanılarak hazırlanan yetiştirme ortamının *H. ulmarius*'un üretim periyotlarının kısaltılması üzerinde olumlu bir etkisinin olduğu belirlenmiştir. Genel olarak FK100 ortamı hızlı kolonizasyonu desteklemiş ve mantar üretiminde erkencilik sağlamıştır. Mantar misellerinin büyümesi ve taslak gelişimi üzerinde yetiştirme ortamının lignoselülozik içeriği ve C:N oranının önemli etkisi vardır. Yang

(2000), C:N oranının yaklaşık 22-30:1 oranında olmasının taslak oluşumunu ve şapka gelişimini desteklediğini, daha yüksek C:N oranının ise misel gelişimini desteklediğini öne sürmüşlerdir. Çalışmamıza en hızlı misel gelişiminin, taslak oluşumunun ve şapka gelişiminin desteklediği FK100 yetiştirme ortamının C:N oranı 61.36 olup, diğer yetiştirme ortamlarının C:N oranından düşüktür. Diğer taraftan, Öztürk ve Atila (2021), *H. ulmarius* mantarının hızlı misel gelişimi ile yetiştirme ortamının selüloz içeriği arasında bir ilişki bulunduğunu ve yüksek selüloz içeriğinin misel gelişim süresini kısalttığını bildirmişlerdir. Çalışmada yürütülen korelasyon çalışmaları, misel gelişim süresi ile N ( $r^2 = -0.953$ ) ve C:N oranları ( $r^2 = -0.955$ ) ile negatif, hemiselüloz içeriği ( $r^2 = 0.939$ ) ile pozitif bir korelasyon olduğu ortaya çıkarmıştır. FK100 yetiştirme ortamının düşük hemiselüloz içeriği muhtemelen miselin hızlı gelişimine katkı sağlamış olabilir. Bu durum yerfıstığı kabuğunun kimyasal özelliklerinin yanı sıra fiziksel yapısı ile ilgili olabilir. Havalanma kapasitesi yüksek, kaba bir yapıya sahip ortamların misel gelişimini hızlandırdığı ve mantar üretim sürecini kısalttığı bazı çalışmalarda vurgulanmıştır (Wang ve ark., 2021; Hu ve ark. 2022).

### Farklı yetiştirme ortamlarının *Hypsizygus ulmarius* mantarının verim ve biyolojik etkinliği üzerine etkileri

Çalışmamızda S25:FK75 ortamı, diğer ortamlara kıyasla önemli ölçüde daha yüksek verim ve BE(%) sergiledi ( $p < 0.001$ ) (Tablo 4).

Tablo 4. Farklı yetiştirme ortamlarının *Hypsizygus ulmarius* mantarının verim ve biyolojik etkinliğine etkisi

Yetiştirme ortamı	Flaş I (g)	Flaş II (g)	Flaş III (g)	Toplam verim (g/kg)	Biyolojik etkinlik (%)
<b>Kontrol</b>	130.83±13.9 b	81.94±13.0 b	-	210.36±4.0 d	63.74±1.1 d
<b>S75:FK25</b>	143.10±12.7 a	77.56±10.5 b	-	220.66±6.2 c	66.87±1.8 c
<b>S50:FK50</b>	136.22±10.2 ab	111.08±11.5 a	-	246.19±8.5 b	70.34±2.3 b
<b>S25:FK75</b>	147.68±11.1 a	83.40±12.8 b	37.53±8.6	266.98±8.4 a	78.52±2.3 a
<b>FK100</b>	121.07±7.3 c	50.55±6.0 c	35.83±6.5	207.45±5.8 d	59.27±1.6 e
<b>P değeri</b>	<0.001	<0.001	<0.001	<0.001	<0.001

Her değer ortalama ± standart sapma olarak ifade edilmiştir (n=10). Sütunlarında yer alan aynı harf ile adlandırılmış değerler arasında Tukey testine göre istatistiksel olarak fark yoktur

Farklı yetiştirme ortamlarında üretilen *H. ulmarius* için verim 207.45 g/kg -266.98 g/kg ve BE %59.27-%78.52 arasında değişmiştir. Genel olarak, samana eklenen fıstık kabuğu miktarı arttıkça BE (%) yükselirken, yerfıstığı kabuğunun tek başına kullanıldığı yetiştirme ortamı FK100'de en düşük BE (%) elde edilmiştir. Çeşitli substratlar üzerinde yapılan diğer yetiştirme çalışmalarında BE değerleri %36 ile %93 arasında (Oztürk ve Atila, 2021) veya %231.7 ve %437.5 arasında (Malayil ve ark., 2017) bulunmuştur. Belirli suşların genetik arka planı, substratların bileşimi ve hazırlanmasındaki farklılıkların yanı sıra yetiştirme metodolojileri ve çevre koşulları, bu verim farklılıkları için açıklama sağlayabilir.

S25:FK75 ortamından elde edilen verim kontrol ortamına göre %26.9 oranında daha yüksekti. FK100 yetiştirme ortamı ise istatistiksel olarak kontrol ortamı ile aynı grupta yer almıştır. *H. ulmarius* mantarının üretiminde kullanılan beş yetiştirme ortamı arasında, FK100 ortamı diğer ortamlara göre daha hızlı misel gelişim hızı, taslak ve şapka oluşum süresi bakımından diğer ortamlara göre daha iyi sonuçlar sergilese de, aynı performans mantar verimi konusunda gözlenmemiştir. Özellikle yerfıstığı kabuğu karıştırılarak hazırlanan yetiştirme ortamlarındaki hızlı misel gelişimi, yüksek verim ve BE değerleri, bu tarımsal atığın ticari *H. ulmarius* üretimi için umut verici bir alternatif substrat olduğunu göstermektedir.

90 gün boyunca sürdürülen bu çalışmada S75:FK25 ve FK100 ortamlarından 3 hasat, diğer 3 yetiştirme ortamından ise 2 hasat elde edilmiştir. Ancak FK100 ortamında 3 kez hasat yapıldığı halde her bir hasatta elde edilen verim düşük olduğundan toplam verim düşük olmuştur. Çalışmada kullanılan yetiştirme ortamlarının hepsinde ilk hasatta elde edilen verim, toplam verimin %55-65'ini oluşturmuştur. Birinci hasatta en yüksek verim 143.10 g/kg ve 147.68 g/kg ile S25:FK75 ve S75:FK25 ortamlarından elde edilmiştir. İkinci hasatta en yüksek verim 111.08 g/kg ile S50:FK50 yetiştirme ortamında belirlenmiştir. Sadece S75:FK25 ve FK100 ortamlarından elde edilen 3. hasatlar ise sırası ile 37.53 g/kg ve 35.83 g/kg'dır.

## Farklı yetiştirme ortamlarının *Hypsizyguş ulmarius* mantarının şapka boyutları etkinliđi üzerine etkileri

Bu çalışmada kullanılan beş farklı yetiştirme ortamında gelişen mantarların şapka çapı, sap uzunluđu ve sap çapı bakımından önemli farklılıklar gözlenmiştir ( $p < 0.001$ ) (Tablo 5).

Tablo 5. Farklı yetiştirme ortamlarının *Hypsizyguş ulmarius* mantarının şapka boyutlarına etkisi

Yetiştirme ortamı	Şapka çapı (mm)	Sap uzunluđu (mm)	Sap çapı (mm)
Kontrol	86,3±8.7 ab	69,9±7.5 b	23,5±0.7 a
S75:FK25	81,4±2.2 ab	74,7±8.0 b	17,5±3.5 c
S50:FK50	78,1±6.2 b	75,4±6.3 b	17,7±1.7 c
S25:FK75	98,3±4.0 a	87,0±5.6 a	19,6±1.8 b
FK100	84,4±7.5 ab	45,8±5.9 c	17,7±0.8 c
P values	<0.001	<0.001	<0.001

Her deđer ortalama ± standart sapma olarak ifade edilmiştir (n=10). Sütunlarında yer alan aynı harf ile adlandırılmış deđerler arasında Tukey testine göre istatistiksel olarak fark yoktur

Mantarların şapka çapları, 78.1 mm-98.3 mm, sap uzunluđu 45.8 mm-87.0 mm, sap çapları ise 17.5 mm-23.5 mm arasında deđişmiştir. En büyük şapka çapı ve sap uzunluđuna sahip mantarlar, en yüksek veriminde elde edildiđi S25:FK75 ortamından hasat edilmiştir. En kalın saplara sahip olan şapkaların ise kontrol ortamında geliştiđi gözlenmiştir. Büyük boyutlu şapkaların iyi kalitede olduđu kabul edilir ve mantar üretiminde yüksek kaliteli olarak derecelendirilir (Li ve ark., 2019) ancak bu tür şapkalar paketleme sırasında kırılma eğiliminde olabilir ve kalite düşebilir.

## SONUÇ VE ÖNERİLER

Yetiştirme ortamları bileşenlerinin analizi, bunların kolonizasyonu ve şapka oluşumuna cisimlere biyolojik dönüşüm verimlilikleri ile ilgili veriler, yerfistitđi kabuđunun ticari olarak *H. ulmarius* yetiştiriciliđi için umut verici bir alternatif substrat olduđunu göstermiştir. Ülkemizde, özellikle Akdeniz bölgesinde bol miktarda ortaya çıkan ve kullanım alanı sınırlı olan yerfistitđi kabuklarının mantar üretiminde kullanılması, bu atıkların çok deđerli bir protein kaynađı ve çeşitli tıbbi özelliklere sahip bir ürüne biyodönüşümünün sağlanmasının yanı sıra, bu atıkların etkin bir şekilde deđerlendirilmesi ve atık yönetiminin kolaylaşmasına da katkı sağlayacaktır.

#### Abstract

Tooth whitening has been found to have side effects on cell metabolism in dental pulp tissue because of peroxide content. In this study, we evaluated the effect of hydrogen peroxide (HP) on apoptosis in human dental pulp stem cells (hDPSCs) and whether alpha-tocopherol (AT) has protective effects against possible apoptosis in vitro. Without treatment (control group), the second group; 2 µg/mL hydrogen peroxide was applied for 30 minutes, the third group; before 100 µM alpha-tocopherol was applied to cells for 24 hours after then 2 µg/mL hydrogen peroxide was applied to the same cells during for 30 minutes. Cytotoxicity of alpha-tocopherol was determined using the XTT assay. For the determination of apoptosis, mRNA levels of Bcl-2 and Bax were determined by Real-Time PCR analysis. In the comparisons of groups with the control, evaluations were performed using the Student's t-test (p<0.05). According to the results of the XTT analysis, the alpha-tocopherol dosage that provided the most cell viability to be applied in the experiment was determined as 100 µM. Apoptosis was induced by hydrogen peroxide and alpha-tocopherol inhibited hydrogen peroxide-induced apoptosis in HDPCs by regulating the mRNA levels of Bcl-2 and Bax.

**Keywords:** Human dental pulp stem cell, hydrogen peroxide, alpha-tocopherol, apoptosis

#### INTRODUCTION

Dental aesthetics especially in terms of tooth color are widely needed in daily life from past to present. Dental bleaching is preferred in the treatment of tooth discoloration due to its low-cost aesthetic dentistry procedure and non-invasive approach (Fioresta et al. 2023).

Hydrogen peroxide (HP) is widely used as a dental bleaching agent. It acts through the releasing reactive oxygen species (ROS) that has the ability to reach the pulp through the tooth enamel and dentinal tubules causing decreased cellular metabolism causing a pathologic oxidative condition, lipid peroxidation, as a side effect (Benetti et al. 2017).

Apoptosis is mitochondrial-mediated cell death and is key in homeostatic tissue mechanisms (Benetti et al. 2017). The increase in the mitochondrial membrane permeability due to mitochondrial swelling may trigger the release of cytochrome c that later activates Bax, Bcl-2 and caspase-3 leading to apoptosis (Arrozi et al. 2020).

Vitamin E is a fat-soluble antioxidant molecule that prevents lipid peroxidation by scavenging reactive oxygen species, which is known to possess protective abilities against aging processes. Tocopherol is the predominant isoform of vitamin E and a natural agent with antioxidant and anti-inflammatory properties (Escobar et al. 2020).

Human dental pulp stem cells (hDPSCs) are mesenchymal stem cells (MSCs) exhibiting clonogenicity and capability of self-renewal and have high proliferation rate and multilineage differentiation potential such as neuronal cells, chondroblasts, adipocytes, and osteoblasts. They are ideal for tissue engineering, osteogenesis, and regenerative medicine (Escobar et al. 2020).

Nevertheless, the apoptotic pathway induced by hydrogen peroxide and possible anti-apoptotic effects of alpha-tocopherol on human dental pulp stem cells has not been fully studied; therefore, in this study we evaluated the effect of hydrogen peroxide (HP) on apoptosis in human dental pulp stem cells (hDPSCs) and whether alpha-tocopherol (AT) has protective effects against possible apoptosis in vitro.

## **MATERIALS AND METHODS**

### **Cell line, Cell Culture**

Human dental pulp stem cells were used in the study. DPSCs were cultured and subcultured into T75 cell culture flasks in Minimum Essential Medium Alpha (MEM alpha) modifications with L-glutamine, D glucose (Biological Industries Co.) supplemented with 10% fetal bovine serum (Gibco Co.), 100 IU/mL penicillin, 10 mg/mL streptomycin (Biological Industries Co.) in a humidified incubator (Nuve) with 5% CO<sub>2</sub> and 95% air at 37°C.

Minimum Essential Medium Alpha (MEM alpha) modifications with L-glutamine, D glucose (Biological Industries Co.); supplemented with 10% fetal bovine serum (Gibco Co.), 100 IU/mL penicillin, 10 mg/mL streptomycin (Biological Industries Co.) was used to culture and subculture hDPSCs. Cells were fed in cell culture flasks and placed in a humidified incubator with 5% CO<sub>2</sub>, 37°C (Nuve). The cell medium was refreshed on average every 3-4 days and cell passages were performed when the cells reached 90% confluence.

### **Determination of Cell Viability**

The 100 µM, 200 µM, 500 µM, 1 mM, 2 mM concentrations of alpha-tocopherol (Sigma-Aldrich Co.) in MEM alpha medium were prepared. The cytotoxic effect of alpha-tocopherol on hDPSCs was determined by XTT (sodium 3'-[1-(phenylaminocarbonyl)-3,4-tetrazolium]-bis(4-methoxy-6-nitro)benzene sulfonic acid hydrate) assay. Cells reaching 90% density were removed from the flasks by Trypsin-EDTA solution. Cells were seeded into 96-well microplates with 2.5×10<sup>4</sup> cells per well. The seeded cells were incubated in 100 µL of completed MEM-Alpha for 24 h in a CO<sub>2</sub> incubator at 37°C. After incubation, the media in the wells were refreshed, then different concentrations of alpha-tocopherol were added to the microplate wells and incubated for 24 hours. XTT analysis was performed to evaluate cell viability at the end of the period, with a commercial cell proliferation kit (Biological Industries Co.). The cell medium in the wells of microplate was removed and 50µL of the XTT reaction solution and 50µL of MEM-Alpha were added to each well and the plate was incubated for 4 h at 37°C, 5% CO<sub>2</sub>. After the incubation, the optical densities of cells in microplate were measured with an ELISA microplate reader (Thermo Fisher Scientific) both at a wavelength of 450 nm and at a wavelength of 630 nm at the same time. To measure reference absorbance; a wavelength of 630 nm measurement was subtracted from the 450 nm measurement for all wells. The average of the absorbance values obtained from the control wells was accepted as 100% viable cells. The percentages of viability values in the experimental wells were calculated by comparing the absorbance values obtained from alpha-tocopherol applied wells to the control absorbance value.

### **Determination of the Dosages of alpha-tocopherol and hydrogen peroxide**

According to the results of the XTT analysis, the alpha-tocopherol dosage that provided the highest cell viability to be applied in the experiment was determined as 100 µM.

Hydrogen peroxide dosage applied to hDPSC was determined based on the study of Soares et al. 2014. The reason we choosed this dosage was that they simulated office tooth bleaching in cell culture. They measured the quantity of HP diffused through the tooth enamel and dentin into the cell culture medium as 2 µg/mL.

### **Experimental design**

The following three groups were formed for this study. The first group without treatment (control group); the second group; cells were exposed to 2 µg/mL HP for 30 min, the third group; before 100 µM alpha-tocopherol was applied to cells for 24 h after then 2 µg/mL HP was applied to the same cells during for 30 minutes.

### **Total RNA isolation, cDNA Synthesis and RT- PCR**

Total RNA was isolated from study groups with TRIzol reagent (Invitrogen, USA) according to manufacturer instructions. Complementary DNA (cDNA) synthesis was performed using cDNA synthesis kit, according to the manufacturers' instructions. Quantitative expression analysis of Bax, Bcl-2 were determined by Real-Time PCR (StepOne Plus, Applied Biosystem). The specific binding forward and reverse primer sequences of the associated gene and gene symbols are given in Table 1. Beta Aktin was used as housekeeping gene for normalization of RT-PCR data.

## Statistical analysis

The analysis of the findings was performed using the Delta-Delta Ct method and quantified using the Gene globe analysis platform. In the comparisons of groups with the control, evaluations were conducted using the Student's t-test, and  $p < 0.05$  was considered as the level of significance.

## RESULTS and DISCUSSION

The viability of the human dental pulp stem cells exposed to alpha-tocopherol is shown in Fig. 1. According to the results of the XTT analysis, 100  $\mu\text{M}$  concentrations of alpha-tocopherol provided the highest cell viability (132%) and therefore this concentration was applied in the experiment. 200  $\mu\text{M}$  concentrations of alpha-tocopherol did not reveal a change in cell viability compared to the control group, while the 0.5, 1 and 2 mM concentrations of alpha-tocopherol decreased the cell viability.

The mRNA expression levels of bcl-2 and bax genes of hydrogen peroxide and both hydrogen peroxide and alpha-tocopherol applied to human dental pulp stem cells were determined. The results were normalized using the mRNA expression level of the  $\beta$ -actin reference gene. mRNA expression rates of bcl-2 and bax genes were determined. The mRNA expression levels of all genes were evaluated as 1.0 for the control group and the results were given as fold values compared to the control group. Fold changes levels of bax and bcl-2 are given respectively in Fig. 2.

Although it had been reported hydrogen peroxide-induced apoptosis in human gingival fibroblasts (Gutiérrez-Venegas et al. 2015) and human dental pulp stem cells (Llena et al. 2019) but molecular mechanism of the prevention of apoptosis with antioxidants such as alpha-tocopherol remains unclear.

It has been reported that Bcl-2, anti-apoptotic protein and Bax pro-apoptotic resided in the mitochondrial outer membrane and were involved in mitochondrial-dependent apoptosis pathways by regulating mitochondria membrane permeability. Proapoptotic protein Bax induces cell apoptosis via mitochondrial membrane permeabilization (Gutiérrez-Venegas et al. 2015). In the present study, hydrogen peroxide treatment resulted in significantly increased expression of Bax and Bcl-2 and both hydrogen peroxide and alpha-tocopherol treatment significantly decreased expression of bax and Bcl-2 which played a role via mitochondrial pathways in hydrogen peroxide-induced apoptosis in hDPSCs. Results revealed that hydrogen peroxide exhibited potential to trigger apoptosis in mitochondria pathways as previously reported and alpha-tocopherol also reduced hydrogen peroxide-induced apoptosis.

**Table 1.** Forward and reverse primer sequences designed for use in real time polymerase chain reaction.

Gene Name	Forward	Reverse
<i>Beta-actin</i>	TCCTCCTGAGCGCAAGTACTC	CTGCTTGCTGATCCACATCTG
<i>BCL-2</i>	TGCACCTGACGCCCTTAC	AGACAGCCAGGAGAAATCAAACAG
<i>BAX</i>	TCAGGATGCGTCCACCAAGAAG	TGTGTCCACGGCGGCAATCATC

**Figure 1.** The % change in viability of human dental pulp stem cells (hDPSCs) treated with different concentrations of alpha-tocopherol for 24 hours.

**Figure 2.** Fold changes levels of the control, hydrogen peroxide and both hydrogen peroxide and alpha-tocopherol groups in hDPSCs. Fold changes levels of bax and bcl-2 were examined by RT-PCR.  $\beta$ -Actin was used as a housekeeping gene. RT-PCR, real time polymerase chain reaction ( $p < 0.05$ ).

## CONCLUSION

Hydrogen peroxide showed apoptotic effects and alpha-tocopherol showed anti-apoptotic effects on human dental pulp stem cells. However, further studies are needed to better understand how alpha-tocopherol affects the molecular mechanisms in cell cycle.

#### Abstract

Nanoparticles exhibiting upconversion properties are preferred today due to many advantages such as sharp emission peaks, long fluorescence lifetime, low toxicity, and superior photostability. Upconverting nanoparticles (UCNPs) are often lanthanide-doped and are used in important areas such as bioimaging, biosensors, security systems, and drug delivery systems. UCNPs can absorb low-energy near-infrared (NIR) photons and emit higher-energy photons in the visible (VIS) or UV region. In contrast to UCNPs, luminescent materials exhibiting downconversion (DC) properties (e.g., organic fluorescence, quantum dots, MOFs, and carbon dots) are actively used in applications such as optics, energy, and bioimaging. Carbon dots (CDots, CDs), which exhibit DC properties and hold an important place among carbon-based nanomaterials, are known for their excellent optical properties. UC materials and carbon dots are garnering increasing interest because of their attractive features and wide-ranging applications. Integrating materials with DC and UC properties to create dual-modal luminescent materials is an emerging research topic. The aim of this study is to create a dual-modal luminescent material by integrating rare-earth-doped UC materials with carbon dots, which exhibit DC properties. Firstly, UCNPs were synthesized using a solvothermal method, and then UCNP@CD materials were obtained by integrating CDs into UCNPs using an *in-situ* method. The synthesized DC and UC fluorescent materials were subjected to physical and chemical characterization analyses using high-resolution transmission electron microscopy (HR-TEM), UV/Vis spectrophotometry, Zeta potential, Fourier-transform infrared spectroscopy (FT-IR), and X-ray diffraction (XRD) devices.

**Keywords:** Upconverting, carbon dot, downconverting nanoparticles, solvothermal synthesis

#### INTRODUCTION

Carbon dots, which exhibit characteristics such as low toxicity, biocompatibility, adjustable photoluminescence, and high quantum yield (QY), are prominent research subjects among materials capable of downconversion. Moreover, CDs demonstrate luminescence properties that adhere to Stokes' law (Liu, Li and Yang, 2020.). These properties make CDs valuable in various applications, including biomedical, bioimaging, biosensors, sensors, photocatalytic devices, and photocatalysis devices. These CDs are utilized in various fields such as tumor imaging, drug delivery systems, photoacoustic imaging, photosensitizers, and light-emitting diodes (Himaja, Karthik and Singh, 2015.).

Materials displaying upconversion (UC) characteristics possess several crucial attributes, including low toxicity, sharp emission peaks, and photostability. Rare-earth-doped upconverting materials exhibit enhanced fluorescence properties. UCNPs absorb low-energy near-infrared photons and emit photons in the high-energy visible and ultraviolet regions. Materials with upconversion capabilities are actively used in applications such as optics, bioimaging, biosensors, drug delivery systems, cancer treatment, security systems and pollution analysis (Chen *et al.*, 2014.; Mettenbrink, Yang and Wilhelm, 2022.).

Interest in materials capable of both downconversion and upconversion is steadily growing, expanding the scope of research. In recent years, there has been a focus on integrating two different dual-mode luminescent materials capable of both downconversion and upconversion. Fluorescent CDs and rare-earth-doped UCNP materials have been integrated into various studies. Wu and colleagues have introduced a simple solvothermal method for synthesizing dual-mode luminescent NaYF<sub>4</sub>:Yb, Er(Tm)/CD composites for anti-counterfeiting barcodes. In this study, CDs exhibited relatively weak adsorption on the surface of UC materials (Wu *et al.*, 2016.). Sun and colleagues have used CD-modified NaYF<sub>4</sub>:Yb, Er nanoparticles (UCNPs@CDs) as

fluorescent nanoprobe for the simultaneous detection of  $\text{Fe}^{2+}$  and  $\text{Fe}^{3+}$  ions (Sun *et al.*, 2021.). Wang and colleagues have modified the surface of UCNP with ATP-sensitive CDs to develop an upconversion nanoprobe activated by lysosomal ATP for ratiometric imaging of hepatotoxicity (Wang *et al.*, 2022.). Research continues to improve the absorbance and dual-mode fluorescence properties of developed UCNP@CD materials.

In this current study, the aim is to synthesize dual-mode luminescent nanomaterials capable of downconversion and upconversion through the *in-situ* method using solvothermal synthesis and the combination of UCNP and CD. Thus, by integrating UCNP with CDs, UCNP@CDs are expected to possess the optical properties of both UCNP and CDs, thanks to their excellent optical characteristics

## MATERIALS AND METHODS

All chemicals used in the synthesis of the materials were used without purification. Yttrium (III) chloride hexahydrate ( $\text{YCl}_3 \cdot 6\text{H}_2\text{O}$ ), Ytterbium (III) chloride hexahydrate ( $\text{YbCl}_3 \cdot 6\text{H}_2\text{O}$ ), Erbium (III) chloride hexahydrate ( $\text{ErCl}_3 \cdot 6\text{H}_2\text{O}$ ), Ammonium fluoride ( $\text{NH}_4\text{F}$ ) were purchase from Sigma-Aldrich. NaOH and urea were purchase from IsoLab. Ethanol was provide from Tekkim. Lemon salt was procured from local supermarket. Ultrapure water used throughout all the experiments was purified by the Milli-Q system (Millipore Inc.,  $\Omega=18 \text{ M}\Omega \text{ cm}$ ).

### Synthesis of Upconverting Nanoparticles (UCNP)

$\text{NaYF}_4:\text{Yb, Er}$  UCNP were prepared according to a literature procedure (Tan *et al.*, 2019.; Sun *et al.*, 2021.). In brief, 0.15 mmol  $\text{YCl}_3 \cdot 6\text{H}_2\text{O}$ , 0.05 mmol  $\text{YbCl}_3 \cdot 6\text{H}_2\text{O}$ , and 0.0006 mmol  $\text{ErCl}_3 \cdot 6\text{H}_2\text{O}$  were first mixed in a beaker in ethanol/water (1:1 (v/v)) until a homogeneous solution was obtained. Oleic acid (OA) was added to the homogeneous solution. Then, in a separate beaker, a solution prepared in ethanol/water (1:1 (v/v)) containing NaOH (0.4 g) and  $\text{NH}_4\text{F}$  (0.05 g) was added drop by drop to this solution and stirred for 10 minutes on a magnetic stirrer. The final solution was transferred to a 100 mL Teflon-lined autoclave and subjected to heat treatment at  $200^\circ\text{C}$  for 7 hours. After the reaction, the obtained UCNP's were collected by centrifugation at 8000 rpm for 5 minutes, and the precipitate was washed three times with ethanol. Finally, the product was dried at  $60^\circ\text{C}$  for 12 hours.

### Carbon Dot (CD) Synthesis

The synthesis of carbon dots was carried out by modifying a procedure from the literature (Alas *et al.*, 2019.). Initially, 0.12 g of citric acid and 0.12 g of urea were dissolved in EtOH:water (1:1 (v/v)). The resulting homogeneous solution was transferred to a 100 mL Teflon-lined autoclave and subjected to heat treatment at  $200^\circ\text{C}$  for 7 hours. After the reaction, the brown solution was centrifuged at 8000 rpm for 5 minutes, and the supernatant was collected. Finally, the product was dried at  $60^\circ\text{C}$  for 12 hours.

### UCNP@CD Synthesis

In-situ integration of CDs into the obtained UCNP powder was achieved. In a beaker, citric acid and urea were dissolved in ethanol/water (1:1 (v/v)) until a homogeneous solution was obtained. This homogeneous solution was then added to a separate beaker containing a UCNP aqueous solution. The final mixture was transferred to a 100 mL Teflon-lined autoclave and subjected to heat treatment at  $200^\circ\text{C}$  for 7 hours. After the reaction, the UCNP were collected by centrifugation at 8000 rpm for 5 minutes, and the precipitate was washed three times with ethanol. Finally, the product was dried at  $60^\circ\text{C}$  for 12 hours.

## RESULT and DISCUSSION

As shown in Scheme 1, UCNP@CD were prepared by mixing UCNP with CD precursors followed by an easy and simple in situ solvothermal process.

**Scheme 1.** Schematic illustration of synthesis of UCNP@CD by in-situ solvothermal.

Figure 1 shows digital images of the fabricated samples under 650 nm and 980 nm laser excitation. CDs exhibit faint radiation at 650 and 980 nm. However, when CDs are integrated into UCNPs, the radiation reflected by UCNP@CD under the laser is visibly more intense compared to UCNPs.

**Figure 1.** The digital images of CD, UCNP, and UCNP@CD under 650 nm and 980 nm laser excitation.

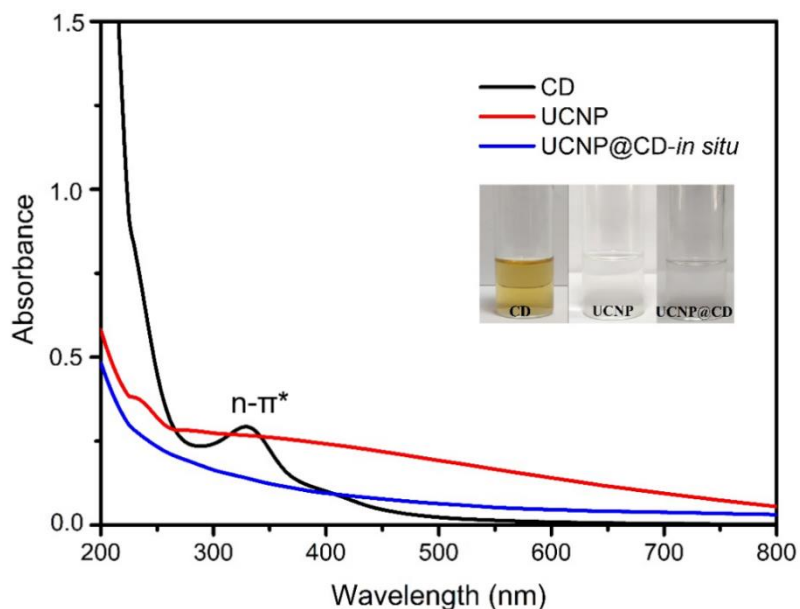

Under laser excitation at 650 nm and 980 nm, CD exhibits lower fluorescence compared to UCNP, but the fluorescence properties of UCNP@CD noticeably increase as a result of integrating the two materials.

**Figure 2.** Zeta potentials of CD, UCNP, and UCNP@CD.

The zeta potentials of CD, UCNP, and UCNPs@CDs were measured in an aqueous environment and are shown in the Figure 2. The zeta potentials of CD, UCNP, and UCNPs@CDs were  $-5 \pm 1.12$  mV,  $-47.73 \pm 3.55$  mV, and  $-26.9 \pm 0.1$  mV, respectively. It can be observed that the zeta potential of CD is opposite to that of UCNP, allowing the two particles to come together and form a compound due to the attraction of opposite poles. Additionally, the increase in zeta potential of UCNP@CDs compared to UCNP is attributed to the presence of numerous amine ( $-\text{NH}_2$ ) groups on the surface of CD. This indicated that CDs successfully changed the surface charge of UCNPs and loaded onto the surface.

**Figure 3.** UV/Vis absorption spectra of CD, UCNP, and UCNP@CD

Figure 4 shows the optical UV/Vis spectrum of CD, UCNP, and UCNP@CDs. CDs exhibited a maximum absorption peak at around 330 nm, attributed to the  $n-\pi^*$  transition of  $\text{C}=\text{O}$  or  $\text{C}=\text{N}$  bonds. UCNPs showed strong optical absorption in the UV region, along with a tail extending into the visible region. In the UV-Vis spectrum of UCNP@CDs, the peak points corresponding to CDs were not observed, likely due to the dominant optical contribution of UCNPs over CDs. UCNP@CDs, similar to UCNPs, exhibited strong optical absorption in the UV region with a tail extending into the visible region.

**Figure 4.** XRD spectra of UCNP and UCNP@CD.

The X-ray diffraction (XRD) patterns of the synthesized UCNP and UCNP@CD are presented in the Figure 4. The XRD profile of UCNPs clearly demonstrates the crystallization phase (JCPDS 28-1192) (Sun *et al.*, 2021.). The XRD pattern of UCNP@CDs shows well-crystallized structures identical to those of UCNPs. This indicates that the crystallographic structure of NaYF<sub>4</sub>:Yb, Er was preserved during the modification process.

**Figure 5.** HR-TEM images of (A) CD, (B) UCNP, and (C) UCNP@CDs (Inset images: magnified views showing lattice spacing).

The morphological images of the synthesized materials were examined using HR-TEM analysis. CD nanoparticles appear to be uniformly spherical in shape, with an average particle size distribution of  $5.49 \pm 1.62$  nm (Figure 5A). As shown in Figure 5B, UCNPs also exhibit a spherical shape with a homogeneous distribution and an average particle size of  $4.06 \pm 1.20$  nm. All nanoparticles displayed similar shapes and uniform sizes. A lattice spacing of 0.28 nm was observed in UCNPs, corresponding to the (200) plane of the  $\alpha$ -phase NaYF<sub>4</sub>:Yb, Er (Janjua *et al.*, 2018.). UCNP@CDs exhibited a core-shell structure, with the shell thickness measuring approximately 1.5 nm (Figure 5C). However, the absence of the crystal structure of CD within the UCNP structure indicates that the added CDs are amorphous.

## CONCLUSION

As a result of the study, UCNP@CDs were successfully obtained by integrating CD and UCNP using the *in situ* solvothermal synthesis method. It was observed that under laser excitation at 650 nm and 980 nm, integrated UCNP@CD exhibited brighter fluorescence properties compared to CD and UCNP. Based on the zeta potential results, UCNP displayed a more negative value compared to CD. The integrated material obtained from the combination of these two materials exhibited intermediate properties between UCNP and CD. This indicates the successful synthesis of UCNP@CD. According to the UV-VIS analysis results, UCNP@CD did not show the characteristic 330 nm peak of CD. Instead, the integrated material exhibited strong optical absorption properties in the UV region, similar to UCNP. This dominance of UCNP over CD is reflected in the graphical results. XRD results indicated that the integrated material UCNP@CD retained the crystal characteristics of UCNP, confirming the successful integration of the two materials. Evaluation of HR-TEM analysis results revealed that CD, UCNP, and UCNP@CD were spherical in shape, homogeneously distributed, and that UCNP@CD had a core-shell structure. These materials can be used as promising candidates in applications such as anti-counterfeiting and excellent optical probes for multicolor cell imaging.

## ACKNOWLEDGEMENTS

I would like to express my gratitude to my advisor, Associate Professor Dr. Rükân GENÇ ALTÜRK, and my co-advisor, Dr. Melis Özge ALAŞ ÇOLAK, for their guidance and support. I also extend my thanks to my colleagues in the FUNGROUP for their support throughout the study.

#### Abstract

Doxorubicin, an anthracycline antibiotic, is commonly used antineoplastic agent against different solid tumors and hematological malignancies. The most serious dose limiting side effect is cardiotoxicity which can occur in both acute and chronic form and characterized with loss of cardiac functions, arrhythmia, and heart failure. Because of wide spectrum usage of doxorubicin, there are numerous studies in literature about molecular mechanisms of doxorubicin induced cardiotoxicity. In these studies, rat or mice models are commonly employed due to their cardiovascular system closely resembling to human. These studies utilize varying dosages and dosing schedules to assess the extent of doxorubicin's cardiotoxicity. However, in the current study, the aim is to focus on comparing two specific dosing schemes. Male Sprague-Dawley rats were grouped as; 1) Control group; 2) DoxA group (5 mg/kg i.p. injections on day 1, 3, 5), and 3) DoxB (10 mg/kg i.p. single injection on day 1). In all groups, firstly blood samples were taken intracardially and then isolated hearts were perfused by Langendorff system on day 7. Heart coronary perfusion pressure and heart rate per minute were measured. Moreover, the left ventricle of the heart tissue samples was fixed in formalin 10% for histopathological studies. Our findings indicate that a single 10 mg/kg doxorubicin injection increased coronary perfusion compared to DoxA group ( $p<0.05$ ). Furthermore, creatine kinase levels in blood also increased significantly more in DoxB group ( $p<0.05$ ). MDA analysis showed that both dosing schemes significantly increased MDA levels by comparing with control group ( $p<0.05$ ), with no statistically significant difference between the DoxA and DoxB groups ( $p>0.05$ ). The histopathological analysis further confirmed that DoxB grouped sustained more severe damage compared to DoxA group. In summary, the present study provides comprehensive evidence that a single 10 mg/kg doxorubicin dose induces more severe cardiotoxic effects than repeated doses.

**Keywords:** Doxorubicin, Cardiotoxicity, Perfusion Pressure

#### INTRODUCTION

Doxorubicin, an anthracycline antibiotic obtained from *Streptomyces peucetius* var. *Caesius*, is one of the commonly used antineoplastic agents against several solid tumors and hematologic malignancies in both adult and children (Sawicki et al., 2021). The major dose limiting side effect of doxorubicin is cardiotoxicity which clinically characterized with deterioration of cardiac functions, arrhythmia, cardiomyocyte function loss, heart failure. Besides these irreversible and deleterious side effects, doxorubicin also causes nephrotoxicity, neurotoxicity, and hepatotoxicity (Octavia et al., 2012). Due to the fact that doxorubicin is an important wide spectrum chemotherapeutic agent, there are several studies to understand the molecular mechanism of its cardiotoxicity and ameliorate cardiac functions such as designing of different analogues or co-usage of various antioxidants and iron chelators (Li et al., 2000, Cusack et al., 2006; Hole et al., 2014; Ozgen et al., 2016 & 2022; Yu et al., 2020). It has been proven that molecular mechanism of doxorubicin cardiotoxicity includes activation of programmed cell death pathways induced by elevated oxidative stress and reactive oxygen species levels. However, the exact mechanism has not been solved yet and all the previous attempts only provided

limited alleviation on cardiac functions. Therefore, the mechanism of doxorubicin cardiotoxicity remains still unclear and there are still numerous ongoing studies on preclinical phase (Rawat et al., 2021).

In the studies about doxorubicin cardiotoxicity, laboratory animal models are commonly employed due to possessing very similar and intact cardiovascular system to human and they could provide remarkably valuable information especially about the effects of experimental therapeutics. Therefore, establishment of high degree doxorubicin cardiotoxicity in laboratory animal models is highly essential (Hayward et al., 2007). In a literature survey, it can be easily found that there are several different dosages and dosing schedules to produce doxorubicin cardiotoxicity in laboratory animal models (Ozgen et al., 2016; Hole et al., 2014; Yu et al., 2020). The dosing schedules can be mainly divided into two groups: single dose injection and repeated injections. Both dosing schedules generated different levels of cardiotoxicity in animal models (Najafi et al., 2020). The aim of the current study is to investigate the difference between these two main groups about the establishment of doxorubicin cardiotoxicity by using the Langendorff model in regard to physiological, biochemical and histopathological manners.

## MATERIALS AND METHODS

Doxorubicin Hydrochloride were purchased from Sigma Aldrich (Germany); Ketamin Hydrochloride from Pfizer (USA); Ksilazin from Bayer (Germany); and Heparin from Roche (Switzerland). Unless otherwise mentioned, all other reagents were purchased from Sigma Aldrich (Germany).

### Pharmacological Experiments

Thirty-two adult male Sprague-Dawley rats, 250-300 g in weight were purchased from the Department of Medical Science Application and Research Centre of Dicle University (DUSAM), Diyarbakır. All rats were fed with standard diet and tap water, and all experiments were performed according to the "Guide for Care and Use of laboratory Animals" (National Institutes of Health publication 85-23, revised 1985). The experimental protocol was approved by the Dicle University Animal Research Ethics Committee (DUHADEK 2018/21).

The animals were divided into 3 groups (n=8);

**Control Group:** single intraperitoneal (i.p.) injection of 1 ml of sterile saline on day 1 and sacrificed on day 7.

**Doxorubicin A (DoxA) Group:** 5 mg/kg i.p. of doxorubicin injection respectively on day 1, 3, 5 and sacrificed on day 7.

**Doxorubicin B (DoxB) Group:** single i.p. injection of 10 mg/kg of doxorubicin on day 1 and sacrificed on day 7.

In all groups, seven days after first injection, rats were anesthetized with intramuscular injection of 100 mg/kg ketamine and 15 mg/kg xylazine. After heparinization with 500 IU/kg through femoral vein for purpose of preventing a coagulation during procedure, hearts were isolated and immediately cannulated through the aorta and placed to the Langendorff system. In this system, hearts were perfused with Krebs solution (aspirated with 5% CO<sub>2</sub> and 95% O<sub>2</sub> mix) at 11 ml/min constant flow rate. After 30-45 min stabilization period, perfusion pressure values were measured by pressure transducer located at infusion cannula and heart rates were recorded through electrodes placed on isolated heart. All the measured values were recorded by Biopac MP 30 software (Biopac Systems).

### Biochemical Analysis

In all groups, the obtained heart tissue samples were stored at -80°C until further experiments. Tissue malondialdehyde (MDA) levels, an indicator of lipid peroxidation, were measured by the thiobarbutyric acid (TBA) method in non-perfused heart samples of all groups. In this method, firstly heart tissue samples were homogenized by adding cold TCA mixture (1 ml of 10% TCA and 8 ml of 5% TCA per 1 g tissue) and then centrifuged at 13000 rpm for 20 minutes. Next to collecting supernatant into a new eppendorf tube, an equal volume of 0,67 % TBA solution was added and heated to 100°C for 10 minutes. 1,1,3,3-tetraethoxypropane, standard for MDA analysis, was also studied under same conditions. Finally, UV absorptions of all samples were measured at a wavelength of 532 nm by using spectrophotometer. The absorption spectrum was recorded in the range of 480-600 nm. The MDA concentrations were calculated using the molarity coefficient (1.56x10<sup>5</sup>) reported by Jordan and Scenkman. The results were defined as nmol/gr of tissues.

## Histopathological Studies

In all groups, the left ventricle of the heart samples was fixed in formalin 10% until histopathological studies. The tissue specimens were blocked by embedding in paraffin in the casting device (Thermo, Histostar) after histological tissue follow-up process with an automatic tissue tracking device (Thermo, Excelsior AS). 4-5  $\mu\text{m}$  thick cross-section from the left ventricle of specimens were taken from the paraffined blocks with a microtome device (Leica, RM2245). Next to the deparaffinization, the sections were stained with Hematoxylin-Eosin (H&E) by standard methods in an automatic staining device (Shardon, Varistain Gemini). At the end, the heart samples were examined by a light microscope (Nikon, Eclipse 50i) for histopathological evaluation.

## Statistical Analysis

In all experiments, the obtained data were expressed as arithmetic mean  $\pm$  standard deviation. Statistical analyzes were performed using the SPSS program 11.0 (Chicago, ill., USA). Kruskal Wallis test was used to evaluate the difference between the groups. The difference between the two groups was calculated using the Mann-Whitney U test. Significance level was accepted as  $p < 0.05$  in all statistical analyzes.

## RESULTS

### Pharmacological Results

The obtained coronary perfusion pressure and heart rate data from the isolated hearts perfused by Langendorff system according to groups were shown in Figure 1 and Figure 2, respectively. It was found that there was a statistically significant increase of each parameter in both DoxA and DoxB groups compared to the control group ( $p < 0.05$ ). When the DoxA and DoxB groups were compared, it was seen that a single dose of 10 mg/kg doxorubicin statistically more increased the coronary perfusion pressure in DoxB group ( $p < 0.05$ ). Although there was a more increase in heart rate of DoxB group, it was not statistically meaningful due to  $p > 0.05$ .

**Figure1:** Perfusion pressure and heart rate in all groups (a-k  $p < 0,05$ ; b-k  $p < 0,05$ ; b-a  $p < 0,05$ )

Figure 2: Heart rate (beat/min) in all groups (a-k  $p < 0,05$ ; b-k  $p < 0,05$ ; b-a  $p > 0,05$ )

### Biochemical Results

In Figure 3, the cardiac tissue MDA analysis results, the end product of lipid peroxidation, were shown and it can be inferred that doxorubicin injections significantly increased MDA levels in comparison to control group ( $p < 0,05$ ). When Dox groups were compared, there was not a statistically significant difference between DoxA and DoxB groups ( $p > 0,05$ )

Figure 3: Cardiac tissue MDA levels in all groups (a-k  $p < 0,005$ ; b-k  $p < 0,005$ ; a-b  $p > 0,05$ )

### Histopathological Results

In histopathological examinations, cardiac tissue specimens were evaluated in terms of intracellular vacuolization, nuclear degeneration, cytoskeletal cardiomyocyte degeneration, intercellular edema, neutrophilic and lymphoplasmocytic infiltration, macrophage infiltration, necrosis, apoptosis, fibrosis. As seen in figure 4, doxorubicin injected groups showed significant cardiomyocyte degeneration and focal nuclear degeneration by comparing to control group. While significant cardiomyocyte degeneration characterized by a significant increase in the cytoplasm and a tendency to disperse, loss of cytoskeletal organization and striation, and indistinct cytoplasmic borders and focal nuclear degeneration was observed in DoxB group, only moderate significant cardiomyocyte degeneration was found in DoxA group. Besides that, heterogeneously distributed vesicular chromatin pattern, irregular nuclear membrane and markedly degenerated nuclei characterized by marked enlargement were also demonstrated in DoxB group.

**Figure 4:** Photomicrographs of hematoxylin and eosin-stained sections of heart tissue. Control group (40x10 and 100x10; a and b, respectively); DoxA group (40x10 and 100x10; c and d, respectively); DoxB group (40x10 and 100x10; e and f, respectively).

## DISCUSSION

Doxorubicin is one of the mostly used antineoplastic therapeutic agent against various cancer types. Cardiotoxicity is the most life threatening side effect of Doxorubicin both in acute or chronic usage (Sawicki et al., 2021). There are several previous and ongoing studies aiming to understand and improve treatments for the mechanisms of doxorubicin cardiotoxicity (Octavia et al., 2012). Most of these studies usually have been performed by using laboratory animal models thanks to the similarity of their cardiovascular system and being reliable, well-accepted and cost-effective (Hayward et al., 2007).

In literature, different doses and dosing schemes are used for investigation of the mechanism of doxorubicin induced cardiotoxicity. There are two main groups about dosing scheme: single dose or repeated injections (Najafi et al., 2020). For instance, while repeated injections of 10 mg/kg doxorubicin respectively on day 1, 3, and 5 were performed in the study of Yu et al. in 2020, a single dose of 10 mg/kg doxorubicin was injected on day 1 in the study of Ozgen group (Yu et al., 2020; Ozgen et al., 2022). There are several more examples of

different dosing schedules that are recently analyzed in two different comprehensive review (Najafi et al., 2020; Sritharan and Sivalingam, 2021). In this study, the aim was to compare of these two main dosing schedules of doxorubicin by different analyses.

In the first dosing schedule, DoxA group, 5 mg/kg doxorubicin was injected on day 1, 3, and 5; and sacrifice was performed on day 7. However, in the second dosing schedule, DoxB group, a single injection of 10 mg/kg doxorubicin was injected on day 1; and sacrifice was performed on day 7. In all groups, hearts were isolated, cannulated through aorta and perfused with Krebs-Henseleit solution by Langendorff system. The coronary perfusion pressure values and heart rates were recorded. In accordance with literature, it was found that doxorubicin injection was significantly increased perfusion pressure and heart rate comparing to control group that indicates doxorubicin-induced cardiac dysfunction (Renu et al., 2018, Varga et al., 2015). Elevated tissue MDA levels pointed out that there was a generation of ROS and oxidative stress in induced cardiac damage as in previous studies (Sheibani et al., 2020). After being clear about production of cardiotoxicity in doxorubicin injected groups, two dosing schedules were compared. Firstly, coronary perfusion pressure was statistically significantly higher in DoxB group. When the heart rates were compared, although there was more increment in DoxB group, the statistical analysis revealed that the difference was not significant. Moreover, MDA analysis also indicated that there was not a statistically significant difference between DoxA and DoxB groups that can be concluded that both dosing schedules revealed similar degree of oxidative stress.

Our histopathological findings were also in accordance with both our other results and literature (El-Agamy et al., 2016). It is observed that there is a doxorubicin induced tissue damage such as cardiomyocyte degeneration and focal nuclear degeneration compared to control group. While, every other day injection of doxorubicin in DoxA group generated moderate significant cardiomyocyte degeneration, very significant cardiac damage was observed in DoxB group characterized by a significant increase in the cytoplasm and a tendency to disperse, loss of cytoskeletal organization and striation, and indistinct cytoplasmic borders and focal nuclear degeneration, heterogeneously distributed vesicular chromatin pattern, irregular nuclear membrane and markedly degenerated nuclei.

## CONCLUSION

All in all, the present study revealed that a single dose of 10 mg/kg doxorubicin generated higher degree of cardiotoxicity than repeated doses based on perfusion pressure, heart rate, and histological analysis results; while MDA experiment results indicate a similar level of toxicity.

#### Abstract

*Helichrysum arenarium* (L.) Moench is a perennial herbaceous plant native to Europe, Central Asia, and China that belongs to the Asteraceae family. Flavonoids, chalcones, phenolic acids, coumarins, and pyrones are abundant in the blooms of *Helichrysum arenarium*. Furthermore, these flowers have antiviral, anti-inflammatory, antiproliferative, antibacterial, antiallergic, antioxidant, antiradical, cholinergic, hepatoprotective, and detoxifying capabilities. These qualities support a wide range of applications, including those in pharmacy, alternative medicine, and natural treatment. The aim of this study is to obtain oil from the health-beneficial *Helichrysum arenarium* plant by utilizing traditional maceration method and allowing it to steep in olive oil for one month, and to determine some bioactive properties of this oil. In this context, analyses of total carotenoid, total chlorophyll, total phenolic, total flavonoid contents and DPPH-radical scavenging activity were performed on both *Helichrysum arenarium* (L.) plant and its oil. When the analysis results were examined, it was concluded that *H. arenarium* oil contained higher carotenoids ( $8.80 \pm 0.45^a$  mg/kg) compared to the plant ( $1.22 \pm 0.06$  mg/kg) and also contained more phenolic contents ( $72.48 \pm 3.93^a$  mg GAE/100 g), flavonoids ( $2148.19 \pm 16.64^a$  mg QE/100 g) and antioxidant activity ( $46.30 \pm 1.09^a$  mM Trolox/100 g) compared to olive oil (TPC:  $52.61 \pm 1.84^b$  mg GAE/100 g; TFC:  $1938.63 \pm 12.89^b$  mg QE/100 g; DPPH:  $29.36 \pm 1.44^b$  mM Trolox/100 g). To facilitate comparative assessment of the analysis outcomes, identical analyses have also been carried out in olive oil. The richness of bioactive compounds in the *Helichrysum arenarium* plant has facilitated the achievement of quality oil.

**Keywords:** antioxidant, *Helichrysum arenarium* (L.), maceration, olive oil, phenolic

#### 1. Introduction

*Helichrysum arenarium* (also known as sandy everlasting) is a herbaceous perennial plant in the Asteraceae family, native to Europe, Central Asia, and China (Pljevljakušić et al., 2018). It is a compact semi-rosette shrub, typically 15-40 cm tall, with flowers that can be citric-yellow, yellow-brown, dark orange, or even orange-brown (Judzentiene et al., 2022). The Asteraceae family is the biggest flowering plant family, with over 1,600 genera and 23,000 species found in a variety of climates and areas across the world. (Babotă et al., 2018).

*H. arenarium* Moench has a long history of use in European alternative medicine as a medicinal plant with several documented benefits; it supports its use for digestive issues, a sense of fullness, and bloating, and, most significantly, no serious negative effects have been observed (Kramberger et al., 2021). In many publications, it is reported that this plant exhibits various biological activities, including antimicrobial, antimalarial, antioxidant, antidiabetic, anti-inflammatory, antiviral, and anti-tuberculosis activities (Bajrami et al., 2023). *H. arenarium* (L.) Moench is abundant in polyphenols and its infusions offer advantageous effects for individuals with metabolic syndrome (Petelin et al., 2022). *Helichrysum* species have found applications in numerous traditional medicines, as flavoring agents and dietary supplements, as well as for ornamental, cosmetic, and pharmaceutical purposes (Judzentiene et al., 2022). *Helichrysum* species have been utilized as herbal tea in Turkey for centuries due to their bile-regulating and diuretic properties, particularly for addressing gallbladder disorders (Eroğlu et al., 2010).

Among the various components identified (including flavonoids, coumarins, phthalides,  $\alpha$ -pyrone derivatives, terpenoids, essential oils, volatile compounds, and fatty acids), the most significant ones are the flavonoids

(Czinner et al., 2000). So far, approximately 40 distinct flavonoids have been detected in the inflorescence of *H. arenarium*, with chalcone isosalipurposide and the isomers of flavanone naringenin being the predominant ones (Ivanović et al., 2021).

Many research have been conducted to support the use of *H. arenarium* for its health benefits. Umaz et al. (2020) used a technique called SPME/GC-MS to identify the volatile compounds in *H. arenarium* plants from two different locations. They found nearly 30 volatile compounds in both regions, including  $\alpha$ -selinene,  $\alpha$ -pinene,  $\alpha$ -humulene, and limonene, which are known to have numerous health benefits. Another study found that flavonoids are responsible for sandy everlasting flower extracts' cholagogue action. *H. arenarium* inflorescence includes three forms of flavonoids: flavonols, flavones, and flavanones. The chalcone isosalipurposide and the flavanones naringenin and naringenin-5-O-glucoside are the primary components of sandy everlasting (Dănilă-Guidea et al., 2022).

In this study, it was aimed to obtain oil from the *H. arenarium* plant by using the maceration method, keeping it in olive oil for one month. Furthermore, the study aims to evaluate several bioactive properties associated with this oil. In this regard, the analyses of the total carotenoid, total chlorophyll, total phenolic, total flavonoid contents, and DPPH-radical scavenging activity was conducted for both the *H. arenarium* (*L.*) plant and its derived oil. To enable a meaningful comparative assessment of the analysis results, identical analyses were also performed using olive oil as a reference. The comparative analysis reveals that *H. arenarium* oil consistently exhibits statistically higher values when compared to olive oil. The abundance of bioactive compounds within the *H. arenarium* plant has played a pivotal role in the production of high-quality oil.

## 2. Materials and Method

### 2.1. Materials

*H. arenarium* plant was obtained from a local herbalist, and olive oil was obtained from the market. In order to obtain oil by the maceration method, *H. arenarium* plant was placed in a transparent glass container and completed with natural extra virgin olive oil. It was kept in a place exposed to sunlight for 1 month. At the end of 1 month, it was filtered and stored in amber colored bottles at +4°C until analysis. *H. arenarium* oil as shown in Figure 1.

Fig. 1 *Helichrysum arenarium* oil

### 2.2. Standarts and reagents

Sigma-Aldrich (St. Louis, MO, USA) provided the Folin-Ciocalteu's phenol reagent, gallic acid, quercetin, 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical, and 6-hydroxy-2,5,7,8-tetramethylchromane-2-carboxylic acid (Trolox). All reagents of analytical or chromatographic grade were obtained from Merck (Darmstadt, Germany) or Sigma-Aldrich.

### 2.3. Extraction of Bioactive Components and total phenolic, total flavonoids, total carotenoid, total chlorophyll content and DPPH-radical scavenging activities of *Helichrysum arenarium* plant and oils

Total antioxidant activity, total phenolic, and total flavonoid levels were determined using methanolic extract. In brief, the *H.arenarium* plant, oil, and olive oil were extracted using MeOH at a sample:solvent ratio of 1:20, vortexing for 30 seconds, and centrifugation at 6000 rpm for 20 minutes. Total phenolic contents of *H. arenarium* plant, oil and olive oil were determined according to the Folin-Ciocalteu assays proposed by Alvarez-Parilla et al. (2011) and Gutfinger et. al. (1981), respectively, expressed as mg gallic acid equivalent (GAE) per kg of sample using calibration curves ( $R^2 = 0.9981$ ). The total flavonoid content of methanolic

extracts was calculated using the technique proposed by Dewanto et al. (2002). Results were reported as mg quercetin equivalents (QE) per kg of sample using a calibration curve ( $R^2 = 0.9900$ ). Total antioxidant activity of *H. arenarium* plant, oil, and olive oil were determined using the DPPH-radical scavenging assays developed by Brand-Williams et al. (1995), Singh et al. (2002), and Rotondi et al. (2004), respectively. The results were expressed as millimoles Trolox equivalent (TE) per kg of sample by a Trolox calibration curve ( $R^2 = 0.9928$ ). Total carotenoid contents of *H.arenarium* plant, oil and olive oil were spectrophotometrically determined according to the methods suggested by Guizhen et al. (2007) and Franke et al. (2010), Total chlorophyll contents of *H. arenarium* plant, oil and olive oil were spectrophotometrically evaluated according to the methods suggested by Donlao and Ogawa (2019).

#### 2.4. Statistical Analysis

All assays were performed in triplicate. The findings were subjected to one-way ANOVA in SAS using the General Linear Model (PROC GLM) technique. (Version 8.2, Sas Institute, Inc., Cary, NC, USA). Duncan's test was used to compare differences.

### 3. Results

The chemical characteristics of *H. arenarium* plant were given in Table 1.

**Table 1** The chemical characteristics of *H.arenarium* plant

	Total Chlorophyll (mg/kg)	Total Carotenoid (mg/kg)	Total Phenolic Content (mg GAE/100 g)	Total Flavonoid Content (mg QE/100 g)	DPPH (mM Trolox/100 g)
<i>Helichrysum arenarium</i>	28.99±0.15	1.22±0.06	1477.03±6.05	4355.13±7.68	767.86±1.04

The chemical characteristics of *H.arenarium* oil and extra virgin olive oil were given in Table 2.

**Table 2** The chemical characteristics of *H. arenarium* oil and extra virgin olive oil

	Total Chlorophyll (mg/kg)	Total Carotenoid (mg/kg)	Total Phenolic Content (mg GAE/100 g)	Total Flavonoid Content (mg QE/100 g)	DPPH (mM Trolox/100 g)
<i>Helichrysum arenarium</i> Oil	6.21±0.01 <sup>a</sup>	8.80±0.45 <sup>a</sup>	72.48±3.93 <sup>a</sup>	2148.19±16.64 <sup>a</sup>	46.30±1.09 <sup>a</sup>
Extra Virgin Olive Oil	4.60±0.14 <sup>b</sup>	6.69±0.37 <sup>b</sup>	52.61±1.84 <sup>b</sup>	1938.63±12.89 <sup>b</sup>	29.36±1.44 <sup>b</sup>

Mean values in the same column with different superscript letters are significantly different ( $p < 0.05$ ).

#### 4. Discussion

The chemical properties of the *H. arenarium* plant and its oil obtained by the maceration method are given in Tables 1 and 2. Phenolic compounds are responsible for the color, flavor, and odor of many foods, and they are also important for human health. When the total phenolic content were examined, it was found that the GAE was  $52.61 \pm 1.84$  mg/100 g extra virgin olive oil sample, while the GAE was  $72.48 \pm 3.93$  mg/100 g in *H. arenarium* oil and  $1477.03 \pm 6.05$  mg/100g in *H. arenarium* plant. *H. arenarium* oil has more phenolic substances than olive oil, which is likely due to the high bioactive content of the *H. arenarium* plant. The maceration method was able to transfer the phenolic compounds from the plant to the oil, but the amount of phenolic content in the oil was not as high as the amount in the plant. Based on previous research in this subject, Izol (2021) found that the total phenolic substance content in extracts obtained by maceration from *Salvia sclarea* L. plants ranged from 15.74 to 79.37 mg GAE/g. Ivanović et al., (2021) found the total phenolic content of  $6.23 \pm 0.18$  mg GAE/100g as a result of ultrasound-assisted extraction of the *H. arenarium* plant. Stankov et al., (2020) obtained essential oil from the *H. arenarium* plant by hydrodistillation method. When the results were examined, it was determined that the total phenolic content was  $7.56 \pm 0.08$  mg GAE/100 g. Studies show that maceration is a more effective oil extraction method for preserving total phenolic content.

Total flavonoid content in *H. arenarium* plant was  $4355.13 \pm 7.68$  mg QE/100 g. It was  $2148.19 \pm 16.64$  mg QE/100 g in *H. arenarium* oil and  $1938.63 \pm 12.89$  mg QE/100 g in extra virgin olive oil. The maceration method was able to transfer the flavonoid compounds from the plant to the oil, but the amount of flavonoid contents in the oil was not as high as the amount in the plant. Stankov et al. (2020) obtained oil from the *H.arenarium* plant by ethanol maceration method; as a result of this study, they determined the total flavonoid content as  $3.34 \pm 0.15$  mg QE/100 g. Obtaining oil by maceration using olive oil has a higher effect on flavonoid content. Cacique et al. (2020) found that the total flavonoid content of *Catharanthus roseus* (L.) obtained by the maceration method is  $19.98 \pm 0.18$  mg QE/100 g. Tohidi et al. (2017) compared the total flavonoid content of 14 different thyme species and found that *T. vulgaris* has the highest flavonoid content ( $8.55 \pm 0.04$  mg QE/100 g), while *T. serpyllum* has the lowest flavonoid content ( $1.89 \pm 0.04$  mg QE/100 g). When compared to these studies, it is seen that the total flavonoid content of the *H. arenarium* plant is seen to be higher.

Carotenoids are important compounds with both color and antioxidant properties. When the total carotenoid content were examined, it was found that the TCC was  $6.69 \pm 0.37$  mg/100 g extra virgin olive oil sample, while the TCC was  $8.80 \pm 0.45$  mg/100 g in *H. arenarium* oil and  $1.22 \pm 0.06$  mg/100 g in *H. arenarium* plant. This suggests that *H. arenarium* oil is a good source of carotenoids and antioxidants. Primitivo et al. (2022) found that *H.italicum* flowers contain  $67.9 \pm 4.9$  µg/g of total carotenoids. It is seen that the total carotenoid content of the *H. arenarium* plant is higher than the *H. italicum* species. Stankov et al. (2020) used hydrodistillation to extract essential oil from the *H. arenarium* (L.) Moench plant. They found that the plant contained  $10.68 \pm 0.11$  µg/g of carotenoid content. This is a similar result to our study.

The total chlorophyll content for *H. arenarium* plant was  $28.99 \pm 0.15$  mg/kg (Table 1). It was determined as  $6.21 \pm 0.01$  mg/kg for *H. arenarium* oil and  $4.60 \pm 0.14$  mg/kg for extra virgin olive oil (Table 2). Khan et al. (2015) extracted essential oil from *Cymbopogon martinii* and found that it contained  $3.44 \pm 0.12$  mg/kg of chlorophyll content. *H. arenarium* plant appears to have high chlorophyll content. *H. arenarium* contains high levels of chlorophyll in its plant form, but this value drops to single digits in its essential oil, suggesting that the chlorophyll structure may have been disrupted during processing. The difference between olive oil and *H. arenarium* essential oil may be due to the process used or the olive oil used in maceration. Stankov et al. (2020), found that the amount of chlorophyll in the oil they obtained from the *H. arenarium* was  $51.24 \pm 0.24$  µg/g. The differences in essential oils may be due to the raw materials growing in different places and the other extraction methods used. The maceration method is not very effective in extracting chlorophyll from the *H. arenarium* plant.

The antioxidant activity of *H. arenarium* plant, its essential oil, and extra virgin olive oil, tested using the DPPH-radical scavenging activity, is presented in the Table 1 and Table 2. The DPPH radical scavenging activity of *H. arenarium* oil is significantly higher than that of extra virgin olive oil, likely due to *H. arenarium*'s high antioxidant capacity. The antioxidant levels of various plant species have been extensively investigated in the literature. Süzgeç-Selçuk et al. (2011) found that the antioxidant level of *Helichrysum chasmolyticum* aerial parts, measured by the DPPH method after methanol extraction, was IC50 0.92 mg/mL. Albayrak et al. (2010) studied the antioxidant properties of four different subspecies of *H. arenarium*: *subsp. erzincanicum*, *rubicundum*, *araxinum*, and *pseudoplicatum*. They found the DPPH IC50 values to be 23.03

$\mu\text{g/mL}$ , 47.64  $\mu\text{g/mL}$ , 27.32  $\mu\text{g/mL}$ , and 38.82  $\mu\text{g/mL}$ , respectively. Aćimović et al. (2021) found that the essential oil of *H. italicum* had an antioxidant activity of 254.66  $\mu\text{mol TE}/100\text{ g}$  as determined by the DPPH method. Researchers have used the DPPH assay to determine the antioxidant activity of *H. arenarium* inflorescence and leaves, as well as *H. italicum* inflorescence essential oils and extracts. It was concluded that the activity of leaf extract ( $19.13 \pm 0.04\text{ mmol/L TE}$ ) was three times more than that of inflorescence extract ( $6.13 \pm 0.04\text{ mmol/L}$ ) (Judzentiene et al., 2022). When these studies were examined, it was observed that the maceration process reduces antioxidant capacity. However, the antioxidant capacity of *H. arenarium* oil was found to be higher than that of extra virgin olive oil ( $p < 0.05$ ).

## 5. Conclusion

This study aimed to obtain oil from the *H. arenarium* plant using the maceration method and extra virgin olive oil. The chemical properties of the plant and the oil obtained were compared to extra virgin olive oil. The plant possessed high total carotenoid, total chlorophyll, total phenolic substance, total flavonoid, and antioxidant activity values, according to the results the chemical properties of *H. arenarium* oil obtained by the maceration method were better than those of olive oil, with a statistically significant difference ( $p < 0.05$ ). Flavonoids, chalcones, phenolic acids, coumarins, and pyrones are all abundant in *H. arenarium*. In addition, these flowers exhibit various biological activities, including antiviral, anti-inflammatory, antiproliferative, antimicrobial, antiallergic, antioxidant, antiradical, cholinergic, hepatoprotective, and detoxification properties. *H. arenarium* has the potential to provide various benefits to human health, both in herbal and oil form. There are not many studies on *H. arenarium* plant in the literature. Our study is expected to advance the literature and inspire new research.

#### Abstract

A study was carried out to remove the Congo red dyestuff, which is extremely dangerous for human and environmental health, from wastewater by the photodegradation method using a boron mine, widely available in our country. The adsorbent used in the study is Magnesium Borate, which was synthesized by choosing the hydrothermal method from artificial methods. Prepared magnesium borate samples were characterized by methods such as X-ray diffraction (XRD), scanning electron microscopy (SEM) and fourier transform infrared spectroscopy (FT-IR). Dye solutions of the same concentration were prepared, and different masses of Magnesium Borate adsorbent were added to the dye solutions. The removal of Congo Red dye in the UV reactor by the photodegradation method was investigated. The obtained mass scanning results were examined. As a result of the research, it was seen that magnesium borate in different masses provided effective colour removal from wastewater. It has been found that the initial dye concentration and textural structure of the adsorbent play an important role in its adsorption capacity.

**Keywords:** Wastewater treatment, Congo Red, Magnesium Borate, Photodegradation.

#### INTRODUCTION

It is well known that organic dyes such as Congo red (CR) are highly toxic, potentially carcinogenic, and do not easily biodegrade (Guo et al., 2019). Excessive use of CR causes environmental pollution and has become a challenging task for environmental protection agencies (Rajesh et al., 2014). As a target in the United Nations World Water Development Report published in 2021; it is aimed to reduce wastewater pollution by 2030 (Nations, 2021).

Colour removal processes of industrial wastewater containing dyestuffs are gaining ecological importance (Kocaer et al., 2002). Before disposal, waste must be adequately treated using environmentally friendly technologies (Rashid et al., 2021). Researchers have put great effort into removing organic pollutants from the environment in order to maintain a clean environment. Various methods have been proposed for the removal of dye waste such as adsorption (Wang et al., 2022), photocatalytic treatment (Liu et al., 2022), electrochemical treatment (Di et al., 2020), and microbial treatment (Rizqi and Purnomo, 2017).

Borate is a kind of important functional material because of its unique and rich structure. For example, magnesium borates might be as antiwear and antifriction additives (Zeng et al., 2008), flame retardant (Zhang et al., 2017), and nanowhiskers (Zhu et al., 2009; Zhu et al., 2014). Magnesium borate compound can be synthesized by artificial methods as well as it can be found naturally. Magnesium borates can be produced artificially by hydrothermal (liquid-state) and thermal (solid-state) methods.

In this study, it is aimed to purify the non-biodegradable Congo Red dye, which is extremely dangerous for human and environmental health, from industrial wastewater by photocatalytic degradation by using magnesium borate synthesized by hydrothermal method. The synthesized Magnesium borate samples were characterized using X-ray diffraction (XRD), scanning electron microscopy (SEM) and fourier transform infrared spectroscopy (FTIR) techniques. CR dye solutions with the same concentration were prepared. Colour removal was investigated by photodegradation method in the UV reactor by adding different masses of Magnesium Borate to the dye solutions.

## MATERIALS AND METHODS

The materials used in this study; Magnesium oxide (MgO) document source for magnesium borate production was Merck (99.9%) quality and boric acid (H<sub>3</sub>BO<sub>3</sub>) boron source was obtained from Etibank Bandırma Boron and Acid Factory. Congo Red dyestuff, which is a red crystalline powder with a molecular weight of 696.68 g/mol, was purchased from AFG Bioscience. Ethanol (C<sub>2</sub>H<sub>5</sub>OH) was purchased from Honeywell. The pure water used in the experiments was supplied from the "Human Power I+" brand water purification system. Raw materials were used without any pre-treatment.

Magnesium borate production was carried out using certain amounts of magnesium and boron sources with the help of FOUR E'S SCIENTIFIC magnetic hot plate stirrer. For all trials, it was decided to have a mole ratio of 1:6 (Mg:B) (Derun et al., 2015). During production, boric acid mineral was dissolved in 50 ml of distilled water and heated up to the determined temperature of 100°C. Then, magnesium oxide, which is a source of magnesium, was added and the reaction was carried out at 100°C, for 3 hours at a stirring speed of 500 rpm in a magnetic stirrer. While the experiments were carried out in a closed container, the reaction temperatures were kept constant with the temperature control unit.

After the reaction was complete, the products in the reaction vessel were allowed to cool. The samples were thoroughly washed with 96% ethanol and separated from unreacted boric acid by applying a vacuum filtration process. It was then dried in an oven at 40 °C for about 24 hours. The SEM image of the produced Magnesium borate was taken at 20 kV and analysed in the FTIR instrument for chemical bond analysis in the range of 4000-650 cm<sup>-1</sup>. Experimental parameters for magnesium borate synthesis are given in Table 1.

**Table 1.** Experimental parameters for magnesium borates synthesis

Mg/B Molar Ratio	Temperature (°C)	Stirring Speed (rpm)	Reaction Time (h)	Dried Temperature (°C)
1:6	100	500	3	40

An example of the produced magnesium borate powders is shown in Figure 1.

**Figure 1.** Sample of magnesium borate after drying

Congo Red aqueous dye solutions were prepared at a concentration of 50 mg/L for dye photodegradation in the laboratory. 5 ml of the dye solutions were taken and transferred to quartz tubes. 0.01, 0.03, 0.05, 0.07 and 0.09 g of magnesium borate were weighed into the quartz tube and kept in the Kerman UV 21/13 brand UV reactor for 15 minutes. The wavelength at which the CR dyestuff gave the highest absorbance in the UV vis spectrophotometer device was determined as 498 nm ( $\lambda_{max}$ ) in the 400-800 nm range. The relationship between

absorbance and concentration was determined using calibration curves generated at the specified wavelength for Congo Red.

## RESULTS and DISCUSSION

### XRD Results

The XRD results of the products synthesized by the hydrothermal magnetic stirring method are given in Table-2. The synthesized products emerged as two different magnesium borate minerals. The products obtained are admontite, a magnesium borate mineral containing between seven and fifteen moles of crystalline water. XRD results is given in Table 3.

**Table 3.** Results of XRD

Identified Phases	Ref. Code	Chemical Formula	Score
Admontite	01-076-0540	$MgO(B_2O_3)_3(H_2O)_7$	54
Admontite	00-034-1438	$Mg_2B_{12}O_{20}15H_2O$	29

The XRD pattern of the synthesized magnesium borate sample can be seen in Figure 2.

**Figure 2.** XRD pattern of prepared sample

### SEM Results

SEM analysis was performed to determine the surface morphology of the produced Magnesium borate mineral and to perform grain size analysis. The surface morphologies of the produced magnesium borate are shown in Figure 3.

**Figure 3.** The surface morphologies of the fabricated magnesium borate (a) 10000X (b) 1000X

When the SEM surface images are examined, the grain size of magnesium oxide varies between 2.52 μm and 9.23 μm. The hydrothermal method was preferred because it facilitates the adjustment of particle size and shape. Clumping was prevented by obtaining a homogeneous appearance.

#### FTIR Results

The synthesized Magnesium borate was characterized using FTIR. The FTIR spectrum of this synthesized magnesium borate is presented in Figure 4.

**Figure 4.** FT-IR Spectrum of the prepared sample

## Variation of the Initial Dye Concentration of Congo Red

Variations in the initial concentration of the Congo red dye were performed to determine the optimum photodegradation concentration occurring using magnesium borate. The curve for determining the optimum conditions for photodegradation of Congo red dye on the effect of concentration is shown in Figure 5.

Figure 5. Concentration-Absorbance graph

## Effect of Adsorbent Amount on Adsorption

The effect of the amount of adsorbent parameter on the removal of dyestuff with magnesium borate adsorbent was investigated. The working range in this parameter has been determined by means of literature information. When the magnesium borate mass absorbance graph was examined, the maximum removal of Congo Red dye was obtained at the optimum 0.0509 g mass. The results obtained as a result of the photooxidation reaction showed that the UV radiation intensity was effective in removing the colour from the wastewater. The analysis results of the amount of absorbent on the absorption are given in Table 2.

Table 2. Analysis results of the amount of absorbent on the absorption

Wavelength (nm)	Concentration (mg/L)	Weight (g)	Absorbance (Abs)
498 nm	50 mg/L	0.0118	0.651
		0.0303	0.609
		0.0509	0.564
		0.0705	0.567
		0.0901	0.596

## CONCLUSION

Existing colour removal methods, physical or chemical treatments applied to wastewater containing dyestuffs are effective when the wastewater volume is small. Conventional treatment methods are not sufficient to treat high volumes of water. In this study, the applicability of the photodegradation method in the treatment of industrial wastewater was investigated. The functionality of the use of photochemical processes in the decolorization process of Congo red solutions and the effectiveness of industrially important magnesium borates were examined. It was produced by artificial hydrothermal synthesis method and its contribution to CR photodegradation was investigated. The obtained mass scanning results were examined.

1. As a result of the research, it was seen that magnesium borate in different masses provided effective color removal from wastewater. The impact on the UV Reactor environment allowed degradation of the CR dyestuff. Maximum removal of Congo Red dye at optimum weight was achieved.

2. Magnesium borate was successfully synthesized by hydrothermal method. This was demonstrated by the results of characterizations using XRD, SEM and FTIR.

3. It was found that the initial dye concentration and textural structure of the adsorbent play an important role in the adsorption capacity.

this study, magnesium borate, which is thought to be a potential adsorbent, will be a promising and innovative perspective in terms of wastewater treatment by affecting the photocatalytic degradation of Congo Red dyestuff.

## ACKNOWLEDGEMENTS

This research was supported by the Coordination Unit for Scientific Research Projects, Istanbul Nisantasi University (project no. BAP2022/18).

#### Özet

Süt; memelilerin yaşamları boyunca en önemli biyolojik sıvılardan biridir ve canlıların yaşam döngülerinde, düzgün büyüme ve gelişmelerini sağlamak için gerekli olan ilk enerji ve besin kaynağı rolünü üstlenir. Sütte bulunan hem makro besinler (proteinler, laktoz ve lipitler) hem de aralarında belirli bir dengenin gözlendiği mikro besinler (vitaminler ve mineraller) yaşamın ilk aşamalarında vücuda fayda sağlamaktadır. Bunun dışında temel gıda maddesi olan süt ve süt ürünleri bu bileşimleri nedeniyle insan beslenmesinde önemli bir yer teşkil etmektedir. Enerji, protein, vitamin ve mineral maddeler içeren sağlık için önemi yüksek bir gıda kaynağı olan süt; doğrudan tüketilebildiği gibi peynir, yoğurt, tereyağı, kaymak gibi ürünlerin yapımında da kullanılmaktadır. Ülkemizde 2022 yılında TUIK verilerine göre çiğ süt üretiminin %92,3'ünü inek sütü, %4,9'unu koyun sütü, %2,5'ini keçi sütü ve %0,2'sini manda sütü oluşturmaktadır. Ülkemizdeki süt üretiminde koyun ve keçi sütünün payı düşük olarak gözüktüğü de, tüketici açısından daha yüksek bir değere sahiptir. Koyun sütü, keçi ve inek sütünden daha yüksek toplam katı madde ve temel besin içeriği içerir. Keçi sütü ise daha iyi sindirilebilirliğe sahiptir, tıpta ve insan beslenmesinde bazı terapötik değerlere sahip olması açısından inek veya insan sütünden farklılık gösterir. Ayrıca, özellikle sert iklim koşullarına veya verimsiz topraklara sahip fakir bölgeler ve topluluklar için de önemli bir geçim kaynağıdır. Gıda kaynağı olarak değerlendirilmesi nedeniyle sütün hijyenik ve kaliteli olması gerekmektedir bu da ancak sağlıklı memeye sahip hayvanlardan elde edilebilir. Meme sağlığı, süt verimi ve kalitesini etkileyen en önemli faktör; ineklerde de olduğu gibi küçükbaş hayvanların da en önemli sorunlarından birisi olan mastitistir. Küçükbaş hayvanlarda mastitis; kontrol ve tedavisinin zorluğu, hayvan refahını bozması, ekonomik kayıplara yol açması (hayvanların ölümü, tedavi maliyetleri, sütün tüketim dışı kalması, sütün miktar ve kalitesinin azalması), hijyenik (enfekte sütü tüketerek tüketicilerin enfeksiyon kapması veya zehirlenmesi riski) ve yasal (bakteriyolojik süt kalitesinin tanımları) sebepler nedeniyle önemli bir hastalıktır. Bu çalışma koyun ve keçilerde meme sağlığı ve mastitisin özetlenerek aktarılması amacıyla ele alınmıştır. Bu bildiride küçük ruminantlarda memenin savunma mekanizmaları, mastitisin etiyojisi, tanısı, tedavisi ve koruma ve kontrol stratejileri ile ilgili bilgiler verilecektir.

**Anahtar Kelimeler:** Koyun, Keçi, Meme sağlığı, Mastitis

#### Mammary gland health and diseases in sheep and goats

#### Abstract

Milk is one of the most important biological fluids throughout the lives of mammals and plays the role of the first source of energy and nutrients necessary to ensure proper growth and development in the life cycle of living things. Both macronutrients (proteins, lactose, and lipids) and micronutrients (vitamins and minerals), among which a certain balance is observed in milk, benefit the body in the first stages of life. Apart from this, milk and dairy products, which are basic foodstuffs, have an important place in human nutrition due to their composition. Milk, which is a food source of high importance for health, contains energy, protein, vitamins, and minerals. While it can be consumed directly, it is also used in the production of products such as cheese, yogurt, butter, and cream. According to TUIK data, in our country in 2022, 92.3% of raw milk production will be cow milk, 4.9% sheep milk, 2.5% goat milk, and 0.2% buffalo milk. Although the share of sheep and goat milk in milk production in our country seems low, it has a higher value for the consumer. Sheep milk contains higher total solids and essential nutrients than goat and cow milk. Goat milk, on the other hand, has better digestibility and differs from cow or human milk in that it has some therapeutic values in medicine and human nutrition. It is also an important source of income for poor regions and communities, especially those with harsh climatic conditions or infertile soils. Since milk is considered a food source, it must be hygienic and of high quality, and this can only be obtained from animals with healthy mammary glands. The most important factor affecting mammary gland health, milk yield, and quality is mastitis, which is one of the most important

problems for small ruminants as well as cows. Mastitis is an important disease in small ruminants due to many reasons, including difficulty in control and treatment, deterioration of animal welfare, causing economic losses (death of animals, treatment costs, milk being out of consumption, decrease in quantity and quality of milk), hygiene (risk of infection or poisoning of consumers by consuming infected milk), and legal requirements (bacteriological milk quality). This study was conducted to summarize mammary gland health and mastitis in sheep and goats. In this paper, information will be given about the defense mechanisms of the mammary gland in small ruminants and the etiology, diagnosis, treatment, protection, and control strategies of mastitis.

**Key Words:** Sheep, Goat, Mammary gland health, Mastitis

## Giriş

Küçükbaş hayvanlarda mastitisin birçok açıdan oldukça önemli olduğu düşünülmektedir. Öncelikle meme bezi hastalıklarının süt veriminde niceliksel ve niteliksel düşüşe yol açması ve tedavi masrafları nedeniyle ekonomik açıdan önemlidir. Ayrıca, ciddi şekilde etkilenen hayvanlar çoğunlukla ölür ya da itlaf edilir. Süt ve süt ürünlerinde hijyen ve güvenlik kriterlerinin önemini de belirtmekte fayda vardır; kontamine olması muhtemel ürünlerin tüketimi nedeniyle tüketiciler arasında hastalık oluşturma riski vardır (Novac ve ark., 2019). Yani süt sığırlarında olduğu gibi, koyun ve keçilerde de meme içi enfeksiyon, hayvanların sağlığı, refahı, üretkenliği ve süt kalitesi açısından büyük bir sorundur. Klinik mastitisin sıklığı sığırlara göre önemli ölçüde düşüktür, ancak birçok işletmede ön sağımın olmaması, düşük dereceli mastitisin gözden kaçmasına neden olur. Koyun ve keçilerde klinik mastitis genellikle sığırlara göre daha şiddetlidir. Sığırlarda olduğu gibi koyun ve keçilerinde de subklinik mastitis meydana gelir ve süt üretiminin azalması ve süt kalitesinin düşmesi gibi benzer etkiler ortaya çıkar (Manning ve ark., 2021). Bu çalışma koyun ve keçilerde meme sağlığı ve mastitisin özetlenerek aktarılması amacıyla ele alınmıştır. Bu bildiride küçük ruminantlarda memenin savunma mekanizmaları, mastitisin etiyojisi, tanısı, tedavisi ve koruma ve kontrol stratejileri ile ilgili bilgiler verilecektir.

## Memenin Savunma Mekanizmaları

Meme dokusunun mastitisten korunması için yeterli bağışıklık fonksiyonları gereklidir. Meme bezi bağışıklığı, bezin anatomik özelliklerinin yanı sıra hücrel ve humoral savunma mekanizması da dahil olmak üzere spesifik olmayan ve spesifik koruma faktörlerinin koordinasyonuna bağlıdır. Meme bezinin savunma mekanizmalarından olan doğuştan gelen ve kazanılmış bağışıklık, meme bezinin enfeksiyonlardan korunmasında hayati bir rol oynar (Stoimenov, 2022). Doğal bağışıklık, genelde spesifik olmayan bağışıklık olarak tanımlanır ve meme başının anatomik bariyeri, makrofajlar, nötrofiller, Natural killer (NK) ve bazı salgısal maddeler tarafından yapılır (Rişvanlı ve ark., 2019).

## Meme bezinin anatomik özellikleri

Meme bezinin derisi, meme başı ve meme başı kanalı mikroorganizmalara karşı ilk savunma hattıdır. Meme bezinin sağlıklı derisi; parankimi ve kanal sistemini çevresel faktörlerin etkisinden tamamen izole eder. Normalde sağlıklı bir bezin derisi bakteriyostatik ve bakterisidal etkiye sahip yağ asitleri ile kaplıdır (Alnakip ve ark., 2014). Meme bezinin ana savunma mekanizmalarından biri meme başı kanalıdır. Hem fiziksel bir bariyer hem de antimikrobiyal ajanların kaynağı olarak görev yapar. Meme başı kanal sfinkteri bakterilere karşı fiziksel bir bariyer sağlar. Kanalı çevreleyen düz kas sütün sızmasını önler ve tamamen kapanması sayesinde patojenlerin girişine karşı bir engel oluşturur. Ayrıca meme başı kanalının meme başı sinusuna açılan bölgedeki Fürstenberg rozeti de güçlü mukoza kıvrımlarından oluşmaktadır. Enfeksiyöz ajanların meme bezine nüfuzu çoğu zaman meme başı kanalı yoluyla gerçekleşir çünkü meme bezi ile çevre arasındaki tek doğrudan bağlantı yolu burasıdır (Zecconi ve ark., 2002; Paulrud, 2005; Sudhan ve Sharma, 2010; Kaçar ve Kırşan, 2016).

Meme başı kanalın antibakteriyel özellikleri; iç yüzeyinin, mikroorganizmaların tutunmasını ve tutulmasını ve ayrıca meme bezine daha fazla göçünü önleyen hidrofobik lipitlerle kaplı olmasıyla ifade edilir (Paulrud, 2005; Alnakip ve ark., 2014). Meme başı kanalı antimikrobiyal özelliği olan skuamöz epitel hücrelerinde üretilen serbest yağ asidi içeren balmumu benzeri bir madde olan laktosebum denen keratin tabakası ile kaplıdır (Kaçar ve Kırşan, 2016). Meme bezinin korunmasında bir diğer önemli faktör memenin yapısı ve meme başının konumudur. Örneğin küçük ve horizontal olarak yönelmiş meme başlarında, ayrıca derin ve sarkık memelerde mastitis riski artmaktadır (Gelasakis ve ark., 2015). İlk savunma mekanizması olan meme başı kanalını geçen patojen bakteriler, ikinci savunma mekanizması olan hücrel savunma ile karşı karşıya gelirler. Doğal savunmanın bir parçası olan hücrel savunmada nötrofiller, makrofajlar ve lenfositler görev yapar (Rişvanlı ve ark., 2019).

### Hücresel savunma özellikleri

Sütteki somatik hücreler; makrofajlar, lenfositler ve polimorfonükleer nötrofiller gibi esas olarak bağışıklık sistemine ait hücrelerdir. Dökülen meme epitel hücreleri de aynı zamanda somatik hücreler olarak sınıflandırılır. Mastitis, meme bezinin esas olarak bulaşıcı mikroorganizmalara karşı inflamatuvar tepkisidir. Somatik hücreler, meme içi enfeksiyona karşı inflamatuvar yanıtta rol oynar. Somatik hücre sayısı hayvanların sağlık durumunu yansıtır ve sütün kalitesinin belirlenmesinde temel parametre olarak kabul edilir. Koyunların sağlıklı meme bezlerinden elde edilen sütteki bu hücrelerin sayısının, inek sütündeki somatik hücre sayısından daha fazla olduğu bilinmektedir. Somatik hücreleri oluşturan farklı hücre tiplerinin ayırt edilmesi ve tanımlanması da sağlıklı meme bezlerini mastitisli meme bezlerinden ayırmanın önemli bir parçasıdır. Lökositlerle karşılaştırıldığında meme epitel hücreleri somatik hücrelerin daha küçük bir kısmını oluşturur (Stoimenov, 2022). Boutinaud ve Jammes (2002), meme epitel hücrelerinin keçi sütündeki toplam hücre sayısının %26'sını oluşturduğu ifade etmektedir.

Lökositlerin sayısı ve türü, meme bezindeki patojenlerden korunma için önemlidir. Somatik hücrelerin bir parçası olan ve kan dolaşımı yoluyla bezde ulaşan lökositlerin hemen her tipi meme bezinde bulunabilir. Lenfositler, makrofajlar ve polimorfonükleer nötrofiller (PMN), meme bezindeki inflamatuvar yanıtlarda önemli bir rol oynar. Bu hücreler, mikroorganizmaları tanıma ve hızlı bir bağışıklık tepkisi oluşturma yeteneği sayesinde memenin patojenlere karşı hücresel korumasında rol alır. Sağlıklı bir meme bezindeki somatik hücre değerlerinin  $2,5 \times 10^5$  hücre/mL süt olmakla birlikte  $6 \times 10^5$  hücre/mL süttten daha fazla olabildiği de belirtilmiştir. Mastitis görülmeyen koyunlarda en fazla sayıda makrofajlar (%46-84) bulunur, laktasyonun başında ve ortasında seviyeleri daha yüksekken, sonuna doğru ise azalmaktadır. Somatik hücrelerin toplam sayısını oluşturan diğer hücreler PMN'ler (%2-28), lenfositler (%11-20) ve meme epitel hücreleridir (%1-2) (Katsafadou ve ark., 2019; Stoimenov, 2022).

Mastitis sırasında mukozayı oluşturan hücrelerin apikal yüzeyinde hücresel bağışıklık tepkisini tetikleyen reseptörlerinin varlığı tespit edilmiştir. Epitel hücreleri ayrıca patojeni kaplayan bir zarın (fagozom) oluşmasının neden olduğu fagositik aktivite de gösterir (Günther ve Seyfert, 2018). Meme epitel hücrelerinin meme bezinin korunmasındaki bir diğer önemli rolü de sitokinler, kemokinler gibi çeşitli inflamasyon araçlarının salgılanmasıdır. Meme epitel hücrelerinin koruyucu işlevi, iltihaplanma sürecine dahil olan serum amiloid ve haptoglobin üretimi ile tamamlanır. Ek olarak, meme bezinin bağışıklık savunmasında kritik bir rol oynayan antibakteriyel bir peptid olan katelisin salgılayarak çeşitli patojenlere yanıt verirler. Bu peptid meme bezindeki meme epitel hücreleri ve nötrofiller tarafından sentezlenir (Cubeddu ve ark., 2017).

Mikroorganizmalara karşı ilk savunma hattını makrofajlar ve nötrofiller sağlar. Enfekte olmayan hayvanlarda somatik hücre sayısının (SHS) çoğunluğunu makrofajlar oluşturur. Makrofajlar meme bezine ulaştıklarında farklılaşan kan monositlerinden köken alır. En belirgin özellikleri fagositik aktiviteye sahip olmalarıdır. Makrofajlar nonspesifik olarak, bakterileri, hücresel döküntü ve birikmiş süt komponentlerini fagosite edebilen aktif hücrelerdir. Ayrıca damarlardan enfeksiyon bölgesine PMN lökositleri çeken bir takım kimyasal maddeler salgılar. Bunlar: sitokinler (tümör nekrozis faktör, interlökinler) ve kemokinler, antimikrobiyal peptitler ( $\beta$ -defensin ve katelisin) dir (Riştvanlı ve ark., 2019; Stoimenov, 2022). Antijenlerin tanınabilmesi için antijen sunan moleküllere bağlanması gerekir ve ortaya çıkan bu kompleks hücre yüzeyinde yer alır. Antijen sunan moleküller ayrıca sınıf I ve sınıf II ana doku uyumluluk kompleksleri (MHC) olarak da bilinir. Makrofajlar, MHC sınıf II ile birlikte antijenleri işler ve lenfositlere sunarlar, böylece lokal bağışıklık tepkisinde rol oynarlar. Bu sayede kan damarlarının geçirgenliğinde artış sağlayarak kan hücresi elementlerinin ve moleküllerinin yangılı meme bezine nüfuz etmesini sağlarlar (Sordillo, 2005; Stoimenov, 2022).

Meme bezini enfeksiyona karşı koruyan ikinci savunma hattı niteliğindeki Polimorfonükleer lökositler, hücresel savunmanın en önemli hücreleridir. Lökositlerin ana işlevlerinden biri mikroorganizmaları yıkımlamak ve fagosite etmektir. Antikorlar ve komplement sistemi bakterileri opsonizasyon adı verilen bir işlemle bağlayarak nötrofillerin patojenleri sindirmesine aracılık eder. Nötrofiller, *E. Coli*'nin karbonhidrat açısından zengin fimbrialarını tanıyabilen lektin karbonhidrat reseptörleri sayesinde opsonize edici ajanların yokluğunda fagositik aktivitelerini ifade edebilirler. PMN'ler, süperoksit radikalleri ve hidrojen peroksit gibi reaktif oksijen bileşiklerini serbest bırakarak fagosite edilen bakterilerin yok edilmesini sağlar. Nötrofiller bu bileşiklere ek olarak peroksidazlar, lizozim, hidrolitik enzimler ve laktoferrin de salgılar. Bu hücrelerin hücre içi granülleri, defansinler, enzimler (miyeloperoksidaz) ve proteazlar (elastaz, katepsin tip B, D ve G) gibi bakterisidal peptitler içerir. Nötrofiller, mikroorganizmaların lipoprotein zarının yok edilmesinden sorumlu olan katelisin sentezleme yeteneğine sahiptir. PMN'ler meme bezinin korunmasında rol oynadıktan sonra apoptoza uğrarlar (Deligönül, 2011; Riştvanlı ve ark., 2019; Stoimenov, 2022).

Lenfositler hücresel savunmada görev alan diğer bir hücre grubudur. Ana temsilcileri T ve B lenfositleri ve doğal öldürücü hücrelerdir (NK hücreleri). Lenfositler, patojenik yapıları membran reseptörleri aracılığıyla tanır ve böylece bağışıklık tepkisine aracılık eder. Lenfositlerin ana işlevi bağışıklık hafızasıdır ve bu nedenle

bir patojenle yeniden karşılaşıldığında hızlı bir bağışıklık tepkisi sağlarlar. B-lenfositlerin rolü, bulaşıcı ajanlara karşı antikor oluşumunu teşvik etmektedir; bu özelliği patojenlere yönelik spesifik reseptörleri tarafından sağlanır. Hücre içi mikroorganizmalara karşı, enfekte hücreleri öldürerek ve makrofajları aktive eden NK'lar sitokin olan interferon-gamma'yı (IFN- $\gamma$ ) salgılatan özel hücrelerdir. Normal hücre moleküllerini tanıyan reseptörlere sahiptirler. MHC sınıf I molekülü olmayan bütün hücreleri öldürür (Sordillo, 2005; Rişvanlı ve ark., 2019; Stoimenov, 2022).

### **Hümmoral savunma özellikleri**

İmmünoglobulinler (Ig), süt ve kolostrumda bulunan en önemli spesifik hümmoral faktörlerdir. Bunlar meme bezine kan dolaşımı yoluyla girer veya doğrudan meme bezinde üretilebilirler. IgG1, IgG2 ve IgM, bakterilerin opsonizasyonunda rol oynar ve dolayısıyla bu patojenler, meme bezindeki nötrofiller ve makrofajlar tarafından tanınır. İmmünoglobulinler ayrıca kompleman fiksasyonunda da rol oynar, bakterilerin endotelial hücrelere bağlanmasını önler, mikroorganizmaların aglütinasyonunu teşvik eder, virüsleri ve toksinleri nötralize eder (Sordillo ve Streicher, 2002; Stoimenov, 2022). Lemos ve ark., (2015) sağlıklı bir meme bezindeki immünoglobulin A konsantrasyonlarının 0,027 mg/mL olduğunu ve meme içi enfeksiyon varlığında konsantrasyonların neredeyse üç kat arttığını (0,06 mg/mL) ifade etmiştir.

Laktoferrin, esas olarak meme epitel hücreleri tarafından ve daha küçük miktarlarda nötrofiller tarafından üretilen, demir bağlayıcı bir glikoproteindir. Laktoferrin üretimi alveolar gelişimle ilişkilidir. Laktoferrin esas olarak mevcut demir için bakterilerle rekabet ederek veya bakteriyel yüzeylere bağlanarak bakteriyostatik etki gösterir; bu nedenle Gram-negatif bakterilere (örn., koyun mastitislerinin başlıca etkeni olan *M. haemolytica*) karşı özellikle önemlidir (Sordillo ve Streicher, 2002; Katsafadou ve ark., 2019). Enfekte koyun meme bezlerindeki ortalama laktoferrin konsantrasyonlarının, sağlıklı meme bezlerindeki ortalama laktoferrin konsantrasyonlardan 4,8 kat daha yüksek olduğu gösterilmiştir (Lemos ve ark., 2015).

Lizozim (N-asetilmuramil hidrolaz), meme bezinin antibakteriyel korumasının bileşenlerinden biridir. Lizozim kan dolaşımı yoluyla meme bezine ulaşır veya meme içi enfeksiyonlar sırasında meme bezinde lökositler tarafından sentezlenir. Esas olarak Gram-pozitif bakterilere karşı inhibitör veya litik etkiye sahiptir (Alnakip, 2014). Lizozim aynı zamanda düzenleyici T-lenfositleri aktive ederek epitelyal yüzeylerdeki immün homeostazdaki inflamatuvar yanıtın düzenlenmesine de katkıda bulunur (Stoimenov, 2022).

Laktoperoksidaz, karaciğer kökenli tiyosiyanat ve bakteriyel veya endojen kökenli hidrojen peroksit varlığında meme bezinde lokal olarak sentezlenir. Antibakteriyel aktivitesini, lökositlerin bakterisidal aktivitesini artıran bir metabolit olan hipotiyosiyanat gibi aktif oksijen ürünlerinin oluşumu yoluyla gösterir (Katsafadou ve ark., 2019). *Staphylococcus aureus* gibi Gram pozitif bakterilere karşı bakteriyostatik, *Escherichia coli* gibi Gram negatif bakterilere karşı ise bakterisidal etkiye sahiptir. Gram negatif bakteriler çok az H<sub>2</sub>O<sub>2</sub> üretirler ve bu nedenle laktoperoksidaz sistemi, muhtemelen mastitis kontrolünde önemli değildir. *Streptococcus uberis* gibi Gram pozitif bakterilerin, laktoperoksidaz sistemi için yeterli H<sub>2</sub>O<sub>2</sub> üretebildiği ve Gram pozitif bakterilerden kaynaklı mastitis kontrolü için bu enzimin yararlı olduğu bildirilmektedir (Rişvanlı ve ark., 2019). İn vitro koşullar altında sistemin, klinik durumlarda yalnızca kuru dönemde benzer etkinlik gösteren önemli antibakteriyel özelliklere sahip olduğu bulunmuştur; emzirme dönemindeki rolü, muhtemelen diğer süt proteinlerinin müdahalesi nedeniyle sınırlıdır (Katsafadou ve ark., 2019).

### **Meme savunmasını etkileyen diğer faktörler**

Çeşitli faktörler meme bezinin savunma mekanizmalarının azalmasına ve dolayısıyla mastitis gelişmesine yol açmaktadır. Yetersiz beslenme mastitise zemin hazırlayan bir faktördür. A vitamini eksikliği, etkilenen hayvanların meme bezinin epitelyal bariyerinin bütünlüğünü ve işlevini bozarak klinik ve subklinik mastitis riskini arttırmaktadır (Koutsoumpas ve ark., 2013). Yetersiz selenyum konsantrasyonu koyunlarda meme bezinin hücresel korumasında azalmaya yol açar. Vasil ve ark., (2021) gebe koyunlarda oral selenyum ve E vitamini uyguladıkları koyunlarda mastitis vakalarında azalmaya neden olduğunu belirtmektedir. Çinko meme başı keratini ve derisinin bir bileşenidir; çinko eksiklikleri meme kanalının bütünlüğünü olumsuz yönde etkileyebilir ve dolayısıyla bakteri girişini kolaylaştırabilir. Ayrıca enerjinin fagositozu ve bakterilerin lökositler tarafından hücre içi öldürülmesini teşvik etmede önemli bir faktör olduğu kabul edilmiştir; bu bağlamda gebelik toksemisi olan koyunlarda doğum sonrası erken dönemde mastitis gelişme riskinin yüksek olduğu tespit edilmiştir (Barbagianni ve ark., 2015).

Eksik veya aşırı sağım, mikroorganizmaların gelişimi için uygun koşullar sağlaması nedeniyle meme içi enfeksiyon gelişme riskini artırır. Makineli sağımda mastitis oluşumuna zemin hazırlayan vakum ve titreşim frekansındaki bozukluklar gibi faktörler, sağım sistemlerindeki önemli arızalardır. Sağım makinelerinin yanlış temizlenmesi ve dezenfekte edilmesinin yanı sıra aşırı kullanımı da patojenlerin birikmesine neden olur. Manuel sağımlarda ise meme içi enfeksiyonlara sağımçıların elleriyle bulaşan mikroorganizmalar neden olur, en yaygın olanı ise *Staphylococcus spp.* dir ki küçükbaş hayvanlarda mastitisin ana etiyolojik ajanıdır. Makineli sağım dokulara zarar vererek savunma mekanizmalarını ve bariyerlerini bozar. Emzirilen kuzular, *M.*

*Haemolitic*'nin kuzu bademciklerinden koyunların papiller kanalına taşınmasına neden olmaktadır (Stoimenov, 2022). Küçük ruminantlarda mastitis oluşturan diğer riskler arasında çevresel, genetik ve hayvana bağlı faktörler yer almaktadır. Hayvanın yaşı, barınakların durumu ve temizliği, süt verim miktarı, hayvanın genel sağlık durumu, doğum sayısı, laktasyon dönemi ve laktasyon sayısı da bu faktörler içinde yer alır (Satılmış ve Yeşilkaya, 2023).

### **Mastitisin Etiyolojisi**

Mastitis, sütte fiziksel, kimyasal ve genellikle bakteriyolojik değişiklikler ve glandüler dokularda patolojik değişikliklerle karakterize, meme bezinin iltihabıdır (Mbago, 2022). Mastitise, bakteri, virüs ve mantar gibi çeşitli mikroorganizmaların yanı sıra yaralanmanın da neden olabileceği belirtilmektedir (Mavrogianni ve ark., 2011; Satılmış ve Alkan, 2021). Koyun ve keçilerde, mastitis vakalarının büyük çoğunluğunun bakteriyel kaynaklı olduğu bilinmektedir (Satılmış ve Yeşilkaya 2023).

Mastitis genel olarak klinik ve subklinik olarak ayrılmaktadır (Olechnowicz ve Jaśkowski, 2014). Klinik mastit, belirgin semptomlarla ortaya çıkan meme bezinin bakteriyel enfeksiyonları için kullanılan terimdir. Klinik mastitisin gözle görülür belirtileri arasında bir veya daha fazla memede şişlik, kızarıklık, anormal süt (pıhtı veya serum varlığı) ve ayrıca anoreksi, ateş veya agalaksi gibi diğer semptomlar yer alır. Genellikle klinik mastitisin sonucu memede toksemi ve gangrenöz nekroz görülebilir. Klinik mastitis vakalarının oranı genellikle %5'in altındadır. Çeşitli patojenler mastitise neden olabilir ancak keçi ve koyunlarda meme içi enfeksiyonlarda en sık rastlanan mikroorganizmalar *Staphylococcus spp.* dir (Baştan ve Salar, 2016; Olechnowicz ve Jaśkowski, 2014).

Subklinik mastit, sütteki inflamatuvar hücrelerin sayımı ile tespit edilen memenin inflamasyonu ile karakterizedir. Meme bezlerinde herhangi bir klinik anormallik olmayan ve görünüşte normal süt veren, bakteriyolojik olarak pozitif ve SHS'si  $\geq 500 \times 10^3$  hücre/mL olan koyunlarda subklinik mastitis olduğu kabul edilir. Kronik mastitis klinik veya subklinik olabilir ancak memenin uzun süre devam eden inflamasyonu ile karakterizedir. Subklinik mastitisler genellikle sürünün genelini etkilemekte ve insidensi %5 ile %30 arasında değişmektedir (Manning ve ark., 2021).

Koyun ve keçilerde mastitise neden olan patojenlerin en önemlisi *Staphylococcus aureus* olmakla birlikte, *Streptococcus*, *Enterobacteriaceae*, *Corynebacteria* türleri, *Pseudomonas aeruginosa*, *Mannheimia haemolytica*, *Lentivirus* (Visna-Maedi), *Aspergillus fumigatus*, *Serratia marcescens* ve *Burkholdelia cepacia* da mastitise neden olabilmektedir (Bergonier ve ark., 2003; Olechnowicz ve Jaśkowski, 2014; Baştan ve Salar, 2016; Satılmış ve Yeşilkaya, 2023).

Klinik mastitisin sık görülen iki etkeni *Staphylococcus aureus* ve *Mannheimia haemolytica* dir. Emziren koyunlardaki klinik mastitis vakalarının yaklaşık %40'ından *S. aureus* sorumlu iken sağılan koyunlarında yaklaşık %80'inden sorumludur. Aynı zamanda sağılan keçilerde de klinik mastitisin en yaygın nedenidir (Mavrogianni ve ark., 2011). *M. haemolytica*, emzirilen koyunlarda klinik mastitis vakalarının yaklaşık %40'undan sorumludur. Emziren koyunlarda ve keçilerde klinik mastitise neden olan diğer bakteriyel ajanlar koagülaz negatif *Stafilokoklardır* (bunlar ayrıca subklinik mastitisin en sık görülen etkenleri), *Escherichia coli* ve *Streptococci*'dir. Mikoplazmanın çeşitli türleri de koyun ve keçilerde mastitise, özellikle de *Mycoplasma agalactia* bulaşıcı agalactia sendromuna (süt kesen) neden olur (Mavrogianni ve ark., 2011; Baştan ve Salar, 2016). Koyun ve keçilerin klinik mastitislerinin %20- %30'unda *Streptococcus spp.* gözlenmektedir. *Streptokoklar* sporadik patojenlerdir ve genellikle kötü barınma koşullarının olduğu ortamlarda daha çok izole edilmektedir (Satılmış ve Yeşilkaya, 2023).

Koyun ve keçilerde koagülaz negatif stafilokok türleri ile birlikte bazı streptokoklar, gram negatif bakteriler ve *Corynebacterialar* subklinik mastitise neden olmaktadır. Koyun ve keçilerde erken laktasyon döneminde Koagülaz negatif *Staphylococcus* (KNS) kaynaklı meme içi enfeksiyonlarda spontan iyileşme oranının %50 olduğu ve enfekte hayvanların yaklaşık %25'inin doğumdan sonraki 6. haftaya kadar enfekte kalabildiği belirtilmektedir. Enfekte meme loblarında SHS'nin sağlıklı meme loblarına göre daha yüksek olduğu, keçilerde subklinik mastitislerde sıklıkla *Corynebacteria spp.*, *Streptococcus spp.* ve *S. aureus* gibi diğer patojenler izole edildiği bildirilmektedir (Baştan ve Salar, 2016).

### **Mastitisin Tanısı**

Çoğu durumda, klinik muayene bulgularına dayanarak klinik mastit tanısı konulabilir. Sütçü sürülerde genellikle mastitisli hayvanlar ilk olarak sağım sırasında görülür. Etçi sürülerde koyunların memelerine bu kadar düzenli ve yakın ilgi gösterilmediği için hastalığın erken belirtilerinin gözden kaçma olasılığı yüksektir. Mastitisli hayvanlar, etkilenen meme bezinin olduğu tarafta topallık gösterebileceğinden, bu sürü içerisinde ayırt edilmesine yardımcı olabilir (Fragkou ve ark., 2014).

İnspeksiyon ve palpasyon ile kronik mastitislerin (memede asimetri, sklerozis, apse oluşumu gibi) teşhisi, tedavi uygulanacak veya sürüden çıkarılacak hayvanlar belirlenebilir (Baştan ve Salar, 2016). Sürü sağlığı yönetiminin bir parçası olarak da her laktasyon döneminin sonunda, sürüdeki tüm koyunların memeleri elle

muayene edilmelidir. Hastalığın diğer patolojik durumlarla birlikte bulunabilmesi nedeniyle başlangıçta genel bir klinik muayene gereklidir. Hayvanın rektal ısı ölçülmelidir. Daha sonra memenin detaylı klinik muayenesi yapılmalıdır (Fragkou ve ark., 2014).

Hastalığın etkili tedavisi için neden olan etkenin doğru tanımlanması önemlidir. Sütçü sürülerde mastitis tanısı için altın standart bakteri kültürüdür (Contreras ve ark., 2007; Toquet ve ark., 2021). Bakteriolojik kültür mastitise neden olan patojenlerin izolasyonu için en uygun teşhis yöntemidir. Mastitis oranı yüksek sürülerde, fazla sayıda enfekte hayvandan çok sayıda süt örneğinde tekrarlı bakteriolojik muayene yapılması yerine bazı hayvanlardan alınan örneklerde seçici bakteriolojik testler, kapsamlı numune toplama maliyetini düşürmeye hizmet eder ve bu işletmelerde mastitis kontrol programlarını benimsemesine yardımcı olabilir (Contreras ve ark., 2007; Baştan ve Salar, 2016).

Subklinik mastit, yalnızca sütteki değişikliklerle karakterize edilir ve tespiti için özel testlere ihtiyaç vardır. Subklinik mastitten her zaman şüphelenilmelidir. Sütçü sürülerde süt üretiminin azalmasının başlıca nedenlerindedir (Fragkou ve ark., 2014). Subklinik mastit tanısı, enfeksiyonun (süt örneklerinden mikroorganizmaların izolasyonu) ve/veya meme bezindeki inflamatuvar reaksiyonun saptanmasına dayanır. Sütün bakteriolojik inceleme sonuçlarının doğru yorumlanması için aseptik numune alma çok önemlidir. Aslında subklinik mastitisin en yaygın etiyolojik ajanları olan koagülaz negatif stafilokoklar (Contreras ve ark., 2007; Fthenakis, 2023) aynı zamanda meme derisinde sık görülür. Bu nedenle, toplama işleminin uygun şekilde yapılmaması halinde süt numunesine kolaylıkla bulaşarak yanlış tanıya yol açabilirler (Fragkou ve ark., 2014).

Meme bezindeki inflamatuvar reaksiyonun saptanması için en iyi yöntem, sütteki hücresel içeriğin arttığına gösterilmesidir (Olechnowicz ve Jaśkowski, 2014). California Mastitis Test (CMT), sütteki hücre sayısını indirekt saptayan süt içerisindeki somatik hücre sayısının yüksek veya düşük olduğu konusunda subjektif bir fikir veren, ucuz ve kolay bir tanı yöntemi olarak kabul edilen bir testtir. Somatik hücrelerin çekirdeklerindeki DNA ile reaksiyona giren testin içindeki deterjanlı ayıraç DNA'ları birbirlerine yapıştırıp, jel kıvamının oluşmasına yol açmaktadır. Koyunlarda CMT' nin sağım öncesi yapılması önerilmektedir, koyunlarda subklinik mastitis teşhisinde CMT +1 skorunun ideal eşik değeri olduğu belirtilmiştir. Keçilerde de CMT'nin mastitis teşhisinde kullanılabilir ucuz ve kolay bir tanı yöntemi olduğu, mastitis teşhisinde CMT' nin +2 ve üzeri olması gerektiğini belirtilmektedir (Baştan ve Salar, 2016; Manning ve ark., 2021).

Keçi ve koyunlar arasında mastitis teşhisini etkileyen en önemli farklılıklar sütteki SHS ile ilgilidir. Bu farklılıklar temel olarak enfekte olmamış keçi sütlerinde daha yüksek SHS' nin olması ile ilişkilidir. Keçi sütü salgısının daha yüksek apokrin salınımı nedeniyle lökositlerden daha fazla sayıda sitoplazmik partiküller ve epitel hücre içermektedir (Contreras ve ark., 2007). Keçi sütlerinde doğru SHS ölçümü için fluoro-optik elektronik hücre sayımı, Fossomatik gibi DNA spesifik metotlar ya da direkt mikroskopi ile ölçümde ise Pyronin Y-metil ile boyama kullanılmalıdır (Contreras ve ark., 2007; Baştan ve Salar, 2016). Enfekte olmayan sütçü koyunların SHS'si yaklaşık 200.000 ila 400.000 hücre/mL'lik bir değerdedir ya da daha azdır (Olechnowicz ve Jaśkowski, 2014). Normalde sağlıklı meme loblarında SHS'nin  $<0,1 \times 10^6$  olduğu görülmektedir. Somatik hücre sayısının  $>0,1 \times 10^6$  ve  $<0,5 \times 10^6$  bu değerler üzerindeki olması halinde durum mastitis olarak değerlendirilir (Souza ve ark., 2012; Fragkou ve ark., 2014; Satılmış ve Yeşilkaya, 2023).

Keçilerde kızgınlık, sağım mevsimi, süt verimi ve laktasyon aşaması gibi faktörler de SHS'nin artmasına neden olmaktadır (Olechnowicz ve Jaśkowski, 2014). Genellikle enfekte meme lobundan alınan sütteki SHS değerleri  $> 500.000$  hücre/mL (laktasyonun ilk 90 günü) ve  $> 1.000.000$  hücre/mL (laktasyonun ileri dönemleri) dir. Geç laktasyon döneminde sağlıklı süt keçilerinde SHS 1 ml süte 1.000.000'dan fazladır. Ticari standart olarak keçi sütlerindeki asgari SHS'yi Amerika Birleşik Devletleri, 1.000.000/mL olarak kabul etmektedir (Souza ve ark., 2012; Baştan ve Salar, 2016; Toquet ve ark., 2021).

### **Mastitisin Tedavisi ve Kontrolü**

Saha koşullarında küçükbaş hayvanlarda, klinik ve subklinik mastit tedavileri birbirinden ayrılmalıdır. Çünkü hayvan başına ortalama tedavi maliyeti, seleksiyon değeri ve beklenen iyileşme karşılaştırıldığında farklılık söz konusudur (Bergonier ve ark., 2003). Klinik mastitis gelişen koyunlar genellikle ciddi şekilde hastadır ve geliştirilen tedavi protokollerine göre hemen tedavi edilmelidir (Ruegg, 2011). Akut klinik vakalarda ilk amaç hayvanın hayatını, sonrasında ise memesini kurtarmaktır (Bergonier ve ark., 2003).

Koyunlarda *stafilokokal* mastit tedavisinde tilmikosinin tek dozundan (10 mg/kg) beş gün sonra semptomlarda tam bir azalma olduğunu bildirmektedir (Bergonier ve ark., 2003). Koyun ve keçilerde parenteral uygulamadan sonra çeşitli antibiyotiklerin farmakokinetiği incelenmiştir. İntravenöz yolla günde iki kez tobramisın (25 mg/kg) veya apramisın (20 mg/kg); kas içi yolla günde bir kez enrofloksasin (5 mg/kg) veya norfloksasin (10 mg/kg); kas içi yolla günde iki kez tiamulin (25 mg/kg); Florfenikol (20 ila 25 mg/kg) intravenöz veya intramüsküler yolla günde iki kez şeklinde terapötik kullanımlar önerilmektedir (Bergonier ve ark., 2003). Kuru dönem antibiyotik tedavisi koyunlar ve keçilerde mastit insidansını önemli ölçüde azaltmaktadır

(Contreras ve ark., 2007; Olechnowicz ve Jaškowski, 2014; Manning ve ark., 2021). Kuru dönemde uygulanan antibiyotik tedavisinin yüksek prevalans koşullarında genel sistemik uygulamadan ziyade seçici olarak meme içi uygulanması tercih edilebilir (Bergonier ve ark., 2003; Contreras ve ark., 2007; Olechnowicz ve Jaškowski, 2014). Antibiyotik tedavisi, yeterli ve hijyenik uygulamayı sağlamak için veteriner hekim tarafından gerçekleştirilmelidir (Olechnowicz ve Jaškowski, 2014). Çünkü, *P. aeruginosa* veya *A. fumigatus*'un şırınga ile kontaminasyonu yoluyla iatrojenik kaynaklı ciddi mastitis salgınları görülebilir (Bergonier ve ark., 2003; Contreras ve ark., 2007). Bu noktada antibiyotiklerin aşırı kullanımının antibiyotik direnci riskini arttıracığı ve bir halk sağlığı sorunu haline gelebileceği de göz önünde bulundurulmalıdır (Contreras ve ark., 2007).

Klinik gangrenöz mastitis insidansının yüksek olduğu durumlarda, piyasada küçükbaş hayvanlarda mevcut olan aşılardan klinik gangrenöz mastitise karşı yaygın olarak kullanılmaktadır (Bergonier ve ark., 2003; Contreras ve ark., 2007). Ancak bu aşılardan süt inekleri ve koyunlarda farklı koruyucu etkinliklerinin bildirilmesi ve yeni enfeksiyonları önlemedeki yetersizliklerine rağmen, *S. aureus* kaynaklı meme içi enfeksiyonun prevalansının yüksek olduğu sütçü sürülerde mastitisten korunmadan ziyade klinik semptomları azaltmak için aşılardan kullanılması önerilmektedir (Contreras ve ark., 2007). Subklinik enfeksiyonların aksine aşılama ile klinik mastitis prevalansının azaldığı bildirilmektedir (Contreras ve ark., 2007; Olechnowicz ve Jaškowski, 2014). Ancak mastitisten korunmada küçük ruminantlarda aşılamanın etkinliği konusunda henüz yeterli veriler ve tatmin edici bilgiler yoktur (Baştan ve Salar., 2016). Koyun ve keçilerde kullanım için lisanslı inaktif *S. aureus* içeren bir mastitis aşısı mevcuttur (koyun ve keçiler için VIMCO enjeksiyon emülsiyonu, Hipra Uk & Ireland Ltd) (Manning ve ark., 2021). Uygun şekilde hazırlanmış ölü (atenü) aşı ile aşılama, *Pseudomonas aeruginosa*'nın neden olduğu yeni enfeksiyonların görülme sıklığını azaltabilir; ancak farklı virülansa sahip birden fazla şuşa bağlı salgınlara da neden olabilir (Olechnowicz ve Jaškowski, 2014). Her durumda aşılama, mastitisi kontrol altına almanın tek yolu olarak düşünülmemelidir. Enfeksiyonun kontrolünü arttırmak için diğer meme sağlığı yönetimi önlemleri de uygulanmalıdır (Vasileiou ve ark., 2019; Manning ve ark., 2021; Fthenakis, 2023).

Sürünün sağlık durumunu iyileştirmek için çiftliğin tamamı sıkı hijyen koşullarına tabi tutulmalıdır. Sağım makinesi standartlarının ve sağımhane sistemlerinin optimize edilmesiyle sütçü koyun sürülerinin meme sağlığının iyileştirildiği ifade edilmektedir (Contreras ve ark., 2007; Ruegg 2011; Fthenakis, 2023). Özellikle sürüde yüksek oranda meme içi enfeksiyon görülmesi durumunda, sağım sırası da dahil olmak üzere süt inekleri için uygulanan rutinlerin çoğu küçükbaş hayvanlar için de geçerlidir. Mekanik sağım sistemlerindeki veya sağım hijyenindeki eksiklikler nedeniyle fırsatçı mikroorganizma olan Koagülaz negatif *Staphylococcus*'un prevalansları artmaktadır (Contreras ve ark., 2007; Ruegg 2011). KNS kaynaklı meme içi enfeksiyonları kontrol etmek için, tüm sağım rutinleri gözden geçirilmeli ve vakum seviyesi, pulzasyon değeri ve oranı, sağım ünitesi başına vakum oranı vb. gibi sağım değişkenlerinin doğru olduğundan emin olmak için sağım ekipmanı periyodik olarak kontrol edilmelidir (Contreras ve ark., 2007; Ruegg, 2011; Manning ve ark., 2021). Küçükbaş hayvanlarda, sağım sonrası meme başı daldırma işlemi çoğunlukla yüksek oranda enfekte olan sürülerde kullanılmış ve yeni meme içi enfeksiyonların önlenmesinde çok etkili bir yöntem olduğu ortaya çıkmıştır (Bergonier ve ark., 2003; Contreras ve ark., 2007; Manning ve ark., 2021). Bununla birlikte, meme başı daldırma dezenfektanının kalite kontrolü çok önemlidir, çünkü bazı sporadik salgınlar, kuaterner amonyum bazlı meme başı daldırma maddesi kullanıldığında koyunlarda *S. marcescens* kaynaklı mastitise neden olabilmektedir (Contreras ve ark., 2007).

Modern süt işletmelerinde, üretim ve sağlık nedenleriyle pastörize kolostrum kullanımı artmaktadır. Bu prosedür, doğum sırasında yenidoğanların annelerinden ayrılmasına, akabinde kolostrum ve patojenlerden arındırılmış sütle beslenmelerine olanak tanıdığından hem oğlakların ya da kuzuların hem de annelerin memelerinin sağlık durumunu artırır (Contreras ve ark., 2007).

Hayvan kaynaklarının kontrolünde, genel bir kural olarak, özellikle meme anomalileri bulunan, meme içi enfeksiyonu bulunan, uzun süredir devam eden veya tekrarlayan hastalıkları olan koyunların sürüden çıkarılması gerekir (Fthenakis, 2023). Bu, esas olarak subklinik ve hafif kronik mastitis'in kuru dönem tedavisiyle ve akut veya şiddetli kronik mastitis yaşayan hayvanların seleksiyonu ile gerçekleştirilir (Bergonier ve ark., 2003). Kuru dönem tedavisinden sonra, takip eden laktasyonun başlangıcında hala kronik belirtiler gösteren hayvanlar sürüden çıkartılmalıdır (Bergonier ve ark. 2003; Manning ve ark. 2021). Meme derisi, sağım öncesi meme ucunun daldırılmasıyla kontrol edilebilir; sürü büyüklükleri, sağım rutinleri ve muhtemelen toplu süt florası sorunlarının düşük görülme sıklığı nedeniyle bu önlem genellikle göz ardı edilmektedir. Stafilokokal dermatit veya bulaşıcı ektima vakalarında meme antisepsisi, etkilenen hayvanların ve kuzularının izolasyonu ve bazen de antibiyotik tedavisi uygulanmalıdır (Bergonier ve ark. 2003).

Özetle koyun ve keçilerde meme sağlığı koruma ve hastalık kontrolü prosedürü; 1. Hijyen (hem mera hem barınak hem de sağımda temizlik ve hijyen sağlanmalı), 2. Teat dipping, 3. Kuru dönem tedavisi, 4. Düzenli aralıklarla takip (günlük strip kap ile ön sütün muayenesi, aylık CMT testi ile sürü meme sağlığının kontrolü,

5. Seleksiyon (tedavi edilemeyen hayvanlar sürüden çıkarılmalı, gerekirse hasta memeler enfeksiyonun türüne göre köreltilmeli), 6. Sağımda memede süt kalmamasına önem verilmeli, 7. Aşılama (gerekli hallerde sürüye özel aşı hazırlanmalı) basamaklarını içermektedir (Kocamüftüoğlu, 2019; Fthenakis, 2023).

#### Abstract

In recent years, there has been a lot of interest in high-value bioproducts obtained from microalgae, such as proteins, chlorophyll, carotenoids, and lipids. Microalgae bioproducts can be used in a variety of sectors, including animal feed, agricultural fertilization, natural components for cosmetics, bioactive chemicals in pharmaceuticals, renewable energy sources, and food supplements for nutrition. *Chlorella vulgaris* is one such microalgae that produces these valuable bioproducts on a commercial basis. Extensive studies on the production of high-value bioproducts from microalgae highlight the importance to optimize reactor types for specific microalgae. Among these reactor designs, airlift photobioreactors have various advantages, including the absence of extra components for mixing and the ability to interchange O<sub>2</sub> and CO<sub>2</sub> with aeration gas and medium. In this study, the cultivation of *C. vulgaris* microalgae was investigated in an airlift photobioreactor. The primary goal was to research biomass and high-value biomaterial production. *C. vulgaris* was cultured in an airlift photobioreactor for 7 days, and samples were obtained at regular intervals to assess turbidity, cell count, chlorophyll-a, chlorophyll-b, total carotenoid, and reactive oxygen species (ROS) content. Furthermore, the amount of lipid content was determined at the end of cultivation period. After the harvest, chlorophyll-a productivity, chlorophyll-b productivity, and carotenoid productivity of the *C. vulgaris* incubation were recorded 1.045±0.009, 1.322±0.048, and 0.892±0.005 mg/g dry weight/day, respectively while lipid content of incubated *C. vulgaris* was recorded 0.397±0.006 g/g dry weight. Considering the advantages of airlift photobioreactors, the cultivation of commercial microalgae *C. vulgaris* in an airlift photobioreactor presents great potential for biomass and bioactive material production.

**Keywords:** Microalgae, Airlift photobioreactor, *Chlorella vulgaris*, bioproduct

#### 1. Introduction

Microalgae are known for producing high-value bioactive metabolites. *Chlorella vulgaris*, as one of those microalgae, has been studied intensively for its potential for producing chlorophyll-a, chlorophyll-b, carotenoids, and lipids (Jiang and Nakano, 2022; Li et al., 2023; Tunalı et al., 2020). These metabolites are thought to be a prospective source for commercial product development in a variety of fields, including pharmaceuticals, cosmetics, food, and energy (Sun et al., 2023; Zhuang et al., 2022). Carotenoids could be synthesized from microalgae in various forms, which present different benefits such as anti-inflammatory, antioxidant, and immunomodulatory effects (Zhuang et al., 2022). Mostly due to those benefits, *C. vulgaris* itself has been reported as a fitting choice for human consumption along with its other beneficial applications (Y. Wong et al., 2017). Moreover, *C. vulgaris* also provides high lipid content for biofuel production (Ge et al., 2018). A wide range of applications of microalgae in general resulted in many ways of commercial scale production of microalgae, utilizing bioreactors (Fu et al., 2019). The use of airlift photobioreactors appears to have certain advantages: it allows for the interchange of CO<sub>2</sub> and O<sub>2</sub> between the medium and the aeration gas;

possible cell damage caused by mechanical pumping may be reduced; and circulation is performed without the use of moving components (Xu et al., 2009). Different types of bioreactors offer different advantages and disadvantages, which should be selected based on the target microalgae (Xu et al. 2009). In this study, the cultivation of *C. vulgaris* microalgae was investigated in an airlift photobioreactor. During the production, turbidity, cell count, chlorophyll-a, chlorophyll-b, total carotenoid, and reactive oxygen species (ROS) content of *C. vulgaris* were examined from periodic samples obtained from a 7-day long cultivation. Additionally, lipid content was determined after harvest. The main aim of this study is to investigate the biomass and biomaterial production of *C. vulgaris* in airlift photobioreactor.

## 2. Material and Methods

### 2.1. Algal strain and inoculum preparation

Stock culture of *C. vulgaris* was cultivated in the BG11 medium in a 2-L aerated sterile bottle (Demirel et al., 2015). For the preparation of the inoculum, cells from the stock culture were collected and concentrated by centrifugation (4100×g, 5 min), and the supernatant was discarded. The collected cells were transferred and incubated aseptically under continuous illumination ( $70 \mu\text{Em}^{-2}\text{s}^{-1}$ ) with an aeration rate of 1 vvm in a 2-L airlift photobioreactor containing 1.6 L of BG11 medium.

### 2.2. Analytical methods

During the incubation period of 7 days, samples were collected at certain times in order to analyze turbidity (Huang et al. 2016), cell count (Cirik and Gökpınar, 1993), chlorophyll-a, chlorophyll-b, total carotenoid (Ajala and Alexander 2022), total protein (Lowry et al., 1951), ROS (Lu et al. 2020; Omidian, Rafiei, and Bandy, 2020), and lipid content (Isleten-Hosoglu, Gultepe, and Elibol 2012). All the experiments were done in triplicate and presented in figures and tables with average values. The specific growth rate and doubling time of the culture were also calculated (Eq. 1, 2) (Imamoglu, Sukan, and Conk Dalay 2007).

$$\text{Specific growth rate } (\mu) = \frac{\ln\left(\frac{C_n}{C_0}\right)}{dt} \quad (1)$$

$$\text{Doubling time} = \frac{\ln(2)}{\mu} \quad (2)$$

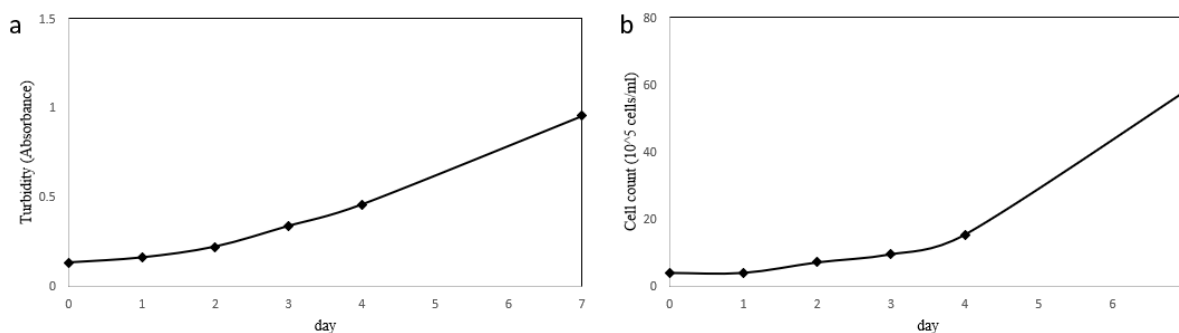

$C_0$  starting from the logarithmic phase,  $C_n$  and  $C_0$  are the biomass concentrations (g/L) on the days  $t_n$  and  $t_0$  (days), respectively.

## 3. Results and Discussion

### 3.1. Growth profiles of *C. vulgaris*

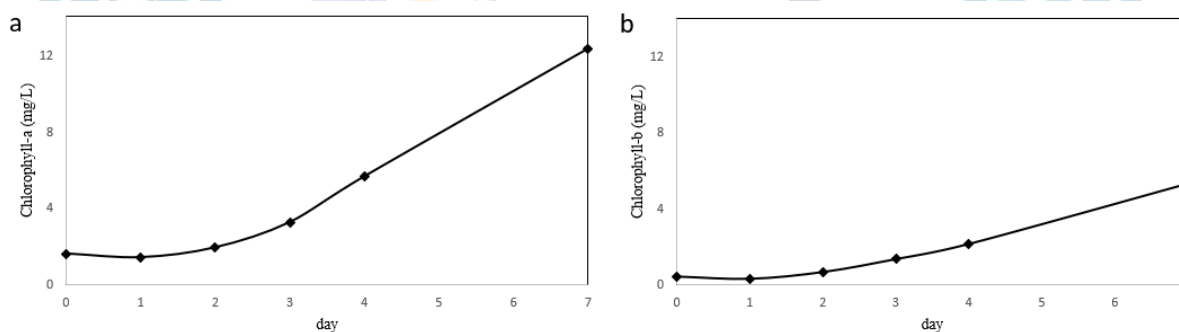

High biomass accumulation carries an important role in lipid production from microalgae (Demirel et al. 2015), which results in many other studies aiming to optimize both parameters in the same system (Liang, Sarkany, and Cui 2009; Ramanna et al. 2014). In this regard, turbidity, cell count, chlorophyll-a, and chlorophyll-b contents of *C. vulgaris* have been detected, along with the specific growth rate and doubling time. Turbidity and cell count of *C. vulgaris* have shown a correlation and steady increase, indicating suitable conditions for cell growth in airlift photobioreactor (Figure 1).

**Figure 1.** Growth profile of *C. vulgaris*. a: Turbidity (Absorbance); b: Cell count ( $10^5$  cells/ml)

Aside from being a valuable component, chlorophyll contents are known indicators of photosynthesizing microorganism growth in any given medium (Doering, Chamberlain, and Haunert 2006), which is *C. vulgaris* in this study. Periodic examination of chlorophyll-a and chlorophyll-b content presents a constant rise, again indicating a successful incubation of *C. vulgaris* in airlift photobioreactor (Figure 2). It is also important to point out that chlorophyll-b synthesis includes chlorophyll-a (Eggink et al. 2004), which is possibly the reason for the stagnation period in chlorophyll-b accumulation during the first days of the incubation.

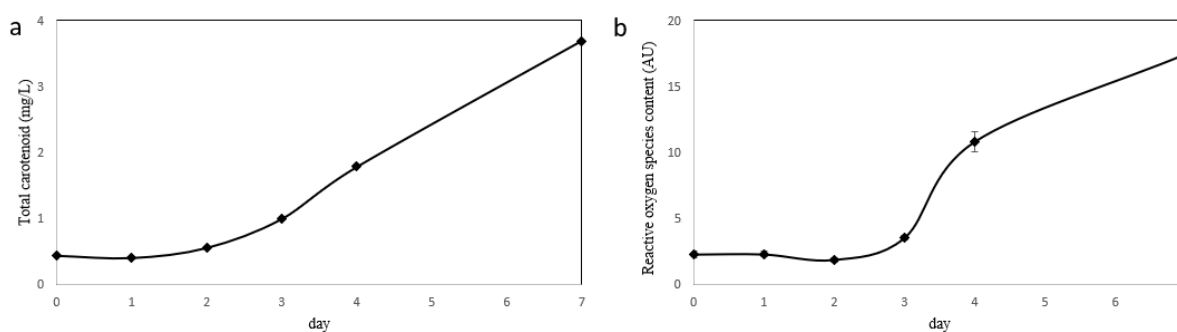

**Figure 2.** Chlorophyll content of *C. vulgaris*. a: Chlorophyll-a (mg/L); b: Chlorophyll-b (mg/L)

Moreover, the specific growth rate and doubling time of *C. vulgaris* incubation in airlift photobioreactor have been investigated and noted to be  $0.516 \pm 0.025$  day<sup>-1</sup>, and  $1.345 \pm 0.066$  day, respectively (Table 1). In a study conducted by Balan and Suraishkumar in 2014, researchers cultivated *C. vulgaris* in various illumination conditions and reported specific growth rates of 0.551, 0.567, and 0.383 day<sup>-1</sup> which correlates with the findings of our study.

### 3.2. Bioactive material production from *C. vulgaris*

Chlorophyll, carotenoids, and lipids are some of the valuable bioactive materials that can be obtained from *C. vulgaris* (Ge et al. 2018; Jiang and Nakano 2022; Levasseur et al. 2018). Periodic examination of the carotenoid and ROS content of *C. vulgaris* incubation has shown a gradual increase throughout the incubation (Figure 3). The increase in ROS content is an indicator of oxidative stress (Hazeem et al. 2019), which is expected to accumulate during the incubation due to nutrient starvation throughout the incubation (Elisabeth, Rayen, and Behnam 2021). On the other hand, stable ROS levels during the first days of incubation show that the airlift photobioreactor is a fitting tool for *C. vulgaris* incubation.

**Figure 3.** Total carotenoid and reactive oxygen species content of *C. vulgaris*. a: Total carotenoid (mg/L); b: Reactive oxygen species (Arbitrary Unit)

After the harvest, chlorophyll-a productivity, chlorophyll-b productivity, and carotenoid productivity of the *C. vulgaris* incubation were recorded  $1.045 \pm 0.009$ ,  $1.322 \pm 0.048$ , and  $0.892 \pm 0.005$  mg/g dry weight/day, respectively while lipid content of incubated *C. vulgaris* was recorded  $0.397 \pm 0.006$  g/g dry weight (Table 1). In a different study conducted by Y. K. Wong et al. in 2017, researchers implemented varying nitrate/phosphate ratios on a *C. vulgaris* incubation medium in order to increase lipid accumulation. The study of the stated research presents a maximum of 53.202 g/g dry weight lipid content, which is higher than the results of this experiment mainly due to the optimization of the process. Similarly, in another study conducted by Ali et al. in 2021, researchers implemented increased salinity and light-intensity stress factors on *C. vulgaris* incubation in order to induce biomaterial production. Researchers have reported significant increases in carotenoid content up to  $4.37 \pm 0.33$  g/L, which is 1.18 times higher than our findings.

**Table 1.** Bioactive products and growth profiles of *C. vulgaris*

Microalgae	<i>C. vulgaris</i>
<b>pH</b>	7.65
<b>Chlorophyll a productivity (mg/g/day)</b>	$1.045 \pm 0.009$
<b>Chlorophyll b productivity (mg/g/day)</b>	$1.322 \pm 0.048$
<b>Specific Growth Rate (day<sup>-1</sup>)</b>	$0.516 \pm 0.025$
<b>Doubling Time (day)</b>	$1.345 \pm 0.066$
<b>Carotenoid productivity (mg/g/day)</b>	$0.892 \pm 0.005$
<b>Lipid content (g/g dw)</b>	$0.397 \pm 0.006$

#### 4. Conclusion

*C. vulgaris* incubation in photobioreactors presents a vast potential for bioactive compound production. In this study, *C. vulgaris* was incubated in an airlift photobioreactor for 7 days in order to obtain valuable bioproducts namely chlorophyll-a, chlorophyll-b, carotenoids, and lipids. It has been observed that an airlift photobioreactor is a valid choice for the production of both *C. vulgaris* biomass and stated bioproducts. However, aeration speed and mixing rates are tied to each other in airlift bioreactor systems. The correlation of those parameters could limit the aeration rate due to a possible increase in shear stress during incubation, which makes incubation with airlift photobioreactor non-fitting for every microalgae. In other cases such as *C. vulgaris*, airlift photobioreactors offer less energy usage due to not requiring additional mixing equipment which makes them suitable for industrial-scale production. For this reason, further experiments for optimization in aeration, light intensity, and medium modifications are required to increase the yield of targeted products in airlift photobioreactor incubation of *C. vulgaris*.

\*l.sumru.sozer@ege.edu.tr

#### Özet

Tarçın, tarçın ağaçlarının kabuğundan elde edilen eşsiz bir baharattır. Sadece lezzet için değil, aynı zamanda çeşitli farmakolojik etkileri ile de öne çıkmaktadır. Tarçın çeşitli türlerinin, özellikle kabuk ve yaprakların, çeşitli biyolojik işlevlere sahip olduğu gösterilmiştir. Antidiyabetik ve antitümör aktiviteleri, güçlü antioksidan aktivitesiyle ilişkilendirilmektedir. Bu nedenle son zamanlarda farklı tekniklerle hazırlanan tarçın ekstreleri üzerinde yoğun araştırmalar yapılmaktadır. *Cinnamomum cassia* (*C. cassia*) yüksek miktarda toplam fenol ve flavanoid içeren bir türdür.

Bu çalışmada *C. cassia* kabuğunun hekzan, metanol ve kloroform ekstrelerinin antioksidan özelliklerini araştırılmıştır. Bu üç ekstre, toplam fenolik içerik, flavonoid içerik ve çeşitli konsantrasyonlarda DPPH radikal temizleme aktivitesi ile antioksidan potansiyelleri açısından taranmıştır. *C. cassia* ekstrelerinin hazırlanmasından sonra ekstrelerin bazı aktif maddeleri HPLC (Yüksek Performanslı Sıvı Kromatografisi) analizi ile değerlendirilmiştir. Kersetin, sinamaldehit, sinamilalkol ve sinamik asit olmak üzere dört bileşiğin miktarı incelenmiştir. *C. cassia* ekstrelerinin lenfositler üzerindeki sitotoksik aktivitesi WST-1 yöntemi ile in vitro olarak araştırılmıştır.

Bulgularımıza göre, en yüksek sinamaldehit ve polifenol düzeyleri metanol ekstresinde saptanmıştır. DPPH kullanılarak yapılan antioksidan aktivitenin hekzan ve metanol ekstrelerinde kloroforma göre yüksek olduğu bulunmuştur. Üç organik çözücünün ekstraksiyon verimi araştırıldığında metanol çözücüsü ile (% 9) daha yüksek ekstraksiyon verimi elde edilmiştir. İnsan primer periferik kan lenfositlerinde yapılan sitotoksikite çalışmasında ekstrelerin lenfositlerle 24 saat inkübasyonu ile hekzan, metanol ve kloroform için IC<sub>50</sub> değerleri sırasıyla 91,74; 62,30 ve 66,42 µg/mL bulunmuştur. Sonuçlarımıza göre metanol ekstresi diğer ekstrelere göre daha yüksek düzeyde radikal temizleyici aktiviteye sahip ve en yüksek sinamaldehit düzeyine sahip ekstre olarak saptanmıştır. Daha ileri araştırmalar, bu ekstrenin oksidatif stres altındaki hücreler için faydalı sonuçlar üretebileceğini düşündürmektedir.

**Anahtar Kelimeler:** *Cinnamomum cassia* kabuğu, hekzan, kloroform, metanol, antioksidan aktivite

#### **A research on the antioxidant properties and phenolic / flavone content of different extracts prepared from *Cinnamomum cassia* bark**

#### Abstract

Cinnamon is a unique material obtained from the bark of cinnamon trees. Not only a flavor agent but also a variety of pharmacological applications. Cinnamon various types, especially bark and leaves, have been shown to have various biological functions. Its antidiabetic and antitumor activities were associated with its strong antioxidant activity. Therefore, intensive research has been carried out on the extracts of cinnamon prepared with different techniques recently. *Cinnamomum cassia* (*C. cassia*) contain higher amount of total phenols and flavanoids.

In the present study, we investigated the antioxidant properties of hexane, methanol and chloroform extracts of *C. cassia* bark. These three extracts were screened for their antioxidant potentials using total phenolic content, flavonoid content, DPPH radical scavenging activity at various concentrations. After preparation of *C. cassia* extracts, some active ingredients of the extracts were evaluated by HPLC (High Performance Liquid Chromatography) analysis. Four compounds namely quercetin, cinnamaldehyde, cinnamylalcohol and cinnamic acide were quantified. The cytotoxic activity of the extracts of *C. cassia* on lymphocytes was investigated in vitro through WST-1 assay.

The findings indicated that the highest levels of cinnamaldehyde and polyphenols were detected in methanol extract. Antioxidant activity using DPPH were found to be high in hexane and methanol extracts. Extraction yield from *C. cassia* of three organic solvents were investigated. Higher extraction yields were obtained by methanol solvent( % 9).The cytotoxicity study in human primary peripheral blood lymphocytes, IC50 values in hexane, methanol and chloroform extracts were found to be 91.74; 62.30 and 66.42 µg/mL, respectively, by 24-hour treatment of extracts with lymphocytes. According to our results, methanol extract showed higher levels of radical scavenger activity and cinnamaldehyde than other extracts. Further research suggests that this extract may produce beneficial results for cells under oxidative stress.

**Keywords:** *Cinnamomum cassia* bark, hexane, chloroform, methanol, antioxidant activity

## GİRİŞ

Bitkilerde bulunan antioksidan bileşikler, sağlığı koruyucu maddeler olarak hareket ederek insan sağlığına önemli katkıda bulunurlar. Antioksidanlar, metabolik ve yaşa bağlı hastalıklarda serbest radikallere karşı oluşan hasarı düzeltmede etkili olduklarından, insan sağlığındaki en önemli bileşikler olarak görülmektedirler. *C. cassia*, Çin ve diğer Güney ve Güneydoğu Asya ülkelerinde yetişen bir türdür. Ülkemizde de yaygın olarak kullanılmaktadır. Tarçın, sinnamaldehyt, sinnamik asit, sinamil alkol gibi birçok esansiyel yağı ve çeşitli reçineli bileşikler içerir. Singh, sinnamaldehytin varlığının tat ve kokuda önemli bir role sahip olduğunu bildirmiştir. (Singh ve ark., 2009)

Ancak bileşenlerin vücuttaki etkileşimi hakkında bilgi eksikliği tarçın kullanımının güvenliği konusunda tartışmalara yol açmaktadır. Son zamanlarda tarçın türlerinin antioksidan, antidiyabetik ve antitümör aktiviteleri çeşitli biyolojik çalışmalarda gösterilmiştir.( Gruenwald ve ark., 2009)

Ayrıca farklı ekstrelerin birçok aktif bileşen içerdiği gösterilmiştir. Diyabet ve çeşitli kanser türlerinin gelişimine karşı koruyucu etki, polifenoller içeren tarçın ekstrelerinin antioksidan aktivitesi ile ilişkilendirilmiştir. Tarçın kabuğunun aktif bileşenlerinden biri olan sinnamaldehytin bazı hücre kültürü çalışmalarında antikanser aktiviteye sahip olduğu gösterilmiştir.( Zaidi ve ark., 2015)

Metabolizmada reaktif oksijen türlerinin (ROS) oluşumu DNA'ya ve diğer hücresel moleküllere zarar verir. Bunun diyabet, kanser, kardiyovasküler ve nörodejeneratif hastalıklar dahil olmak üzere kronik hastalıkların başlangıcında ve gelişiminde önemli bir rol oynadığı ileri sürülmektedir. Canlı hücreler, kendilerini ROS'un neden olduğu hasardan koruyacak antioksidan savunma potansiyeline sahiptir. Serbest radikallere karşı hücresel antioksidan savunma yetersiz kaldığında oksidatif stres ortaya çıkar. Bunun sonucunda lipitlerde, proteinlerde ve DNA'da oksidatif hasar meydana gelebilmektedir (Halliwell, 1994, Hussain ve ark.,2020, Valko ve ark., 2004, Valko ve ark., 2007, Atanassova ve ark., 2011). Muhtemelen DNA, oksidatif saldırının biyolojik olarak önemli bir hedefidir. DNA'ya sürekli oksidatif saldırının kanser gelişiminde önemli bir rol oynadığı yaygın olarak kabul edilmektedir (Demirci-Çekiç ve ark., 2022, Ames ve ark., 1993). Diyetdeki fenolik bileşikler; antioksidan, antikanser, antiviral ve antiinflamatuvar aktiviteleri birçok hastalık için önemlidir. Bu konu çeşitli in vivo ve in vitro çalışmalarla ortaya konmuştur (Halliwell, 2012). *C. cassia* ekstrelerinin birçok aktif bileşen içerdiği gösterilmiştir. Diyabet ve çeşitli kanser türlerinin gelişimine karşı koruyucu etkisi gösterilmiştir. polifenoller içeren tarçın ekstrelerinin antioksidan aktivitesi ile ilişkilidir.

Ekibimiz daha önce *C. cassia* kabuğundan farklı ekstreler ve fraksiyonlar hazırlamıştı. İnsan primer periferik kan lenfositleri, V79 Çin Hamster akciğer fibroblastları ve HL-60 insan promiyelositik lösemi hücreleri gibi farklı hücre tiplerinde, bu ekstrelerin endojen ve oksidatif DNA hasarı, sitotoksik ve apoptotik aktivite çalışmaları tarafımızdan yapılmıştır (Karadağlı ve ark., 2014a, Lermioğlu Erciyas ve ark., 2015, Karadağlı ve ark., 2014b). Bu çalışmada farklı polaritedeki organik çözeltiler ile doğrudan muamele ile hazırlanarak ekstrelerdeki bileşiklerin farkı çözücülere geçmesi sonucu antioksidan aktivite ve hücre canlılığına etkileri araştırıldı. Ayrıca HPLC ile ekstrelerdeki aktif bileşik miktarları da ölçülmüştür.

## MATERYAL VE METOD

### Bitki ekstrelerinin hazırlanması

Bu çalışmada ticari olarak temin edilebilen *C.cassia* kabuğu kullanıldı. Kurutulmuş ve toz haline getirilmiş malzeme (60g) 90 dakika süreyle ekstre edildi. +40°C'de heksan, metanol ve kloroform ile karıştırıldı ve süzüldü (Whatman filtre kağıdı No.4). Her bir organik çözücü ekstresi rotary evaporatör ile konsantre edildi. Kalıntı tersiyer butanol ile alındı, daha sonra donduruldu ve liyofilize edildi. Yüzde verim, bitki materyalinin kurutulmuş ağırlığı cinsinden ifade edildi. Tüm ekstreler +4°C'de karanlıkta tutuldu. Tarçın ekstreleri çalışma boyunca güneş ışığından korundu.

## Lenfositlerin hazırlanması

Sağlıklı bir donörden alınan periferik venöz kan heparinize tüpe alınarak ışıktan korundu. Lenfositler, bir Histopaque(1:1) tabakası üzerine alındı ve oda sıcaklığında 2750 rpm'de 30 dakika süreyle santrifüjlendi. Daha sonra izole edilen lenfositler PBS ile yıkandı. Bu çalışma Ege Üniversitesi Tıp Fakültesi Klinik Araştırmalar Etik Kurulu tarafından İzmir, Türkiye (12.01.2012, 11.12.1/14) tarafından onaylanmıştır.

## WST-1 analizi:

Sitotoksosite, WST-1 kullanılarak belirlendi. Lenfositler, %10 FBS ve %1 (h/h) penisilin streptomisin ile RPMI-1640 içerisinde süspansiyon edildi ve  $1 \times 10^6$ /mL, 50 uL ortam konsantrasyonunda ekildi. Hücreler, CO<sub>2</sub> inkübatöründe (Nuair 5510E, ABD) farklı konsantrasyonlarda (5-1000 µg/mL) *C. cassia* heksan, metanol ve kloroform ekstraktları ile 24 saat boyunca kültürlendi. 24 saatlik bekleme sonrası kuyucuk başına 10 uL WST-1 ilave edildi. 37°C'de 4 saatlik inkübasyonun ardından plaklar, 450 nm'de (Thermo Scientific, Varioskan® Flash) okundu. Tüm deneyler üç tekrarlı gerçekleştirildi. Ekstrelerin IC<sub>50</sub>'si GraphPad Prism 5.0 yazılımı kullanılarak hesaplandı.

## Toplam Fenolik İçerik

Ekstrelerin toplam fenolik içeriği, Folin-Ciocalteu kolorimetrik yöntemiyle analiz edildi. Metanol:su (1:10 h/h) içindeki ekstrenin/standart çözeltinin 0.2 mL'si, suyla 1:10 h/h seyreltilmiş 1 mL Folin-Ciocalteu reaktifine eklendi, 4 dakika sonra 800 uL doymuş sodyum karbonat çözeltisi (75 g/L) ilave edildi. Oda sıcaklığında 2 saatlik inkübasyon sonrası absorbanslar (Thermo Scientific, Varioskan® Flash) 765 nm'de ölçüldü. Gallik asit ile bir kalibrasyon eğrisi elde edildi ve toplam fenolik içerik, g GAE/g DW olarak ifade edildi. Tüm deneyler üç tekrarlı gerçekleştirildi. (Singleton and Rossi, 1965).

## Toplam Flavonoid İçeriği

Toplam flavonoid içeriği Chang ve arkadaşlarının yöntemine göre tayin edildi. 0,1 ml %10 AlCl<sub>3</sub> ve 1 M potasyum asetat (0,1 ml) eklendi ve 2 ml ekstre metanol içerisinde çözüldü. Toplam hacmi metanol ile 5 ml'ye tamamlandı. 40 dakika inkübasyonun ardından absorbans 415 nm'de ölçüldü. Standart kalibrasyon eğrisi kersetin kullanılarak elde edildi ve toplam flavonoid içeriği, g ağırlık başına ifade edildi. Tüm deneyler üç tekrarlı gerçekleştirildi. (Chang ve ark., 2002).

## DPPH Testi

Ekstrelerin serbest radikal temizleme aktiviteleri DPPH yöntemi ile değerlendirildi. Numunenin farklı konsantrasyonlardaki 1,5 ml' si, metanol içindeki 0,5 ml taze hazırlanmış 0,5 mM DPPH 'a eklenerek, karanlıkta 30 dakika bekletildi. Absorbans, Thermo Scientific Varioskan® Flash mikropilaka okuyucu ile DPPH' a karşı 517 nm'de ölçüldü. Referans standardı olarak Trolox kullanıldı. Tüm örnekler üç tekrarlı çalışıldı. Bileşiklerin DPPH radikal temizleme aktivitesi aşağıdaki denkleme göre hesaplandı (Yang ve ark., 2012, Kamleshya ve ark., 2012):

$$\text{Temizleme aktivitesi (\%)} = (A_{\text{DPPH}} - A_{\text{örnek}}) / (A_{\text{DPPH}}) \times 100$$

## HPLC analizi

HPLC analizi, fotodiyot dizisi detektörü ile donatılmış Thermo Scientific Accela Model 1250 sistemi (ABD) kullanılarak gerçekleştirildi. Kersetin, sinamilalkol, sinamik asit ve sinamaldehyden (Sigma Aldrich, ABD) oluşan stok çözelti, metanol (1 mg/mL) içerisinde hazırlandı. Ayırma için ACE-5 C<sub>18</sub> kolonu (250x4,6 mm, 5 µm) kullanıldı. Kullanılan solventler; mobil faz A su içinde %0,25 trifloroasetik asit ve mobil faz B asetonitril içinde %0,25 trifloroasetik asit, gradyan koşulları Tablo 1'de verildi. Mobil faz, kullanımdan önce 0,45 µm membran filtreden süzüldü. akış hızı 0,8 mL/dak olarak ayarlandı. Enjeksiyon hacmi 10 µL dir ve örnekler üç kez enjekte edildi. UV-VIS spektrumları 200 ila 600 nm arasında kaydedildi. Tüm kromatografik işlemler ortam sıcaklığında gerçekleştirildi. Hesaplamalar, external standart yöntemi kullanılarak pik entegrasyonu ile yapıldı. Çalışma standartları için 1-40 µg/mL konsantrasyonlar kullanıldı. Analitlerin kromatografik pikleri, alıkonma süreleri standardinkilerle karşılaştırılarak belirlendi.

Tablo 1. Gradient şartları

Zaman (dk)	Mobil faz A (%)	Mobil faz B (%)
0	90	10
15	30	70
17	90	10

### İstatistiksel analiz

Veri analizi SPSS for Windows, sürüm 15.0 kullanılarak yapıldı. Sonuçların analizinde tek yönlü varyans analizi (ANOVA) testi kullanıldı. İstatistiksel olarak anlamlı fark  $p < 0,05$  düzeyinde kabul edildi.

### BULGULAR

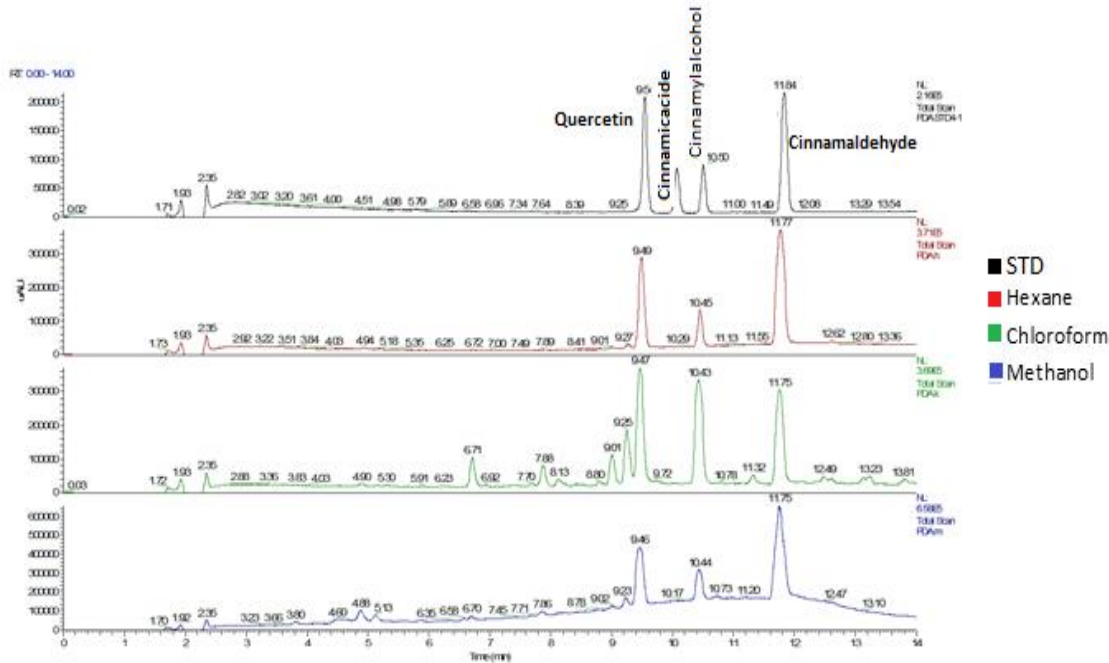

Çalışmada, ekstraksiyon verimi *C. cassia* hekzan, kloroform ve metanol ekstraktları için sırasıyla 1%, 1.2% ve 9% olarak hesaplandı (Tablo 2).

Ekstraksiyon verimi (%) = Dondurulmuş kuru ekstrenin ağırlığı/örneğin ağırlığı x 100

Ekstrelerin bazı biyoaktif bileşiklerinin miktarını belirlemek için HPLC kullanıldı. *C. cassia* ekstraktlarında belirlenen sinmaldehit ve sinamik asit miktarları Tablo 2'de verilmektedir. Ancak kersetin, sinamil alkol tespit edilememiştir. *C. cassia* ekstraktlarındaki toplam fenolik ve flavanoidlerin miktarları Tablo 3'te gösterilmektedir. Standart kersetin ve gallik asit kalibrasyon eğrileri, sırasıyla 0,992 ve 0,9929 R<sup>2</sup> değerlerine sahiptir.

Çalışmamızda *C. cassia* 'dan elde edilen üç ekstrenin antioksidan aktivitesi DPPH yöntemi ile test edildi. Ekstrelerin serbest radikal temizleme aktiviteleri Şekil 3'te gösterilmektedir. *C. cassia* hekzan ve metanol ekstraktlarının kabukları dikkat çekici antioksidan aktiviteler sergilemiştir. Kabukların IC<sub>50</sub>'si sırasıyla 22,55, 142,2, 25,24 µg/ml (hekzan, kloroform, metanol) bulunmuştur. Tüm ekstraktların DPPH radikal temizleme aktivitesi, konsantrasyonun artmasıyla doğru orantılı artmıştır (Şekil 2). Kloroform ekstresi, hekzan ve metanol ekstraktlarına göre düşük antioksidan aktiviteye sahiptir.

WST-1 yönteminde, lenfosit canlılığı, ekstraktlarla 24 saat süre sonunda konsantrasyona bağlı olarak azalmaktadır. Kontrolde hücre canlılığını %50 (IC<sub>50</sub>) azaltmak için gereken konsantrasyon, hekzan, kloroform ve metanol ekstraktları için sırasıyla 91,74; 62,30 ve 66,42 µg/ml' dir.

Şekil 1: *C. cassia* kabuğu ekstraktlarından elde edilen flavonoidlerin HPLC profili (1:kersetin; 2: sinamilalcohol; 3:sinamik asit; ve 4:sinmaldehit)

Tablo 2. Hekzan, kloroform ve metanol ekstralarının ekstraksiyon verimi ve *C. cassia* kabuğundan elde edilen aktif bileşimler

Ekstre	Ekstraksiyon verimi (%)	Sinnamaldehit (µg/ml)	Sinnamic Asit (µg/ml)
Hekzan	1 %	28,25	14,20
Kloroform	1.2 %	22,24	52,43
Metanol	9 %	40,13	24,84

Tablo 3. *C. cassia* ekstralarında toplam flavonoidler ve fenolik içerikler

	Hekzan	Kloroform	Metanol
Total flavanoid içerik (mg kersetin/g kuru ağırlık)	9,30±2,2	10,37±2,4	18,72±0,3
Total fenolik içerik (mg gallik asit/g kuru ağırlık)	21,28±0,3	27,85±0,2	57,91±0,6

Tüm analizler üç ölçüm ortalaması ± standart sapmadır.

## TARTIŞMA

Kozmetikte, baharatlarda ve fitoterapi endüstrisinde kullanılan tarçın dünya çapında üretilmektedir. Bitkiden elde edilen ekstraların fiziksel ve kimyasal bileşimlerinin analizi, bileşenlerinin faydalı etkileri kadar toksik etkilerinin de olması, tüketici güvenliği açısından önemlidir. Ekstrelerin serbest radikal süpürme aktiviteleri, antioksidan bileşimlerin hidrojen kaybetme yeteneğine ve bu bileşenlerin yapısal konformasyonuna bağlıdır. DPPH serbest radikali, stabil bir molekül haline gelmek için antioksidan moleküllerden bir elektron veya hidrojen alır (Baliyan ve ark., 2022).

Şekil 2: *C. cassia* ekstralarının DPPH radikal temizleme aktivitesi.

Metanolde hazırlanan DPPH radikal çözeltisi, bir antioksidan madde varlığında DPPH-H (difenilhidrazin) moleküllerine dönüştürülür. Çalışmamızda tarçının hekzan ve metanol ekstralarının DPPH free radikal scavenging aktiviteleri 200 µg/ml nin üzerindeki dozlarda %90'nın üzerine çıkarken kloroform ekstraları % 400µg/ml de % 68,84 olarak saptanarak daha zayıf bir aktivite göstermiştir. (Şekil 2) Referans standart olarak kullanılan trolox aktivitesi ise 100 µg/ml dozlarında %90'nın üzerine çıkmıştır.

Ekstreler HPLC ile analiz edildiğinde aktif bileşenleri olan sinnamaldehit hekzan kloroform ve metanol ekstralarında sırasıyla 28,25, 22,24, 40,13 µg/ml, ve sinnamik asit 14,20, 52,43 ve 24,84 µg/ml bulunmuştur. Sinnamaldehitin metanol ekstresinde sinnamik asitin ise kloroform ekstresinde daha yüksek düzeyde bulunduğu görülmektedir (Tablo 2).

Antioksidan bileşikler genellikle fenolik formdadır. Fenoller içerdikleri hidroksil grupları ile, radikalleri bağlayan bileşiklerdir. Bu önemli bitki bileşenleri, hidrojen atomlarını hidroksil gruplarından radikallere bırakır ve stabil fenoksil radikallerini oluştururlar. Bu nedenle, bitki ekstrelerinin antioksidan kapasitesini belirlemek için fenolik bileşiklerin miktarının belirlenmesi çok önemlidir (Shi ve ark., 2022). Tarçının fenolik bileşenlerinin de antioksidan ve serbest radikal temizleme aktivitelerinden sorumlu olduğu bildirilmektedir (Hamidpour ve ark., 2015). Fenolik bileşiklerin antioksidan özellikleri, proton kaybı, şelat oluşumu ve radikallerin dismutasyonundan kaynaklanmaktadır. Çalışmada tarçın ekstrelerinin total fenolik içerikleri hekzan kloroform ve metanol ekstreleri için sırasıyla 21,28, 27,85 ve 57,91 mg gallik asit/100g kuru ağırlık ve total flavon içerikleri 9,3, 10,37, 18,72 mg kersetin/100g kuru ağırlık olarak bulunmuştur. Metanol ekstresinin diğer ekstrele göre fenolik ve flavon içeriği açısından daha yüksek olduğu sonuçlarımızdan görülmektedir. Çalışma sonuçlarımız El-Baz ve ark. nın (2023) çalışmasıyla uygunluk göstermektedir

*C. cassia* kabuğunun temel bileşenlerinden olan sinnamaldehit ve diğer bileşenleri olan sinnamik asit, sinnamil alkol, kumarin ve metil öjenolün kantitatif analizine yönelik çalışmalarda *C. cassia*'nın buhar distilasyonu ya da metanol, aseton, kloroform, hekzan gibi çözücülerle ekstraksiyonu sonucunda bu bileşiklerin en yüksek düzeyde metanol çözücüsünde buldukları gösterilmiştir (He ve ark., 2005)

Nile ve ark.ı (2023) *C. zeylanicum* kabuğunun aktif bileşeni sinnamaldehitin HCT 116 ve HT-29 kolon hücrelerinde serbest oksijen radikal oluşumunu artırdığını göstermişler, bileşiğin sitotoksik etkisini, ROS oluşumunun aracılık ettiği apoptozla ilişkilendirmişlerdir. *C. cassia* kabuğu metanol ekstresinin GS-MS analizinin yapıldığı bir çalışmada 35 fitokimyasal saptanmış ve majör bileşenlerin sinnamaldehit (%24.58), p-metoksi sinnamaldehit (%9.87), cis-2-metoksi sinnamik asit (%9.22), sinnamik asit (%7.39), kumarin (%5.31) ve 8,11-oktadekadienoik asit metil esteri (%4.27) olduğu bildirilmiştir (Ahmada ve ark., 2013)

Tarçın esaslı yağının güçlü bir antiproliferatif etkiye sahip olduğu ve hücrelerde reaktif oksijen türlerinin oluşumunu indükleyebilen sinnamaldehiti yüksek oranda içerdiği bildirilmiştir (Cappelli ve ark., 2023). Sinamik asit, lignin, tanenler, flavonoidler, pigmentler, baharatların lezzet bileşenlerinin birçoğunun sentezlenmesinde öncüdür. Büyük moleküllü fenolik bileşiklerin oluşumunda kilit rol oynar. Çalışmamızda ekstrelerde elde edilen farklı antioksidan aktivite düzeylerinin sinnamaldehit ve sinnamik asit miktarlarından kaynaklandığı değerlendirilmiştir. Metanol ekstresinde yüksek fenol ve flavonoid içerik ve antioksidan aktivite saptanmıştır. Bu ekstrede sinnamaldehit düzeyi yüksektir. Kloroform ekstresinde ise DPPH aktivitesi düşük bulunmuştur ve daha yüksek sinnamik asit düzeyi saptanmıştır. Sonuçlarımıza bakıldığında kloroform ekstresi ile daha düşük antioksidan aktivite görülmesi(400 µg /ml da % 68) sinnamaldehit düzeyinin bu ekstrede daha düşük düzeyde olması ile ilişkili olabileceği değerlendirilmiştir.

## SONUÇ

Sonuç olarak incelenen üç farklı ekstreten metanol ekstresi diğer ekstrele göre daha yüksek düzeyde radikal temizleyici aktiviteye sahip ve en yüksek sinnamaldehit düzeyine sahip ekstre olarak saptanmıştır. Bu ekstreten oksidatif stres altındaki hücreler için faydalı sonuçlar üretebileceği daha ileri çalışmalarla ortaya çıkarılabilir görüşündeyiz

## TEŞEKKÜR

Yazarlar bu çalışmaya Ege Üniversitesi Eczacılık Fakültesi Farmasötik Bilimler Araştırma Merkezi'ne (FABAL, İzmir, TÜRKİYE) verdiği destek için teşekkür ederler.

#### Abstract

In this study, it was aimed to develop a topical cream formulation from y/s type emulsions containing *Oleum Rosmarini* so that the *Rosmarinus officinalis* plant can be used in the treatment of rheumatism. Triethanolamine was added for neutralization to some of the emulsion combinations containing oil, surfactant, copolymer and plasticizer at different rates over three different polymer concentrations in order to select the appropriate formulation with preformulation studies. Organoleptic controls of the selected formulations were made and characterizations were made in terms of pH, texture profile analysis, rheology and thermodynamics. The pH value of the optimized formulations was in the range of 5-7. The formulations were obtained homogeneously and no phase separation was observed. It has been observed that the creams provide proper flow and have high stability.

**Keywords:** Cream, *Oleum rosmarini*, *Rosmarinus officinalis*, Rheumatic Disease, Topical Application

#### INTRODUCTION

Rheumatoid arthritis is a multisystem disease of unknown cause, characterized by inflammation of the synovial membrane, leading to progressive destruction of joint cartilage, bone erosion, and chronic deformities that may also involve internal organs. Because chronic pain is a common symptom in most rheumatic diseases and the restrictive effect of pain, pain relief is one of the primary goals of antirheumatic treatment goals (Adami et al., 2019). *Rosmarinus officinalis* (rosemary) is a medicinal plant originating from the Mediterranean and grown worldwide. Several phytochemicals with pharmacological activities can be isolated from essential oils and extracts of *Rosmarinus officinalis*. Some characteristic chemical constituents of this oil include 1,8-cineole,  $\alpha$ -pinene, camphor, bornyl acetate, borneol, camphene,  $\alpha$ -terpineol, limonene and myrcene (Borges et al., 2019). Creams are emulsion-type semi-solid dosage forms with an opaque appearance containing a water phase, volatiles, hydrocarbons, waxes or polyols, dissolved or dispersed in a suitable base, for external application to the skin. These dosage forms are forms containing one or more drug substances dissolved or dispersed in a suitable base (Sahu et al., 2021). The aim of this study is to develop an alternative emulsion formulation prepared for topical use with the essential oil obtained from the *Rosmarinus officinalis* plant due to its anti-inflammatory and analgesic effects in the treatment of rheumatoid arthritis and to investigate its *in vitro* characterization.

#### MATERIALS AND METHODS

##### Materials

All materials used were in pharmaceutical grade.

##### Methods

##### Formulation Studies

Cream formulations were prepared by the emulsification technique. Carbopol 996 and HPMC were used as the water phase and *Oleum rosmarini* was added as the oil phase. Tween 20 was applied as surfactant while propylene glycol was added as plasticizer. Different ratios of the formulation ingredients were tried and characterized *in vitro*, for determination of the optimum formulation and represented in Table 1.

**Table 1.** Formulation Ingredients of the Creams

	Water Phase				Oil Phase		
	Carbopol	HPMC	TEA	Distilled water q.s. (g)	Oleum rosmarini(g)	Tween 20(g)	Propylen glycol (g)
<b>FF1</b>	0.1	2	q.s.	100	30	1	5
<b>FF2</b>	0.1	2	q.s.	100	30	3	2.5
<b>FF3</b>	0.1	2	q.s.	100	30	3	10
<b>FF4</b>	0.1	2	-	100	30	1	5
<b>FF5</b>	0.1	2	-	100	30	3	2.5
<b>FF6</b>	0.1	2	-	100	30	3	10

### Characterization of the creams

Organoleptic properties analyzed manually, pH was determined with the Mettler digital pHmeter, Texture Profile Analysis was done with the Texture Analyzer (TA.XT.PlusC, Stable Micro System, Haslemere, Surry, UK), rheological properties were analyzed by the Haake Rheometer I (Thermo Fisher Scientific Inc., Essen, Germany), and stability evaluation was done by centrifugation and freeze-thaw cycles applied to formulations. All studies were conducted in triplicate.

## RESULTS and DISCUSSION

### Characterization of the creams

pH values of the all formulations were measured between 5- 7, and found to be applicable for skin. Results of the organoleptic evaluation was shown in Table 2. According to organoleptik evaluation F1,2,3 and F6 formulations were chosen for texture profile analysis and rheological analysis (n=3).

**Table 2.** Organoleptic Properties of the Formulations

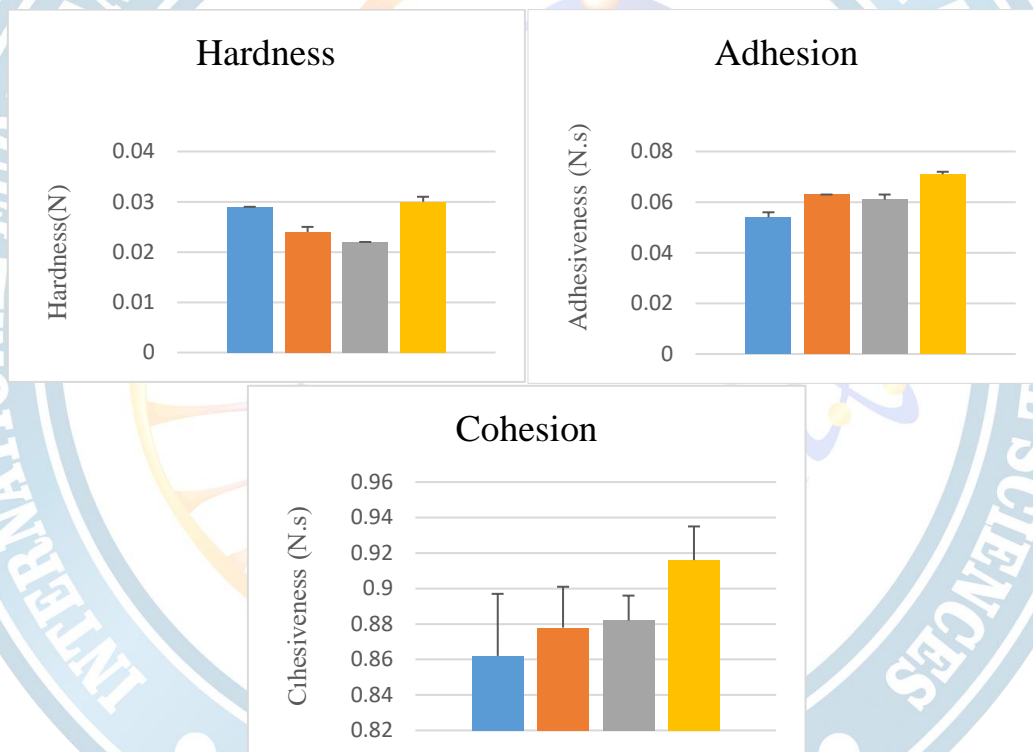

Formulation	Spreadability	Phase Separation	Homogeneity	Appearance
<b>F1</b>	+++	Stabile	Homogen	Convenient
<b>F2</b>	+++	Stabile	Homogen	Convenient
<b>F3</b>	+++	Stabile	Homogen	Convenient
<b>F4</b>	+	Occured	-	-
<b>F5</b>	+	Occured	-	-
<b>F6</b>	+++	Stabile	Homogen	Convenient

For rheological analysis, shear rate results and viscosity changes against shear stress were examined. As the shear rate increased, the viscosity decreased. Due to the increase in shear stress and shear rate, the flow characteristic showed results suitable for pseudoplastic flow (Namjoshi et al., 2020). It maintained its flow properties in both formulations and represented in Figure 1.

**Figure 1.** Rheograms of the F1 and F6 Formulations

It was stated that among the developed formulations, the formulation with high adhesion value and low cohesion value had low interaction with the skin and, accordingly, the cream showed high ease of application (Okur et al., 2020), and results are represented in Figure 2.

**Figure 2.** Texture Profile Analysis of the Creams

## CONCLUSION

In the current study, a suitable formulation in terms of its physicochemical properties was developed by using rosemary oil, an active ingredient of natural origin. Considering the positive results, further research can be done with different studies. Additionally, further studies can be conducted on the effectiveness of the formulation through *ex vivo* and *in vivo* experiments.

### Özet

Manda büyük oranda Asya kıtasında yaşayan, etinden, sütünden, iş gücünden, boynuzundan ve derisinden faydalanılan bir hayvandır. Mandalar yem seçmeden düşük kaliteli yemleri iyi değerlendirebilen ve farklı çevre koşullarına uyum sağlayabilen hayvanlardır. Türkiye’de manda yetiştiriciliği ağırlıklı olarak süt üretimi için yapılmakta olup, et üretimi sonraki amaç olarak gelmektedir. Diğer taraftan ülkemizde manda başına elde edilen et ve süt üretim değerleri manda yetiştiriciliği yüksek olan ülkelerin oldukça gerisindedir. Bu sebeple verimi arttıracak saf yetiştirme ile ırk geliştirme faaliyetlerinin yaygınlaştırılması gereklidir. Yurdumuzda 2021 yılı verilerine göre manda sayısı 185.574 ve çiğ süt üretimi ise 63.943 tona yükseldi. Türkiye’de yetiştirilen mandaların laktasyon süt verimleri 654-761 kg arasında değişmektedir. Mandalarda pubertasa ulaşma yaşı 13-22 ay ile 36-40 aylar arasındadır. Anadolu Mandaları 13-15 ay, bataklık mandaları 21-48 ay ve Nehir mandaları ise 15-18 ayda pubertasa ulaşır. Bir başka yaklaşımda ise erişkin vücut ağırlığının (250 ila 400) yaklaşık % 60'ına ulaştığında pubertasa erişmektedir. Östrus siklusu ortalama 21 (17-26) gündür. Siklus Nehir mandalarında 20-22 gün, Bataklık mandalarında ise 19-20 gün arasında değişmektedir. Mandalarda düzensiz östrus görülme insidansı oldukça yüksektir. Mandalarda da östrus siklusu proöstrus, östrus, metöstrus ve diöstrus olmak üzere 4 döneme ayrılır. Ortalama gebelik süresi Nehir mandalarında 310 gün (300-320) Bataklık mandalarında ise 330 gün (320-340) aralığındadır. Mandaların başlıca reproduktif problemleri; repeat breeder, postpartum sorunlar ve anötrüstrü. Üreme performansının optimizasyonu ve verimin artırılması gebelik, doğum ve postpartum dönemde takip edilerek yaşanacak aksaklıkların giderilmesi ile mümkün olacaktır.

**Anahtar Kelimeler:** Manda, Üreme, Gebelik, İnfertilite

### Reproduction and reproductive problems in buffaloes

#### Abstract

Buffalo is an animal that lives largely in Asia and is used for its meat, milk, labor, horn and skin. Buffaloes are animals that can make good use of low-quality feed without choosing feed and can adapt to different environmental conditions. In Turkey, buffalo breeding is mainly done for milk production, with meat production being the next purpose. On the other hand, meat and milk production values per buffalo in our country are far behind countries with high buffalo breeding. For this reason, it is necessary to expand pure breeding and breed development activities that will increase productivity. According to 2021 data in our country, the number of buffaloes increased to 185,574 and raw milk production increased to 63,943 tons. Lactation milk yield of buffaloes raised in Turkey varies between 654-761 kg. The age of reaching puberty in buffaloes varies between 13-22 months and 36-40 months. Anatolian Buffaloes reach puberty in 13-15 months, swamp buffaloes in 21-48 months and River buffaloes in 15-18 months. In another approach, the adult reaches puberty when he reaches approximately 60% of his body weight (250 to 400). The estrous cycle is 21 (17-26) days on average. The cycle varies between 20-22 days in River buffaloes and 19-20 days in Swamp buffaloes. The incidence of irregular estrus in buffaloes is quite high. The estrous cycle of buffaloes is divided into 4 periods: proestrus, estrus, metestrus and diestrus. The average gestation period is 310 days (300-320) in river buffaloes and 330 days (320-340) in swamp buffaloes. The main reproductive problems of buffaloes are; repeat breeder, postpartum problems and aneutrus. Optimizing reproductive performance and increasing productivity will be possible by monitoring pregnancy, birth and postpartum periods and eliminating any disruptions that may occur.

**Keywords:** Buffalo, Reproduction, Pregnancy, Infertility

## GİRİŞ

Manda daha çok Asya kıtasında yaşayan, etinden, sütünden, kaymağından, iş gücünden, boynuzundan ve derisinden faydalanılan bir hayvandır. Mandalar yem seçmeden düşük kaliteli yemleri iyi değerlendirebilen ve farklı çevre koşullarına uyum sağlayabilen hayvanlardır (Sarıözkan, 2011). Mandalar ineklere nazaran daha dirençli ve yetiştirme maliyetleri daha düşük hayvanlardır. Ancak, fertilitate ve verim açısından ineklerden oldukça geride kalmaktadır ve yetiştirilmesi de karlı olmamaktadır. Fertilitate problemlerinin en önemlileri ise; mevsime bağlı olarak üreme potansiyelindeki değişimler, pubertasin gecikmesi, düzensiz süklus, suböstrus, fertilizasyon oranının düşük olması, postpartum anöstrusun ve buzağılama aralığının uzun olmasıdır (Çizmecci, 2019).

Dünyada manda yetiştiriciliği genellikle aile tipi işletmelerde süt ve et üretimi amacıyla yapılmaktadır (Fao, 2022). Türkiye’de manda yetiştiriciliği; Ege Bölgesi’nde Afyon’da; Marmara Bölgesi’nde İstanbul’da; İç Anadolu Bölgesi’nde Sivas ve Yozgat’ta; Güneydoğu Anadolu Bölgesi’nde Diyarbakır’da; Doğu Anadolu Bölgesi’nde Muş’ta; Karadeniz Bölgesi’nde Samsun, Sinop, Çorum ve Amasya’da yoğunlaşmıştır (Özkan ve ark., 2017). Dünya genelinde 2020 yılında küçükbaş ve büyükbaş hayvan sayısı yaklaşık olarak 4.1 milyar olup, bunun %58.33’ü küçükbaş, %41.67’sini ise büyükbaş hayvan oluşturmaktadır. Yıllık toplam çiğ süt üretimi 900 milyon ton civarında olup 2020 yılı dünya süt üretiminin %81’i inek sütü, %15’i manda, %3,52’si küçükbaş ve %0,35’i ise deve sütüdür (Fao, 2022). Türkiye’de 2020 yılında manda varlığı 192.489 iken, 2021 yılında ise 185.574’e gerilemiştir (TÜİK 2022; HAYGEM, 2022). Türkiye’de 2022 yılında üretilen toplam sütün %92,3’ü inek sütü, %7,4’i küçükbaş (koyun ve keçi) sütü ve %0,3’ü ise manda sütüdür (TÜİK, 2022).

## MANDALARDA ÜREME

### Üreme Organlarının Anatomisi

Dişi üreme sistemi tübüler genital organlardan oluşur (Dyce ve ark., 2004, Hafez ve Hafez, 2004). Sığır ve manda, dişi üreme yolları anatomisi açısından benzerdir, ancak mandada serviksin daha dar olması, serviksin daha kalın olması, ovaryumların daha küçük ve uzun olması gibi bazı farklılıklar bulunmaktadır (Tonizza de Carvalho ve ark., 2014). Dişi genital sistem, gametler ve hormonlar üreten ovaryumları; uterusun bir uzantısı olan ve oosit, sperm ve salguların taşınmasını sağlayan oviduktu; embriyonik ve fetal gelişimin devam ettiği uterusu; çiftleşme ve fetüsün geçiş kanalı olan vajina ve vulvayı içermektedir (Hafez ve Hafez, 2004, Tonizza de Carvalho ve ark., 2014). Mandalarda ovaryum folikülleri de ineklere nazaran küçüktür ve gelişmiş bir folikül 8 mm civarındadır ve rektal muayene sırasında Corpus Luteum (CL) ile karıştırılabilmektedir. CL küçüktür genelde ovaryuma gömülüdür ve belirgin bir taç yapmaz (Çizmecci, 2019).

Mandaların uterus ve serviksleri de ineklerden oldukça küçüktür ancak uterus duvarı daha kaslı ve kalındır. Kornuların arasındaki bağlar kuvvetli olduğu için uterus kornuları daha kıvrıktır. Gebe olmayan bir mandada uterus pelvik boşlukta yer almaktadır. Servikal kanal daha dardır ve halka sayısı da ineklerden daha azdır (Napolean ve Quayam, 1996). Servikal darlık özellikle düvelerde suni tohumlama uygulamalarını güçleştirmektedir (Carvalho ve ark., 2010). Mandalarda vulva daha gevşek, sarkık ve koyu pigmentlidir, ayrıca klitorisleri de daha büyüktür. Mandalarda malak vücutbüyüklüğünün anne vücut büyüklüğüne oranının küçük olması sayesinde doğum daha kısa sürede ve kolay olmaktadır (Tonizza de Carvalho ve ark., 2014).

### Pubertas

Manda düveleri genellikle yetişkin vücut ağırlıklarının yaklaşık %55-60’ına ulaştıklarında pubertasa ulaşırlar. Pubertasa erişme yaşı ise 18 ila 46 ay arasında değişebilmektedir (Jainudeen ve Hafez, 1993). Mandalarda pubertasa ulaşma yaşı 13-22 ay ile 36-40 aylar arasındadır ve genellikle Anadolu Mandaları 13-15 ay, Nehir mandaları 15-18 ay, bataklık mandaları 21-48 ayda pubertasa ulaşmaktadır (Çizmecci, 2019). Pubertasa erişmeyi etkileyen faktörler genotip, beslenme, yönetim, sosyal çevre, iklim, doğum yılı, doğum mevsimi ve hastalıklardır. Uygun koşullar altında nehir tipi mandaların ilk östrusu 15-18 aylıkken, bataklık tipinin ise 21-24 aylıkken göstermektedir (Borghese, 2005). Ergenliğe ulaşılan vücut ağırlığı genotipten güçlü bir şekilde etkilenir ve bataklık tipi için 200-300 kg, nehir tipi için ise 250-400 kg civarındadır. Her ne kadar mandalar sığırlardan daha geç ergenliğe ulaşsa da, daha uzun bir üreme ömrüne sahiptirler ve bu da bu erken ekonomik dezavantajı telafi etmeye yardımcı olabilmektedir (Perera, 2011). Ancak pubertas yaşının gecikmesi, verimin düşmesine ve elde edilecek yavru sayısının azalmasına neden olmaktadır. Mandalarda östrus tespitinin güç olması nedeniyle pubertasin belirlenmesi de güçleşmektedir ve genellikle ilk buzağılama yaşı dikkate alınarak pubertas yaşı tahmin edilmektedir.

## Üreme Özellikleri

Mandalar poliöstrik hayvanlardır ve yıl boyu östrus gösterirler. Fakat mevsimsel üreme özellikleri gösterdikleri de bildirilmektedir. Tropikal bölgelerde genelde sonbahar ve kış aylarında, ılıman iklim kuşağında ise ilkbahar sonu ve yaz aylarında üreme faaliyetleri sergilemektedirler (Perera, 2008). Mandalarda yaz aylarında sıcaklık stresine bağlı anöstrus görülebilmektedir (Roy ve Praksh, 2007). Fotoperiyodun sabit olduğu tropik bölgelerde yağışlardan etkilenirler ve sikluslarında değişimler yaşanabilir (D'Occhio ve ark., 2020). Ülkemizde bulunan Anadolu Mandalarının östrus ve doğumları genellikle Nisan-Ağustos ayları arasında görülmektedir (Çizmeçi, 2019).

Mandalarda yetersiz bakım ve besleme sebebiyle reproduktif sorunlarla karşılaşmaktadır. Mandaların diğer reproduktif problemleri ise, inaktif ovaryum, pubertasin gecikmesi, östrus semptomlarının zayıf olması, suböstrus ya da düzensiz siklus görülmesi ve mevsime bağlı şekillenebilen aöstrusun uzamasıdır. İlk buzağılama yaşı ortalama 3-4 yaş arasındadır. Ancak genellikle birçok manda ilk yavrusunu çok daha ileri yaşta doğurmaktadır (D'Occhio ve ark., 2020).

## Seksüel Sikluslar

Mandaların östrus siklusu süresi ineklere benzer olup 17 ila 26 gün arasında değişmekle birlikte ortalama 21-23 gün civarındadır (Jainudeen ve Hafez, 1993). Olumsuz çevre koşulları, beslenme, steroid hormonların salgılanmasındaki düzensizlikler gibi çeşitli faktörlere bağlı olarak sikluslar kısa (1-10 gün), normal (11-30 gün), uzun (31-60 gün) veya çok uzun (61-90 gün) olabilmektedir (Nanda ve ark., 2003). Siklusların uzamasında östrüs takibinin doğru yapılamaması, suböstrüs, ovulasyonun gecikmesi, implantasyonda yaşanan sorunlar, embriyonik ölümler etkili olmaktadır. Siklusların kısalması ise erken luteal regresyona bağlı şekillenmektedir (Perera, 2011). Östrüs süresi nehir ve bataklık mandalarında benzerdir ve 5 ile 27 saat arasında değişmektedir ve ovulasyon östrusun başlangıcından yaklaşık 24-48 saat (ortalama 34 saat) sonra veya östrusun bitiminden 6-21 saat (ortalama 14 saat) önce gerçekleşir (Kanai ve ark., 1990; Perera, 1999). Sıcak iklimlerde östrüs süresi genellikle daha kısadır ve östrüs belirtileri daha çok gece veya sabahın erken saatlerinde ortaya çıkar (Perera, 2011).

Mandalarda östrüs siklusu sırasında ovaryumun foliküler dinamikleri ineklere benzer. Östrüs siklusu esnasında 1-3 foliküler dalga şekillenebilir, ancak yarısından fazlasında iki dalgalı siklus görülür (Baruselli ve ark., 1997; Presicce ve ark., 2005; Neglia ve ark., 2007). Mandalarda östrusun başlangıcı ile LH artışı arasındaki süre 1 ila 12 saat arasında değişebilir. Ovulasyon, LH dalgalanmasından 26 ila 33 saat sonra meydana gelir (Seren ve ark., 1995). Östrusun dış belirtileri (suböstrüs) olmaksızın endokrin aktivitede önemli farklılıklar olduğu görülmektedir. Mandalarda östrüs siklusu sırasında kan östradiol-17 $\beta$ , kan ve süt progesteron konsantrasyonlarındaki değişimler ineklerdekine benzerdir. Mandadaki CL sığırlara göre daha küçüktür ve dolaşımdaki progesteron (P4) konsantrasyonları da sığırlara göre daha düşük seyrederek (Mondal ve Prakash, 2004). Siklik aktivitenin belirlenmesinde 1 ng/ml progesteron değeri eşik kabul edilmektedir. Süt sığırlarıyla karşılaştırıldığında mandalarda östrüs belirtilerinin hafif olması, dolaşımdaki östradiol-17- $\beta$  konsantrasyonunun düşük olmasından kaynaklanıyor olabilir (Seren ve ark., 1995; Singh ve ark., 2000; Roy ve Prakash, 2009).

## Östrüs Davranışları

Östrüs davranışlarında manda ve sığır arasındaki temel fark, östrusun davranışsal belirtilerinin belirgin olmaması ve dişiler arasındaki eşcinsel davranışın daha nadir olmasıdır. Huzursuzluk, ayakta durma, hareketlerin artması, sütün azalması, heteroseksüel davranış, böğürme, vulvada ödem, çara akıntısı, sık idrar yapma ve erkek atladığında durma gibi belirtiler görülebilmektedir (Perera, 2011). Belirtilerin hepsi aynı anda görülmez ancak mandaların hemen hepsinde vajinal akıntı bulunur. Östrustaki hayvanların yaklaşık yarısında vulvada ödem ve hiperemi görülür (Warriach ve ark., 2015).

## Gebelik ve Doğum

Mandalarda üreme, yıllardan bu yana dişi ve erkeğin yan yana olması ve doğal çiftleşmeye dayanmaktadır. Östrusların senkronize edilerek suni tohumlama ile elde edilen gebelik oranları oldukça düşüktür. Dişilerde gün uzunluğunun arttığı dönemde (ilkbahar-yaz) yapılan senkronizasyon denemelerinde inaktif ovaryum oranının artması gebelik oranını düşürmektedir ayrıca suni tohumlama uygulandığında gebelik oranları daha da düşmektedir (Çizmeçi, 2019).

Mandada embriyonik gelişimin genel özellikleri diğer geviş getiren hayvanlarla benzer olmakla birlikte bazı önemli farklılıklar da bulunmaktadır. Akdeniz nehri mandasında, embriyolar tohumlamadan sonra 74 ila 100 saat oviductta kalır ve 4,5-5 günde uterusu erken morula aşamasında ulaşır (Anwar ve Ullah, 1998). Akdeniz ve Nili-Ravi mandalarında kompakt morulalar östrustan 125 ila 152 saat sonra, blastosist ise 141 saatten itibaren gözlenir (Mehmood ve ark., 1989).

Mandalarda gebelik ve doğum oranları da mevsime göre değişiklik göstermektedir. Doğumların çoğunluğu ülkemizde Nisan-Ağustos aylarında daha sıcak iklime sahip ülkelerde ise Ekim ve Şubat ayları arasında

olmaktadır (Çizmeçi, 2019). Mandalarda gebelik süresi 300 ila 330 gün arasında değişmekte olup, nehir türleri için ortalama 310 gün, bataklık türleri için ise 320 gün civarındadır. Gebeliğin erken tanısı yaklaşık 20. günden itibaren ultrasonla (Presicce ve ark. 2004), 45. günden itibaren ise rektal palpasyonla yapılabilmektedir. Muayane teknikleri ve bulguları temel olarak ineklerdeki benzerdir. Ancak gebelik süresinin farklı olması nedeniyle fötusun gelişim dönemlerinde de bazı farklılıklar olacağı da göz ardı edilmemelidir. Laboratuvar tanı yöntemi, tohumlamadan 20-23 gün sonra progesteron analizine dayanmaktadır (Perera, 2008). Mandada doğum sürecindeki progesteron, östrojen ve prostaglandin  $F_{2\alpha}$ 'da meydana gelen değişiklikler ineklerdeki benzerdir. Uterus involüsyonu genellikle doğumdan sonraki 25-35 günde tamamlanır (Lohan ve ark., 2004) ve laktasyon bu gelişme süresini kısaltabilir (Usmani ve ark., 1990)

Mandalarda doğumdan 1-2 hafta önce abdominal genişleme, memelerin gelişmesi, inmesi ve vulvada ödem gibi belirtiler görülmeye başlar. Doğum süresindeki hormonal değişimler ineklerdeki benzer seyretmektedir. Doğumu malak başlatır ve kortizol seviyesinin artmasıyla serum progesteron seviyesi hızla düşer. Doğumun birinci aşaması olan serviksin açılması ortalama olarak 1-2 saat kadar sürmektedir. Yavrunun kanaldan çıkmasına kadar geçen dönem ikinci dönemdir. Bu dönem genellikle 30-60 dakika kadar sürmektedir. Yavru zarlarının atılmasını içeren üçüncü dönem ise 4-6 saat kadar sürmektedir (Ahmad, 2003)

Doğum sürecinin ineklerden kısa olması güç doğum insidensinin de ineklere oranla düşük olmasının nedenleri arasındadır. Doğum kanalının malağın boyutuna oranla büyük olması güç doğum oranını azaltmaktadır. Ayrıca malakların %95'i normal prezentasyon ve pozisyonda doğum kanalına girer. Ancak doğumların az bir kısmında yavru kanala ters olarak girer ve güç doğum şekillenebilir (Purohit ve ark., 2011). Güç doğum olgularının çoğunluğunu (%59,16) uterus torsiyonu gibi (%83,33) anneye bağlı nedenlerden kaynaklanmaktadır (Srinivas ve ark., 2007). Anneye bağlı güç doğum sebepleri arasında; pelvik anormallikler, vulvave vajinada görülen tıkanıklık, daralma yada yırtıklar, genital kanal tümörleri, torsiyon uteri, uterus inertiası vb. bulunmaktadır (Purohit ve ark., 2011). Yavruya bağlı nedenlerin en önemlisi ise geliş bozukluklarıdır (Srinivas ve ark., 2007).

#### **Post-Partum Dönem ve Sorunları**

İneklerde olduğu gibi, dişi mandalarda da yeni bir gebelik şekillenmesi için hem uterusun involüsyonu olması hem de östrus siklusunun yeniden başlaması gerekir.

Emzirilen bataklık mandasında uterusun involüsyonu 28 (16-60) günde tamamlanırken, elle sağım yapılan mandalarda bu süre 45 güne uzamaktadır. Uterus involüsyonu normal doğumlarda güç doğumlara göre daha erken, emzirilenlerde emzirmeyen veya sağılan mandalara göre daha erken ve düşük süt verenlerde yüksek süt verenlere göre daha erken meydana gelir (Jainudeen, 1986). Uterus involüsyonunu etkileyen faktörler doğum sezonu, doğum sayısı, güç doğum, beslenme ve enfeksiyonlardır. Postpartum anöstrus ya da asiklik dönem mandalarda oldukça değişkendir. Bu dönem genellikle ineklerden daha uzundur ve infertilitenin başlıca nedenlerindedir.

Doğumdan sonra östrus siklusunun yeniden başlaması, buzağılama aralığının uzamasına neden olan önemli bir sorundur. Mandalarda buzağılama aralığı mevsim, bakım ve besleme gibi faktörlere bağlı olarak 400 ile 600 gün arasında değişmektedir. Sığırlarda olduğu gibi hipofiz fonksiyon bozukluğu doğum sonrası inaktif ovaryumun önemli bir nedenidir. Foliküler aktivitede bir artış, doğumdan sonraki 30 ila 60. günler arasında, özellikle bir önceki gebeliğin şekillenmediği kornu tarafındaki ovaryumda meydana gelir, ancak ovulasyon oranı düşüktür. Sürekli emziren ve bakım beslemenin iyi olmadığı mandalarda 150-200 güne kadar ovaryumda aktivite görülmeyebilir (Jainudeen ve Hafez, 2016).

Bataklık mandalarında postpartum dönemde östrus ve ovulasyonlarda gecikme nehir mandalarından daha sık rastlanmaktadır. Ayrıca postpartum ilk 1-2 östrus siklusu normalden daha kısadır. İlk iki siklustan sonra ise luteal dönem uzayabilir ya da inaktif ovaryuma bağlı siklik aktivite durabilir. Ancak sürüde boğa bulunması postpartum siklik düzensizlik oranını azaltabilir ve ovulasyon zamanını düzenlenmesine yardımcı olabilir (Jainudeen ve ark., 1983).

Kış veya ilkbaharda doğum yapan mandalarda yaz veya sonbaharda doğum yapanlara oranla siklik aktivite daha geç başlar. Postpartum ilk östrus mandalarda beslenme, gün ışığı süresi, yağış ve sıcaklıktan etkilenmektedir. Sıcaklıkların yükselmesi boğaların libidosunu düşürmekte ve dişilerde üreme fonksiyonlarını olumsuz etkilemektedir. Siklik aktivite genellikle gün uzunluğunun kısaltıldığı ve havaların serinlediği dönemde başlamaktadır (Gordon, 1996).

Mandaları etkileyen başlıca üreme problemleri anöstrüs, repeat breder ve postpartum sorunlardır. Doğum esnasında yaşanan problemler uterus involüsyonunda gecikme ve metritis gibi problemlere yol açmaktadır. Doğumla ilişkili sorunlar arasında distosi, ölü doğum, abortus, retensiyon sekundinarum gibi olgular yer alır. Ölü doğum ve distosi, hayvanın gelecekteki üreme performansını düşüren en önemli faktörler olarak kabul edilmiştir. Metritisin şekillenme oranını artırır ve plasentanın atılımını geciktirir. Bu tür durumlarda uterus involüsyonu ve ovaryum aktivitesinin başlamasında gecikmeler yaşanır. Devamında sekonder enfeksiyonlar

ve anormalliklerin yaşanma oranı da artmaktadır. Üreme performansının optimizasyonu, mandaların gebelik, doğum ve postpartum dönemde dikkatle takip edilmesi ve yaşanacak aksaklıkların giderilmesi ile mümkün olacaktır (Gordon, 1996).

Retensiyon, endometrit ve prolapsus uteri gibi postpartum problemler, doğum sonrası mandaların ovaryum fonksiyonu üzerinde olumsuz etkilere sahiptir. Ayrıca, metabolik bozukluklar, verim ve mastit gibi problemler ise ovaryum fonksiyonlarında azalmaya neden olmaktadır. Postpartum dönemde genital sistem komplikasyonları arasında kanama, vulval hematoma, laserasyonlar, üreme organlarında (vajina, uterus) yırtılma, perineal yaralanmalar, pelvik organların distale yer değiştirmesi (vajina, uterus, mesane, perivajinal yağ) ve retensiyon yer almaktadır (Purohit, 2012). Metabolik problemler arasında ise süt humması, hipofosfatemi ve ketozis yer almaktadır (Purohit ve ark., 2014b). Meme bezinin komplikasyonları arasında meme ödemi, hemolaksi, hipogalaksi ve mastit gibi durumlar yer almaktadır. Mandalarda genital kanalın gevşemesi ve genişlemesi ile ilgili sorunlar nadiren görüldüğü için doğuma bağlı genital sistem yaralanmaları da nadir görülmektedir (Purohit ve Markandeya, 2015).

### **Ekzojen Hormonlarla Östrus Siklusunun Kontrolü**

Geçmişte mandada östrus senkronizasyonu için kullanılan prosedürler ampirik olarak sığırlar için geliştirilen prosedürlere dayanıyordu. Senkronizasyon protokolleri, prostaglandinler kullanılarak luteal fazın kısaltılması veya progestagenler kullanılarak luteal fazın uzatılmasını içermektedir. Çift doz prostaglandin uygulamaları senkronizasyon amacıyla başarıyla uygulanabilmektedir ancak daha iyi senkronizasyon, gebelik ve yavru elde etmek için foliküler gelişimin manipülasyonu gereklidir (De Rensis ve Lopez-Gatiüs 2007). Bu amaçla ovsynch protokolü kullanılabilir (Paul ve Prakash 2005). Ovsynch, mandalarda östrus siklusunun senkronize edilmesini sağlar ve sabit zamanlı suni tohumlama ile kombine edildiğinde ovulasyon ve fertilizasyon oranlarını arttırabilir. Östrus siklusunun düzenlenmesi ve ovulasyonun uyarılması, östrus belirtilerinin takip edilmesi için ihtiyaç duyulan gözlem süresini ortadan kaldırarak mandanın üreme potansiyelinin arttırılmasına olanak sağlamaktadır (Perera, 2011). Mandalarda anöstrusların üstesinden gelmek için gonadotropin salgılatıcı hormon (GnRH) ve analoglarının enjeksiyonu veya progesteron içeren aparatların 10-12 gün boyunca intravajinal veya subkutan uygulanmasını içeren protokoller uygulanabilmektedir (Perera, 2008).

Mandalarda seçilen protokole ek olarak, başarıya ulaşmak için aşağıdaki faktörlerin de ele alınması gerekir:

- (a) Bakım ve beslenme durumu iyi olan ve hastalıktan arı olan hayvanların seçimi,
- (b) Hayvanların barındırıldığı yerlerin düzgün olması ve stres faktörlerinin minimize edilmesi (taşımaya, kalabalık, iklim vb)
- (c) Mevsimsel üreme dikkate alınarak siklusların başlayıp östrusların daha düzenli ve toplu olduğu dönemler tercih edilmelidir (Drost, 2007).

Başarılı suni tohumlama, spermanın kalitesine, hekimin tecrübesine, tohumlamanın doğru zamanlanmasına ve dişinin sağlık durumuna bağlıdır. Tohumlama için en uygun zaman östrus başlangıcından sonraki 8-12. saattir (Drost, 2007). Suni tohumlama; mandaların genetik özelliklerinin geliştirilmesine yardımcı olmaktadır, ancak mandalarda östrus davranışlarının zayıf olması ve gebelik oranlarının düşük olması nedeniyle tohumlama hala yaygın olarak kullanılamamaktadır. Tüm bu olumsuz faktörlere rağmen, ovsynch ve suni tohumlama kullanılarak uygulanan protokoller geliştirilmiştir (Perera, 2008).

### **MANDALARDA BİYOTEKNOLOJİK UYGULAMALAR**

Günümüzde mandalarda üreme performansını arttırmak için suni tohumlama, multiple ovulasyon ve embriyo transferi (MOET), in vitro embriyo üretimi, kriyobiyoloji, cinsiyeti belirlenmiş malak üretimi ve klonlama gibi biyoteknolojik yöntemler kullanılmaya başlanmıştır (Çizmeçi, 2019)

Mandada ilk başarılı embriyo transferi Amerika Birleşik Devletleri'nde gerçekleştirilmiştir. Ancak mandalarda bu biyoteknolojik uygulamanın başarı oranı reproduktif verime paralel olarak oldukça düşüktür. Süperovule edilen hayvan başına düşen transfer edilebilir embriyo ortalaması 1'den azdır. Manda ovaryumunda ortalama 12.000 (ineklerde 133.000) primer folikül bulunmaktadır (Warriach ve ark., 2015).

Embriyo transferi, donör hayvanın seçimi, taşıyıcı hayvanın seçimi, donörün senkronizasyonu, donörün tohumlanması, embriyonun toplanması, embriyonun değerlendirilmesi, embriyo transferi ve taşıyıcının bakımı aşamalarını içermektedir. Yardımcı üreme teknikleri, konjenital üreme problemlerinin üstesinden gelmek, üreme performansını geliştirmek, süt üretimini arttırmak, yüksek verim ve genetik özelliklerin yaygınlaştırmak ve hastalıkların kontrol etmek amacıyla kullanılmaktadır. Bu teknolojiler, gelişim fizyolojisi, ıslah konularında temel araştırmaların sürdürülmesi ve klonlama ve transgenesis gibi yeni ortaya çıkan biyoteknolojilerin ticari amaçla uygulanması için mükemmel bir embriyo kaynağı sağlar (Gasparrini, 2002; Manjunatha ve ark., 2009).

### **İNFERTİLİTE**

Manda, postpartum uzun süreli anöstrus ve reproduktif verimliliği etkileyen suböstrus göstermesi ile bilinmektedir. İnfertilitenin altında yatan nedenler pubertasa geç ulaşma, iklim, mevsim, yönetim, beslenme,

düşük vücut kondüsyon skoru ve hastalıklardır (Dhami ve ark., 2020). Postpartum anöstrusun uzaması ve repeat breeder manda yetiştiriciliği ve süt endüstrisi için ekonomik kaybın ana nedenleri olarak kabul edilmektedir (El-Wishy, 2007). İnfertil mandaların tedavi edilmesi süt üretimlerinin artırılmasında önemli bir faktördür. Asiklik ve repeat breeder mandaların normal siklus göstermesini sağlamak, üreme verimliliğini artırmak, böylece buzağılama aralığını ekonomik sınırlara getirmek amacıyla dolaşımdaki plazma progesteron seviyelerini modüle etmek için çeşitli hormonal preparatlar ve protokoller kullanılmaktadır (Mirmahmoudi., 2014; Mungad., 2017).

Anöstrus mandalarda infertilitenin en önemli nedenidir. Anöstrüs ise gerçek anöstrus, suböstrus, luteal aktivitenin uzaması, inaktif ovaryum, ovaryum kist ve tümörleri olarak sınıflandırılabilir. Mandalarda infertilitenin bir diğer önemli sebebi ise yangı oluşturarak anöstrus süresini uzatan ve fertilitite oranını düşüren uterus enfeksiyonlarıdır.

Enfeksiyöz etkenler, üreme sistemini doğrudan etkileyerek veya genel sağlık durumunu dolaylı olarak etkileyerek üreme performansını olumsuz yönde etkilemektedir. Mandalar üzerinde yapılan çeşitli çalışmalarda birçok bakteri, virüs, mantar ve protozoa izole edilmiştir, ancak bunların manda türlerinde yaygın hastalık veya infertilitedeki önemi henüz tam olarak belirlenmemiştir (Purohit ve ark., 2014a).

Sürü yönetiminde metabolik profillerin değerlendirilmesi ve infertilite nedeni olarak enfeksiyöz ajanların belirlenmesi önemli etkenlerdir. Sürü infertilitesinin değerlendirilmesinde kan biyokimyasına bakılması faydalı minerallerin eksikliği hakkında bilgi vermektedir. Sürü infertilitesinin nedeni olabilecek muhtemel patojenlerin izolasyonu için uygun numuneler alınarak dikkatli ve uygun bir şekilde yetkili laboratuvarlara gönderilmelidir. İlk buzağılama yaşının uzaması (>42 ay), gebe kalma aralığının uzaması (24 ay), sürünün optimumun altında buzağılama oranına sahip olduğunu düşünmek için yeterli nedenlerdir. Bu problemlerin varlığında beslenme, yönetim ve sıcaklık stresine yönelik değerlendirmeler yapılmalıdır. Bir manda sürüsünde abortus vakalarının yüksek olması durumunda sürü acil olarak incelenmeli ve potansiyel bulaşıcı organizmaların izolasyonu için uygun örnekler yetkili teşhis laboratuvarlarına gönderilmelidir. Gebeliğin 6. ayından sonra abort yapan mandalar, *Brucella abortus* veya *Brucella melitensis* yönünden değerlendirilmeli, etken izolasyonu yapılmalı ve uygun karantina önlemleri alınmalıdır (Purohit ve ark., 20141).

Uterus enfeksiyonları içerisinde en önemli olan puerperal akut (toksik) septik metrittir. Pureperal akut septik metritli mandaların %14,3'ünde güç doğum, %52,4'ünde retensiyon, %2,04'ünde prolapsus vagina, %11,9'unda prolapsus uteri, %19,1'inde ise çeşitli faktörlerin etkili olduğu belirtilmektedir. Puerperal akut septik metritli mandalarda anoreksiya, depresyon, sallantılı yürüyüş, paraliz, ayağa kalkmakta zorlanma, siyah renkli dışkı ile kabızlık, sık ve tekrarlayan ağırlı ıkınma gibi belirtiler mevcuttur. Muayene sırasında rektal ısının  $40.9 \pm 0.18^\circ\text{C}$ , nabız sayısı ve solunum hızının arttığı görülebilir. Vajinal muayenede sulu, kahverengi ve pis kokulu akıntı tespit edilir (Purohit ve Markandeya, 2015).

#### Özet

Kökü tarih öncesi çağlara dayanan Chia tohumu yüksek oranda yağ, protein ve diyet lifi içermesiyle süper gıda olarak popülerleşen bir besindir. Chia tohumunda % 17-24 protein, %18-30 lif ve %25-40 oranında yağ mevcuttur. Tohumun yağ içeriğinin % 80'i  $\alpha$ -linolenik asit (omega-3) ve linoleik asitten (omega-6) oluşmaktadır. Ülkemizdeki piyasada bulunan preparatları Tarım Bakanlığı izniyle piyasaya sürüldüğü için Sağlık Bakanlığı'ndan ruhsat alan beşeri ilaçlar gibi *in vitro* ve *in vivo* etkinlik, güvenlik ve kalite kontrol testlerinden geçmeleri gerekmektedir. Çalışmamızda Türkiye piyasasında, değişik firmalarca pazarlanan farklı formülasyonlara sahip chia tohumu yağları ve yumuşak kapsül formülasyonlarının kalite kontrol açısından değerlendirilmesi amaçlanmıştır. Chia tohumu yağı içeren yumuşak jelatin kapsüller ve yağlar üzerinde organoleptik özelliklerin tayini, ağırlık sapması, dezintegrasyon testi, disolüsyon testi, DPPH antioksidan kapasitesi ölçümü ve fenolik madde tayini analizleri yapılmıştır. Elde edilen verilere göre kapsüller organoleptik özellikler açısından uygunluk göstermektedir. Yumuşak jelatin kapsüllerin ağırlık sapması ortalaması A numunesi için  $0,7283 \pm 0,024g$ , B numunesi için  $1,2947 \pm 0,015g$  olarak bulunmuştur. Yapılan dağılım testinden elde edilen sonuçlara göre kapsüller suni mide vasatında 5 dakika 14 saniye ile 6 dakika 32 saniye aralığında, suni barsak vasatında 5 dakika 14 saniye ile 6 dakika 32 saniye aralığında, suda ise 16 dakika 2 saniye ile 18 dakika 30 saniye aralığında dağılım göstermiştir. Chia tohumu yağı içeren yumuşak jelatin kapsüller ve yağlar üzerindeki kalite kontrol testlerindeki literatüre uygun sonuçlar nedeniyle bitkisel destek olarak kullanımının uygun olacağını düşünmekteyiz.

**Anahtar Kelimeler:** *Salvia hispanica* L. (chia tohumu yağı), omega-3, yumuşak jelatin kapsül, kalite kontrol

#### Quality Control Studies in The Turkey Market on Soft Gelatin Capsules Containing Chia (*Salvia Hispanica* L.) Seeds Oil

#### Abstract

Chia seed, which has its origins in prehistoric times, is a food that has become popular as a superfood with its high content of oil, protein and dietary fiber. Chia seeds contain 17-24% protein, 18-30% fiber and 25-40% fat. 80% of the oil content of the seed consists of  $\alpha$ -linolenic acid (omega-3) and linoleic acid (omega-6). Since the preparations available in the market in our country are put on the market with the permission of the Ministry of Agriculture, they do not need to pass *in vitro* and *in vivo* efficacy, safety and quality control tests like the human drugs licensed by the Ministry of Health. In our study, it is aimed to evaluate the quality control of chia seed oils and soft capsule formulations with different formulations marketed by different companies in the Turkish market. Determination of organoleptic properties, weight deviation, disintegration test, dissolution test, DPPH antioxidant capacity measurement and phenolic substance determination analyzes were performed on soft gelatin capsules containing chia seed oil and oils. According to the data obtained, the capsules are suitable in terms of organoleptic properties. The mean weight deviation of soft gelatin capsules was  $0.7283 \pm 0.024g$  for sample A and  $1.2947 \pm 0.015g$  for sample B. According to the results obtained from the disintegration test, the capsules dispersed between 5 minutes 14 seconds and 6 minutes 32 seconds in the artificial stomach medium, between 5 minutes 14 seconds and 6 minutes 32 seconds in the artificial gut

medium, and between 16 minutes 2 seconds and 18 minutes 30 seconds in pure water. We think that its use as an herbal supplement would be appropriate due to the results in accordance with the literature in quality control tests on soft gelatin capsules and oils containing chia seed oil.

**Keywords:** *Salvia hispanica* l. (chia seeds oil), omega-3, soft gelatin capsule, quality control

## GİRİŞ

Kökünü tarih öncesi çağlara dayanan Chia tohumu yüksek oranda yağ, protein ve diyet lifi içermesiyle "süper gıda" olarak popülerleşen bir besindir. Chia tohumu, yetiştirildiği iklim ve toprak şartlarına bağlı olarak değişmek üzere, %15-23 oranında protein içerir (Munoz ve ark.,2023). Chia tohumunun protein bileşimi dokuzu esansiyel aminoasit olmak üzere, on sekiz çeşit aminoasit içermektedir Chia tohumu gluten içermediği için çölyak hastalarının diyetleri için de uygun bir besindir. Chia tohumu, Avrupa Gıda Komisyonunun 2009/827/EC numaralı kararına göre "yeni gıda" olarak kabul edilmiştir. Amerikan Gıda ve İlaç Dairesi (FDA), chia tohumunu gıda katkı maddesi olarak değil, bir gıda olarak kabul ettiğini belirtmiştir. Chia tohumunun alerjik olmadığı, herhangi bir toksik etki göstermediği ve gıdalara katılarak yenilebilir olduğu yapılan bilimsel çalışmalarla kanıtlanmıştır (Erdoğan ve ark.,2017)

Nutrasötikler, çoğunluğunu bitkisel kökenli farmasötik preparatların oluşturduğu diyet destek ürünleridir. Bu ürünler, çoğunlukla, Tarım Bakanlığı izniyle piyasaya sürülmektedir. Sağlık Bakanlığı'ndan ruhsat alan beşeri ilaçlar gibi *in vitro* ve *in vivo* etkinlik, güvenlik ve kalite kontrol testlerinden geçmeleri gerekmektedir. Bu da pek çok sorunu beraberinde getirmektedir. Küresel anlamda bu konuda sorunlar mevcuttur. Bitkisel ürünlerin toplanma zamanı, toplanma, depolanma, kurutulma zamanları ve işlemleri, etken madde izolasyonu ve standardizasyonu, stabilite ve diğer kalite kontrol çalışmalarının, *in vivo* verilerin eksikliği bu ürünlerin alternatif tedavide ya da konvansiyonel tedaviye destek olarak kullanılmasında önemli faydalar sağlanmasına rağmen kullanımlarını kısıtlayan sorunlardır. Bu sorunların çözülmesi için piyasada bulunan preparatların etkinlik, güvenlik ve farmasötik açıdan değerlendirilmesi gerekir Başaran, 2008).

Bu çalışmada, Türkiye piyasasında, değişik firmalarca pazarlanan farklı formülasyonlara sahip chia tohumu yağları ve yumuşak kapsülleri temin edilerek üzerlerinde kalite kontrol testleri yapılmıştır ve böylece etkinlik ve güvenlikleri açısından karşılaştırılmaları amaçlanmıştır. Bu çalışmalara ek olarak chia yağlarının ve yumuşak kapsüllerinin, toplam fenolik madde içeriği ve 2,2-difenil-1-pikrilhidrazil (DPPH) radikali giderme aktivitesi tayini yöntemleri kullanılarak antioksidan değerleri karşılaştırılmıştır. Çalışmamızın sonunda elde ettiğimiz verilerle, hemen hemen her yaş grubunda güvenli olduğu düşünülen hem besin desteği hem de şifa beklentisi olarak sıklıkla kullanılan chia tohumu kapsüllerinin ve yağlarının farklı firmalarca piyasaya sürülen ürünleri kalite, etkililik ve güvenlik açısından karşılaştırılmıştır.

## MATERYAL VE METOT

Çeşitli firmalarca üretilmiş olan ve eczanelerde satışa sunulan 2 farklı markanın (Zadevital ve Desteque) chia tohumu yumuşak jelatin kapsül formu ve 2 farklı markanın chia tohumu yağı (Zadevital ve Naturoil) formu piyasadan temin edilmiştir. Testlerde gereken tüm hammaddeler ve materyaller Mersin Üniversitesi Eczacılık Fakültesi Farmasötik Teknoloji laboratuvarlarından kullanılmıştır. Farmasötik etkinlik ve kalite kontrol testleri kapsamında yumuşak jelatin kapsüllerde organoleptik özelliklerin tayini, ağırlık testi, dağılıma testi (suda, suni mide vasatında ve suni bağırsak vasatında); DPPH antioksidan kapasitesi ölçümü ve fenolik madde tayini yapılmıştır.

Yumuşak jelatin kapsüllerde organoleptik özelliklerin tayininde en az 20 kapsülü ambalajından çıkarıldı ve incelendi. Pürüzsüz ve hasarsız olmalıdır. Fiziksel kararsızlığın kanıtı, sertleşme veya yumuşama, çatlama, şişme, beneklenme veya kabuğun renginin değişmesi gibi fiziksel görünümdeki büyük değişikliklerle gösterilir.

Ağırlık Sapması tayini doldurulan maddenin kötü niteliklerini, doldurma makinelerinin çalışmasındaki bozuklukları veya imalat safhasında kontrollerin iyi yapıp yapılmadığını tespit eder. Chia tohumu yağı yumuşak jelatin kapsüllerinden her numuneden 10 kapsülün her biri tek tek tartılarak ağırlıkları tayin edildi. Uygun temiz ve kuru bir kesme materyali kullanılarak kapsüller kesildi ve içeriği uygun bir çözücü ile yıkanarak uzaklaştırıldı. Oda ısısında kapsülde kalan çözücünün buharlaşması için nemden koruyarak 30 dakika bekletildi. Her bir kapsül boşken tek tek tartıldı ve boş kapsülün kütlesi ilgili brüt kütleden çıkarılarak içeriğin net kütlesi her kapsül için hesaplandı.

Dağılma Testi kapsamında ilk olarak suda dağılma testi yapıldı. PharmaTest (Almanya) dezentegrasyon cihazında suda sürekli karıştırılarak (100 rpm) dağılma süresi tayin edildi. Suyun sıcaklığı 37°C'ye getirildi. Tüm numunelerden 6 kapsül kullanılarak ayrı ayrı su içinde dağılma süreleri hesaplandı. Suni mide vasatında dağılma testi için Türk Farmakopesi'ne (Avrupa Farmakope Adaptasyonu II-2017) göre 2L suni mide vasatı hazırlandı. Dezentegrasyon cihazına kondu. Her numunenin kapsüllerinden 6'şar adet dezentegrasyon cihazına yerleştirildi. Suni mide vasatının sıcaklığı 37°C'ye getirildi. Sonra her numune için ayrı ayrı kapsüllerin dağılma süresi hesaplandı. Suni bağırsak vasatında dağılma testi için Türk Farmakopesi'ne (Avrupa Farmakope Adaptasyonu II-2017) göre hazırlanan suni bağırsak vasatından 2L dezentegrasyon cihazına konuldu. Her numuneden üçer kapsül kullanılarak dağılma süreleri hesaplandı.

DPPH antioksidan kapasitesi ölçümü bir serbest radikal olan DPPH radikalinin antioksidan madde tarafından yakalanarak mor renginin açılmasının spektrofotometrede ölçülerek tayin edilmesine dayanır. Piyasadan temin edilen farklı chia kapsüllerinden elde edilen metanollü ekstraktların her birinden 1'er ml alınarak, 4 ml 0,1 mM DPPH (metanolde) çözeltisi ilave edildi. Karışım karanlıkta ve oda koşullarında 30 dk bekletildi. Sonra spektrofotometrede 517 nm absorban değerleri okundu. Deney 3 kez tekrarlandı ve aritmetik ortalamaları alındı. % DPPH radikali giderme aktivitesi hesaplandı.

Fenolik madde tayini için farklı chia kapsüllerinden elde edilen metanollü ekstraktlardaki fenolik maddeler Folin-Ciocalteu reaktifi (FCR) ile saptandı. Piyasadan temin edilen farklı chia kapsüllerinden hazırlanan ekstraktların her birinden 1ml alındı üzerine 45ml distile su ilave edildi. Sonra 1ml FCR eklendi. 3 dk sonra 3ml % 2 lik Na<sub>2</sub>CO<sub>3</sub> çözeltisi ilave edilip oda koşullarında manyetik karıştırıcıda 2 saat bekletildi. Sonra spektrofotometrede 760nm'de absorban değerleri okundu. Deney 3 defa tekrar edildi.

## BULGULAR

### *Organoleptik Özelliklerin Tayini*

Çalışmamızda kullandığımız çeşitli firmalarca üretilmiş olan ve eczanelerde satışa sunulan 2 farklı markanın chia tohumu yumuşak jelatin kapsüllerinin organoleptik özellikleri Tablo 1'de gösterilmiştir.

**Tablo 1.** Chia tohumu kapsülleri Organoleptik Özelliklerin Tayini

Karakteristik	A Kapsül Numunesi	B Kapsül Numunesi
Kapsüllerin şekilleri	Oval	Oval
Kapsüllerin kılıfının	Elastik	Elastik
	Normal yumuşaklık	Normal yumuşaklık
Rengi	Renksiz	Renksiz
Boyut	Orta	Büyük
Koku	Kokusuz	Kokusuz

### *Ağırlık Sapması*

Her numuneden önce 10'ar tane dolu kapsül ayrı ayrı hassas terazi ile tartıldı, kapsüller boşaltılıp tartım işlemi her boş kapsül için tekrarlandı. Toplam 20 kapsül dolu ve boş olarak tartıldı. Sonuçlar tabloya yazıldı standart sapma değeri hesaplandı (Tablo 2, 3, değerler gram cinsinden verilmiştir).

**Tablo 2.** A Kapsül Numunesi için Standart Sapma Tablosu

Sıra No	Tanım	Dolu Kapsül	Boş Kapsül	İçerik (yağ) Ağırlığı	İçerik (yağ) Ortalama Ağırlık	İçerik (yağ) Standart Sapma	İçerik (yağ) Standart Sapma %

### **Dağılma Testi**

**Saf Suda Dağılma Testi:** Numune kapsüllerimiz saf suda minimum 16 dk. 02 sn. ile maksimum 18 dk.30 sn. suresi arasında dağıldı.

**Suni Mide Vasatında Dağılma Testi:** Numune kapsüller minimum 5 dk 14 sn ile maksimum 6 dk 32 sn arasında dağılmıştır.

**Suni Bağırsak Vasatında Dağılma Testi:** Numune kapsüller minimum 4 dk 49 sn ile maksimum 5 dk 21 sn arasında tamamen dağılmıştır.

### **DPPH Antioksidan Kapasitesi Ölçümü**

Bu çalışmada piyasadan temin edilen Chia tohumu yağı ve yağ kapsüllerinin metanollü ekstratlarından hazırladığımız çalışma çözeltileri DPPH çözeltisi ile karıştırılıp 517nm'da spektrofotometrede absorban değerleri ölçüldü. Numunenin çözüldüğü metanol ve DPPH çözeltisi kör olarak kullanılmıştır. Standart olarak bütillendirilmiş hidroksitolun (BHT)'ye göre karşılaştırma yapıldı. DPPH radikalini giderme aktivitesi standart

ile karşılaştırıldığında en yüksek A kapsül numunesinde (% 79,49), en düşük % DPPH giderme aktivitesi D yağ numunesinde (% 41,96) hesaplanmıştır (Tablo 4).

**Tablo 4.** Chia tohumu yağları ekstraları ve kapsüllerinin % DPPH Giderme Aktivitesi

Numune	% DPPH giderme aktivitesi (inhibisyon)
A (Kapsül)	79,49±1,15
B (Kapsül)	74,50±4,04
C (Yağ)	48,51±2,15
D (Yağ)	41,96±3,87

#### Toplam Fenolik Madde Tayini

Piyasadan temin edilen Chia tohumu yağlarının ve kapsüllerinin metanollü ekstralarında toplam fenolik madde miktarına ait veriler Tablo 5’de gösterilmiştir. En yüksek değer D yağ numunesinde 93,3 olarak, en düşük değer ise A kapsül numunesinde 28,67 olarak bulunmuştur.

**Tablo 5.** Chia tohumu yağları ekstraları ve kapsüllerinin fenolik madde miktarları

Numune	Toplam fenolik madde miktarı (µg GAE/mg)
A (Kapsül)	27,69±2,11
B (Kapsül)	36,94±1,85
C (Yağ)	76,19±2,01
D (Yağ)	84,26±1,99

#### TARTIŞMA

Bu çalışmada, Türkiye piyasasında, farklı firmalarca pazarlanan chia tohumu (*Salvia hispanica L.*), yağının ve bu yağı içeren yumuşak kapsül preparatlarının güvenli kullanımı açısından kalite kontrol testleri yapılarak etkinlik ve güvenliklerinin belirlenmesi amaçlanmıştır.

Yüksek miktarda omega-3 içeren chia tohumu tüketiminin kolesterol düşürme diyabetle mücadele, kanserle mücadele etkileri bilimsel araştırmalara konu olmuştur (Ayerza, ve Coates W,2007). Doymamış yağ asitlerinin zengin bir kaynağı olan chia tohumunda n-6/n-3 oranı 0,29 olarak bulunmuştur. Düşük n-6/n-3 yağ asidi oranı kardiyovasküler hastalıkların görülme riskinin azalması ile ilişkilendirilmiştir (Biçer ve ark. 2017) Chia tohumlarının alınmasının; serum trigliseridlerini ve düşük yoğunluklu lipoprotein (LDL) değerini önemli ölçüde azalttığı ve yüksek yoğunluklu lipoprotein (HDL) değerini arttırdığı bildirilmiştir. Ayrıca chia tohumunun doyumluk hissini ve bağıışıklığı arttırdığı, kalp-damar ve diyabet gibi hastalıkların da riskini azalttığı bildirilmiştir (Ayerza, ve Coates W,2007). Benzer diğer bir çalışmada günlük 25 g chia tohumunu 7 hafta boyunca tüketen kadınlarda çoklu doymamış yağ asit değerlerinin (özellikle ALA ve EPA değerleri) yükseldiği belirlenmiştir (Jin ve ark. 2012). Nopal, chia tohumu, soya proteini ve yulaf içeren 235 kcal'lik içeceklerin 2 ay süresince belirli aralıklarla içilmesiyle vücut ağırlığının, trigliserid ve kan şekeri seviyelerinin azaldığı belirlenmiştir. Tavares ve ark. (2015) günlük 35 g chia ununun kişilerde, toplam kolesterolünde %13 azalma, HDL değerlerinde %25 artış sağladığını, ayrıca kişilerin kilo ve bel bölgelerinde de belirgin bir azalma olduğunu belirlemişlerdir. Azeem ve ark. (2015) chia tohum ekstraktının, pamuk tohumu yağının raf ömrünü arttırdığını ve lipid peroksidasyonunu önemli ölçüde inhibe ettiğini belirlemişlerdir.

Fareler ve insanlar üzerinde yapılan deneylerde, chia tohumunun Tip-2 diyabet hastalığının başlıca şikayetleri olan görme problemleri ve böbrek yetersizliğini azalttığı yönündedir (Chieeo ve ark., 2009). Chia tohumunun içerdiği diyet lifi, antioksidanlar, omega-3 yağ asidi gibi fonksiyonel bileşenlerin etkileri nedeniyle, düzenli tüketildiğinde, vücudu kansere karşı koruduğu ve kanserli bir bireyde toplam tümör ağırlığını azalttığı gözlenmiştir (Espad ve ark. ,2007).

Chia tohumu bazı fenolik bileşikler, tokoferol, karotenoid, vitaminler ve bazı peptitler gibi antioksidan bileşenleri içermektedir. Flavonoidler ve tokoferol tohumun antioksidan kapasitesinden sorumlu temel yapılarıdır. Chia tohumunun antioksidan kapasitesi 84/g'dır ve bu değer yaban mersininin antioksidan kapasitesine (96/g) yakındır. Antioksidan kapasitenin yüksek olması tohumun uzun süre saklanabilmesini

sağlamaktadır. Tokoferoller, chia tohumu (238-427 mg/kg) ve yer fıstığı yağında (398.6 mg/kg) benzer miktarlarda olup chia tohumundaki en önemli antioksidan bileşiklerdir (Pellegrini ve ark. 2003). Chia tohumu aynı zamanda gallik asit, kafeik asit, klorojenik asit, rosmarinik asit, myristin, kuarsetin ve kampferol gibi fenolik bileşikler de içermektedir (Munoz ve ark., 2013). Antioksidan etki gösterebilen bu fenolik bileşikler hücredeki oksidatif dengenin sağlanmasını destekleyerek kardiyovasküler hastalıklar, diyabet, kanser gibi kronik hastalıklardan koruyucu olabilmektedirler. Kafeik asit, klorojenik asit ve kuarsetin hücredeki yağlar, proteinler ve DNA'nın serbest radikaller ile okside olmasını engelleyerek antioksidan özelliği gösterebilmektedir (Munoz ve ark., 2013; Pellegrini ve ark. 2003).

Chia'nın in vivo olarak antioksidan kapasitesinin değerlendirildiği çalışmalar çok sınırlıdır. Obez ratlar üzerine yapılan bir çalışmada; ratlara 6 ve 12 hafta yüksek yağ ve yüksek fruktoz içeren diyet ile birlikte chia tohumu ve chia yağı verildiğinde chia tohumu ve yağın kanda katalaz (CAT), glutatyon peroksidaz (GPx) aktivitesini, karaciğerde glutatyon reduktaz (GRd) aktivitesini artırdığı bunun sonucunda kanda ve karaciğerdeki antioksidan kapasitenin sırasıyla %35 ve %47 oranında artış gösterdiği belirlenmiştir (da Silva ve ark., 2014).

Son yıllarda destekleyici tedavi seçeneklerinin tıp alanında, giderek artan bir önem kazandığı görülmektedir. Chia tohumu da bu doğal ürünlerin başında gelen ve biyolojik yönden aktif birçok bileşiği içeriğinde bulduran bir üründür. Literatürde yer alan çalışmalar ışığında Chia tohumu doğal bir ürün olarak umut verici bir tedavi seçeneği olabileceği düşünülmüştür. Ancak standardizasyon ve yeterli farmakokinetik-farmakodinamik çalışmalar olmamasından dolayı kullanımı kısıtlıdır. Bir maddenin ilaç olabilmesi için gerekli üç temel özelliği olan hedefe yönelik olması, etkisinin doza bağlı olması ve etkisinin geçici olması gerekmektedir. Bundan dolayı chia tohumunun daha etkili ve güvenli kullanılabilmesi için, etki mekanizmalarını aydınlayabilecek moleküler düzeyde yeni çalışmaların yapılmasına ihtiyaç vardır. Modern tıbbın antibiyotik direnci, antineoplastik direnci, bozulmuş homeostazisin düzeltilmesi gibi patolojik durumlarda yetersiz kalması hali, yeni ilaç ve tedavi desteklerinin araştırılmasını önemli kılmaktadır.

Sağlık yönünden birçok faydası bilinen chia tohumunun in vitro ve in vivo klinik biyoaktivitesi ve güvenlik değerlendirmesiyle alakalı sınırlı sayıda çalışma bulunmaktadır. Buna karşın chia tohumunun iyi bir protein, diyet lif ve doymamış yağ asidi kaynağı olduğu yapılan çalışmalarda ortaya konmuştur. Chia tohumu gıdalarda jel oluşturucu, emülgatör ve stabilizatör gibi özelliklere sahip olup, yüksek omega-3 ve omega-6 içeriğiyle, besinlerin fonksiyonellik açısından zenginleştirilmesinde önemli bir kaynak konumundadır. Bu açıdan bakıldığında chia tohumunun ileri çalışmalar ve standardizasyon işlemlerinden sonra önemli bir yardımcı tedavi seçeneği olabileceği düşünülmektedir.

Chia tohumu (*Salvia hispanica L*) yağı içeren piyasa preparatları, ülkemizde Tarım Bakanlığı izni ile piyasada yer almaktadır. Dolayısıyla bu preparatlar, diğer beşeri ilaçlar gibi çeşitli in vivo ve in vitro kalite kontrol ve güvenlik testlerine tabi tutulmamaktadır. Bu durumun beraberinde getirdiği çeşitli problemler, preparattan beklenen etkinin yeterince gerçekleşmemesine neden olabilir. Yapılan bu çalışma ile piyasada yer alan bu ürünlerde kalite kontrol testleri yapılarak antioksidan aktivitesi saptandı.

Bu çalışmada farklı firmalardan sağlanan chia yağı ve kapsülleri üzerinde farmasötik etkinlik ve kalite kontrol testleri yapılmıştır. Chia'nın tıbbi kullanımını (oral takviyeleri) destekleyen çeşitli epidemiyolojik ve deneysel raporlara rağmen, ekstraksiyon ve etkili dozla ilgili protokoller, sağlam bilimsel verilerle desteklenen insan tüketimine geniş ölçekte uyacak şekilde standartlaştırılmalıdır.

## SONUÇ

Diyette chia bulunması bir dizi farmakolojik özellik sağlar, ancak hücre ve memeli modellerinde mekanik yaklaşımlar kullanılarak biyolojik aktivitesinden sorumlu biyoaktif ve yağ asitlerinin bilgisi ve anlaşılması, daha geniş terapötik kullanımı için hala ana sınırlamalardır.

#### Abstract

Considering the adverse effects of industrial wastes on the environment and water pollution problems, developing sustainable treatment methods is very important. This study was conducted to reduce the environmental impact of textile industry waste. The potential of *Tilia Vulgaris* tree leaves as an environmentally friendly and economical adsorbent and their potential to provide sustainable solutions for managing textile industry waste was investigated. This study mainly concerns the pollution caused by Basic Yellow 28 textile dye. Aqueous solutions of these dyes were purified by adsorption method using *Tilia Vulgaris* tree leaves. Within the scope of the research, batch adsorption experiments were carried out on aqueous solutions of shades, and the most suitable parameters were determined. These parameters include the amount of adsorbent, initial concentration, contact time, and ambient temperature. UV-VIS spectrophotometric method was used to determine the parameters. The results showed that the optimum conditions were 1.5 g, 50 mg/L, 60 min, and 30°C.

**Keywords:** Basic Yellow 28, Adsorption, *Tilia Vulgaris* Leaves

#### INTRODUCTION

With the world's population and rapid urbanization, textile products are needed (Hasani et al., 2022; Islam et al., 2021). Synthetic dyes are frequently employed in the dyeing process across various industries, including the textile industry, cosmetics, printing, food, and pharmaceuticals (Hisada et al., 2019). Synthetic dyes raise COD and BOD levels and are highly hazardous, carcinogenic, and non-biodegradable (Fu and Viraraghavan, 2022).

Since dyes cannot biodegrade, physical or chemical treatment techniques, such as adsorption, coagulation, precipitation, filtration, photocatalysis, and chemical oxidation, remove dye-containing effluents (Chaari et al., 2019; Aragaw and Alene, 2022). Compared to other techniques, adsorption has the most promising potential for treating dye effluents since it is simple to use, less expensive, highly effective, and can recycle dyes and regenerate adsorbents. (Janoš et al., 2003; Mutunga et al., 2020; Gad et al., 2023; Wang and Guo, 2020)

*Tilia Vulgaris* leaves, frequently used as traditional medicinal herbs, provide several health advantages. The flavonoids quercetin and kaempferol found in linden leaves have been associated with anti-inflammatory and anti-swelling activities (Toker et al., 2004). It has been investigated whether linden tree sawdust can act as a heavy metal ion adsorbent (Božić et al., 2009). Therefore, this research aims to examine the suitability and efficiency of linden leaves as an adsorbent for the filtration of synthetic dyes.

Basic yellow 28 dye, which is typically used to dye silk, textiles, paper, food, and cotton, was used in the experiment. This study used BY28 dye-containing aqueous solutions to conduct removal percentage experiments. As a result of the optimization studies, the best percentage removal values were tried to be obtained. The effects of the optimization parameters, such as the amount of adsorbent, the initial concentration of dyestuff, contact time, and temperature, were examined.

## MATERIALS AND METHODS

Basic Yellow 28 (BY28) (MW = 433.5 g/mol,  $C_{21}H_{27}N_3O_5S$ ,  $\lambda_{max} = 438$  nm) is a cationic dye purchased from Sigma-Aldrich for the tests. Batch adsorption tests were conducted in a heated, shaking Julabo SW 22 water bath. During the adsorption studies, samples from the solution medium were obtained, and an Agilent 8453 device was utilized to analyze these samples in a UV-VIS spectrophotometer. The Mikrotest MSD-08 purification system provided the distilled water for the tests. Centrifugation was carried out using an Elektromag M615M centrifuge.

### Preparation of *Tilia vulgaris* Leaves

The leaf of the *Tilia Vulgaris* tree served as the adsorbent in this investigation. The adsorbent utilized was gathered from the İstanbul-Türkiye. The adsorbent was washed with tap water and then distilled to eliminate foreign particles. It was then dried in a Memmert UN55 oven at 80°C and ground to a size of 60 to 80 mesh. It was stored in a desiccator to protect it from moisture and other outside elements.

### Adsorption Experiments

Using an adsorbent made from a *Tilia Vulgaris* tree leaf, the batch adsorption method was chosen to examine the cationic dye BY28's capacity for adsorption from aqueous solutions. The BY28 dye was diluted to varied quantities from stock solutions at 1000 ppm (mg/L). Standard keys were transferred into 100mL beakers at the starting concentration and set in a shaking water bath. The impact of several factors, including starting dye concentration (5-50 ppm), adsorbent amount (0.1-1.5 g), contact time (5-180 min), and temperature (25-40°C), were examined throughout these tests. The sample solution was spun at 5000 rpm for 3 minutes following adsorption, filtered through filter paper, and put in a test tube. The absorbance at maximum ( $\lambda_{max} = 438$  nm) was examined using a UV-VIS spectrophotometer, and the results were noted. The removal percentage (Removal %) and adsorption capacity ( $q_e$ ) of the dyes BY28 in solution were determined using the following equations:

$$\text{Removal (\%)} = \frac{C_0 - C_e}{C_0} \times 100 \quad (1)$$

$$q_e = \frac{C_0 - C_e}{m} \times V \quad (2)$$

In the equations 1 and 2,  $m$  is the amount of adsorbent (g),  $V$  is the volume of dye solution (L), and  $C_0$  is the initial dye concentration,  $C_e$  is the dye concentration at the end (mg/L).

## RESULTS AND DISCUSSION

### The effect of adsorbent quantity on BY28 adsorption

One of the most significant variables affecting the adsorption process and the removal % value is the fluctuation in adsorbent amount. *Tilia Vulgaris* tree leaf was used in the removal studies for the BY28 dye. The remaining variables remained at  $C_0 = 30$  mg/L,  $V = 50$  mL,  $pH = 6.5$ , 150 rpm, 25 °C, and 60 min. The amount of adsorbent used in the trials was changed from 0.1 g to 1.5 g. The removal percentage and  $q_e$  values of BY28 dye were calculated as shown in Figs. 1(a) and 1(b). Accordingly, it was found that employing 1.5 g of *Tilia Vulgaris* tree leaf as an adsorbent in the trial, the best removal percentage was attained at 99%.

Figure 1. The impact of different adsorbent doses on the BY28 dye removal, Removal % (a),  $q_e$  (b).

### BY28 Adsorption and the Influence of Initial Solution Concentration

The initial concentration of the investigated dyestuff at various concentrations ranging from 5 to 50 mg/L is another parameter impacting the removal value. The adsorbent amount was kept at 1.5 g in the studies employing *Tilia Vulgaris* tree leaf as the adsorbent for BY28, while the other variables were held constant at  $V = 50$  mL, pH 6.5, 150 rpm, 25°C, and 60 minutes. As shown in Figs. 2(a) and 2(b), the best removal was discovered at 94.93% for a 50 mg/L starting concentration.

Figure 2. The impact of different initial concentrations on the BY28 dye removal, Removal % (a),  $q_e$  (b).

### Adsorption of BY28 is affected by contact time.

Contact time is a critical element in determining the efficacy of adsorption. While other factors like  $V = 50$  mL, pH 6.5, 25°C, and 150 rpm were held constant, contact times between 5 and 180 minutes were utilized to examine the effect of contact time on the adsorption process. The findings were reported to be 99.85% at 60 min when using 1.5 g of *Tilia Vulgaris* tree leaf and an initial concentration of 50 mg/L for BY28 dye, previously established specifications. In Fig. 3, all measured values are displayed.

Figure 3. The impact of contact time on the BY28 dye removal %.

### The Influence of Ambient Temperature on BY28 Adsorption

Another element that affects the process and efficiency of adsorption is ambient temperature. The impact of ambient temperature on adsorption was evaluated at various temperatures ranging from 25 to 45°C while maintaining constants such as pH 6.5 and 150 rpm. The previously established ideal values of 1.5 g adsorbent, 50 mg/L starting concentration, and 60 minutes of contact time were realized when the *Tilia Vulgaris* tree leaf was utilized for BY28 dye. The results in Fig. 4 indicate that the best removal was 94.94%, attained at 30°C.

Figure 4. The impact of temperature on the BY28 dye removal %.

### CONCLUSION

This investigation used the *Tilia Vulgaris* tree leaf as an adsorbent, primarily employed in literature for therapeutic purposes. The effectiveness of *Tilia Vulgaris* tree leaves in eliminating the harmful dyes BY28 was tested, along with their adsorption capabilities. Therefore, the adsorbent quantity, initial dye solution concentration, contact time, and temperature were determined at their optimum values of 0.15 g, 50 mg/L, 60 min, and 30°C, respectively. It is now known that powdered *Tilia Vulgaris* tree leaves can remove BY28 hazardous dye from wastewater. This makes it promising that it can be utilized to effectively, affordably, and environmentally friendly clean wastewater from the textile sector.

#### Abstract

Several industrial streams carry organic dyes that contribute extensively to environmental and water contamination. The adsorption method provides an efficient result and can be a long-term solution for these two primary concerns. In the present work, mulberry leaves (*Morus nigra L.*) were used as a low-cost adsorbent to remove basic blue 3 (BB3) dye from industrial wastewater. Batch adsorption experiments were performed under various conditions. The removal efficiency of the dye and the influence of different parameters, such as the initial concentration of dye, adsorbent mass, contact time, and temperature, were determined using a UV-Vis spectrophotometer. The optimal conditions found in this research were 30 mg/L, 1.5 g/50 mL, 45 min, and 40 °C, with a removal efficiency percentage of more than 99%.

**Keywords:** Adsorption, Basic Blue 3, Mulberry leaves, Wastewater treatment

#### Introduction

Water contamination is triggered mainly by industrialization, civilization, agricultural operations, and other environmental variables (Wu et al., 1999). A lot of organic pollutants have been discovered in water resources. Improperly treated wastewater containing toxic organic pollutants is extremely harmful because of the variety of adverse impacts and carcinogenic characteristics (Hanaa et al., 2000; Mehtab et al., 2017).

The textile sector has expanded significantly worldwide, and it has released dyeing wastewater containing hazardous chemical substances (Hasan and Jhung, 2015). Dyes are organic substances with a complicated aromatic molecular structure that may give any material an attractive and vivid color. On the other hand, dyes are more durable and difficult to biodegrade due to their complex aromatic molecular structures (Cardoso et al., 2011).

Currently, there are several ways to treat textile dye wastewater with varying degrees of effectiveness. Some techniques, such as adsorption, advanced oxidation, ion exchange, reverse osmosis, chemical precipitation, adsorption, coagulation, and flocculation, have been used for the removal of dyes from water (Yagub et al., 2014). Among them, the adsorption approach involving low-cost adsorbents obtained from different natural, agricultural, and industrial wastes is the most popular method in wastewater treatment (Khan et al., 2011).

Activated carbon is the most used adsorbent. The decolorization of dye effluent with activated carbon derived from agricultural waste has received a lot of interest (Peláez-Cid et al., 2020). The current study is focused on an alternative, low-cost, and effective adsorbent. Many studies have proven the potential of using adsorbents derived from natural, industrial, and agricultural waste as diverse, low-cost adsorbents. The mulberry leaves act as an effective adsorbent (Ahmad Khan and Farooqui, 2022; Poguberović et al., 2016).

The synthetic dye removal of basic blue 3 (BB3) (surfaced Khan et al., 2013; Taşar et al., 2017) was investigated in this study using adsorption techniques with mulberry leaves (*Morus nigra L.*) as an adsorbent and a variety of parameters, including initial dye concentration, amount of adsorbent, contact time, and temperature. The percentage of dye removal under optimum conditions was also examined.

## MATERIALS AND METHODS

All the chemicals used in this research were of analytical grade and basic blue 3 (BB3) dyes were purchased from Sigma-Aldrich and used as received. Distilled water was used to dilute a stock solution of 1000 mg/L of basic blue (BB3) dyes ( $C_{20}H_{26}CN_3O$ ; molecular weight = 359.89 g/mol;  $\lambda_{max}$  = 654 nm). Working solutions are prepared by diluting the appropriate amount of this stock solution.

### Instrumentation

An analytical balance (Radwag), an oven (Memmert UN55), distilled water obtained using a purification device (Mikrotest MSD-08), a UV-Vis Spectrophotometer (Agilent 8453), a shaking water bath (Julabo SW22), an ultrasonic water bath (IsoLab) was used during the experiment.

### Preparation of Crushed Mulberry Leaves

Mulberry leaves were collected from Istanbul, Turkey. To eliminate foreign particles from the surface, it was washed multiple times with tap water and rinsed with distilled water. The mulberry leaves were dried at 80 °C for 24 hours in the oven. After samples are dried and crushed into a fine powder, the mulberry leaf powders are sifted through a sieve (mesh size  $24.0 \pm 0.4$  mm). A desiccator was used to store mulberry leaf adsorbent.

### The Adsorption Process of BB3

To study the adsorption of BB3 dyes, 50 mL of BB3 with the various concentrations of the prepared stock solutions was taken in a 100 ml glass beaker. Batch adsorption experiments were carried out under laboratory conditions at room temperature (25°C) on a water bath shaker for a period of time with a variety of dosages of adsorbent. The influence of various parameters affecting the adsorption process, such as initial dye concentration (5-50 mg/L), adsorbent dosage (0.1-1.5 g), contact time (5-180 minutes), and temperature (25-40°C), has been studied. At the end of the adsorption process, the sample solution was filtered through filter paper and put in a test tube. The absorbance value at the maximum wavelength of BB3, which is 654 nm, has been analyzed using a UV-Vis spectrophotometer and reported. Equations (1) and (2) below were used to determine the removal efficiency (%R) and adsorption capacity ( $q_e$ ) of BB3 dye in solution:

$$\%R = \frac{(C_o - C_e)}{C_o} \times 100 \quad (1)$$

$$q_e = \frac{(C_o - C_e)}{m} \times v \quad (2)$$

Where  $m$  is the amount of adsorbent utilized (g),  $V$  stands for dye solution volume (L), and  $C_0$  is the starting dye concentration.  $C_e$  is the dye concentration at time  $t$  (mg/L).

## RESULTS AND DISCUSSION

### Effect of Initial Dye Concentration on Adsorption of BB3

To evaluate the effect of initial dye concentration on BB3, experiments were carried out with different concentrations ranging from 5 to 50 mg/L. A total of 50 ml of BB3 dye solution of each concentration that has been prepared is put in a 100 ml beaker. 0.5 g of adsorbent dosage were weighed and added. Under laboratory room temperature conditions, the solution was shaken for 60 minutes with a water bath shaker at a speed of 150 rpm. Using filter paper, the mixed solution was filtered in order to separate the solid and liquid phases. The absorbance value of each solution was determined using a UV-Vis spectrophotometer with a maximum wavelength of BB3 dye ( $\lambda_{max}$  = 654 nm). As seen, the results of the optimum removal efficiency have been given in Figure 1. It shows that the optimum value for removal efficiency (%R) of BB3 dye is at a concentration of 30 mg/L.

Figure 1. The effects of initial dye concentration on the R% of the BB3 dye.

### Effect of Adsorbent Amount on Adsorption of BB3

The effect of the amount of adsorbent on the adsorption of BB3 was determined by varying amounts of adsorbent ranging from 0.1 to 1.5 g. The adsorbent was weighed and put in each glass beaker. A total of 50 ml of BB3 dye solution at a 30 mg/L concentration was put in a 100 ml glass beaker. The solution was shaken for 60 minutes at a constant speed of 150 rpm and a temperature of  $26.9 \pm 0.3^\circ\text{C}$ . The filter paper was used to filter the solution, which was put in a test tube. The absorbance value of each solution was determined using a UV-Vis spectrophotometer with a maximum wavelength of BB3 dye ( $\lambda_{\text{max}} = 654 \text{ nm}$ ). The results of the optimum removal efficiency and adsorption capacity values are illustrated below in Figures 2 (a) and (b). Based on the obtained results, it is shown that the optimum values for the percentage removal (%R) of BB3 dye are found when the adsorbent amount is 1.5 g per 50 ml. The removal efficiency increases when the mulberry leaf adsorbent amount is increased.

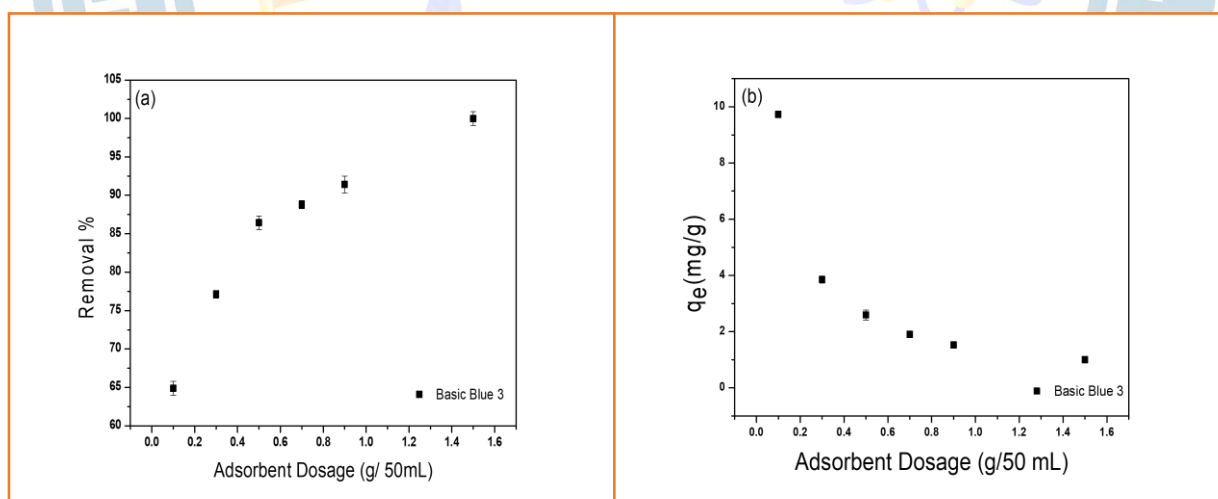

Figure 2. The effects of various adsorbent dosages on the Removal % (a),  $q_e$  (b) of the BB3 dye.

### Effect of Contact Time on Adsorption of BB3

To determine the effect of the contact time on BB3 dye solutions, 50 mL 30 mg/L BB3 was taken and put in a 100 ml glass beaker. A total of 1.5 g of the optimal adsorbent dosage obtained was weighed and added. The solution was shaken at 150 rpm at  $25.7 \pm 0.2$  °C within 5–180 minutes. The solution was filtered using filter paper. Then, the absorbance value of each solution was determined using a UV-Vis spectrophotometer with a maximum wavelength of BB3 dye ( $\lambda_{\max} = 654$  nm). Based on the contact time experiment, the results of the optimum values of the removal efficiency are shown in Figure 3. This graph illustrates that the removal efficiency (%R) of BB3 dyes is optimal for a contact time of 45 min.

Figure 3. The effects of contact time on the Removal % BB3 dye.

### Effect of Temperature on Adsorption of BB3

To study the influence of temperature on the adsorption of BB3 dye solution, experiments were carried out under the following optimal conditions: 50 ml of dye solution with a concentration of 30 mg/L, shaking speed at 150 rpm, contact time for each solution (45 minutes for BB3), and adsorbent dosage of 1.5 gram with various temperatures ranging from 25 to 40°C. The mixed solution was filtered using filter paper and put in a test tube. The absorbance value of each solution was determined using a UV-Vis spectrophotometer with a maximum wavelength of BB3 dye ( $\lambda_{\max} = 654$  nm). As seen, the results of the optimum values of the removal efficiency are illustrated in Figure 4. It indicates that the removal efficiency (%R) of BB3 dye is optimal at temperatures of  $40 \pm 0.2$  °C.

Figure 4. The effects of temperature on the Removal % BB3 dye.

## CONCLUSION

The adsorption method using mulberry leaves as a low-cost adsorbent has been effectively shown to remove BB3 dye solution based on present and past research results. Under optimal conditions, the percentage of dye removal efficiency reached over 99%. According to the results of the experiments, the optimal values of various parameters are as follows: 30 mg/L of concentration, 1.5 g/50 mL of adsorbent amount, 45 minutes of contact time, and 40°C of temperature. According to the data, mulberry leaves can be successfully used as a natural, inexpensive, and environmentally friendly adsorbent to remove toxic BB3 dye.

#### Abstract

*Heptaptera cilicica* is one of the species of the genus *Heptaptera*. The root ethyl acetate extract of *H. cilicica* was fractionated column chromatography and twelve sesquiterpene coumarins; umbelliprenin (1), colladin (2), psoralen (3), bergapten (4), badrakemone (5), colladonin (6), badrakemin (7), marmesin (8), scopoletin (9), umbelliferon (10), 14'-acetoxybadrakemone (11) and 14'-acetoxybadrakemin (12) were isolated. Extract and isolated coumarins were performed against A498 and OU31 renal cancer cell lines. The root ethyl acetate extract of *H. cilicica* and colladin, colladonin, badrakemin, 14'-acetoxybadrakemin showed strong cytotoxic activity against UO31 renal cancer cell line.

**Keywords:** *Heptaptera cilicica*, cytotoxic activity, coumarin.

#### INTRODUCTION

The genus *Heptaptera* Marg. & Reuter (Apiaceae) is represented by 11 species worldwide, four of them; *H. cilicica* (Boiss. & Balansa) Tutin, *H. anisoptera* (DC.) Tutin, *H. anatolica* (Boiss.) Tutin and *H. triquetra* (Vent.) Tutin are growing in Turkey (The WHO Plant Lists, 2023, Herrnstadt et al.,1972).

*H. cilicica* is an endemic species and distributed in the eastern Taurus Mountains in Mersin province of the Mediterranean region of Turkey (Herrnstadt et al.,1972). *Heptaptera* species have been reported to contain sesquiterpene coumarin derivatives (Ban'kovskii et al.,1970, Borisov et al., 1975, Appendino et al., 1992, Appendino et al., 1993, Tosun et al., 2019, Tosun et al., 2021) to which various biological activities such as cytotoxicity, P-glycoprotein inhibitory, cancer chemopreventive, anti-inflammatory, antibacterial, antileishmanial, antiviral, antidiabetic and cholinesterase inhibitory are attributed (Tosun et al., 2021, Nazari et al., 2011, Gliszczynska and Brodelius, 2012, Dastan et al., 2016, Amin et al., 2016, Iranshahi et al., 2018, Erdogan Orhan et al., 2021).

In the present study, initially, the ethyl acetate extract of the roots of *H. cilicica* was tested on renal cancer cell lines and confirmed cytotoxic activity. Afterwards, the extract was fractionated and twelve known coumarins were successfully isolated. Finally, isolated twelve sesquiterpene coumarins were performed on renal cancer cell lines (A498 and UO31).

#### MATERIALS AND METHODS

##### General experiments

NMR spectra was acquired on a Bruker Avance III spectrometer (Rheinstetten, Germany) operating at 500 MHz for <sup>1</sup>H and equipped with a 5 mm indirect observation probe. Initial purification of the ethyl acetate extract was carried out on a Sephadex LH-20 (GE Healthcare, Chicago, IL, USA) column. Further purification of column fractions was performed using silica gel F254 PLC plates (1 mm thickness) (Merck KGaA, Darmstadt, Germany) or combination of PLC and silica gel column chromatography (Silica gel 60, 0.063-0.2 mm particle size, Merck KGaA, Darmstadt, Germany).

##### Plant material

The roots of *H. cilicica* were collected in the vicinity of Mersin-Tarsus in July 2013 and identified by Prof. A. Duran. A voucher specimen (A. Duran 9591) was deposited in the Herbarium of Selçuk University, Faculty of Sciences, Department of Biology (KONYA).

## Extraction

Air-dried and coarsely powdered roots (100 g) of *H. cilicica* was extracted sequentially with dichloromethane (2 L) and methanol (3 L) at room temperature and concentrated, in vacuo, to dryness (yields; 4.99 g dichloromethane extract and 14.01 g methanol extract). The methanol extract was redissolved in a mixture of methanol/water (10:90) and then partitioned with ethyl acetate (EtOAc), the resulting extracts were separately concentrated in vacuo to dryness. Ethyl acetate and aqueous methanol extracts of the roots were 0.88 g and 12.95 g respectively.

## Chromatography

Prepared EtOAc extract was separated on Sephadex LH-20 column using n-hexane:dichloromethane:methanol solvent mixture and fractions were collected. The fractions which had the same spots on TLC were combined. Combined fractions were separated, using silica gel with n-hexane:EtOAc to obtain subfractions. TLC was performed using silica gel 60 F254 plates. Subfractions were separately further purified by preparative TLC using n-hexane:ethyl acetate (90:10; 70:30; 50:50) as solvent system. Twelve coumarins were isolated from subfractions.

## Cytotoxic assay on renal cancer cell lines

The assay used was a two-day, two cell line XTT bioassay (Skehan et al., 1990), an in vitro antitumor colorimetric assay developed by the MTP Assay Development and Screening Section. The renal cancer cell lines used were UO31 and A498. Cells were harvested and plated (45  $\mu$ L) at a seeding density of  $3.0 \times 10^5$  cells per well for the UO31 cell line,  $2.5 \times 10^5$  cells per well for the A498 cell line. The respective cell lines were separately plated into 384-well assay plates and then incubated for 24 h. DMSO solutions of the test materials (8  $\mu$ L) were diluted 1:25 with medium (192  $\mu$ L) and then subjected to five 2:1 serial dilutions (100  $\mu$ L each) on a 96-well plate. Duplicate 40  $\mu$ L aliquots of each sample concentration were then transferred to a 384-well "dilution plate", which could accommodate the duplicate samples from two 96-well plates. A 5  $\mu$ L portion of each solution in the dilution plate was transferred to the cell cultures in the 384-well assay plates to give a final volume of 50  $\mu$ L and a DMSO concentration of 0.4%. Control wells included 8 wells with the positive control sanguinarine chloride at 20  $\mu$ M, as well as DMSO only controls and no cell controls. The Z' factors for the individual plates were calculated and were  $>0.5$  in all cases. The cells were incubated for 48 h at 37  $^{\circ}$ C in the presence of the test samples and then treated with the tetrazolium salt XTT (2,3-bis[2-methoxy-4-nitro-5-sulphophenyl]-2H-tetrazolium-5-carboxanilide). Viable cells reduced XTT to a colored formazan product, and after an additional 4 h incubation period the amount of formazan produced was quantified by absorption at 450 nm, using a 650 nm reference. Plates were read on a PerkinElmer EnVision (model # 2104) reader.

## RESULTS and DISCUSSION

Twelve known sesquiterpene coumarins were obtained as a result of fractionation of the ethyl acetate extract of the roots of *H. cilicica*. Umbelliprenin (1), colladin (2), psoralen (3), bergapten (4), badrakemone (5), colladonin (6), badrakemin (7), marmesin (8), scopoletin (9), umbelliferon (10), 14'-acetoxybadrakemone (11), 14'-acetoxybadrakemin (12).

$^1$ H NMR data of the known compounds agree with the data given in the literature for umbelliprenin (1) (Tian et al. 2013), colladin (2) (Ban'kovskii et al., 1970), psoralen (3), bergapten (4) (Tosun et al., 2020), badrakemone (5) (Appendino et al. 1992a), colladonin (6) (Perel'son, M et al., 1975), badrakemin (7) (Asghari et al. 2016), marmesin (8) (Abu-Mustafa and Fayez, 1961), scopoletin (9) (Tosun et al., 2020), umbelliferon (10) (Singh et al., 2010), 14'-acetoxybadrakemone (11) (Tosun et al., 2021), 14'-acetoxybadrakemin (12) (Tosun et., 2019).

The ethyl acetate extract of the roots of *H. cilicica* showed high cytotoxic activity against UO31 renal cancer cell line with IC<sub>50</sub> value 0.08  $\mu$ g/mL, in contrast extract didn't show cytotoxic activity on A498 renal cell line up to 50  $\mu$ g/mL concentrations (Table 1.).

Umbelliprenin (1), colladin (2) and especially 14'-acetoxybadrakemin (12) showed strong cytotoxic activity against UO31 renal cell line. Colladonin (6) and badrakemin (7) showed strong cytotoxic activity against UO31 and mild cytotoxic activity against A498 renal cell lines. Other sesquiterpene coumarins which isolated from root ethyl acetate extract of *H. cilicica* didn't show cytotoxic activity (Table 1.).

**Table 1.** IC50 values of EtOAc extract and isolated sesquiterpene coumarins against renal cell lines.

	A498 (µg/mL)	UO31 (µg/mL)
EtOAc extract	>50	0.08
Umbelliprenin	>50	1.8
Colladin	>50	0.39
Psoralen	>50	>50
Bergapten	>50	>50
Badrakemone	>50	11
Colladonin	21	0.75
Badrakemin	20	0.38
Marmesin	>50	>50
Scopoletin	>50	>50
Umbelliferon	>50	>50
14'-acetoxybadrakemone	>50	>50
14'-acetoxybadrakemin	>50	0.017

## CONCLUSION

*Heptaptera* species have been reported to contain sesquiterpene coumarins derivatives. Furthermore, these type of coumarins which isolated from *Heptaptera* species are reported as cytotoxic activity (Tosun, 2019-2020). Previously, six of these sesquiterpene coumarins (umbelliprenin, colladin, colladonin, badrakemin, 14'-acetoxybadrakemone, 14'-acetoxybadrakemin) were reported dichloromethane extract of the roots of *H. cilicica*. Tosun et al., reported that dichloromethane extract and colladin showed strong cytotoxic activity on colon cancer cell lines. (Tosun et al., 2021). In the present study, ethyl acetate extract of the roots of *H. cilicica* showed strong cytotoxic activity on UO31 renal cancer cell line. In conclusion, the ethyl acetate extract of the roots of *H. cilicica* has strong cytotoxic activity against UO31 renal cancer cell line and colladin, colladonin, badrakemin and especially 14'-acetoxybadrakemin may be responsible for the cytotoxic activity.

## ACKNOWLEDGEMENTS

I would like to thank Dr. John A. Beutler, Molecular Targets Laboratory, CCR, NCI, Frederick, MD, U.S.A., for the cytotoxic activity testing and Prof. A. Duran for the collection and identification of plant material.

## Özet

Fosil kaynakların daha az kullanılması ve çevreye salınan emisyonların dolayısıyla çevre kirliliğinin azaltılması amacıyla yenilenebilir enerji kaynaklarının değerlendirilmesi çevre ve insan sağlığının yanında ekonomik olarak ta önemlidir. Bir bölgenin mevcut yenilenebilir enerji potansiyelinin araştırılarak o bölge için yapılan fizibilite çalışması hem ekonomik açıdan hem de fosil kaynaklı olmayan bir enerji kaynağının kullanımıyla sağlanacak çevresel korumanın birçok avantajı için ilk adımdır.

Bu çalışmada, Danimarka Riso Ulusal Laboratuvarı olarak bilinen Danimarka Teknik Üniversitesi Rüzgâr Enerjisi Departmanı tarafından Weibull parametre tahmininden faydalanılarak geliştirilen WAsP Rüzgâr Atlası Analiz ve Uygulama Programı kullanılmıştır. Bu program vasıtasıyla Sivas ilinin 1 yıllık saatlik meteorolojik verilerinden faydalanılarak kurulması tasarlanan rüzgâr çiftliğinden elde edilebilecek rüzgâr enerjisi potansiyeli araştırılmıştır. Yapılan çalışmada bölgede hedeflenen enerji ihtiyacının karşılanması için 28 adet Vestas V52'ye (850 kW) türbin ile tasarlanan bir rüzgâr çiftliğinden elde edilebileceği belirlenmiştir.

### Analysis of the wind energy potential of Sivas province with the help of wind atlas analysis and application program

## Abstract

Utilizing renewable energy resources in order to reduce the use of fossil resources and reduce emissions to the environment and therefore environmental pollution is important not only for the environment and human health, but also economically. A feasibility study conducted by investigating the existing renewable energy potential of a region is the first step towards many advantages of both economic and environmental protection that will be provided by the use of a non-fossil energy source.

In this study, the WAsP Wind Atlas Analysis and Application Program, developed by the Technical University of Denmark Wind Energy Department, known as the Danish Riso National Laboratory, using Weibull parameter estimation, was used. Through this program, the wind energy potential that can be obtained from the wind farm designed to be established by using the 1-year hourly meteorological data of Sivas province was investigated. In the research, it was determined that meeting the targeted energy need in the region could be obtained from a wind farm designed with 28 Vestas V52 (850 kW) turbines.

**Keywords:** Wind Energy, WAsP, Renewable energy, Sustainability, Wind Atlas

## GİRİŞ

Enerji, bir ülkenin kalkınması bakımından ana unsurdur. Çevresel sürdürülebilirlik, modern çağın esas hedeflerinden biridir. Türkiye'nin enerji üretimi için kullandığı enerji kaynaklarının toprak, su ve hava gibi hayati elementler üzerinde önemli kirlenmeye sebep olması, bu enerji kaynaklarının en kısa sürede kullanımını azaltmanın gerekliliğinin bir göstergesidir. Atmosferi ve olaylarını araştıran bilim olan meteoroloji, bu nedenle çevresel sürdürülebilirlik alanında kilit bir faktördür. Enerji üretimi ise çevreye salınan CO<sub>2</sub> emisyonlarının en büyük kaynaklarından biridir. Rüzgâr gibi yenilenebilir kaynaklardan enerji üretimi sırasında herhangi bir karbondioksit veya diğer hava kirlenmeye sebep verilmemektedir (Abbasi ve Abbasi, 2010). Rüzgâr, incelenmesi çok karmaşık olan bir elementtir ve karakterize edilmesi, hızı, yoğunluğu, yönü, zeminin pürüzlülüğünün etkisi, engellerin etkisi, rüzgârın stabilitesinin etkisi vb gibi çeşitli parametrelerin bir fonksiyonudur (IEA Statistics, 2021).

Rüzgâr çiftlikleri aracılığıyla yaygın olarak mekanik, elektrik ve termal olmak üzere üç tür enerji elde edilebilmektedir. Bu nedenle, rüzgâr çiftlikleri Dünya’da birçok ülkenin yayla bölgelerinde giderek daha fazla yer almaya başlamıştır (Barrios, ve Rodríguez, 2004). Rüzgar enerjisi sıfır emisyon eşliğinde bir elektrik akımı sağlayabilmektedir. Rüzgâr türbinleri bir rüzgâr çiftliğinin ana elemanlarından biridir. Son yıllarda sürekli desteklenen teknik gelişmelerle çıktısını doğrudan bir şebekeye sağlayan büyük rüzgâr türbinleri, elektrik santrallerindeki üretim tesisi ile rekabet edebilecek niteliklere sahiptir. Rüzgâr türbinlerinin kuşlarla veya habitatlarla olası etkileşimi ve özel korumaya veya diğer sosyal veya çevresel sınırlamalara ihtiyaç duyan toplulukların sağlığına ilişkin olası tehlikelerine rağmen, hızla fosil yakıtlarla rekabetçi bir enerji kaynağı olarak dikkat çekmektedir (Walker ve ark., 2015). Bir rüzgâr çiftliği tasarlanırken ekonomi için yeterli bir yıllık çıktı sağlamak esastır. Bu da, son derece rüzgârlı bir alan gerektirir. Bu nedenle, bir rüzgâr hızı araştırması, herhangi bir ülke veya bölgedeki büyük ölçekli rüzgâr enerjisi potansiyellerini araştırmanın ilk ve en belirgin adımıdır.

Türkiye’de rüzgâr enerjisinin potansiyelinin belirlenmesini içeren araştırmalar yapılmaktadır. Bilir ve ark. Türkiye’nin başkenti Ankara’nın İncek ilçesi için rüzgâr enerjisi potansiyelini belirlemek amacıyla gerekli rüzgâr hızı ve yönü bilgilerini kullanmıştır. Yaptıkları analizlerin değerlendirilmesiyle araştırılan ilçenin büyük çaplı rüzgâr türbinlerinin kurulumu için uygun bir bölge olmadığını bununla birlikte küçük çaplı rüzgâr türbinlerini kurabilmek için değerlendirilebilir bir bölge olduğunu rapor etmişlerdir (Bilir ve ark., 2015). Ersöz ve Onat, rüzgâr enerjisi potansiyeli ve rüzgâr karakteristiklerinin analizini yapmak için yapay sinir ağları yöntemini kullanmışlardır (Onat ve Ersoz, 2011). Gökçek ve ark. Kırklareli şehrinin rüzgâr enerjisi potansiyelini ve rüzgâr karakteristiklerini araştırmışlardır. Rüzgâr hızı ve yönü bilgisi olarak, 2004 yılına ait saatlik verilerle hesaplamalarını yapmışlardır. Senelik ortalama güç yoğunluk değeri 139 W/m<sup>2</sup> olarak rapor edilmiştir (Gökçek ve ark., 2007).

Bu araştırma çalışmasının temel amacı, aletli meteorolojik hava istasyonundan alınan yerel hava durumu verilerini kullanarak Sivas şehrinin bulunduğu alanda mevcut rüzgâr gücünü değerlendirmektir. Veriler WASP yazılımı ile analiz edilerek rüzgâr yoğunluğu, rüzgâr yönü belirlenerek, rüzgâr çiftliği kurulumu için gerekli parametreler için elde edilen çıktılarla birlikte değerlendirilmiştir. Ayrıca WASP simülasyonundan elde edilen veriler esas olarak rüzgâr türbininin çalışma alanları için en uygun rüzgâr türbinini ve hedeflenen enerjiyi sağlayabilecek türbin sayısını bulmak için kullanılmıştır.

### Sivas için WASP ile Rüzgâr Enerjisi Potansiyelinin Tespiti

Türkiye’nin büyük illerinden biri olan ve İç Anadolu bölgesinde yer alan Sivas ili 28 488 km<sup>2</sup> yüzölçümüne sahip olup ve rakım yüksekliği ortalama 1285 m.’dir. Sivas ilinin ana geçim kaynağı tarım ve hayvancılıktır. Sanayi Sivas ilinde yeni yeni gelişmektedir. Küçük sanayinin daha etkin olduğu ana sanayi kuruluşları demir-çelik fabrikaları, süt fabrikaları, tuğla fabrikaları, dikimevi, yem ve un fabrikalarıdır. Fabrika sayısının giderek artması sebebiyle bu işletmelerin gereksinim duyduğu enerji miktarı da her geçen gün artmaktadır. Bu nedenle gerekli enerjinin karşılanması için bazı alternatif çözümler araştırılmaktadır.

Bu araştırmada Şekil 1’de Google üzerinden gösterildiği gibi 37,002 Doğu boylamı ve 39,7437 Kuzey enleminde yer alan Sivas ilinde araştırma yapılmıştır. Şekil 2’de ise araştırılan bölgenin izohipsli dem haritası gösterilmiştir.

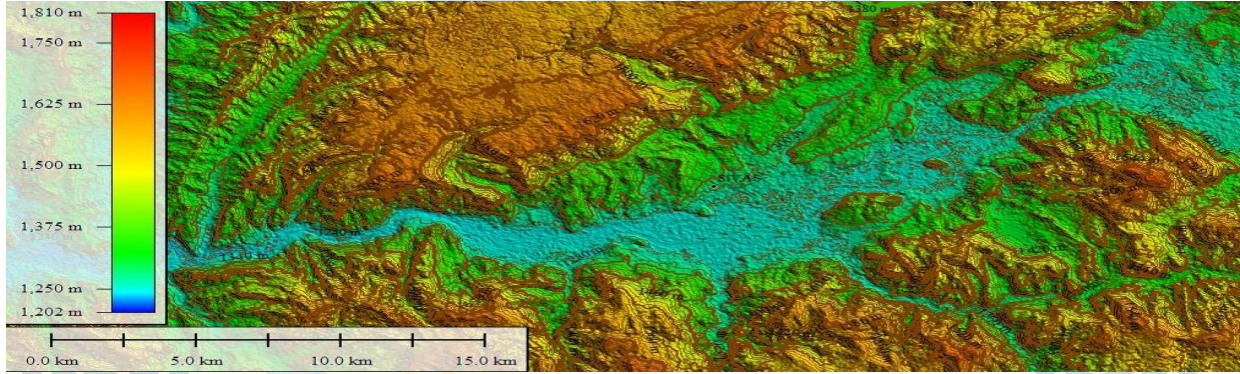

Şekil 1. 37,002 Doğu Boylamı ve 39,7437 Kuzey Enleminde yer alan Sivas ili Google earth görüntüsü

Sivas ilinde rüzgâr hızını ölçmek için kullanılan anemometrelerin yer aldığı alanda 100 metre aralıklarla izohipsli şekilde çizilmiştir.

Sivas ili için yapılan bu araştırmada Meteoroloji Genel Müdürlüğü'nden alınan veriler yerden 10 m yükseklikte bir yıllık her güne ait 24 saatlik rüzgâr hızı ve yönü verileri söz konusu ile ait enlem ve boylamlar için datalar girilip WaSP simülasyon programına girdi olarak işlenmiştir. Daha sonra anemometre yeri 1,286.2 m. olarak belirtilmiştir. Sonuçta, kurulan sistem kuzey-doğu güney-batı genel rüzgâr yönlü olarak modellenmiş olup anemometreden elde edilen birim zaman aralığında birim alandan geçiş yapan rüzgâr gücü  $4 \text{ W/m}^2$  ve ortalama rüzgâr hızı  $1.12 \text{ m/s}$  olarak elde edilmiştir. Tahmini olarak belirlenen güç yoğunluk değeri,  $1.091 \text{ kg/m}^3$ 'lük hava yoğunluğu için bulunmuştur. Tablo 1'de Sivas için alan bilgisi verilmiştir.

Şekil 2. Sivas İzohipsli Dem Haritası

Tablo 1. Sivas Alan Bilgisi

Anemometer height a.g.l	10m
Elevation a.s.l	1286,2 m
Net altitude a.s.l	1296,2 m
Mean air density	$1,091 \text{ kg/m}^3$

Şekil 3. Sivas ilinde anemometrenin yerleştirildiği yer

Şekil 4. 10 m. Yüksekliğinde yerleştirilen anemometrenin rüzgâr yönlerine göre hızlarının gösterimi

Gözlemlenmiş rüzgâr enerjisi için anemometre verileri 39,44°D ve 37,00°K’de elde edilmiştir. Şekil 3’de Sivas ilinde anemometrenin yerleştirildiği yer gösterilmiştir. 10 m. Yüksekliğinde yerleştirilen anemometrenin rüzgâr yönlerine göre hızlarının gösterimi Şekil 4’de verilmiştir. Sivas ili için rüzgâr yönleri Tablo 2’de gösterilmiştir. Tablo 3’de Sivas ili için Histogram kutuları detaylandırılmıştır. Tablo 3’de Sivas ili için barometrik referans bilgileri verilmiştir.

Şekil 8. Sivas ili için WASP Sonuç Görüntüsü

WASP simülasyonu aracılığıyla ile gözlemlenmiş ortalama rüzgâr iklimi analizini elde edebilmek için Meteoroloji istasyonları tarafından ölçülmüş veriler içe aktarılmıştır. Rüzgâr yönü ve hızını yerden 10 m yükseklikte ölçerek elde edilmiş Meteorolojik veriler, her 22.5<sup>o</sup> lik rüzgâr yönü için gözlemlenmiş ortalama rüzgâr iklimini yani rüzgâr frekansını, ortalama rüzgâr hızını göstermektedir. WASP simülasyonu aracılığıyla rüzgâr enerjisi değerlendirmesi yapılırken, bu gözlemlenmiş ortalama rüzgâr iklimi içe aktarılmıştır. Gözlemlenmiş ortalama rüzgâr ikliminin, rüzgâr datalarının sektörler şeklinde sınıflandırılması ve Weibull dağılımı metodu ile hesaplanması sonucu oluşturulmuştur. Herbir sektör için k ve c karakteristikleri yardımıyla, istasyondan elde edilen rüzgâr verileri yerine ölçülen sonuçları temsil eden gözlemlenmiş ortalama rüzgâr iklimi değerleri kullanılır. Belli bir alanda rüzgâr yönü dağılımları rüzgârgülü ile gösterilir. Bu pusula şeklinde 12 sektöre bölünür ve ortalama rüzgâr hızı ile birlikte rüzgârın estiği yöne göre ortalama zamanın yüzdesel değerini gösterir. Güney Batı-Kuzey Doğu yönleri araştırılan lokasyonda hâkim rüzgâr yönüdür. Gözlemlenmiş ortalama rüzgâr iklimi ile girdi verisi ile WASP yazılımı tarafından, türbin sahalarından gelen topografik etkileri türbin sahasında bölgesel rüzgâr iklimi ve göbek yüksekliğinde (55 m) rüzgâr türbini Vestas V52'ye (850 kW) ye göre uygulanmıştır. Sivas ili için planlanan hedef toplam gücü yani 22.968 MWh olduğu hesaba katılarak bu elektrik gücünü elde etmek için bölgede 28 adet rüzgâr türbini ile bir rüzgâr çiftliği kurulabileceği takdirde bu enerji ihtiyacının karşılanabileceği rapor edilmiştir.

## SONUÇ

Fosil yakıtların tükenebilir doğası ve iklim değişikliğine katkıları, bugün toplumları kirletmeyen ve tükenmez yenilenebilir enerjilere doğru ilerlemeye itiyor. Sera gazları üreten birçok insan faaliyetine karşı, rüzgar enerjisi gibi bir yenilenebilir enerji kaynağının kullanımı açık ara en büyük emisyon azaltıcılardan biridir [37]. Rüzgâr enerjisi potansiyelinin değerlendirilmesi, rüzgâr türbinleri veya rüzgâr çiftlikleri ile ilgili kararları etkileyen önemli bir adımdır, ancak tüm yerler rüzgâr türbinlerinin kurulması için uygun değildir. Bu nedenle, güç üretiminin belirli bir yerini değerlendirmek için düşük rüzgâr potansiyelinin değerlendirilmesi gereklidir.

Bu araştırmanın sonuçları, gelecekte Türkiye'nin Sivas ilinde veya benzer rüzgâr özelliklerine sahip başka bir yerde yerden 10 metre yükseklikte bir rüzgâr türbini geliştirmek için referans olarak uygulanabilir. Ek olarak, belirli sermaye harcamalarını tahmin etmek için kapsamlı ve dikkatli bir ekonomik analize ihtiyaç duyulacaktır.

#### Abstract

The protein film voltammetry method is used for understanding the electrokinetic behavior of an enzyme from the relation between chemical activity and electropotential. This method has some advantages such as fast and direct electron transfer between enzymes to the electrode surface, a small amount of enzyme is required for protein film voltammetry, and the absence of the complex coating on the electrode surface can increase the diffusion rates of the electrons. The electrokinetic properties of assimilatory nitrite reductase enzyme NirB from *Escherichia coli* were determined for the first time in the present study. The nitrite reductase enzyme was directly adsorbed on a glassy carbon electrode surface and this electrode was used for the characterization of the enzyme via cyclic voltammetry method. The electrokinetic properties of nitrite reductase NirB enzyme were analyzed by the Michaelis-Menten method, and the V<sub>max</sub> and K<sub>m</sub> values were determined to be 68.97 μA and 324.54 μM nitrite, respectively. The mass transfer mechanism of electrons to the electrode surface was determined from scan rate experiments between 25 to 500 V.s<sup>-1</sup> and the mass transfer was found to be diffusion controlled.

**Keywords:** Protein film voltammetry, Nitrite reductase, electrokinetic, Michaelis menten.

#### INTRODUCTION

The nitrogen cycle can be divided into seven enzymatic steps: Dinitrogen reduction to ammonia (ammonification), dissimilatory nitrite reduction to ammonia (also called ammonification), ammonia oxidation to nitrite (first step of nitrification), nitrite oxidation to nitrate (second step of nitrification), nitrate reduction to nitrite, nitrite reduction to dinitrogen by denitrification and anaerobic ammonium oxidation to dinitrogen (anammox) (Milton and Minter, 2017). Nitrite reductase (NirB) is one of the important enzymes in the denitrification process of nitrite reduction to ammonia with the following reaction (Akhtar et al., 2013; Yılmaz et al., 2022):

Enzyme kinetics of different types of nitrite reductases (NrfA, cytochrome c, and NirB) have been studied in some microorganisms, including *Bacillus firmus* (Gao et al., 2017), *Bacillus megaterium* (Chu et al., 2017), *Candida utilis* (Sengupta et al., 1996), *Escherichia coli* (Yılmaz et al., 2022), *Hydrogenobacter thermophilus* (Suzuki et al., 2006), *Mycobacterium tuberculosis* (Akhtar et al., 2013), and *Rhodobacter capsulatus* (Olmo-Mira et al., 2006). The electrokinetic properties of cytochrome c nitrite reductase were also studied by some researchers (Angove et al., 2002; Wijma et al., 2007). However, there is a lack of information on the electrokinetic characterization of nitrite reductase NirB of *E. coli*, which was cloned and characterized recently (Yılmaz et al 2022). The electrokinetic properties of enzymes can be determined by means of the protein film voltammetry (PFV) method.

The protein film voltammetry method is a relatively new electrochemical approach that is used for the determination of enzyme characteristics based on direct electron transfer between protein and electrode (Léger et al., 2003; Gulaboski et al., 2012). The current that results from the oxidation or reduction of the protein is proportional to the transported electrons per second. The protein is immobilized on an electrode surface by adsorption to form an electroactive film then, by applying a potential, electrons are driven in and out of the

active sites, resulting in diagnostically useful current signals. In this method, protein is configured as a film on an electrode. In the present study, the electrokinetic properties and mass transport mechanism of the nitrite reductase NirB enzyme were determined by the protein film voltammetry method.

## MATERIALS AND METHODS

### Reagents

All chemicals used in the present study were purchased from Sigma unless otherwise stated. Nitrite reductase NirB from *E. coli* was purified and quantitated as previously (Yılmaz et al., 2022). The purified enzyme was stored at +5 C° until used. The protein concentration in the purified enzyme mixture was measured according to the Bradford method using bovine serum albumin as a standard (Bradford, 1976). The protein concentration of the purified enzyme was calculated as 190  $\mu\text{g}\cdot\text{ml}^{-1}$ . The activity of the purified enzyme was determined by revising the protocol generated by Martínez-Espinosa. The amount of nitrite consumed in 5 mins in 50 mM PBS (phosphate buffered saline) using 3mM dithionite-reduced methyl viologen (MV) as the electron donor (Martínez-Espinosa et al., 2001) was calculated as enzyme activity. The remaining nitrite after reaction was determined colorimetrically by a diazo-coupling reaction, at 543 nm (Griess, 1879). The activity of the enzyme then the activity of  $\sim 521.1 \mu\text{mol nitrite consumed min}^{-1} \text{mg}^{-1}$  protein in 50 mM PBS, in the presence of 3 mM MV (as electron donor), and 16 mM sodium dithionite (reducing agent), pH 7.1. Phosphate buffered saline solution (50 mM, pH 7.1) was prepared by mixing  $\text{K}_2\text{HPO}_4$ ,  $\text{KH}_2\text{PO}_4$ , and NaCl. Nitrite stock solutions (sodium nitrite, 100%; Isolab, Türkiye), were prepared in PBS pH 7.1.

### Protein film voltammetry

Electrochemical measurements were carried out at potentiostat (VersaSTAT3). Glassy carbon working electrode (d=3mm, CHI104), platin wire counter electrode, and Ag/AgCl reference electrode (3 M KCl, BASI) were used in electrochemical measurements and electrolyte (PBS) was deoxygenated with  $\text{N}_2$  for 5 mins before each test. Glassy carbon working electrodes were polished with 1, 0.3, and 0.05 micron alumina slurry respectively. Electrodes were checked by cyclic voltammetry in 0.5 M sulfuric acid and freshly cleaned electrodes were used for protein film voltammetry. Enzyme films on freshly prepared electrodes were prepared by covering the surface of the electrode with 20  $\mu\text{l}$  of enzyme solution for 5 mins. After 5 minutes protein solution was gently removed from the electrode surface and the electrode was placed in the cell for electrochemical measurements. The cell containing 50 mM PBS was flushed with pure  $\text{N}_2$  before each test for deoxygenation.

**Figure 1.** Schematic presentation of sub-monolayer film of nitrite reductase NirB on the glassy carbon electrode surface.

The Michaelis-Menten equation (Eq. (1)) was used to analyze the kinetic data. The values of  $V_{max}$  and  $K_m$  were determined by non-linear regression analysis of the corresponding Michaelis-Menten curves ( $v$  vs. [nitrite]) using the algorithm of the Lineweaver–Burk plot (Eq. (2)). Maximum catalytic current obtained at the addition of different concentrations of nitrite was accepted equal to  $V_{max}$  ( $i_{max} = V_{max}$ ).

The Michaelis Menten and Lineweaver Burk equations are as follows:

$$v = \frac{v_{max}*[S]}{[S]+K_m} \quad (1)$$

$$\frac{1}{v} = \frac{K_m}{V_{max}[S]} + \frac{1}{V_{max}} \quad (2)$$

[S]: Nitrite concentration at the beginning of the reaction.

$V$ : Initial reaction rate

$V_{max}$ : Maximum reaction rate, ( $i_{max} = V_{max}$ )

$K_m$ : Nitrite concentration when the reaction rate is  $V_{max}/2$

The mass transport mechanism in the process was investigated by scan rate experiments. The cyclic voltammograms at the scan range between 25-500  $mV \cdot sec^{-1}$  were collected after the addition of 2 mM nitrite to the cell containing 1 mM MV.

## RESULTS and DISCUSSION

Freshly polished glassy carbon electrodes were covered with 20  $\mu l$  of NirB enzyme solutions for 5 min and then placed in an electrochemical cell containing PBS solution. To prevent the inactivation of nitrite reductase the electrolyte was flushed with pure  $N_2$ . Before the kinetic experiments were carried out, the effect of scan rates (between 25 to 500  $V \cdot s^{-1}$ ) on catalytic currents was examined and the results are shown in Figure 2. The results show that catalytic currents were increased with increasing the scan rates as expected. As it is known the peak currents must be linearly proportional to the square root of the scan rate and for the diffusion-controlled processes, the slope of  $\log(\text{current})$  vs.  $\log(\text{scan rate})$  is 0.5. In the present study the mass transfer process was found to be diffusion-controlled one (slope is equal to 0.49).

**Figure 2.** Effect of scan rates on the oxidation and reduction peaks of NirB immobilized GCE electrodes in the presence of 2 mM nitrite.

When the scan rates were set to  $500 \text{ mV}\cdot\text{sec}^{-1}$ , separate peaks of oxidation and reduction were obtained. The reduction peaks seen near  $-0.6 \text{ V}$  and  $-1 \text{ V}$  could belong to the reduction of methyl viologen (Ding et al., 2019). However, peak currents at these reduction potentials ( $-0.6$  and  $-1 \text{ V}$ ) were not increased with increasing the nitrite concentration as seen in Figure 3. Only the reduction peak observed at  $-1.4 \text{ V}$  was increased with nitrite addition and it can belong to nitrite reduction to ammonia. Electrokinetic nitrite reductase reaction rate and  $K_m$  values were calculated from the currents at the potential of  $-1.4 \text{ V}$ . The  $V_{\text{max}}$  and  $K_m$  values were determined by using the Lineweaver-Burk linearization method (Eq. (1)) and calculated to be  $68.97 \mu\text{A}$  and  $324.54 \mu\text{M}$  nitrite, respectively. This  $K_m$  value of the enzyme is similar to the  $K_m$  determined by *in vitro* enzyme assay (Yılmaz et al 2022).

Figure 3. Cyclic voltammogram of protein film voltammetry \*Scan rate:0.05V.

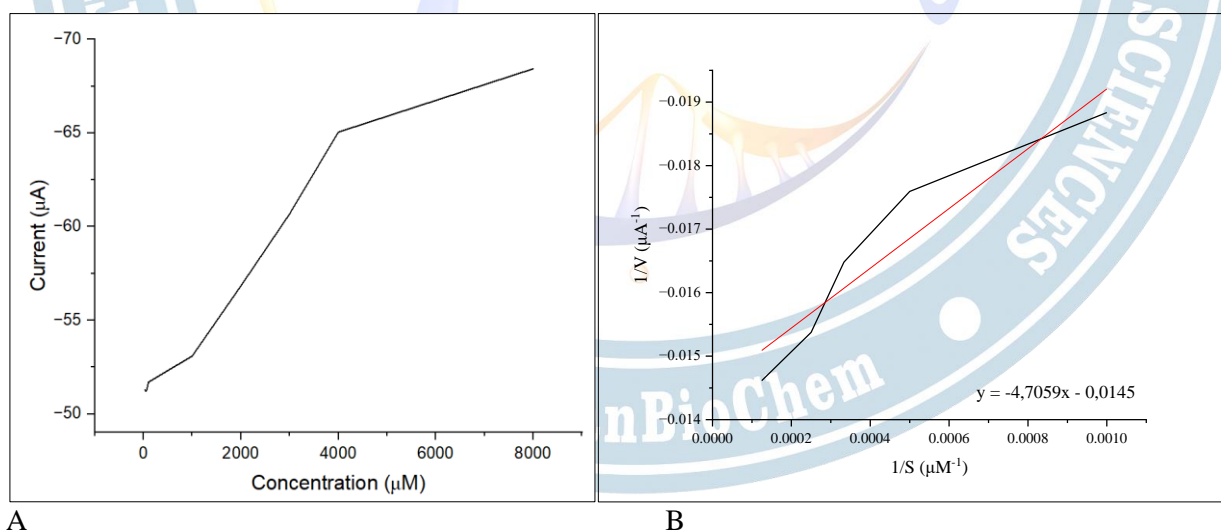

Figure 4. A) Catalytic reduction currents vs. Nitrite concentration B) Lineweaver-Burk plot nitrite concentration range between 1-8 mM  $\text{NO}_2^-$  \*Scan rate:0.05V.

## CONCLUSION

Protein film voltammetry supplies much important information about the interaction of enzyme activity and electrokinetic properties of the enzyme. This method is a fast, easy, and economical alternative to the analytical methods for the characterization of the enzymes. In the present study, the mass transfer mechanism of NirB nitrite reductase of *E. coli* was determined by scan rate experiments, and the process was found to be diffusion-

controlled. The electrokinetics properties of the enzyme were determined by using Michaelis Menten's equation and the nitrite reduction peak potential was observed at a potential of -1.4 V. Km value of the NirB enzyme is found similar to its Km value obtained with in vitro enzyme assay. Protein film voltammetry was found to be a useful method for kinetic characterization of NirB nitrite reductase.

\*Sorumlu yazar e-mail: [ebru.derelli@gmail.com](mailto:ebru.derelli@gmail.com)

## Özet

Biberde tuza toleransın artırılmasına yönelik olarak nano silisyum (Nano-Si) uygulamalarının etkinliğinin araştırıldığı çalışmada, materyal olarak Şölen biber çeşidi kullanılmıştır. Stres bitkileri için, 3 gerçek yapraklı aşamada 0 (kontrol), 50, 100 ve 150 mM olmak üzere 4 farklı tuz dozuna, Nano-Si uygulamalarında ise tuz stresi ile birlikte 0, 0,5, 1, 2 ve 3 mM dozlarına yer verilmiş, haftada bir kez olmak üzere yaprakdan spreyleme şeklinde uygulanmıştır. Stres sonunda hasat edilen bitkiler, yeşil aksam yaş ve kuru ağırlıkları, gövde boyu ve çapı, yaprak sayısı ve alanı, yaprak su oransal içeriği (YOSİ), yeşil aksam Na, Cl, K ve Ca içeriği, malondialdehit (MDA), toplam klorofil ve karotenoid içeriği bakımından incelenmiştir. Tuz stresi biber çeşitlerinde bitki büyüme parametreleri ile YOSİ, K ve Ca iyon konsantrasyonu, toplam klorofil ve karotenoid içeriğinde azalmaya neden olmuş; Na ve Cl iyon konsantrasyonu ile MDA içeriğinde ise artış meydana gelmiştir. Buna karşın, tuz stresi ile birlikte nano-Si uygulamalarında tuz stresine oranla değişen oranlarda bitki büyüme parametreleri, YOSİ, K, Ca, fotosentetik pigmentlerde iyileşme sağlanmıştır. Ayrıca Na ve Cl iyon alımı ortalama olarak %6-23 düzeyinde sınırlandırılırken; MDA içeriğindeki artış %83-285 düzeyinde engellenebilmiştir. Çalışma sonucunda, nano-Si uygulamalarının tuz stresi ile ortaya çıkan zararlanmayı değişen oranlarda iyileştirdiği ve toleransı artırmada etkili olduğu, uygulamalar arasında bu olumlu etki açısından 0.50 mM ve 1 mM nano-Si uygulamalarının ön plan çıktığı belirlenmiştir.

**Anahtar Kelimeler:** MDA, Silisyum, Sodyum klorür, *Solanaceae*, Tuz stresi

### Effect of Nano Silicon Application on Salt Tolerance of Pepper (*Capsicum annuum* L.)

## Abstract

In the study investigating the effectiveness of nano silicon (Nano-Si) applications to increase salt tolerance in pepper, Şölen pepper variety was used as material. For stress plants, 4 different salt doses of 0 (control), 50, 100 and 150 mM were applied at the stage of 3 true leaves, and Nano-Si applications included 0, 0.5, 1, 2 and 3 mM doses along with salt stress and were applied once a week by foliar spraying. Plants harvested at the end of the stress were analyzed in terms of fresh and dry weights, stem length and diameter, number and area of leaves, leaf water content (LWRC), Na, Cl, K and Ca ions content, malondialdehyde (MDA), total chlorophyll and carotenoid contents. Salt stress caused a decrease in plant growth parameters, RWC, K and Ca ion concentration, total chlorophyll and carotenoid content, and an increase in Na and Cl ion concentration and MDA content in plant. On the other hand, plant growth parameters, RWC, K, Ca, photosynthetic pigments were improved in nano-Si treatments with salt stress at varying rates compared to salt stress. In addition, Na and Cl ion uptake was limited by 6-23% on average, while the increase in MDA content was prevented by 83-285%. As a result of the study, it was determined that nano-Si applications improved the damage caused by salt stress at varying rates and were effective in increasing tolerance, and 0.50 mM and 1.00 mM nano-Si applications were prominent among the treatments in terms of this positive effect.

## GİRİŞ

Artan dünya nüfusu ve buna bağlı olarak artan gıda ihtiyacı, tarımsal üretimde verimliliğin ön plana çıkmasına, mevcut üretim alanlarından en yüksek verimin alınmasına yönelik çalışmaların hız kazanmasına neden olmuştur. Özellikle abiyotik stres faktörleri, küresel gıda güvenliği, gıda kalitesi ve bitki verimliliği üzerinde sınırlayıcı etkilere sahiptir. Dünyadaki sulanabilir tarım arazilerinin yaklaşık %20'si toprak tuzluluğundan olumsuz etkilenmektedir. Bu sorun aşırı gübre kullanımı, uygun olmayan sulama sularının kullanımı, doğal çevre koşulları ve küresel iklim değişikliği ile birlikte artış göstermiştir (Zhao ve ark., 2021). Tuz stresi, çimlenme, büyüme ve gelişme, çiçeklenme ve meyve tutumunu engelleyerek bitkileri olumsuz etkilemektedir. Tuzlu topraktaki yüksek sodyum konsantrasyonları, bitkide su alımını ve besinlerin emilimini sınırlar. Su eksikliği ve beslenme dengesizliği, ozmotik stres ve iyonik stres dahil olmak üzere birincil stresleri ön plana çıkartmaktadır. Bu birincil stresler oksidatif stresle sonuçlanmakta, ikincil bir strese de neden olabilmektedir. Tuz stresi ile birlikte çeşitli fizyolojik ve moleküler değişiklikler meydana gelmekte ve fotosentez sınırlanarak bitki büyüme ve gelişmesinde sorunlar ortaya çıkmaktadır (Gong, 2021).

Silisyum (Si), oksijenden sonra yer kabuğunda (%28) en çok bulunan ikinci toprakta ise (%54) en bol bulunan elementtir. Stres altındaki bitkilerde önemli rollerinden dolayı Si, faydalı veya yarı gerekli bir element olarak bilinmesine karşın gereklilik kriterlerini karşılamadığı ve bitki metabolizmasında yer aldığına dair yeterli kanıt olmadığı için gerekli olmayan bir besin maddesi olarak sınıflandırılmıştır. Si, temel bir besin maddesi olarak geniş çapta tanınmamakla birlikte, genellikle bitki büyümesi, fizyolojik/metabolik yollar, hücre yapısı ve çok çeşitli abiyotik ya da biyotik çevresel streslerin hafifletilmesi için yararlı olan "değerli bir element" veya "yapısal element" olarak kabul edilir. Birçok çalışma farklı bitki türlerinde tuzluluk, ağır metal stresi, kuraklık gibi abiyotik stres koşullarında bitki büyüme ve gelişmesi ile verimi artırmadaki rolünü doğrulamıştır (El-Ramady ve ark., 2022).

Biyoteknoloji ve tarım sektöründe önemli bir yere sahip olan nanoteknoloji, gıda işleme endüstrileri, patojen tespiti ve teşhisi, gıda mühendisliği, ambalaj malzemeleri ve ekipmanları gibi farklı alanlarda yer almaktadır. Nanopartiküller boyutları 1-100 nm arasında değişen küçük moleküllü parçacıklar olup genellikle nano ölçekli parçacıklar (NSP'ler) olarak adlandırılmaktadır. Nanopartiküller, bitki büyüme ve gelişme destekleyicileri, herbisitler, nano-pestisit, nanogübreler gibi tarım sektöründe geniş kullanım alanına sahiptir. Nanogübrelerin az miktarda kullanımı, gübre tasarrufu sağlanmasına katkıda bulunmakta ayrıca toprakta kimyasal gübre ve pestisitlerin birikmesi nedeniyle oluşan artan toprak toksisitesini azaltmaya yardımcı olmaktadır. Bunun yanı sıra abiyotik veya biyotik stres koşullarında fizyolojik ve biyokimyasal düzeyde farklı mekanizmaları uyararak stres koşullarına toleransın sağlanmasında etkili olmaktadır (Saxena ve ark., 2016). Silisyum nanopartiküller geniş alanda etkili bir şekilde yayılım gösterebilmekte olup 7.0 nm çapa sahip 1.0 gram silika nanoparçacıklarının 400 m<sup>2</sup>'ye eşit geniş bir absorpsiyon yüzeyi gösterdiği tahmin edilmektedir. Ayrıca, Si nanopartiküller turgor basıncını artırarak yaprak nisbi su içeriği ve su kullanım etkinliğini olumlu etkilemektedir. Si partikülleri aynı zamanda antioksidan enzim aktivitelerinde artış sağlaması, iyon regülasyonunda etkili olması gibi özellikleri sayesinde tuzluluk, kuraklık, ağır metal toksisitesi gibi abiyotik stres koşullarına toleransın artırılmasında etkili olmaktadır (Liang ve ark., 2007; Saxena ve ark., 2016).

Dünyada ve ülkemizde önemli bir potansiyele sahip olan biber, geniş alanlarda yetiştirilmekte, taze- sofralık ve sanayilik olarak değerlendirilebilen önemli bir sebze grubunu oluşturmaktadır. Dünya biber üretimi 2021 yılında 2 milyon ha alanda 36.286.643 ton olup, Türkiye biber üretiminde Çin ve Meksika'dan sonra 802.617 da alanda 3.091.295 tonluk üretimle üçüncü sırada yer almaktadır (Anonim, 2022). Küresel iklim değişikliğinin en önemli sonuçlarından biri olan tuzluluk sonucu birçok tarımsal üründe verim ve verim parametrelerindeki olumsuzluklar karşısında farklı uygulamaların ele alınarak, tarımsal sürdürülebilirliğin sağlanması oldukça önemlidir. Bu doğrultuda nano-Si uygulamalarının bitki üzerindeki pozitif etkileri değerlendirildiğinde, biberde tuz stresi karşısında bitki büyüme ve gelişme üzerinde nano-Si etkilerinin belirlenmesi bu çalışmanın en önemli çıkış noktasını oluşturmaktadır.

## MATERYAL VE METOT

Çalışmada materyal olarak Şölen biber çeşidi kullanılmış, tohumlar 2:1 oranında karıştırılmış torf:perlit karışımı içeren viyollere ekilmiştir. Tohum ekiminden 55 gün sonra fideler 12 litre hacmindeki plastik saksılara (torf:perlit) her saksıda üç adet bitki olacak şekilde şaşırtılmıştır. Bitkiler saksılara şaşırtıldıktan 18 gün sonra tuz stresi uygulamalarına başlanmıştır. Bu amaçla çalışmada 4 farklı NaCl dozuna (0, 50, 100 ve 150 mM NaCl) yer verilmiştir. Nano-Si uygulaması için; 0, 0.5, 1, 2 ve 3 mM dozları kullanılmıştır. On altı gün stres uygulamalarına maruz bırakılan bitkiler hasat edilerek yeşil aksam yaş ve kuru ağırlıkları, gövde boyu ve çapı, yaprak sayısı ve alanı, yaprak oransal su içeriği, lipid peroksidasyon içeriği (MDA), toplam klorofil, yeşil

aksam sodyum (Na), klor (Cl), potasyum (K) ve kalsiyum (Ca) içerikleri bakımından değerlendirilmiştir. Çalışmada, yaprak oransal su içeriği (YOSİ) Türkan ve ark. (2005), MDA içeriği Lutts ve ark. (1996) ve toplam klorofil Kusvuran ve ark. (2021) tarafından belirtilen yöntemler izlenerek gerçekleştirilmiştir. İyon içeriklerinin belirlenmesinde Dasgan ve Koc (2009) tarafından belirtilen yöntem izlenmiştir. Bitki yeşil aksam klor konsantrasyonunun belirlenmesi Nielsen (2017)'e göre ve Mohr metodu ile yapılmıştır. Çalışma tesadüf parselleri deneme desenine göre 3 tekrarlamalı her tekrarda 3 bitki olacak biçimde yürütülmüştür. Verilerin istatistiksel analizinde JMP (versiyon 8.0) programı kullanılmıştır. Ortalamaları arasındaki farklılıklar LSD testine ( $p \leq 0.05$ ) göre gruplandırılmıştır.

## BULGULAR

Nano-Si uygulamalarının tuza toleransın sağlanması yönündeki etkinliğinin incelendiği çalışmada, farklı tuz konstrasyonları ile oluşturulan tuz stresi koşullarında yaş ve kuru ağırlık, gövde boyu ve gövde çapı, yaprak sayısı ve yaprak alanı değerlerinde değişen oranlarda azalmaya neden olmuştur. Yaş ağırlık değerleri stres koşullarında %52-73, kuru ağırlık değerlerinde %28-65, gövde boyu ve çapında %16-59, yaprak sayısı ve yaprak alanı bakımından %19-83 oranında azalma göstermiş, bu değişim 150 mM NaCl uygulamasında ön plana çıkmıştır. Nano-Si uygulamaları ile genel olarak stresin olumsuz etkisi sınırlandırılmış ortalama olarak %17-39 oranında iyileşme sağlanmıştır. Nano-Si uygulamaları kendi içerisinde değerlendirildiğinde, en yüksek iyileşmenin sağlandığı dozlar 0,5 ve 1 mM dozları olmuştur (%17-116 artış) (Şekil 1).

Şekil 1. Nano-Si uygulamalarının tuz stresi koşullarında morfolojik parametreler üzerindeki etkisi

Yaprak oransal su içeriği (YOSİ), tuz stresine bağlı olarak kontrol bitkilerine oranla azalma göstermiştir. YOSİ %7-43 oranında azalmış, bu değişim 150 mM NaCl uygulamasında belirginleşmiştir. Nano-Si uygulamaları ile birlikte YOSİ değerlerindeki azalma sınırlandırılmış ve uygulama yapılmayan bitkilere oranla ortalama olarak %17 oranında iyileşme sağlanmıştır. Elde edilen bulgular çerçevesinde, en etkin nano-Si dozu 0.5 ve 1

mM konsantrasyonları olurken, bu uygulamalarda %18-37 oranında yaprak oransal su içeriği korunmuştur (Şekil 2).

Şekil 2. Nano-Si uygulamalarının tuz stresi koşullarında yaprak oransal su içeriği (YOSİ) üzerindeki etkisi

Yeşil aksam Na, Cl, K ve Ca iyon içeriklerinin de incelendiği çalışmada; Na ve Cl iyon içeriği tuz konsantrasyonundaki artışa bağlı olarak artış göstermiş, bu artış özellikle 150 mM NaCl uygulamasında en yüksek düzeye ulaşmıştır. Kontrol bitkilerine oranla 150 mM NaCl uygulamasında %1603 oranında Na ve %1133 oranında Cl iyon konsantrasyonunda artış tespit edilmiştir. Nano-Si uygulamaları ile birlikte Na iyon içeriğinde ortalama olarak %14 ve Cl iyon içeriğinde %16 oranında azalma meydana gelmiş ve toksik Na ve Cl iyon alımı sınırlandırılmıştır. Bu sınırlama 0,5 ve 1 mM nano-Si uygulamasında %17-24 düzeylerinde gerçekleşmiştir. K ve Ca iyon alımı tuz stresine bağlı olarak azalma göstermiş, bu azalma 150 mM NaCl uygulamasında %51 (K) ve %56 (Ca) oranlarında tespit edilmiştir. Nano-Si uygulaması ile birlikte K ve Ca iyon içerikleri korunmuş dolayısıyla %4-73 oranlarında iyileşme sağlanmıştır (Şekil 3).

Şekil 3. Nano-Si uygulamalarının tuz stresi koşullarında Na, Cl, K ve Ca içeriği üzerindeki etkisi

En yüksek fotosentetik pigment içerikleri kontrol bitkilerinin nano-Si uygulamalarında belirlenmiş, toplam klorofil ve karotenoid içeriği tuz stresi ile birlikte azalma göstermiştir (Şekil 4). Bu değişim toplam klorofilde %5-56, karotenoid içeriğinde ise %6-51 oranında tespit edilmiştir. Nano-Si uygulamaları tuzun tüm düzeylerinde iyileştirici bir özellik göstermiş, ve toplam klorofil ve karotenoid içeriğinde ortalama olarak %7-61 oranında tuz stresinin olumsuz etkisi sınırlandırılmıştır.

Şekil 4. Nano-Si uygulamalarının tuz stresi koşullarında toplam klorofil ve karotenoid içeriği üzerindeki etkisi

Malondialdehid (MDA) içeriği stres koşullarında artmış (%138-328), en yüksek MDA içeriği 150 mM NaCl uygulamasında 20,68  $\mu\text{mol g}^{-1}\text{T.A.}$  (%328 artış) belirlenmiştir. Nano-Si uygulamalarında ise değişim %83-269 düzeyinde olup, ortalama olarak %16 düzeyinde MDA içeriğindeki artış sınırlandırılmıştır. Nano-Si uygulamaları içerisinde 0,5 ve 1 mM nano-Si uygulamalarında %14-28 oranında iyileşme sağlanmıştır (Şekil 5).

Şekil 5. Nano-Si uygulamalarının tuz stresi koşullarında MDA içeriği üzerindeki etkisi

## TARTIŞMA

Artan dünya nüfusunun beslenme ihtiyaçlarının karşılanma gerekliliği, bitkisel üretim ve verimliliğin artırılmasına yönelik ilgiyi de artırmıştır. Bu nedenle, bitkisel üretimde verim ve kalitenin nasıl iyileştirileceği acil bir küresel tarım sorunu haline gelmiştir. Tuz stresi, dünya çapında tarımı tehdit eden önemli bir çevresel sorundur. Dünyadaki sulu tarım alanlarının yaklaşık %20'si toprak tuzlanmasından olumsuz etkilenmektedir. Doğal çevrenin bozulması, kötü sulama uygulamaları, gübreleme ve iklim değişiklikleri gibi faktörler sorunun giderek artmasına neden olmaktadır. Bu doğrultuda, verimin etkili bir şekilde iyileştirilmesine yönelik uygulamalar büyük önem taşımaktadır (Zhao ve ark., 2021). Tuzluluk, bitkilerde morfolojik ve biyokimyasal fonksiyonlar üzerinde olumsuz bir etkiye neden olmaktadır. Tohum çimlenmesini, bitki büyümesini, gelişmesini ve verimi olumsuz etkilemektedir (Zhang ve Dai 2019). Klorofil ve karotenoidlerin içeriğini azaltmakta, kloroplast yapısını ve PSII sistemini bozarak fotosentetik sistemlerin etkinliği sınırlandırılmaktadır (Pan ve ark., 2020). Toprak tuzluluğu, toprak su potansiyelini ve yaprak su potansiyelini azalmasına; bitki su ilişkisinde dengesizlikler ve sonuçta ozmotik strese yol açmaktadır (Navada ve ark., 2020). Tuzluluk sodyum ve klor iyon içeriklerindeki artış ile ozmotik stresin meydana gelmesine sebep olmaktadır. Tarımsal üretimde önemli bir yere sahip olan nano-Si partikülleri nano-herbisitler, nano-gübreler ve nano-pestisitler olarak kullanımları yoluyla çeşitli abiyotik stresleri hafifletmede etkinlik gösterebilmektedirler (Rastogi ve ark., 2019). Silisyum, bitkilerde fizyolojik fonksiyonları uyarmanın yanı sıra bitkinin stres koşullarında hayatta kalma potansiyelini geliştirmede önemli bir yer tutmaktadır. Bu doğrultuda silisyum, bitkinin abiyotik stres

toleransını artırmakta, fotosentetik aktiviteyi iyileştirilmesinde, iyon regülasyonunun sağlanmasında ve elementlerin toksisite etkisinin azaltılmasında rol oynamaktadır (Merwad ve ark., 2018).

Farklı nano-Si dozlarının (0.5, 1, 2 ve 3 mM nano-Si) tuza toleransın sağlanması açısından etkilerinin incelendiği bu çalışmada, 2 farklı biber çeşidi, farklı düzeylerde (0, 50, 100 ve 150 mM NaCl) oluşturulan tuz stresine maruz bırakılmıştır. Tuz stresi bitki büyüme parametrelerinde azalmaya neden olmuş, bu azalma çeşitler ve tuz konsantrasyonlarına bağlı olarak farklılıklar göstermiştir. Özellikle 150 mM NaCl uygulamasında tuz stresi etkisi en belirgin biçimde görülmüştür. Buna göre kontrol bitkilerine oranla ortaya çıkan azalma büyüme parametreleri bakımından %15-83 düzeyinde gerçekleşmiştir. Bitkilerde büyüme ve gelişmeyi olumsuz etkileyen en önemli faktörlerin başında tuz stresi gelmektedir. Özellikle stres koşullarında ortaya çıkan ozmotik etki, iyon toksisitesi, fotosentez etkinliğinin azalması ve beslenme yetersizliği nedeniyle ortaya çıkan fizyolojik bozukluklardan kaynaklanmaktadır (Almodares ve ark., 2008). Biberde farklı NaCl dozlarının bitki büyüme ve gelişmesine etkisini inceleyen Kaouther ve ark. (2013), bitki yaş ve kuru ağırlıkları ile morfolojik parametreler ve yaprak oransal su içeriği gibi fizyolojik parametreler bakımından azalma meydana geldiğini ifade etmişlerdir. Benzer sonuçlar Afzal ve ark. (2014) tarafından gerçekleştirilen çalışmada da vurgulanmış, araştırmacılar tuz konsantrasyonundaki artışa bağlı olarak biber genotiplerin değişen oranlarda zararlanma ile karşı karşıya kaldıklarını ifade etmişlerdir. Nano-Si uygulamaları tuz stresinin ortaya koyduğu olumsuzluk ve zararlanmaları önemli düzeyde sınırlandırdığı, bu sınırlandırmanın uygulama dozuna göre değişim gösterdiği belirlenmiştir. Genel olarak bitki büyüme parametreleri bakımından nano-Si uygulamalarının %17-39 düzeyinde iyileşme sağladığı görülmüştür. Silisyumun bitki su dengesini sağlanması, bitki savunma sistemlerinin aktivasyonu, iyon regülasyonun sağlanması üzerindeki iyileştirici etkilerine bağlı olarak tuzluluğun bitkiler üzerindeki olumsuz etkilerini azalttığını, vurgulayan Haghghi ve Pessarakli (2013) domateste yaş ve kuru ağırlıklar, kök hacmi, yaprak su içeriği, fotosentetik oran, mezofil iletkenliğini ve bitki su kullanım verimliliği ve klorofil konsantrasyonu nano-Si uygulamasıyla artış göstermiştir.

Yüksek miktarda tuz konsantrasyonu bulunması, toprak ozmotik basıncının artmasına neden olarak, bitkinin su alım gücünü düşürmekte, hatta tamamen durdurmaktadır. Özellikle Na ve Cl iyonları ile ortaya çıkan iyon toksisitesi ise su taşınımında etkili olan hücrelerde zararlanmalara yol açmakta böylece bitki su ilişkisinde bozulmalara neden olmaktadır. Gerçekleştirilen bu çalışmada tuz uygulamalara NaCl oranına bağlı olarak YOSİ değerlerinde azalmalara neden olmuştur. Bu değişim 150 mM NaCl uygulamasında ön plana çıkmış ve ortalama olarak kontrol bitkilerine oranla %31 düzeyinde azalma meydana gelmiştir. Nano-Si uygulamaları stres koşullarında azalan yaprak oransal su içeriğini iyileştirmede (%3-37 artış) oldukça etkili olmuştur. Uygulamalar içerisinde 0.50 ve 1.00 mM nano-Si uygulamalarında bu etki ön plana çıkmıştır. Silisyum stres koşullarında transprasyon oranını düşürerek bitki bünyesindeki nemin korunmasında önemli bir rol oynamaktadır (Haghghi and Pessarakli 2013). Kalteh ve ark. (2014) silisyumun bir tabaka oluşturarak hücre duvarının dayanıklılığını arttırdığını, 7 nm çapındaki bir gram silisyum nanopartikülün 400 m<sup>2</sup>'ye eşit bir soğurma yüzeyine sahip olduğunu, bu nedenle, Si nanoparçacıkları, ksilem nemini ve su translokasyonunu etkileyerek su kullanım etkinliğini artırdığı ifade etmiştir.

Kök bölgesinde tuz birikimi, ozmotik stresin yanı sıra K ve Ca gibi temel element ve minerallerin alımını kısıtlamakla beraber, Na ve Cl alımını indükleyerek hücre iyonu homeostazını (dengeleşimini) olumsuz etkilemektedir. Biberde gerçekleştirilen farklı çalışmalarda NaCl uygulamaları ile oluşturulan tuz stresi koşullarında bitki bünyesinde Na ve Cl iyon içeriklerinde artış meydana geldiği ifade edilmiştir. Stres karşısında büyümede azalmanın nedeni, stomaların kapanması ile yapraklarda toksik Na ve Cl birikimine bağlı olarak fotoasimilat üretiminin miktarının sınırlanmasıdır. Nano-Si, tuz stresi koşullarında terlemeyi kontrol altında tutarak, su kaybını önlemekte böylece bitki bünyesine Na ve Cl iyon girişi sınırlanmaktadır (Haghghi ve Pessarakli, 2013). Biberde gerçekleştirilen bu çalışmada, Nano-Si uygulamaları Na ve Cl iyon alımını %6-23 ve %5-23 oranında sınırlandırırken; K içeriğinde %4-21 ve Ca içeriğinde %9-73 oranında iyileşme sağlamıştır. Soyada gerçekleştirilen bir çalışmada, tuz stresi ile birlikte Na iyon içeriğinde artış meydana geldiğini, nano-Si uygulamasının K alımını teşvik ederken Na iyon alımının ise sınırlandığını ifade etmişlerdir (Farhangi-Abriz ve Torabian, 2018). Alsaeedi ve ark. (2019) hıyarda, nano-Si uygulamalarının tuz stresi koşullarında toksik Na alımını %38-77 oranında azalttığını, K içeriği korunarak K/Na oranı %127-735 oranında artış gösterdiğini bildirmişlerdir.

Stres sonucu oluşan serbest radikaller, membran lipid ve proteinlerin geri dönüşümsüz şekilde hasara uğramasından sorumludur. Lipid peroksidasyonun son ürünü, malondialdehid (MDA), eten ve pantendir. Oluşan MDA, hücre membranlarından iyon alışverişine etki ederek membrandaki bileşiklerin çapraz bağlanmasına yol açar ve iyon geçirgenliğinin ve enzim aktivitesinin değişimi gibi olumsuz sonuçlara neden olur. Lipid peroksidasyonu; membran bütünlüğünün yok olmasına, hücrenin elektrolitlere permeabilitesinin

artmasına neden olur (Gözen ve Kuşvuran, 2021). Kavun, biber, domates, patlıcan ve brokoli gibi farklı bitki türlerinde gerçekleştirilen çalışmalarda tuz stresi koşullarında bitkilerde MDA içeriğinin arttığını göstermiştir. Nano-Si uygulamaları MDA içeriğindeki artışı %83-285 oranında engellemiştir. Farhangi-Abriz ve Torabian (2018) soyada ve Ismail ve ark. (2022) bezelyede gerçekleştirmiş oldukları çalışmalarında nano-Si uygulamaları ile MDA içeriğinde azalma meydana geldiğini ifade etmişlerdir.

Tuz stresi, kloroplastın parçalanmasına, pigment protein komplekslerinin kararsızlığına, klorofillerin yok olmasına ve karotenoidlerin miktar ve bileşiminde değişikliklere neden olmaktadır (Bayram ve ark., 2021). Nano-Si uygulamaları biberde toplam klorofil ve karotenoid içeriğinde kontrol bitkilerine oranla %5-56 düzeyinde azalmaya neden olmuştur. Nano-Si uygulamaları meydana gelen azalmayı belirli oranda sınırlanmış fotosentetik pigmentlerde %9-87 iyileşme sağlanmıştır. Bu çalışmada, nano-Si uygulaması, tuzlu koşullar altında biberde daha yüksek fotosenteik pigment içeriğinin ortaya çıkmasına imkan sağlamış, NaCl'nin biberde klorofil içeriği üzerindeki olumsuz etkilerinin hafifletilmesine yardımcı olmuştur. . Önceki çalışmalar tuz stresinin börülce, fasulye, bakla ve soyada tuz stresinin bitki büyümesinde önemli azalmalara neden olduğunu, ancak Si uygulamalarının toplam fotosentetik pigment içeriği, fotosentetik hız, klorofil içeriği, stoma iletkenliği, terleme ve hücreler arası karbondioksit konsantrasyonu artırarak bitkilerin büyüme ve gelişmesini büyük ölçüde iyileştirdiğini göstermiştir (Avestan ve ark., 2019). Haghghi ve Pessarakli (2013) domateste, Avestan ve ark. (2019) çilekte gerçekleştirmiş oldukları çalışmalarında nano-Si uygulamalarının tuz stresi koşullarında klorofil içeriğinde meydana gelen kayıpları önemli ölçüde sınırladığını vurgulamışlardır.

## SONUÇ

Tuz stresi bitkisel üretimi ve verimliliği etkileyen temel abiyotik stres faktörlerinin başında gelmektedir. NaCl ve nano-Si ile muamele edilen biber fideleri, büyüme ve fizyolojik özelliklerde önemli değişiklikler göstermiştir. Bu çalışmada fideler tuz stresine maruz bırakıldığında, bitki büyüme ve gelişmesinde, fotosentetik pigment içeriği, YOSİ, K ve Ca içeriğinde azalma meydana gelirken MDA, Na ve Cl içeriğinde ise artış meydana gelmiştir. Bununla birlikte, nano-Si, hücrel oksidatif hasarı hafifleterek tuzluluğun olumsuz etkilerini önemli ölçüde azaltmıştır, bu değişim dozlara bağlı olarak değişim göstermiştir. Dozlar bakımından 0.5 ve 1 mM konsantrasyonları daha etkin bulunmuştur. Büyüme parametrelerinde, fotosentetik pigmentlerde, K ve Ca iyon içeriğindeki iyileştirmeler, nano-Si uygulamaları sonrası bitkilerin tuzluluğa karşı toleransının artırılmasında etkili bulunmuştur.

## TEŞEKKÜR

Bu çalışma Çankırı Karatekin Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından KYO210621L09 numaralı proje ile desteklenmiştir.

#### Abstract

In biomedical diagnostics, electrochemical cells are important tools. This study explains the application of electrochemical cells in biomedical diagnosis, focusing on the modulation of impedance information at different frequencies as a function of cell fluid content. The relationship between the sample's composition and the chamber's reaction dynamics with impedance at distinct frequencies is examined. Also, a novel, practical and low-cost chamber design is presented.

To explain the underlying principles governing the electrochemical cell's behavior, an electrical equivalent circuit model for the chamber is proposed. The chamber's ionic fluid content for different concentrations is monitored through impedance spectroscopy. This study showed that electrochemical impedance spectroscopy can be used as economic and efficient tool for biomedical diagnostics with implications for a wide range of applications in the field of healthcare and life sciences.

**Keywords:** Impedance spectroscopy, microfluidics, biosensor, diagnosis, electrochemical chamber

#### INTRODUCTION

##### Electrochemical Cell

A basic Electrochemical impedance measurement setup consist of chamber with two electrodes in an electrolyte solution. The impedance for different alternating current (AC) signal with a constant frequency is dependent on several factor due to the solution dynamics and reactions. These factors include ion migration, the presence of free electrons in the solution, and the system's capacitive response. Electrical impedance spectroscopy is the impedance value for various frequencies. (Lasia, 2014) The resistivity of the bulk solution, permittivity of the solution, geometric electrode placement, electrode-solution interface, electrochemical processes occurring on the electrode and electrolyses have an effect on the impedance value in the two electrode systems. (Grimnes et al., 2005)

The data obtained from the EIS system is usually an impedance data for a specific frequency. An electrical equivalent model of an electrochemical system allows for more thorough data analysis, which may provide information about the structure of the materials in the electrochemical cell and the reactions formed in it.

##### Electrical Equivalent Model of a Cell

The design of the system, such as geometric placement of the electrodes and resistivity and permittivity features of the solution, makes bulk resistance and the capacitance of the model simply definable.

There is a relationship between resistivity and the quantity and mobility of the unbound electrons in a substance. Additionally, based on an electrical field applied to the substance, there is a relationship between permittivity and polarization. If the elements in the solution are changed, the resistivity and permittivity of the solution vary.

Different types of geometric configurations of two electrode systems exist, which are forward looking electrodes, co-planar electrodes and interdigitated electrodes. To reveal particular characteristics of electrical information, alternative electrode configurations may be utilized.

According to the description of the electrical equivalent circuit model, the experimental data and the equivalent circuit data must fit. The constituent parts of the electrical equivalent circuit model of the electrochemical cell should be evaluated based on an analysis and comprehension of the physical and chemical characteristics of the electrochemical system. (Krause, 2007)

In the electrical field, ion migration based on electrode charges leads to a double layer of charge on the electrode's surface, separated by a thick dielectric. This structure is called double layer capacitance ( $C_{DL}$ ), which depends on frequency, and it is influenced by factors such as electrode potential, temperature, ion types, ionic concentrations, impurity adsorption, oxide layers, electrode roughness, electrode potential, and so on. (Luo, 2013 and Genry, 2017)

When surfaces are inhomogeneous, rough, or porous, which leads to observing frequency-dependent behaviour, since ideal capacitor model is suitable, constant phase element (CPE) is employed to model the actual double layer capacitance.  $\alpha$  means phase coefficient, which represents the behaviour of CPE. (Hong et al., 2005 and Córdoba et al, 2015)

The ratio of the applied voltage to the current resulting from the charge transfer is defined as the charge transfer resistance ( $R_{CT}$ ). The resulting current is influenced by the transferred ion concentration, potential formed during electrochemical reactions and reaction products. (Lvovich, 2012)

The impedance occurring because of the ion migration and diffusion in the diffusion layer stands for Warburg impedance ( $Z_W$ ). It is strongly influenced by the frequency of the applied voltage. Higher frequencies result in lower  $Z_W$  because of faster ion migration or vice versa for lower frequencies. (Lvovich, 2012)

**Figure 1.** Randles electrical equivalent circuit model for an electrode.  $R_{CT}$  is the charge transfer resistor,  $Z_W$  is Warburg impedance,  $C_{DL}$  is the double layer capacitance, and  $R_{sol}$  is bulk resistance.  $R_{CT}$  and  $C_{DL}$  are related to the electrode-electrolyte interface and the reactions in that area that include the linear, semi-infinite diffusion of electroactive particles between electrode and electrolyte.

The resistance of the bulk solution can be easily clarified for higher frequencies in Bode plots of Randles electrical equivalent circuit model. In Nyquist plot, the imaginary versus real components of the impedance value graph can be plotted for the Randles equivalent circuit model, and the resulting graph includes information about both phase and magnitude. Nyquist and Bode plots provide the best visualization and description of the Randles model. (Randviir and Banks, 2013)

Lower frequencies have a linkage with the diffusion limited process, and high frequencies have a linkage with the electron transfer limited process. At high frequencies,  $R_{sol}$  value is obtained. Warburg impedance increases its visibility only at lower frequencies. On inhomogeneous, rough, or porous surfaces, CPE replaces  $C_{DL}$ . (Ahmed et al., 2014)

**Figure 2.** Randles electrical equivalent circuit model for full electrochemical system with two identical electrodes.  $R_{sys}$  is ohmic resistance of electrical wiring and  $C_{sol}$  is bulk capacitance.

In Figure 2  $C_{sol}$  is significant. The impedance is determined predominantly by a co-planar electrode system's capacitance, which relies on material, geometry, and permittivity of solution. The capacitance value has a big effect on system's impedance, regardless of whether the capacitance value is high or low.

### Impedance Spectroscopy

Electrochemical biosensors behave as a detector that can include EIS, and they have three different types according to their sensing method: impedimetric, amperometric, and potentiometric. Besides all these techniques that may contain EIS, impedimetric one mainly uses it. (Ahmed et al, 2014)

Biosensors based on EIS, which can be easily downsized, rapid, sensitive, and affordable, can be used in studies to determine the structural features of the solution/material that influence the permittivity and conductivity, or electrochemical reactions such as enzyme-catalysed reactions or specific binding reactions of some species on the surface of modified electrodes or in the solution. (Bahadır and Sezgintürk, 2016)

Pathogen and cell detection are also possible. Studies by Cheng et al. (2007), Shafiee et al. (2013), Toner et al. (2010), and Demirci et al. (2014) regarding impedance spectroscopy-based cell and virus detection and tracking with cell and virus lysate have been found in the literature.

## MATERIALS AND METHODS

### Chamber Design

Polymer-based microfluidic chips are well suited to move the impedance measurement processes forward. The design of the chips is made up of three layers; the bottom polymer layer with electrodes on it, the medium layer with double sided adhesive and a patterned channel, and the top polymer layer with inlet and outlet patterns.

#### Electrode Layer

The screen-printing technique is used to obtain the electrode layer and a silver paste mixture, which has highly conductive silver ink composition and is silicon adhesive, is applied on the flexible polymer surface. With a flexible hydrophobic polymer film from the protective cover film of double-sided adhesive (DSA), a mask pattern is formed. The pattern is created with the help of computer-aided design software, and a laser cutter is used. The mask is first positioned on a flexible hydrophilic polymer. On one side of the mask, the silver paste mixture is dropped. The mixture is spread on the mask by using a microscope glass slide as a squeegee. The open spaces are filled with the mixture.

After the screen-printing process, the mask is carefully taken away continued in baking at  $80^\circ$  for sixty minutes. The electrodes are ready at the end of the baking process. It is possible that at the end of the process, errors are unavoidable since the laser cutter cannot cut the polymer in its actual dimensions, and baking has also an effect on the size of the electrodes.

#### Channel layer

The channel layer, which is patterned on DSA and created by a CAD software, is to form a cavity for solution to be filled, and using constant volume of solution is crucial in impedance measurements.

#### Inlet layer

The inlet layer, which is designed in CAD software, is formed with the flexible hydrophilic polymer cut by the laser cutter. The chamber is assembled by removing the protective film from one side of DSA so that it is laminated.

In order to minimize errors, this process is repeated numerous times. There is no requirement to use complex and expensive devices during the process. The steps may be done in any environment.

### Experimental Setup

Probes of LCR meter, which is a device to measure the impedance, are attached to the electrodes of the chip, the sample solution is added into the channels, and magnitude and phase of impedance of the solution is recorded. The input AC potential is 1 peak-to-peak voltage ( $V_{pp}$ ) and AC frequency is between 100 Hz and 1 MHz. In this paper, the maximum difference value for impedance change is approximately 1 kHz, which means that the magnitude of impedance is 1 kHz.

### RESULTS

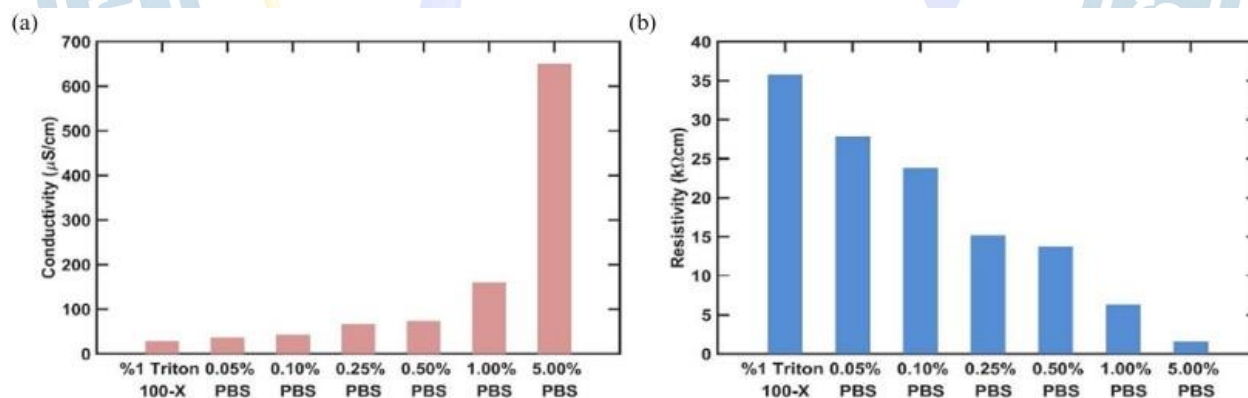

Even if the main purpose of this paper is to detect analytes, known conductance-valued solutions are measured firstly in order to obtain better knowledge about the system and impedance results. 1% Triton 100-X solution in DI pure water is used as control solution. Six test sample solutions, which are prepared at 0.05%, 0.1%, 0.25%, 0.50%, 1.0%, and 5.0% PBS in DI pure water, exposure to a conductivity test by using a conductivity meter.

Figure 3 (a) shows that different solutions with different concentrations have different conductivity levels. The determination of the resistivity for test samples and the control solution is done by impedance spectra measurements at a frequency range between 100 Hz and 1 MHz.

All the test samples and the control solutions are tested according to the procedure. For a solution 3 FFChips are used, and all the sample volumes are same with each other. The average of three impedance magnitude spectra measurements for a solution is calculated and this step is applied for all other solutions. According to the results, the Nyquist plot in Figure 4 is sketched.

### DISCUSSION

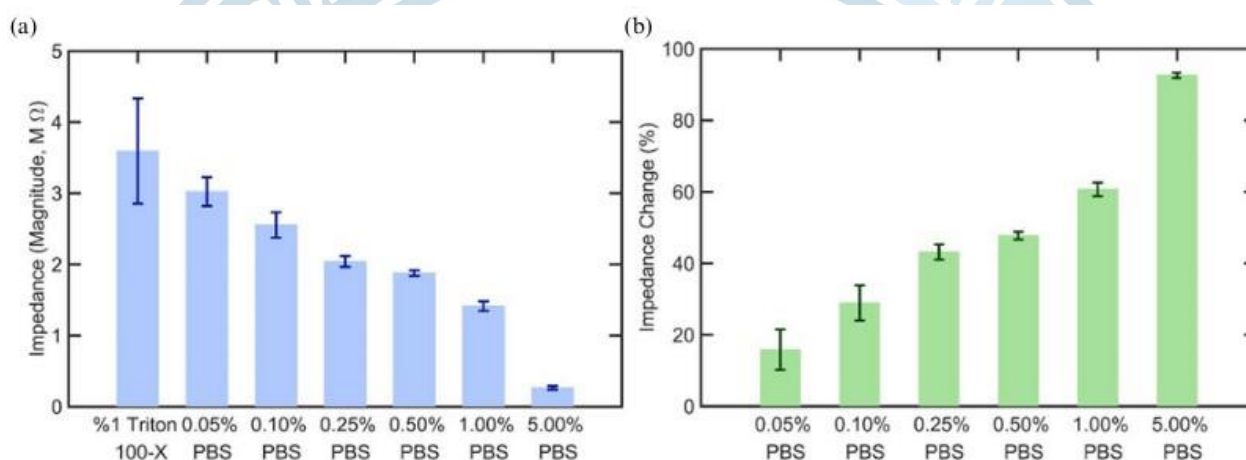

The definition of one of the electrical models of the FFChip was made, along with the background of the electrical impedance spectroscopy analysis system. DI and some concentrations of PBS solutions filled channel measurements were done. The results of these known-concentrated solutions demonstrated that the system is capable of detect even  $k\Omega$  of differences.

**Figure 3.** Test values a) Conductivity test values at various PBS concentrations b) Resistivity test values at various PBS concentrations.

**Figure 4.** Nyquist plot of impedance values of control solution and different PBS concentration-solutions for a frequency range between 100 Hz and 1 MHz.

**Figure 5.** a) Impedance magnitude values of all the solutions at 1 kHz. Error bars represent standard deviations (STD) of the mean of impedance magnitude. (n=3), b) The impedance magnitude changes of all the sample test solutions with respect to average control value at 1 kHz. Error bars represent standard deviations (STD) of the mean of impedance magnitude. (n=3)

## CONCLUSION

Lightweight, flexible, thin, affordable, easy to manufacture, disposable and mass-producible features make the flexible polymer film effective material for biosensors. With its portability, sensitivity, and rapid property, electrical impedance spectroscopy is efficacious in detection methodology.

## ACKNOWLEDGMENTS

We would like to thank The Scientific and Technical Research Council of Turkey (TUBITAK) for providing financial support.

#### Özet

Enerji darboğazı ve petrol sıkıntısı, araştırmacıları enerji kazancına katkı sağlayabilecek çalışmalara yöneltmiştir. Özellikle enerjinin büyük bölümünün kullanıldığı inşaat sektöründe enerjinin çok daha ekonomik kullanılması için çalışmalar artarak devam etmektedir. Binalarda daha az enerji kullanımı, daha az çevre kirlenimi emisyon yayılması ve daha düşük maliyet anlamına geldiği için bina kabuğunda doğru malzemelerin seçilmesiyle ekolojik, ekonomik ve enerji açısından oldukça önemli faydalar elde edilebilir.

Her yörenin jeolojik yapısında oluşmuş doğal taşları özellikle olduğu yörede kullanmak amacıyla geliştirilen bu çalışmada Şırnak iklim şartlarında Şırnak ilinde çıkarılan kayrak taşının bina kabuğunda duvar kaplama malzemesi olarak kullanılması durumunda enerji performansına etkileri ANSYS paket programı üzerinden dış duvarda sıcaklık dağılımı yönünden detaylandırılmıştır. Çalışmada farklı yapı malzemeleri ve taş yünü yalıtım malzemesi kullanılarak oluşturulan alternatif senaryolar karşılaştırılmıştır. Daha enerji performanslı malzeme ve daha az yakıt kullanılmasıyla çevresel etkilerin azaltılması amaçlanmıştır. Bu çalışma ile farklı yörelerdeki yapı ve yalıtıma destek sağlayabilecek doğal taşların; yapı, yalıtım veya duvar kaplama amaçlı kullanılarak yapılacak analizlerle enerji tasarrufuna destek olabilirliği hakkında karar vericilere, müteahhitlere ve mühendislere fikir verebilecek örnek bir çalışma hedeflenmiştir.

**Anahtar Kelimeler:** Doğal taş, kayrak taşı, ANSYS paket programı, bina kabuğu, sıcaklık dağılımı

#### Ability of natural stones to support building energy performance

#### Abstract

Energy bottleneck and oil shortage have led researchers to work that can contribute to energy gain. Efforts are increasingly continuing to use energy more economically, especially in the construction sector, where most of the energy is used. Since less energy use in buildings means less pollutant emissions and lower costs, significant ecological, economic and energy benefits can be achieved by choosing the right materials for the building envelope.

In this study, which was developed with the aim of using the natural stones formed in the geological structure of each region, especially in the region where it was formed, the effects of the slate stone extracted in Şırnak province, in Şırnak climate conditions, on the energy performance in case of use as a wall covering material in the building shell were detailed in terms of temperature distribution on the outer wall via the ANSYS package program. In the study, alternative scenarios created by using different building materials and rock wool insulation material were compared. With this study, natural stones that can support the structure and insulation in different regions; An exemplary study is aimed to give an idea to decision makers, contractors and engineers about its ability to support energy saving with analyzes to be made by using it for building, insulation or wall cladding purposes.

**Keywords:** Natural stone, slate, ANSYS package program, building envelope, temperature distribution

## GİRİŞ

Kayrak taşı diğer adlarıyla dam taşı, arduvaz, kayağan taşı, ince yapraklar şeklinde yarılabilen ya da ayrılabilen, killi ve ince taneli, mikalı, kuvarlı, kloritli, siyah, kül ve gök rengine rezervinden çıkarılan bir çeşit başkalaşım doğal taştır. Alçak sıcaklık ve basınçta oluşmaktadır. Çekme mukavemeti fazladır.

Başkalaşım işlemine uğramış ana özdek, genellikle tortul kayaç şeklindeki volkanik tozlar ve kumuda ihtiva edebilen ince parçacıklı bir çeşit kildir (shale-şeyl, çamurtaşı). Esas doğal taş, bazı durumlarda bazı bölümleri başkalaşıma uğramış olduğundan, yapısında mevcut tortul katmanlaşmayı ve ilk mineralleri belli alanlarında barındırabilir. Tortul şeklindeki kayalar bazı durumlarda, yarılmış yüzeylerde izlendiği gibi, birbirini takip eden şerit yapısında katman katman bir yapıya bürünebilir. Yarıma olayı, yeryüzeyinin derinliklerinde uzun süre gömülü kalan taşın üzerine yapılan baskıdan dolayı ortaya çıkar. Bu sebeple, rezerv oluşumu sırasında sıkışık şekilde kıvrılmışan daha yeni kısımlarda de yer yer gözükmekle beraber, kayrak taşı genellikle daha eski taşlar arasında yerleşir. Yarımanın yönü, başkalaşım olayı esnasında kayrak taşına etki eden gerilimin yönüne göre değişir. Orijinal Kayrak taşı, katmanlaşmanın yönü boyunca ayrılmaz, yönlenmeyi olabildiğince fazla açıyla kesen yarıma yönünde ayrılır. Kayrak taşı, az-dereceli yerel meta-morfizma ile volkanik kül veya kil tarafınan meydana çıkan orijinal bir şeyl taşı çeşidi olduğu için tortul taş şeklinde oluşan ince tanecikli, homojen, yapraklanmış meta-morfik taş yapısında iri tanecikli yapraklanan kısım, sadece meta-morfik sıkışmanın yönlenmesine dik olan düzlemlerde meydana gelir. Güçlü şekilde yapraklanma elde edilmişse "slaty bölünme" gerçekleşmiş olur. Ayrılmış tabakalar, pürüzlü veya düzgün yapıda olabilir (Çelik ve MY, 2003). Kayrak taşı geçirmiş oldukları meta-morfizma ile klivaj yapıda olurlarsa yapıları daha düzgün tabakalar şeklinde ayrışabilir. Kayrak taşı gözenekli bir yapıda bulunmaz. Aşınmalara ve atmosferik etkilere karşı oldukça dayanıklı olduğundan eğilme veya büzülme yapmaz (Çelik, ve ark., 2001). İşlenme sırasında yapraklanmış kısım yönünde vurmak suretiyle zemin karoları ve uzun çatı vb alanlar için kullanılabilir doğal taşın düz ve pürüzsüz levhalar elde edilecek şekilde biçimlendirilmesiyle yapı sektöründe kullanıma sunulur. Yuvarlak şekilde geniş yüzeyli yapıda da olabilir. Kayrak taşı çatılar için kaplama malzemesi olarak da yaygın şekilde kullanılmıştır. Çatı üzerinde kullanılan kayrak taşının birkaç yüzyıl boyumca bozulmadan kaldığı tarihi kayıtlarda bulunmuştur. Sadece kalsit ve pirit içerdiği durumlarda biraz daha çabuk bozulur ve ortaya çıkan H<sub>2</sub>SO<sub>4</sub> çatı montajında kullanılan çivilerin paslanmasına sebep olduğundan çatı kaplamada kullanılan malzemeyi boşa çıkarabilir (Devlet Planlama Teşkilatı, 2001).

Kayrak taşının homojen yapıda, oldukça sert, fazla ısıya dayanımlı ve su geçirmeyen bir yapısı vardır. Kayrak taşının ısı yalıtım kabiliyeti yüksektir (Taşlıgil, ve ark., 2016).. Bu nedenle duvar kaplama malzemesi veya yapı malzemesi olarak kullanıldığında bina yalıtımına katkıda bulunur. Kayrak taşı yardımıyla binanın ısı yalıtımı ile sağlanan avantajlar bu taşla yapılan uygulamaların sürdürülebilirliği desteklemesi bakımından önemli bir referanstır. Aynı şekilde kayrak taşı hemen hemen her çeşit iklim şartlarının olumsuz etkilerine oldukça fazla direnç gösterebildiği için ve bina kabuğunun dış tabakasının yıpranmasını azalttığı içinde sürdürülebilirliğe önemli katkı sağlamaktadır (<https://ardesiaslate.com.tr/bina-dis-cephe-kaplama>).

Kayrak taşından ayrıca yalıtım özellikli mineral yünü de elde edilebilir. Rezervinden çıkarıldığı şekliyle doğal olarak kullanılabilirdiği gibi kesilip parlatarak da kullanılabilir. Arduvaz taşının artık parçaları katkı ve dolgu malzemesi olarak bazı endüstriyel alanlarında kullanılabilir. Genleştirilen sleyt düşük ağırlıklı yapı malzemesi olarak kullanılabilir toz ve pul sleyt taşından hem plastik-lastik hem de asfalt agregası ayrıca ilaç sektöründe dolgu malzemesi üretiminde faydalanılır (Aytekin, 2007).

Kayrak taşında gözlenen renk genellikle gri renktir. Bununla birlikte, kayrak taşı sadece bir bölgeden bile farklı renklerde çıkarılabilir. Mesela, Dünyaya baktığımızda Kuzey Galler'de çıkarılan kayrak taşı genellikle soluk ama koyuca bir griliktir. Bununla birlikte içinde birçok farklı tonu barındırabildiğinden mavi, yeşil veya mor renklide çıkan bölümlerinde renk zenginliğini sağlayabilir. Yapısında organik madde fazla ise daha çok koyu gri veya gri renkte olabilir. Kayrak taşı, ince bir karbonat taş, ilksel taş tabaka ardalanması içeriyorsa mavimtrak bir gri renk alabilir. Günlenme maruziyeti varsa kahverengimsi, kızılımsı renklerin baskın olduğu bir renkte olabilir. Kayrağın bazen yüzey kısmında siyah renkli bulunan dentirik yapı taşta fosil görünüşü verir (Hudson, 1972).

Soykan andezit, mermer ve arduvaz taşları ile polimer beton üreterek ve yaptığı deneylerde arduvaz içerikli malzeme en yüksek basma mukavemetini en düşük aşınma kaybını veren malzeme olduğunu belirtmiştir (Soykan, ve ark., 2015).Yine Soykan ve ark. andezit ve arduvazın beton agregası olarak kullanıma uygunluğunu araştırmışlardır (Soykan, ve ark., 2015).. İnebolu'da tarihi yapıların çatı kaplama malzemeleri üzerine yaptığı çalışmada yalnızca kayrak taşının kullanıldığını belirtilmiştir (Halaç ve Dağlı 2022). Abay yine aynı bölgede çatı kaplama malzemesi olarak kayrak (yöresel adıyla marla) taşının kullanıldığını rapor etmiştir (Abay, 2019). Yılmaz ve arkadaşları tüf taşlarının, Balo ve ark Limra taşının duvar kaplama malzemesi olarak

kullanıldığında duvar enerji performansına etkilerini araştırmışlardır (Balo, ve Sua, 2018-Yılmaz ve ark., 2019).

Türkiye’de geniş bir yayılıma sahip olan Kayrak taşı önemli değerlendirilebilir nitelikte potansiyele sahiptir. Kayrak taşı Türkiye’de Eskişehir, İzmir, Denizli gibi şehirlerde ve en fazla İç Anadolu bölgesinde olmak üzere Akdeniz, Karadeniz ve Ege gibi farklı bölgelerde işlenmektedir. Kastamonu - Zonguldak arasında, Muğla, Bodrum ve Başkale-Hakkâri yolunda Türkiye’deki en çok rezerv alanı bulunmaktadır (Taşlıgil ve Şahin, 2016)

Kayrak taşı’nın üretimi Dünya’da birçok bölgede yapılmaktadır. Kanada, Hindistan, İngiltere, Amerika Birleşik Devletleri, Çin, Brezilya, Tayvan, kayrak üretimi yapan ülkelerin başında yer almaktadır. Dünya’nın en büyük rezervlerinden bir tanesi Rajasthan (Hindistan) bölgesindedir. Ayrıca İngiltere’de Galler, İtalya’da Lavanga, Almanya’da Bavyera’nın kuzeyi, Portekiz’de Valongo, Dünya’nın lider rezervlerine sahiptir. Amerika ve Avrupa ülkelerinde özellikle tarihi yapılarda çatı kaplama için eskiden beri kiremit yerine tercih edilmiştir. Türkiye’nin önemli firmalarından birinin yaptığı araştırmaya göre, her yıl Dünyada yaklaşık 30 milyon m<sup>2</sup>’lik çatı kaplama işleminin yapıldığı ve bunların. %5’i Amerika’da, %92’si Avrupa’da geri kalan kısmının ise başka bölgelerde yapıldığı belirtilmiştir. Kayrak taşı en fazla değerlendiren Avrupa ülkelerinin %43 oranla Fransa, %17 ile Almanya, %18 ile İspanya, %11 ile Büyük Britanya olduğu rapor edilmiştir. Avrupa’da 400 yıldır kullanılmakta olan Kayrak taşı günümüzde de çatı kaplama malzemesi olarak çatılarda yer almaktadır (Taşlıgil ve Şahin, 2016)

Kayrak taşının duvar kaplama malzemesi amaçlı kullanılabilmesi için Türk standartlarında belirtilen minimum yoğunluk değerinin 2,55 gr/cm<sup>3</sup> olması gerekmektedir. Uludere bölgesindeki binalarda kullanılmak üzere araştırılan Şırnak yöresi Kayrak taşının yoğunluğu 2.75 gr/cm<sup>3</sup> civarındadır. Bu değer standardı karşılamaktadır (Sert, 2010 ).Kayrak taşının bazı uygulama örnekleri Şekil 1’de gösterilmiştir.

Şekil 1. Kayrak taşının uygulam örnekleri

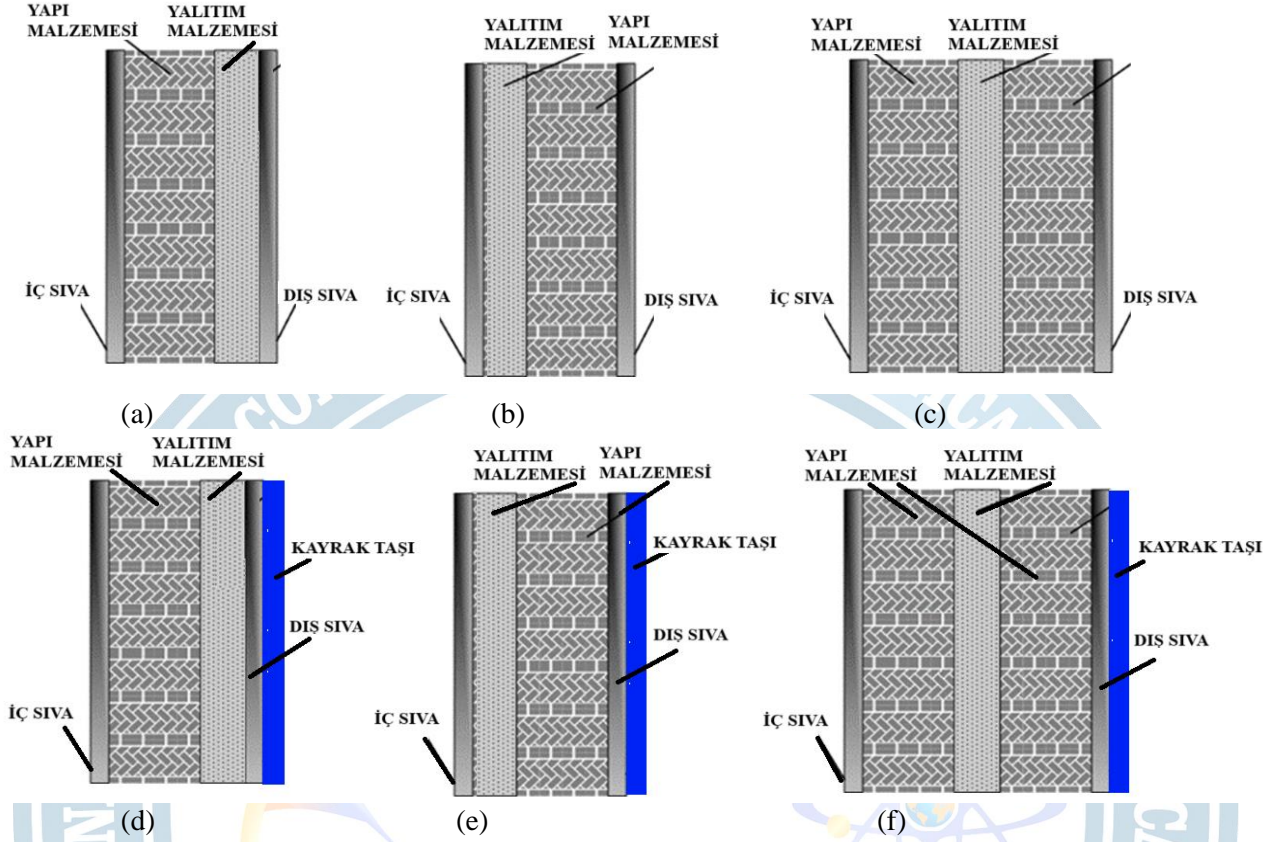

Bu araştırmada öncelikle Şırnak ilinde rezervi bulunan Kayrak taşına ait teknik özellikler ve kullanım alanları incelenmiştir. Daha sonra Uludere ilçesi iklim şartları için Kayrak taşının duvar kaplama malzemesi olarak kullanılması durumunda farklı duvar tipleri, farklı yapı malzemeleri ve taşıyıcı yapı ile tasarlanan bina kabukları için duvardaki sıcaklık dağılımı analizleri ANSYS yazılımı ile araştırılmıştır.

### ANSYS yazılımı ile sıcaklık dağılımının analizi

Araştırma Türkiye ısı haritasında 1. Bölge üzerinde bulunan Şırnak Uludere ilçesi iklim koşulları altında yapılmıştır. Bu araştırmada öncelikle Şırnak ilinde rezervi bulunan Kayrak taşına ait teknik özellikler ve kullanım alanları incelenmiştir. Daha sonra Kayrak taşının, Uludere ilçesi iklim şartlarında bina tasarımlarında duvar kaplama malzemesi olarak kullanımı için farklı doğal içerikli yapı malzemeleri (ponza taşı içeren beton, gözeneksiz agrega içeren beton ve ahşap ürün içeren beton) ve piyasada en çok kullanılan yalıtım malzemelerinden biri olan taş yünü kullanılarak 18 farklı bina kabuğu tipi modellenmiştir. Modelleme için 3 farklı duvar yapısı (dıştan yalıtımlı, içten yalıtımlı ve sandviç) temel alınmıştır. Daha sonra ANSYS yazılımıyla sıcaklık dağılımlarına göre ısı geçişi analizleri ile sonuçlar değerlendirilmiştir.

Şekil 2’de dıştan-içten yalıtımlı duvar ve sandviç duvar önce duvar kaplama malzemesi kullanılmadan daha sonra dış duvarın kaplanmasıyla oluşturulan duvar yapıları verilmiştir. Bina kabuğunu oluşturan bileşenler ve analizi yapılan alternatif tipler Tablo 1’de sunulmuştur. Dış duvar bileşenlerinin teknik özellikleri Tablo 2’de gösterilmiştir.

Şekil 2. Analizde faydalanılan duvar yapıları [(a) Duvar kaplama malzemesi kullanılmayan dıştan yalıtımlı duvar, (b) Duvar kaplama malzemesi kullanılmayan içten yalıtımlı duvar, (c) Duvar kaplama malzemesi kullanılmayan sandviç duvar, (d) Duvar kaplama malzemesi olarak Kayrak taşı kullanılan dıştan yalıtımlı duvar, (e) Duvar kaplama malzemesi olarak Kayrak taşı kullanılan içten yalıtımlı duvar, (f) Duvar kaplama malzemesi olarak Kayrak taşı kullanılan sandviç duvar]

Tüm duvar tipleri arasında en iyi performans, yapı malzemesi olarak pomza taşı içeren beton ve en dış katmanda Kayrak taşı kullanıldığı zaman tespit edilmiştir. En kötü performans ise yapı malzemesi olarak gözeneksiz agrega içeren beton en dış katmanda Kayrak taşı kullanılmadan oluşturulan alternatifle belirlenmiştir.

**Tablo 1.** Bina kabuğunu oluşturan bileşenler ve analizi yapılan alternatif tipler

Tip	Duvar yapısı	Duvar Katmanları					
		Dış kaplama	Dış sıva	Yapı malzemesi	Yalıtım malzemesi	Yapı malzemesi	İç sıva

**Şekil 3.** Uludere ilçesinde grafiksel görünüm ile en performanslı duvar alternatiflerinin sıcaklık dağılımı [(a) En iyi performans veren Kayrak taşı kullanılan dıştan yalıtımlı duvar için (Tip 4), (b) En iyi performans veren Kayrak taşı kullanılan içten yalıtımlı duvar için (Tip 10), (c) En iyi performans veren Kayrak taşı kullanılan sandviç yalıtımlı duvar için (Tip 16), (d) En iyi performans veren Kayrak taşı kullanılmayan dıştan yalıtımlı duvar için (Tip 1), (e) En iyi performans veren Kayrak taşı kullanılmayan içten yalıtımlı duvar için (Tip 7), (f) En iyi performans veren Kayrak taşı kullanılmayan sandviç duvar için (Tip 13)]

Bu araştırmada, Türkiye’de birinci ısı bölgesinden Uludere ilçesi iklim şartları esas alınarak bina kabuğunda Şırnak Kayrak taşının kaplama elemanı olarak kullanılması halinde enerji geçişine etkileri sıcaklık dağılımları ile incelenmiştir. Analizlerde ANSYS yazılımından faydalanılmıştır. Analizlerin değerlendirilmesiyle ponza taşı agregalı beton ve Kayrak taşı kombinasyonunun enerji geçişinde sıcaklık dağılımları açısından en iyi performansı gösterdiği gözlemlenmiştir.

**Şekil 4.** Uludere ilçesinde ağ görünümle en kötü performanslı duvar alternatiflerinin sıcaklık dağılımı [(a) En kötü performans veren Kayrak taşı kullanılan dıştan yalıtımlı duvar için (Tip 5), (b) En kötü performans veren Kayrak taşı kullanılan içten yalıtımlı duvar için (Tip 11), (c) En kötü performans veren Kayrak taşı kullanılan sandviç yalıtımlı duvar için (Tip 17), (d) En kötü performans veren Kayrak taşı kullanılmayan dıştan yalıtımlı duvar için (Tip 2), (e) En kötü performans veren Kayrak taşı kullanılmayan içten yalıtımlı duvar için (Tip 8), (f) En kötü performans veren Kayrak taşı kullanılmayan sandviç duvar için (Tip 14)]

**Şekil 5.** Uludere ilçesinde vektörel görünümle yapı malzemesi ahşap ürün içeren beton kullanılan du en iyi ve en kötü performanslı duvar alternatiflerinin sıcaklık dağılımı [(a) En iyi performans veren Kayrak taşı kullanılan dıştan yalıtımlı duvar için (Tip 6) (b) En kötü performans veren Kayrak taşı kullanılmayan içten yalıtımlı duvar için (Tip 9)]

Kayrak taşı dış kaplama bileşeni olarak kullanılmadan ve yapı malzemesi gözeneksiz agregalı beton kullanıldığında enerji etkinliğinde sıcaklık dağılımı açısından minimum katkı belirlenmiştir. Kayrak taşı ile en iyi performansı veren duvar yapısının dıştan yalıtımlı duvar olduğu görülmüştür. Tüm alternatifler değerlendirildiğinde Kayrak taşının bina kabuğunun enerji performansını arttırmaya destek olabileceği tespit edilmiştir. Duvar alternatiflerinde enerji performansını artması sebebiyle enerji kullanımı, salınan emisyon miktarı ve enerji maliyeti azaltacaktır. Petrol temelli yapı ve kaplama malzemelerinin yerine daha doğal içerikli malzemelerin kullanılması insan sağlığına, ekolojiye, ve hem ülkeye hem de araştırılan ilçeye enerji ve ekonomi açısından faydalar sağlayacaktır.

## SONUÇ

Bu çalışma ile Uludere ilçesinde duvar kaplama malzemesi olarak Kayrak taşı kullanımının özellikle pomza taşı agregalı beton ve ilçe için tespit edilmiş optimum kalınlıkta kullanılan taş yünü kominasyonu ile en iyi performansın dıştan yalıtımlı duvarda elde edildiği görülmüştür. Bölgede yeni tasarlanacak binaların doğal malzeme seçimi ile yeşil bina konseptine yaklaştırma açısından örnek bir çalışma olarak tasarlanan bu çalışmanın, müteahhitlere, mühendislere ve karar vericilere yapılan ANSYS analizi desteğinde fikir vermesi amaçlanmıştır.

#### Özet

Örümceklerin vücutlarının dış kısmı seta adını verdiğimiz kıl benzeri yapılarla kaplıdır. Yer örümceklerinde bu yapıların cins düzeyinde farklılıklar gösterdiği bilinmektedir. Bu çalışmada, Erciyes Dağından toplanmış olan 2 cinse ait 2 türün seta morfolojileri çalışılmıştır *Cryptodrassus creticus* (Chatzaki, 2002) ve *Drassyllus praefficus* (L. Koch, 1866) türlerinin genellikle abdomen ve sefalotoraks gibi vücut kısımları üzerinde yer alan setaların morfolojileri Scanning Electron Microscopy (SEM) kullanılarak belirlenmeye çalışılmıştır.

**Anahtar Kelimeler:** Gnaphosidae, Seta, Erciyes Dağı, Örümcek, Araneae

### **Comparison of seta morphology of ground spiders of the genera *Cryptodrassus* and *Drassyllus* (Araneae: Gnaphosidae)**

#### Abstract

Spiders cuticle is covered with hair-like structures that called setae. It is known that these structures differ at the genus level in ground spiders. In this study, the seta morphologies of 2 species belonging to 2 genera collected from Erciyes Mountain were studied. The morphologies of the setae of *Cryptodrassus creticus* Chatzaki, 2002 and *Drassyllus praefficus* (L. Koch, 1866), which are generally located on body parts such as abdomen and cephalothorax, were studied using Scanning Electron Microscopy (SEM) has been attempted to be determined.

**Keywords:** Gnaphosidae, Seta, Erciyes mountain, Spider, Araneae

#### Giriş

Gnaphosidae familyası hem cins hem de tür sayısı bakımından örümceklerin en zengin gruplarından. Örümcekler, Dünya’da 132 familya, 4313 cins, 51051 tür (World Spider Catalog, 2023), ülkemizde ise 55 familya, 370 cins, 1255 tür ile temsil edilmektedirler (Demir ve Seyyar, 2017; Danışman vd., 2023).

Gnafozidler genellikle 1–15 mm uzunluğunda, bacakları iki 2 tırnaklı, genellikle desenlenme göstermeyen örümceklerdir. Genellikle toprakta, taş altlarında, ağaç kabuklarında, kaya çatlaklarında veya kurumuş yaprak döküntüleri arasında yaşarlar ve buralarda tüp şeklinde ağlar örerler.

Tüm yer örümceklerinin vücutlarının üst kısmı seta adı verilen kıllarla kaplıdır. Yapılan çalışmalar incelendiğinde yer örümceklerinin vücut örtüsü üzerinde 10 farklı seta tipine rastlanılmıştır (Zakharov, Ovtsharenko, 2015). Setalar, yer örümceklerinin vücutlarının farklı kısımlarında değişik görevleri yerine getirmek üzere farklılaşmıştır. Örümcekler tarafından genellikle duyu organı ve mekanoreseptör olarak kullanılırlar. Vücut üzerinde abdomenin tüm kısımlarında, cephotrax üzerinde, bacaklar, pedipalp ve spinneretler üzerinde yoğun bir şekilde bulunurlar. Örümceklerin bazı gruplarında vücut örtüsünü oluşturan bu setaların farklı morfolojilerde olduğu ve örümcek sınıflandırmasında önemli olabileceği belirtilmiştir

(Lehtinen 1967, 1975a,b). Gnaphozidler üzerine yapılan çalışmalar cins seviyesinde setaların morfolojik yapılarının farklı olduğunu göstermektedir. Salticidae ve Oxyopidae familyalarında da seta morfolojilerindeki farklılığın cins hatta tür ayrımında kullanılabilirliği ile ilgili birkaç çalışma yapılmıştır (Hill 1979; Townsend ve Felgenhauer, 2001).

Bu çalışmanın amacı, Gnaphosidae familyasına ait olan 2 cinse ait 2 türün seta morfolojilerini SEM ile belirlemek ve setaların bu cinslerin yer örümcekleri sınıflandırmasında kullanılabilirliğini ortaya koyabilmektir.

### Materyal ve Metot

Yer örümceklerine ait örnekler Erciyes dağında (Kayseri) yapılan arazi çalışmaları sonucunda toplanmıştır. Teşhisi yapılan türlerin seta morfolojilerini belirlemek üzere Niğde Ömer Halisdemir Üniversitesi Merkezi Araştırma Laboratuvarında bulunan Elektron Mikroskopu kullanıldı. İki gnaphozid cinsine ait *Cryptodrassus creticus* (Chatzaki, 2002) ve *Drassyllus praeficus* (L. Koch, 1866) türlerinin prozoma, opistozoma ve bacakları ayıklandı. Her bir tür için bu vücut kısımları staplar üzerine düzgün konumda yerleştirildi ve daha net görüntü elde etmek için bu numunelerin yüzeyi Sputter Coater (Cressingto Auto 108) marka cihaz ile altınla kaplandı. Sonrasında yüzey morfolojisini incelemek için EVO LS 10 ZEISS marka cihaz kullanılarak fotoğrafları çekildi.

Şekil 1. Zeiss Marka evo 40 model SEM

### Bulgular

Yer örümceklerinin iki cinsine ait iki türün, *Cryptodrassus creticus* (Chatzaki, 2002) ve *Drassyllus praeficus* (L. Koch, 1866) türlerinin prozoma ve opistozomaları üzerinde bulunan setaların morfolojileri SEM yardımıyla çekilmiş olup bu iki cinse ait setaların morfolojileri kıyaslanmıştır.

Şekil 2. *Cryptodrassus creticus* türüne ait plumose seta morfolojisi (abdomen)

Şekil 3. *Drassyllus praeficus* türüne ait setasız kütikula (abdomen)

### Sonuç ve Tartışma

SEM yardımıyla fotoğraflanan Gnaphosidae familyasına ait 2 cinse ait 2 türü setalarının incelenmesi sonucunda *Cryptodrassus creticus* türünde tüysü (plumose) tip seta görülürken, *Drassyllus praeficus* türünde ise seta örneğine rastlanmamış olup Şekil 3.'de görülen yapıların sensilla olduğu tespit edilmiştir. Yapılan bu çalışma yer örümceklerinde bir ön çalışma niteliğinde olup diğer gnaphozid cinslerinin setalarının veya aynı cinse ait tüm türlerin seta morfolojileri incelenirse, yer örümceklerinin ayırımında seta morfolojisinin taksonomik olarak kullanılmasının ne derece de etkili olacağı görülebilir.

## Teşekkür

Finansal desteğinden dolayı Niğde Ömer Halisdemir Üniversitesi Bilimsel Araştırmalar Birimine (Proje No: FEB 2018/09- TÜBİTAK C) teşekkür ederiz.

#### Özet

Son yıllarda potansiyel sağlığı geliştirici bileşikler ile ilgili çalışmalara odaklanılmıştır. Bu bileşik gruplarından biri, havuç, maydanoz, kereviz, yabani havuç ve rezene gibi ilgili sebzelerde yaygın olan falcarinol tipi alifatik C17-poliasetilenlerdir. Falcarinol tipi poliasetilenler, anti-inflamatuar, antiplatelet, sitotoksik ve antitümör aktivitenin yanı sıra bakteri ve mikoplazmaya karşı birçok biyoaktivite göstermektedir. Bu çalışma kapsamında, farmakolojik olarak etkinliği yüksek olan falcarinolun yapısal ve elektronik özellikleri incelenmiştir. Bileşiğin moleküler optimizasyon hesapları Spartan 10 yazılımı kullanılarak Yoğunluk Fonksiyonel Teorisinin (DFT) B3LYP metodu ve standart 6-311+G\*\* baz setleri kullanılarak yapılmıştır. Öncü moleküler orbitaller olan en yüksek dolu moleküler orbital (HOMO) ve en düşük boş moleküler orbital (LUMO) enerjileri kullanılarak hesaplanan sertlik ve yumuşaklık parametreleri ile global kimyasal aktivite verileri elde edilmiştir. Bileşiğin moleküler elektrostatik potansiyel (MEP) harita analizi gerçekleştirilmiştir. Ayrıca, moleküler yerleştirme, ADME ve toksisite özellikleri in silico olarak analiz edilmiştir. Asetilkolinesteraz (PDB kodu: 1EVE) ve pankreatik alfa-amilazın (PDB kodu: 1B2Y) falcarinol ile bağlanma enerjileri sırasıyla -7.0 kcal/mol ve -6.1 kcal/mol olarak hesaplanmıştır.

**Anahtar Kelimeler:** Falcarinol, Moleküler yerleştirme, Spartan 10

#### Electronic, Structural and Pharmacokinetic Characterization of Falcarinol: DFT, Molecular Docking and ADMET Studies

#### Abstract

In recent years, it has been a focus on studies of potential health-promoting compounds. One of these groups of compounds is the aliphatic C17 polyacetylenes of the falcarinol type, which are common in related vegetables such as carrots, parsley, celery, parsnips, and fennel. Falcarinol-type polyacetylenes show anti-inflammatory, antiplatelet, cytotoxic, and antitumour activity as well as many bioactivities against bacteria and mycoplasma. Within the scope of this study, the structural and electronic properties of falcarinol, which has high pharmacological activity, were investigated. Molecular optimisation calculations of the compound were performed at B3LYP/standard 6-311+G\*\* basis set of Density Functional Theory (DFT) using Spartan 10 software. Global chemical activity data were obtained with hardness and softness parameters calculated using the highest occupied molecular orbital (HOMO) and lowest unoccupied molecular orbital (LUMO) energies, which are the leading molecular orbitals. Molecular electrostatic potential (MEP) map analysis of the compound was performed. Additionally, molecular docking, ADME and toxicity properties were analyzed in silico. The binding energies of acetylcholinesterase (PDB code: 1EVE) and pancreatic alpha-amylase (PDB code: 1B2Y) with falcarinol were calculated as -7.0 kcal/mol and -6.1 kcal/mol, respectively.

**Keywords:** Falcarinol, Molecular docking, Spartan 10

## GİRİŞ

Havuç, poliasetilenler ve karotenoidler olmak üzere iki grup fitokimyasal için özellikle iyi bir kaynaktır (Lund ve White, 1990; Bernart ve ark., 1996). Diğer sebzelerle karşılaştırıldığında havuç, insan diyetine daha fazla katkı sağlayabilir. Antioksidan, anti-kanserojen ve bağışıklık arttırıcı faydaları, yara iyileşmesi, kolesterolü düşürücü, anti-diyabetik, anti-enflamatuvar, antibakteriyel ve antifungal özellikleri araştırmacılar tarafından rapor edilmiştir (Pandey ve ark., 2020). Son zamanlarda yapılan bir dizi çalışma, Apiaceae familyasının üyelerinde bulunan bir grup C17 poliasetilenin kanser hücrelerine karşı sitotoksositeye sahip olduğunu bildirmiştir (Kobæk-Larsen ve ark., 2005; Christensen ve Brandt, 2006). Havuçlar (*Daucus carota* L., Apiaceae) falcarinol tipinde 3 poliasetilen, yani falcarinol, falcarindiol ve falcarindiol-3-asetat içerir. Bu bileşikler bitkide (kök) mantar enfeksiyonlarını önler. Ayrıca insanlarda anti-bakteriyel, anti-inflamatuvar ve anti-trombosit-agregasyon etkilerine sahiptirler (Rawson ve ark., 2011). İnsan tümör hücrelerine karşı önemli bir sitotoksik aktivite gösteren falcarinol, panaxynol olarak da adlandırılır (Zheng ve ark., 1999). Falcarinol havuçta bulunan en biyoaktif poliasetilen olarak bildirilmiştir. Falcarinol, iki karbon-karbon üçlü bağı ve iki çift bağı olan bir moleküldür (Larqué ve ark., 2022). Karbon 9 pozisyonundaki çift bağ, oksijen ve NADPH (veya NADH) kofaktörleri gerektiren desaturasyon ile ortaya konan *cis* stereokimyasına sahiptir, molekül, yağ asidinin hücre zarlarında katılmasını önleyen bir bükülme oluşturur (Yates ve England, 1982). Bu çalışma kapsamında, dikkat çekici biyoaktif bir bileşik olan falcarinol bileşiğinin yapısal ve elektronik özellikleri incelendi ve alzheimer ile diyabet hastalıklarına karşı etkinliği moleküler yerleştirme çalışmaları ile tahmin edildi.

Şekil 1. Falcarinol bileşiğinin yapısı

## MATERYAL VE METOT

Falcarinol bileşiğinin, Spartan 10 paket programı (Spartan'10, version 1.1.0.) içerisinde yer alan B3LYP/6-311+G\*\* yoğunluk fonksiyonu yöntemi (DFT) kullanılarak kuantum kimyasal hesaplamaları yapıldı. Optimize yapının kimyasal kararlılığı için gaz fazında en yüksek dolu moleküler orbital enerjisi ( $E_{HOMO}$ ), en düşük boş moleküler orbital enerjisi ( $E_{LUMO}$ ), enerji farkı ( $\Delta E$ ), kimyasal sertlik ( $\eta$ ), elektronegatiflik ( $\chi$ ) ve dipol moment ( $\mu$ ) değerleri gibi çeşitli parametreleri hesaplandı. Ayrıca moleküldeki elektrofilik ve nükleofilik tepkimelerin olabileceği bölgelerin belirlenmesinde ve molekül içi hidrojen bağı oluşumu hakkında önemli bilgiler veren Moleküler elektrostatik potansiyeli (MEP) haritası hesaplandı. Yerleştirme analizleri, AutoDock Vina yazılımı ve UCSF Chimera (Butt ve ark., 2020) kullanılarak gerçekleştirildi. Asetilkolinesterazın üç boyutlu yapısı (PDB kodu: 1EVE) ve pankreatik alfa-amilazın üç boyutlu yapısı (PDB kodu: 1B2Y) PDB formatlarında 3D yapısı RSCB PDB web sitesinden sağlandı. Ligand-reseptör 3D etkileşimlerini görselleştirmek için Biovia Discovery Studio Visualizer kullanıldı. Falcarinol bileşiğinin ADMET (absorpsiyon, dağılım, metabolizma, atılım ve toksisite) özellikleri tahmin etmek için SwissADME, SwissTargetPrediction, ADMETlab, Pro-Tox II ve admetSAR gibi çeşitli web araçları kullanıldı.

## BULGULAR ve TARTIŞMA

HOMO-LUMO enerji değerleri arasındaki fark önemli bir stabilite indeksidir. Büyük bir HOMO-LUMO enerji açığı molekülün daha kararlı ve daha az reaktif olduğunu, küçük bir HOMO-LUMO enerji açığı ise molekülün daha az kararlı ve daha reaktif olduğunu temsil eder (Kim ve ark., 2005). HOMO-LUMO enerji aralığına sahip HOMO ve LUMO enerji değerleri, elektronegatiflik, sertlik, yumuşaklık, elektrofiliklik indeksi ve kimyasal potansiyel gibi parametreleri tahmin etmek için kullanılır. Enerji açığındaki azalma genellikle molekülün sertliğinin azalmasına ve daha kolay polarizasyonuna yol açar. Molekül optimizasyonu, fonksiyonel B3LYP/6-311+G\*\* temel setinde gaz, su ve etil alkol ortamında gerçekleştirildi ve HOMO-LUMO enerjileri hesaplandı. Falcarinol molekülü için hesaplanan HOMO-LUMO enerjisi (a.u.) ve bant aralığı değeri sırasıyla 0.2112 eV, 0.2129 eV ve 0.2124 eV'dir. Ayrıca falcarinol molekülünün elektronik özellikleri ve global reaktivite parametreleri hesaplandı ve hesaplanan sonuçlar Tablo 1'de verilmiştir.

Tablo 1'de verilen enerji bant aralığının 1.5 eV'den az olması molekülün termodinamik açıdan kararlı ve dayanıklı olmadığını göstermektedir. Bu aynı zamanda molekülün kendisiyle reaksiyona girebileceği, dimerizasyon ve polimerizasyonun meydana gelebileceği anlamına da gelir. Elektrofilisite indeksi ( $\omega$ ), özellikle organik moleküllerin güçlü veya zayıf elektrofilik özelliklerini anlamak için kullanılmaktadır. Buna

göre moleküller;  $\omega > 1.5$  eV ise güçlü elektrofil, 0.8 eV ve 1.5 eV arasında ise orta dereceli elektrofil,  $\omega < 0.8$  eV ise zayıf elektrofilik karaktere sahip olarak değerlendirilmektedir (Domingo ve ark., 2008). Frontier moleküler orbitallerin (FMO) 3 boyutlu çizimleri ve FMO boşluklarının ( $\Delta E$ ) enerjileri Şekil 2'de gösterilmiştir.

**Tablo 1.** Falcorinol molekülünün kimyasal reaktivite tanımlayıcıları

Parametreler	(eV)
$E_{\text{HOMO}}$	-0.240
$E_{\text{LUMO}}$	-0.027
Enerji bant aralığı ( $\Delta E = E_{\text{LUMO}} - E_{\text{HOMO}}$ )	0.212
İyonlaşma potansiyeli ( $I = -E_{\text{HOMO}}$ )	0.240
Elektron ilgisi ( $A = -E_{\text{LUMO}}$ )	0.027
Elektronegatiflik ( $\chi = (I + A)/2$ )	0.134
Kimyasal sertlik ( $\eta = (I - A)/2$ )	0.106
Kimyasal yumşaklık ( $\sigma = 1/2\eta$ )	4.697
Kimyasal potansiyel ( $\mu = -(I + A)/2$ )	-0.134
Elektrofiliklik indeksi ( $\omega = \mu^2 / 2\eta$ )	0.084
Maksimum yük aktarım indeksi ( $\Delta N_{\text{max}} = -\mu/\eta$ )	1.260

**Şekil 2.** Falcorinol için farklı ortamlarda HOMO-LUMO enerji farkları ( $\Delta E$ )

Moleküler elektrostatik potansiyel (MEP), moleküler davranışın reaktivitesini, yapı-aktivitesini ve hidrojen bağımlı açıklamak için kullanılan yararlı bir yöntemdir (Murray ve Sen 1996). Yeşil renkli kısımlar elektrostatik potansiyelin sıfır olduğu bölgelerdir. MEP haritalarında elektrostatik potansiyel Kırmızı<Turuncu<Sarı<Yeşil<Mavi sırasıyla artar.

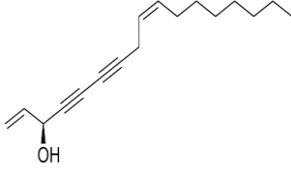

Şekil 3. Falcarinol molekülün MEP haritalarının gösterimi

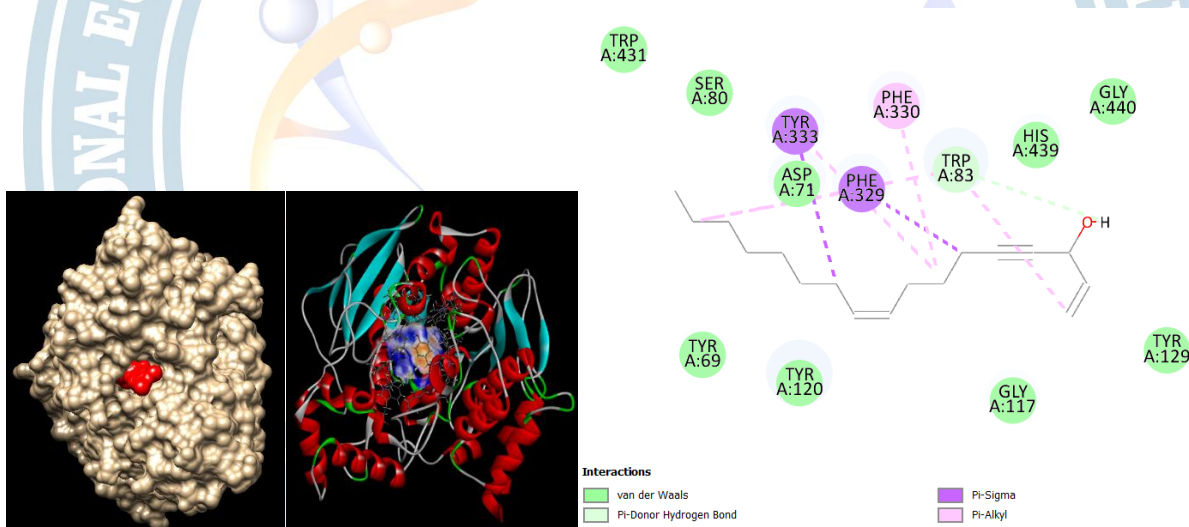

Şekil 3'te görüldüğü gibi haritadaki kırmızı renk hidroksil grubundaki oksijen atomunun elektronca en zengin bölge olduğunu göstermektedir. Bunun nedeni, oksijen atomu üzerindeki çiftleşmemiş ve proton çekici olan elektron çiftidir ve bu bölge yüksek elektrofilik saldırı etkinliği temsil etmektedir. Molekülün diğer kısımlarında görülen yeşil renk, elektron yoğunluğunun daha az olduğunu göstermektedir. Pozitif bölgeler hidrojen atomlarının üzerinde bulunur ve nükleofilik saldırılar için uygundur.

Moleküler yerleştirme analizleri, enzimler ve bileşikler arasındaki reaksiyonların moleküler etkileşimlerinin aydınlatılmasına yardımcı olur. Yerleştirme analizleri, hedef bileşiklerin etki mekanizmasının, ve uygun bağlanma bölgelerinin anlaşılmasını kolaylaştırır. Yerleştirme analizi sonucunda falcarinol molekülünün sırasıyla asetilkolinesteraz (AChE) (PDB kodu: 1EVE) ve pankreatik alfa-amilaz (PDB kodu: 1B2Y) ile etkileşimi gerçekleştirildi. Yerleştirme sonucu falcarinol molekülünün sırasıyla -7.0 kcal/mol ve -6.0 kcal/mol olmak üzere iyi bir bağlanma enerji değeri gösterdiğini destekledi.

**Tablo 2.** PDB ID: 1EVE ve PDB ID: 1B2Y ile falcarinol molekülünün yerleştirme sonuçları

Toksisite tahmini Pro-Tox II web sunucusu sayesinde gerçekleştirildi. Öngörülen sonuçlar Şekil 6'da verilmiştir. Toksisite sonuçlarına ilişkin olarak, falcorinol molekülü için bazı tahminler elde edilebilir: Molekül sitotoksik, kanserojen, immünotoksik veya mutajenik değildir. Pro Tox-II'ye göre molekül, toksisite sınıfı 6 olarak sınıflandırılmıştır.

Şekil 6. Falcorinol bileşiğinin Pro-Tox II ile toksisite tahmini

### SONUÇ

Falcorinol molekülünün kuantum kimyasal hesaplamaları, B3LYP/6-311+G\*\* temel seti kullanılarak DFT düzeyinde belirlenmiş ve analiz edilmiştir. Sonuçlardan görüldüğü gibi falcorinol molekülünün enerji aralığının ( $\Delta E$ ) küçük olması onun sert bir molekül olmadığını göstermektedir. Molekül çözünür. Yerleştirme sonuçları, bu molekülün her iki hedef protein ile etkileşimlerinde ikincil etkileşim türlerinin etkin olduğu gösterdi. Molekülün sitotoksik, kanserojenik, immünotoksik veya mutajenik olmadığı Pro-Tox II programı ile tahmin edildi.

## Özet

Çalışmada, Portulacaceae familyasına ait semizotu bitkisinin ağır metaller ile kirletilmiş toprakta fitoremediasyon denemesini içermektedir. Çalışma, sonbahar mevsiminde sera koşullarında ve toprak organik madde içeriği %5 olacak şekilde saksı deneyleri şeklinde gerçekleştirilmiş, orta seviyede ağır metallerle kirli toprakta yetiştirilen semizotu bitkilerinin ağırlıkları ve bitkilerin yenilebilir kısımlarına aldığı metal konsantrasyonları değerlendirilmiştir. Birbirine paralel olarak hazırlanan kirli toprak saksılarında süreç sonucunda ortalama %40 oranında çimlenme gözlenirken, herhangi bir kirletici müdahalesi olmamış toprak içeren saksılarda bu oran ortalama %82 oranında gerçekleşmiştir. Serada 55 günlük deney süreci sonucunda, topraktan bitkiye ağır metal geçişleri Cr, Cu, Ni ve Zn için transfer katsayısı 1 den büyük olup, anlamlı bir biçimde geçişi ifade etmektedir. Özellikle hareketliliğinin yüksek olduğu bilinen Zn için bu değer bitki gelişiminin daha kuvvetli olduğu kontrol saksılarında 2,88 ile yüksek bir geçişe işaret etmektedir.

**Anahtar kelimeler:** : Semizotu, ağır metal, fitoremediasyon, transfer katsayısı

## Abstract

The study includes a phytoremediation trial of purslane plant belonging to the Portulacaceae family in soil contaminated with heavy metals. The study was carried out in the form of pot experiments in greenhouse conditions in the autumn season with a soil organic matter content of 5%, and the weights of purslane plants grown in soil contaminated with moderate levels of heavy metals as well as the metal concentrations in the edible parts of the plants were evaluated. While an average of 40% germination rate was observed as a result of the process in contaminated soil pots prepared in parallel with each other, this rate was 82% on average in pots containing soil without any pollutant intervention. As a result of the 55-day experiment period in the greenhouse, the transfer coefficients for heavy metal transfers from soil to plants for Cr, Cu, Ni and Zn were found to be greater than 1, indicating a significant transfer from soil to plants. Especially for Zn, which is known to have high mobility, this value indicates a high transition with 2.88 in control pots where plant growth is stronger.

**Key words:** Purslane, heavy metal, phytoremediation, transfer coefficient

## GİRİŞ

Semizotu, *Portulacaceae* familyasına ait tek yıllık, çok yapraklı, sürünen otsu bir bitkidir. Semizotu diğer bitkilere göre yüksek oranda omega-3 yağ asitleri, B-kompleks vitaminleri içerir ve iyi bir C vitamini kaynağıdır. Semizotu demir, fosfor, bakır, çinko, magnezyum, kalsiyum, potasyum ve manganez gibi önemli mineraller açısından da önemli besin değeri olan bir sebzedir (Açak, 2017; Dweck 2001; Turan ve ark., 2003). Bitkinin yabancı formları uzun yıllardan beri bilinmesine rağmen insan beslenmesindeki yeri ve önemi yeni yeni anlaşılmaya başlanmıştır. Türkiye'de semizotunun kültür formu ticari olarak Ege, Marmara ve Akdeniz bölgelerinde üretilmekte olup, yabancı formları ise tüm bölgelerde çoğunlukla kullanılmaktadır (Eşiyok, 2012; Yurdağül, 2019). İlkbahar-yaz mevsiminde hızlı bir biçimde büyüdüğü bilinen bitkilerde kuru madde miktarı artmaktadır (Convington, 2004). Bitkinin en iyi gelişme gösterdiği mevsim erken ilkbahar olduğu için yetiştiriciliği genellikle bu dönemde yapılmaktadır. Kullanılan toprak kaliteli ve organik olursa semizotu da bir o kadar besleyici olmaktadır.

Semizotu literatürde pek çok çalışmada fitoremediasyon bitkisi olarak tanımlanabilmektedir. Yedagari tarafından 2017’de yapılan bir çalışmada (Güneybatı İran) semizotu bitkisinin nikel ve kadmiyumla kirlenmiş toprakta ağır metal ayırıcı bir ürün olarak performansı incelenmiştir. Bu çalışmanın sonucunda, nikelin düşük kadmiyum konsantrasyonu ile daha fazla bitki dokusuna geçtiği, toprakta kadmiyumun 20 mg/kg'dan fazla olmasının nikelin bitkiye taşınmasını azalttığı görülmüştür. Sonuçlar ayrıca *Portulaca oleracea* L. ekstraksiyon içeriğinin toprağın ağır metal özelliğinin farklılaşmasından önemli ölçüde etkilendiğini göstermiştir. Büyüme mevsimlerinde semizotunda 29,6-30,2 mg/kg kadmiyum ve 85,4- 86,1 mg/kg nikel görülmüştür. Ayrıca mevcut çalışmada aynı zamanda *P. oleracea* 'nin ekstraksiyon içeriğinin, nikelin hareketliliğinden etkilendiği ve nikel ile iletilen kadmiyumun toksisitesinin bitki dokularında mevcut olduğu görülmüştür. Bu çalışma yararlı ağır metallerin etkisi hakkında bilgi vermiş olması ve semizotu bitkisinin fitoremediasyon potansiyelini göstermesi bakımından önem taşımaktadır. Deepa ve ark. (2006), büyük ölçüde, birçok ağır metalin neden olduğu stres koşulları altında bitkilerin büyüme kapasitesinin incelenmesine odaklanmıştır. Araştırmacılar bitki büyümesini etkileyen metallerin toksite sırasını Cd>Cu>Al>Zn>Hg>Se>Pb olarak belirlemişlerdir. Eid ve Shaltout (2016), Mısır'ın kuzeyindeki Nil Deltası'ndaki kanalizasyon çamuru depolama alanında yetişen semizotu bitkisinin Zn ve Mn'yi aşırı biriktirebildiğini kanıtlamıştır.

Mısır'da gerçekleştirilen bir çalışmada, endüstriyel atıksuların toksik etkilerine maruz kalan tarım arazilerinde yetişen semizotu bitkisinin toprakta mevcut Mn(II), Cu(II), Zn(II), Fe(III) ve Pb(II) iyonlarını biriktirme kapasitesi incelenmiştir. Fitoremediasyon verimi zenginleşme faktörü (BCF) olarak Cu (II) için 7.4, Fe(III) için 2.06; Zn(II) için 4.33, Mn(II) için 2.06 ve Pb(II) için 3.89 olarak tespit edilmiştir. Biyoakümülyasyon faktörü (BF) ve translokasyon faktörleri denenilen topraklar ve metal iyonları için 1'in altında bulunmuştur (El-Shami et.al. , 2019).

Prabha v.d. (2015), çeşitli Se konsantrasyonlarında alfisol içinde yetiştirilen semiz otunun gövde kesimleri tarafından selenyum (Se) alımını ve birikimini araştırmışlardır. Hindistan'da gerçekleştirilen çalışmada, 42 günlük kısa bir büyüme döneminde maksimum 63.4  $\mu\text{g g}^{-1}$  kuru ağırlık elde edilmiş ve bitki kısımları arasında Se birikme sırası yapraklar (31,5  $\mu\text{g g}^{-1}$ )> saplar (16,4  $\mu\text{g g}^{-1}$ )> kökler (15,5  $\mu\text{g g}^{-1}$ ) şeklinde olmuştur. Akümülyasyon potansiyeli, bitkinin temin edilebildiği 15.2  $\mu\text{g g}^{-1}$  Se  $\text{g}^{-1}$  toprak konsantrasyonundan dört kat daha yüksek olmuştur. Bitki dokularında Se biriktirebilmesine rağmen, topraktaki Se konsantrasyonlarının artırılması bitkilerin büyüme hızında artan konsantrasyona bağlı bir azalmaya neden olmuştur (yaprakların yenilenmesi, yaprak sayısı, kök sayısı, kök uzunluğu, gövde uzunluğu ve biyokütle).

Alyazour v.d. (2020) tarafından gerçekleştirilen bir çalışmada, kirli topraktan potansiyel bir Cr (VI) hiperakümülyatör olarak görülen semizotu bitkisi yetiştirirken, toprak organik içeriği, pH ve sülfat konsantrasyonunun, Cr (VI) fito-ekstraksiyonu üzerindeki etkisi araştırılmıştır. Semizotu fideleri, (i) üç organik içerik bileşimi, (ii) altı pH seviyesi ve (iii) altı sülfat tuzu konsantrasyonunda 200 ppm Cr (VI) solüsyonları ile sulanmıştır. Farklı bitki dokularındaki krom konsantrasyonu, değişik koşullar altında izlenmiştir. Sonuçlar, *Portulaca oleracea* tarafından Cr (VI) alımının (i) düşük organik içerikli toprakta (% 0.42), (ii) hafif alkali pH aralığında (~8) ve (iii) 300–600 ppm arasında sülfat konsantrasyonunda tercih edildiğini göstermiştir.

Bir başka çalışma Hindistan Gujrat, Vadodra'daki tarla alanlarında yetişen iki semizotu türü bitkilerinin hem endüstriyel atık su ile hem de kuyu suyu ile sulanmasının etkilerini araştırmıştır. Sulanan endüstriyel atık sular ve bununla sulanan toprak, kuyu suyu ve bununla sulanan toprağa kıyasla çok yüksek düzeyde ağır metallere (Fe, Zn, Cd, Cr ve As) sahip olduğu tespit edilen çalışmada, sulanan atık topraklarda yetişen her iki türün bitkileri, maksimum köklerde ve en az çiçeklerde olmak üzere tüm bitki kısımlarında yüksek metal birikimi göstermiştir. *Portulaca*'nın her iki türü birden fazla ağır metal, yani Cd, Cr ve As. *P. tuberosa*'da Cd, Cr ve As'ın toplam sürgün konsantrasyonları ( $\mu\text{g g}^{-1}$  km) sırasıyla 1,571, 7,957 ve 3,118 iken, *P. oleracea*'da bunlar sırasıyla 1,128, 7,552 ve 2,476 olduğu tespit edilmiştir (Tiwari v.d., 2008).

Sivakumar v.d. (2020) *Portulaca oleracea* L.'nin gövde kesimlerinin fitoremediasyon verimliliğini araştırmıştır. Dietilen triamin penta asetik asit (DTPA) ile ekstrakte edilebilen Cu ve Cd seviyeleri tüm topraklarda test edilmiştir. Bitkinin sap kesimleri 30 gün büyütüldükten sonra bitki büyüme parametreleri ve Cd ve Cu birikimi test edilmiştir. DTPA ile ekstrakte edilebilen Cu (8.45 ila 35.34  $\mu\text{g / g}$ ) ve Cd (0.18 ila 3.10

$\mu\text{g} / \text{g}$ ) seviyeleri, bölgeler arasında çok farklılık göstermiş ve Cu seviyeleri tüm topraklarda Cd'den daha yüksek çıkmıştır (3,46 ila 135,92 kat daha yüksek). 30 günlük büyümenin ardından, bitkilerin yaprak sayısında ( $39 \pm 2,0$  ila  $41 \pm 1,5$  yaprak), kök uzunluğunda ( $8,0 \pm 0,7$  ila  $8,7 \pm 0,7$  cm) ve taze ağırlıkta ( $11.40 \pm 0.59$  ile  $11.73 \pm 0.36$  g) Cu birikimi Cd'ninkinden daha yüksektir (2,45 ila 5,92 kat). Hesaplanan birikim faktörü (Cu ve Cd'nin topraktan bitkilere taşınması) Cd için (3.01 ila 39.22) Cu'dan (1.24 ila 4.59) daha yüksektir. Toprakta DTPA ile ekstrakte edilebilir Cu ve Cd, bitkilerde Cu ve Cd birikimi ve hesaplanan birikim faktörü arasında net bir eğilim bulunmamıştır.

Sunulan çalışma, ticari olarak satılan semizotu tohumlarıyla bir fitoremediasyon denemesini içermektedir. Çalışma, semizotunun iyi gelişme göstermediği sonbahar mevsiminde sera koşullarında ve toprak organik madde içeriği %5 olacak şekilde saksı deneyleri şeklinde gerçekleştirilmiş, orta seviyede ağır metallerle kirliliği toprakta yetiştirilen semizotu bitkilerinin ağırlıkları ve bitkilerin yenilebilir kısımlarına aldığı metal konsantrasyonları değerlendirilmiştir.

## MATERYAL VE METOD

Çalışmada kullanılan tohum örnekleri yapılan ön çalışmalar ile çimlenme oranının %50 den yüksek olduğu belirlenen piyasadan temin edilen tohumlardır. Tohumların ekildiği toprak ve organik madde içeriğini yükseltmek amacıyla kullanılan keçi gübresi ve torf ise Ege Bölgesi'nde faaliyet gösteren yerel bir peyzaj firmasından temin edilmiştir.

Deneylerde kullanılan toprak karışımının %5 oranında organik madde içermesi için, başlangıç organik madde içeriği %1.8 olan toprağa sırasıyla %31 ve %74 organik madde içeren torf ve keçi gübresi karışımı ilave edilmiştir. Toprak karışımlarının tarla kapasitesi standart gravimetrik yöntemlere göre ölçülmüştür. (Güven vd., 2022). Deney düzeneği her biri 6 kg toprak karışımı içeren 8 L hacimli plastik deneme saksılarında tasarlanmıştır. Çalışmada kullanılan toprak karışımını ağır metaller açısından kirletmek amacıyla Güney Marmara bölgesi'nde terkedilmiş eski bir maden sahasından alınan pasa örneği kullanılmış, 6 kg lık toprak karışımına homojenize hale getirilmiş 350 gram pasa ilave edilerek yeni karışım sağlanmıştır. Saksılar kirletilmiş ve kirletilmemiş (kontrol) toprak karışımları ile 3'er tekrarlı olacak şekilde hazırlanmış ve Dokuz Eylül Üniversitesi Tınaztepe Yerleşkesi'nde bulunan seraya yerleştirilmiştir.

Çalışma Ekim-Aralık 2022 tarihinde gerçekleştirilmiştir. Saksılar seraya yerleştirdikten sonra her saksıya 20 adet tohum ekilmiştir. Bu tohumlar deneysel ekimde kullanılacağı için önce 1/5 oranında seyreltilmiş ağartıcı ve 1 ml Tween 20 eklenmiş su ile tohumların yüzey sterilizasyonu sağlanarak ekim gerçekleştirilmiştir. Ekim bittikten sonra saksılara can suyu verilerek her gün çimlenme takibi gerçekleştirilmiştir. Çimlenme tamamlandıktan sonra semizotu bitkisi ile kuraklık etkisini araştıran bir çalışmada verim üzerine en etkin sulama miktarı olarak belirlenen %75 tarla kapasitesi ile günaşırı sulamalar gerçekleştirilerek bitki büyümeleri değerlendirilmiştir (Güven vd, 2022).

Bitki büyümeleri, bitki sayısı ve bitki ağırlığı ile değerlendirilmiştir. Bitki yetiştirmeden önce toprak örneklerinde ağır metallerin enstrümental analizi için örnekleri asit ile parçalama esasına dayanan ön işlem gerçekleştirilmiştir. Modifiye edilmiş EPA 3050 B Yöntemi kullanılarak gerçekleştirilen parçalama işleminde Perkin Elmer Sample Preparation Block 50-48 kullanılmıştır. Bunun için 0.5 gram toprak örnekleri sırasıyla 5 ml %50 HNO<sub>3</sub>, 2.5ml derişik HNO<sub>3</sub>, 1.5 ml %30 H<sub>2</sub>O<sub>2</sub> (oksidasyon sonuna dek 5 ml yi geçmeyecek şekilde ilaveler ile), ve nihayetinde 5 ml derişik HCl ile muamele edilmiştir. Farklı sürelerde 120 °C ve 95 °C sıcaklıklarda gerçekleştirilen bu parçalama sürecinin sonucunda ekstraktlar seyreltilerek okunmaya alınmıştır (USEPA, 1996). Bitki örneklerinde ağır metallerin enstrümental analizi için aynı blok parçalayışı kullanılmış, hava ile kurutularak öğütülen bitki organlarına dair örnekler 0.2 gram olacak şekilde tartılarak konulmuştur. Tüplere 5 ml konsantr HNO<sub>3</sub> eklenmiş ve önceden 110 °C ye ısıtılmış blok parçalayıcıda 2 saat süreyle ekstrakte edilmiştir. Süre sonunda soğumaya alınan tüplere, sonrasında 1ml %30 H<sub>2</sub>O<sub>2</sub> eklenerek 1 saat daha parçalanmaya bırakılmıştır. İşlem sonunda soğuyan numuneler 50 ml'ye seyreltilerek 0.45  $\mu\text{m}$  filtre kağıdından süzölmüş ve analizleri gerçekleştirilene kadar +4 °C de saklanmıştır (Ashrafi vd., 2015)

## TARTIŞMA

Sera içerisindeki sıcaklık ve nem ölçümleri 27 Ekim – 21 Aralık 2023 tarihleri arasında 55 gün olmak üzere, 30 dakika aralıklarla günde 48 veri alınarak belirlenmiş ve günlük ortalama sıcaklıklar Şekil 1 ile ifade edilmiştir. Bu süre zarfında sera koşullarında en yüksek sıcaklık 36,3 °C ile 3 Kasım 2023 günü öğle saatleri, en düşük sıcaklık ise 4 °C ile 21 Aralık 2023 günü sabaha karşı kaydedilmiştir. Benzer şekilde ölçülen nem oranlarına göre, sera koşullarında en yüksek nem oranı %83 ile 14 Aralık 2023 günü belirlenirken, en düşük nem oranı ise %13 ile 28 Ekim 2023 günü kaydedilmiştir (Şekil 1).

Şekil 1. Deney süreci boyunca değişen sıcaklık ve nem salınımı

Saksılardaki ağır metal içeriği Tablo 1 ile ifade edilmektedir. Buna göre kirli saksılarda ortalama Al içeriği 8744 mg/kg iken, kontrol saksılarında bu değer ortalama 8922 mg/kg olarak görülmektedir. Bu durum, yer kabuğundaki doğal Al seviyesinin ortalama 82.300 mg/kg olması sebebiyle kirlilik olarak kabul edilmemektedir. Benzer şekilde, kontrol saksılarındaki Mn seviyesinin ortalama 446 mg/kg konsantrasyonunda olması, bu elementin doğal seviyesinin ortalama 950 mg/kg olması sebebiyle kontrol saksılarında kirliliği ifade etmemektedir (CRC, 2016). Diğer elementler dikkate alındığında, As seviyesi, kirli saksılarda ortalama 25 mg/kg olarak bulunurken kontrol saksılarında 12 mg/kg olarak belirlenmiştir. Bu durum kontrol saksılarında da As kontaminasyonu olduğunu göstermektedir. Cd elementi kirli saksıda 2.28 mg/kg ile kirliliği ifade ederken, kontrol saksısında 0.14 mg/kg ile kontaminasyon olmadığını göstermektedir. Cr değerleri saksılarda ortalama 44 mg/kg seviyesinde olup doğal konsantrasyon olan 102 mg/kg altındadır. Cu konsantrasyonları (kirli toprakta ortalama 69 mg/kg ve kontrol saksılarında ortalama 23.4 mg/kg) maden pasası ile müdahale edilmiş toprakta bu elemente dair önemli bir kontaminasyonu ifade etmemektedir. Benzer şekilde Ni açısından da kontaminasyon söz konusu değildir. Pb konsantrasyonları, kontamine saksılarda ortalama 229 mg/kg ile ciddi bir kurşun kirliliğine işaret etmektedir. Zn ise ortalama 404.7 mg/kg lık seviyelerde kirliliği ifade etmektedir. Çalışmada kullanılan pas örneklerinin terk edilmiş Pb-Zn maden sahasından geldiği dikkate alındığında, kontamine saksılarda yüksek Pb-Zn değerleri beklenen bir durumdur.

**Tablo 1.** Kontamine edilmiş (kirli= ve müdahale görmemiş (Kontrol) topraklardaki ağır metal değişimleri

	Kirli 1	Kirli 2	Kirli 3	Kirli Ortalama $\pm$ SS	Kontrol 1	Kontrol 2	Kontrol 3	Kontrol Ortalama $\pm$ SS
Al (mg/kg)	8331,67	9063,17	8838,53	8744.45 $\pm$ 374.71	8685,18	8832,54	9249,07	8922,26 $\pm$ 292,6

Saksılardaki çimlenmeler deney süreci boyunca düzenli olarak takip edilmiş olup Şekil 2 ile ifade edilmektedir. Buna göre birbirine paralel olarak hazırlanan kirli toprak saksılarında süreç sonucunda %25-65 (ortalama %40) oranında çimlenme gözlenirken, herhangi bir kirletici müdahalesi olmamış toprak içeren saksılarda bu oran %70-95 (ortalama %82) oranında gerçekleşmiştir. Bu durum, ağır metal varlığının bitki gelişimindeki olumsuz etkisini ifade etmektedir.

**Şekil 2.** Saksılardaki çimlenme sayıları

Çalışmada mevsime bağlı olarak bitki gelişimi zayıf gözlemlenmiş olup, kirletilmemiş topraktaki bitki gelişimi kirli toprağa göre daha belirgindir. Aynı zamanda mevsimin sonbahar-kış geçişine denk gelmiş olması ve iklim koşulları bitki gelişiminin olumsuzluğu üzerinde en önemli faktördür.

Bitkilerdeki ağır metal konsantrasyonları Tablo 3 ile ifade edilmektedir. Çizelge aynı zamanda, bitkilerin içerdiği ağır metal seviyeleri ile bu metallerin bitkinin yetiştiği topraktaki konsantrasyonları dikkate alınarak hesaplanan n toprak-bitki transfer katsayıları (TC) nı da içermektedir. Transfer katsayısı bir elementin toprak ortamındaki mobilitesini ve biyoelverişliliğini gösteren önemli bir indikatördür (Chen ve Ma, 2001) Bu değer  $TC = \frac{\text{Bitki dokusundaki ağır metal konsantrasyonu}}{\text{Topraktaki ağır metal konsantrasyonu}}$  ile hesaplanmaktadır (Pascual vd., 2004). Bu değerlere göre, As bitkilerde gözlemlenmemiş olup, topraktan bitkiye geçişi yoktur. Al elementinin kirli toprakta transfer katsayısı 0,21 iken yakın Al konsantrasyonuna sahip temiz saksılarda bu katsayı 494 mg/kg Al ile 0,06 olarak bulunmuştur. Cd elementinin kirletilmiş toprakta yetişen bitkide 2,1 ppm seviyesinde bulunması, 0,93 transfer katsayısına denk gelmektedir. Cr, kirletilmiş toprakta 1,07 transfer katsayısı ile yüksek bir birikime işaret ederken kirletilmemiş toprakta bu değer 0,37 dir. Cu, her iki toprak türünde de 1,63 ve 1,92 TC ile bitkiye geçişi ifade eder. Mn geçişleri düşük

oranda seyrederken (kirlı toprakta 0,19 ve temiz toprakta 0,34), Ni kirlı toprakta 56,6mg/kg ile 1,3 TC olarak bulunmuştur. Kirleticinin asıl bileşeni olan Pb ve Zn sonuçları değerlendirildiğinde ise, Pb kirlı ve temiz topraklarda sırasıyla 0,19 ve 0,64 transfer katsayıları ile bitki bünyelerinde birikim göstermektedir. Diğer yandan kirlı toprakta yetişen bitkide 528,1 mg/kg (1,3 TC) olarak ölçülürken, temiz toprakta bulunan Zn, bitkide 160,4 mg/kg birikerek 2,88 TC ye ulaşmıştır.

**Tablo 2.** Bitkilerde biriken ağır metal seviyeleri ve transfer katsayıları

	Kirletilmiş toprakta yetişen bitki (mg/kg)	Transfer katsayısı	Kontrol saksılarında yetişen bitki (mg/kg)	Transfer katsayısı
Al	1824.1	0.21	494.35	0.06
As	0.0	0.00	0	0
Cd	2.1	0.93	0	0
Cr	47.0	1.07	16.70	0.37
Cu	112.2	1.63	45.01	1.92
Mn	264.3	0.19	150.44	0.34
Ni	56.6	1.30	23.69542	0.53
Pb	43.4	0.19	6.525376	0.64
Zn	528.1	1.30	160.3968	2.88

## SONUÇ

Çalışma, ülkemizde de yoğun olarak yetişen ve tüketilen semizotu bitkisinin madden pasa atığı ile kirletilmiş toprakta ağır metalleri bünyesine alabilme kapasitesi üzerine bir ön değerlendirme çalışmasıdır. 55 günlük çalışma sonucunda, kirlı toprağın bitki büyümesini olumsuz etkilediği gözlemlenmiştir. Toprakta bitkiye ağır metal geçişleri Cr, Cu, Ni ve Zn için transfer katsayısı 1 den büyük olup, anlamlı bir biçimde geçişi ifade etmektedir. Özellikle hareketliliğinin yüksek olduğu bilinen Zn için bu değer bitki gelişiminin daha kuvvetli olduğu kontrol saksılarında 2,88 ile yüksek bir geçişe işaret etmektedir. Çalışmanın sonbahar-kış döneminde gerçekleşmiş olması, ve buna bağlı bitki gelişiminin nispeten zayıf olmasına rağmen elde edilen bitkiye geçiş katsayıları, semizotu bitkisinin gelişimi daha yüksek olan bahar-yaz dönemlerinde kirletilmiş topraklardan fitoremediasyon yolu ile bitkiye ağır metal geçişinin geçerli bir arıtma yöntemi olarak kullanılabilirliğini belirtmektedir.

## TEŞEKKÜR

Çalışma, Dokuz Eylül Üniversitesi BAP Koordinasyon Birimi tarafından kabul edilen FBA-2022-2896 kodlu ve ve “İklim Değişikliğine Uyum Kapsamında Toprak Sağlığı Araştırmaları Canlı Laboratuvarı (LivingLab)” isimli proje ile Avrupa Birliği tarafından desteklenen Prima 2019-11, PRIMA/0009/2019, P2P/PRIMA/1218/0006, 01DH20006, Prima2019-12, STDF Valuefarm projesi tarafından mali olarak desteklenmektedir.

#### Özet

Bakteriyofajların, antibakteriyel etkinlikleri, Sir Alexander Fleming'in penisilini keşfinden yaklaşık 10 yıl öncesinde ilk 'faj tedavisi' denemeleri ile başlamıştır. Antibiyotiklerin ortaya çıkmasıyla, fajların bakteriyel enfeksiyonların tedavisinde kullanımı azalmıştır. Fakat antibiyotiklerin, tedavilerde uzun süreli, yaygın ve gelişmiş güzel kullanımlarından dolayı etkinliklerinin giderek azalması ve bunun sonucunda çoğul antibiyotik dirençli mikroorganizmaların giderek artması, etkili tedavi alternatiflerinin azalmasına yol açmıştır. Ayrıca, bazı bakterilerin oluşturduğu biyofilmler, antibiyotiklerin etkinliğini engelleyip tedavileri güçleştirmektedir. Son yıllarda, yeni antibiyotik geliştirilmediği için, dirençli mikroorganizmaların oluşturduğu enfeksiyonlarda tedavi olanakları azalmaktadır. Bu durum, uygulanabilir alternatif tedavi seçenekleri üzerinde yeni arayışlara zorlamaktadır. Faj tedavisi, şu anda karşı karşıya olunan bakteriyel direnç çağıyla mücadele etmek için önemli bir tedavi alternatifi olabilir. Fajların kısa replikasyon süresi ve çok sayıda yeni faj (virion) oluşturabilme yetenekleri, enfeksiyon etkeni tamamen öldürüldüğünde işlevini durdurması, ökaryot hücrelerde bilinen hiçbir yan etkilerinin olmaması, hızlı ve düşük maliyetli üretimleri enfeksiyon hastalıklarının tedavisinde önemli alternatifler olmasını sağlamıştır. Ayrıca tedavide fajların etkisini artırmak için faj-antibiyotik kombinasyonları veya faj kokteylleri kullanılabilir. İki veya daha fazla farklı fajın oluşturduğu faj kokteylleri, tedavide geniş etki spektrumu sağlar ve direncin ortaya çıkmasını geciktirir/engeller. Böylece, tedavilerde daha uzun süre kullanımlarına imkân sağlanır. Biyofilm oluşturan patojen mikroorganizmaların neden olduğu enfeksiyonların güç olan tedavisinde antibakteriyel olarak kullanılabilirler. Bir diğer yaklaşım ise, fajların, özellikle tıbbi alanlarda veya klinik cihazlarda, kontaminasyonları ortadan kaldıran dezenfektan olarak kullanılmasıdır. Bu derleme, günümüzde enfeksiyon hastalıklarında bakteriyofaj aracılı tedavilere ışık tutmak ve önemini gündeme getirmek amacıyla yazılmıştır.

**Anahtar Kelimeler:** Antibiyotik direnci, bakteriyofajlar, bakteriyofaj tedavisi, kombinasyon tedavi, sinerjistik etki.

#### Abstract

The antibacterial activity of bacteriophages began with the first 'phage therapy' trials about 10 years before Sir Alexander Fleming's discovered penicillin. With the advent of antibiotics, the use of phages in the treatment of bacterial infections has decreased. However, the gradual decrease in the effectiveness of antibiotics due to their long-term, widespread and indiscriminate use in treatments and the consequent increase in multiple antibiotic resistant microorganisms has led to a decrease in effective treatment alternatives. In addition, biofilms formed by some bacteria hinder the effectiveness of antibiotics and complicate the treatment. In recent years, as no new antibiotics have been developed, treatment options for infections caused by resistant microorganisms are decreasing. This situation forces new searches for viable alternative treatment options. Phage therapy could be an important therapeutic alternative to combat the current era of bacterial resistance. The short replication time of phages, their ability to generate large numbers of new phages (virions), their ability to stop functioning when the infectious agent is completely killed, their lack of known side effects in eukaryotic cells, and their rapid and low-cost production have made them important alternatives in the treatment of infectious diseases. In addition, phage-antibiotic combinations or phage cocktails can be used to increase the effect of phages in treatment. Phage cocktails consisting of two or more different phages provide a broad spectrum of action in treatment and delay/prevent the emergence of resistance. Thus, they can be used in treatments for longer periods of time. They can be used as antibacterials in the difficult treatment of infections caused by biofilm-forming pathogenic microorganisms. Another approach is to use phages as disinfectants to eliminate contamination, especially in medical areas or clinical devices. This review was

written to shed light on bacteriophage-mediated therapies in infectious diseases today and to bring up their importance.

**Key Words:** Antibiotic resistance, bacteriophages, bacteriophage therapy, combination therapy, synergistic effect.

## GİRİŞ

Yaklaşık 100 yıl önce keşfedilen bakteriyofaj (faj), kısa iplikli DNA ya da RNA içeren bakteri virüsleridir. Yirmi - otuz dakikalık yaşam siklusları ile basit bir virion yapısına sahiptirler (1). Bakteriyofaj, eski Yunan dilinde “bakteri yiyen” olarak adlandırılmıştır. Bakterilerin geçemediği filtrelerden geçebilen, ultra-mikroskopik organizmalardır. Konak bakteri hücrelerinde çoğalırlar. Bakteriyofajın enfekte ettiği ve ürettiği bakteri türleri kendisine spesifiktir (2). Dünya üzerinde yaklaşık 6000 farklı bakteriyofaj türü olduğu düşünülmektedir. Okyanusta en az  $10^7$  faj  $ml^{-1}$  olduğu ve toprak fajlarının sayısının  $10^8$  virion  $g^{-1}$  kadar olabileceği tahmin edilmektedir (3,4).

Bakteriyofajların, antibakteriyel etkinlikleri, Sir Alexander Fleming'in penisilini keşfinden yaklaşık 10 yıl öncesinde ilk 'faj tedavisi' denemeleri ile başlamıştır. Frederick William Twort (5) ve Felix d'Hérelle (6), sırasıyla 1915 ve 1917 yıllarında birbirinden bağımsız olarak bakteriyofajları keşfetmişlerdir, d'Hérelle özellikle o zamana kadar başarılı bir tedavisi bulunmayan dizanteri gibi enfeksiyonları tedavi etmek için faj süspansiyonlarını kullanmıştır (7). Antibiyotiklerin ortaya çıkmasıyla, fajların önemi azalmasına rağmen, bakteriyel enfeksiyonların tedavisinde fajların kullanımı dünyanın çeşitli bölgelerinde, özellikle Doğu Avrupa ülkeleri ve Rusya'da devam etmiştir. Fajlar, en sıklıkla Gürcistan'da bakteriyel enfeksiyonların tedavisinde kullanılmıştır. d'Hérelle ve George Eliava 1923 yılında, Tiflis'te Eliava Enstitüsü'nü kurmuşlardır. Eliava Enstitüsü'nde, ikinci dünya savaşı sırasında yaralanan askerlerin tedavisinde faj kokteylleri kullanılmıştır. Günümüzde aynı enstitüde, bakteriyofaj uygulamaları devam etmektedir. Ayrıca, enfeksiyonu önleme ve tedavisi, veterinerlik, çevre kontrolü ve gıda güvenliği alanlarında da faj uygulama çalışmaları yapılmaktadır (8). Polonya'nın Wrocław şehrinde, 2005 yılında, özellikle antibiyotik tedavisine dirençli kronik bakteriyel enfeksiyonları tedavi etmek için fajların kullanıldığı faj terapi merkezi kurulmuştur (9).

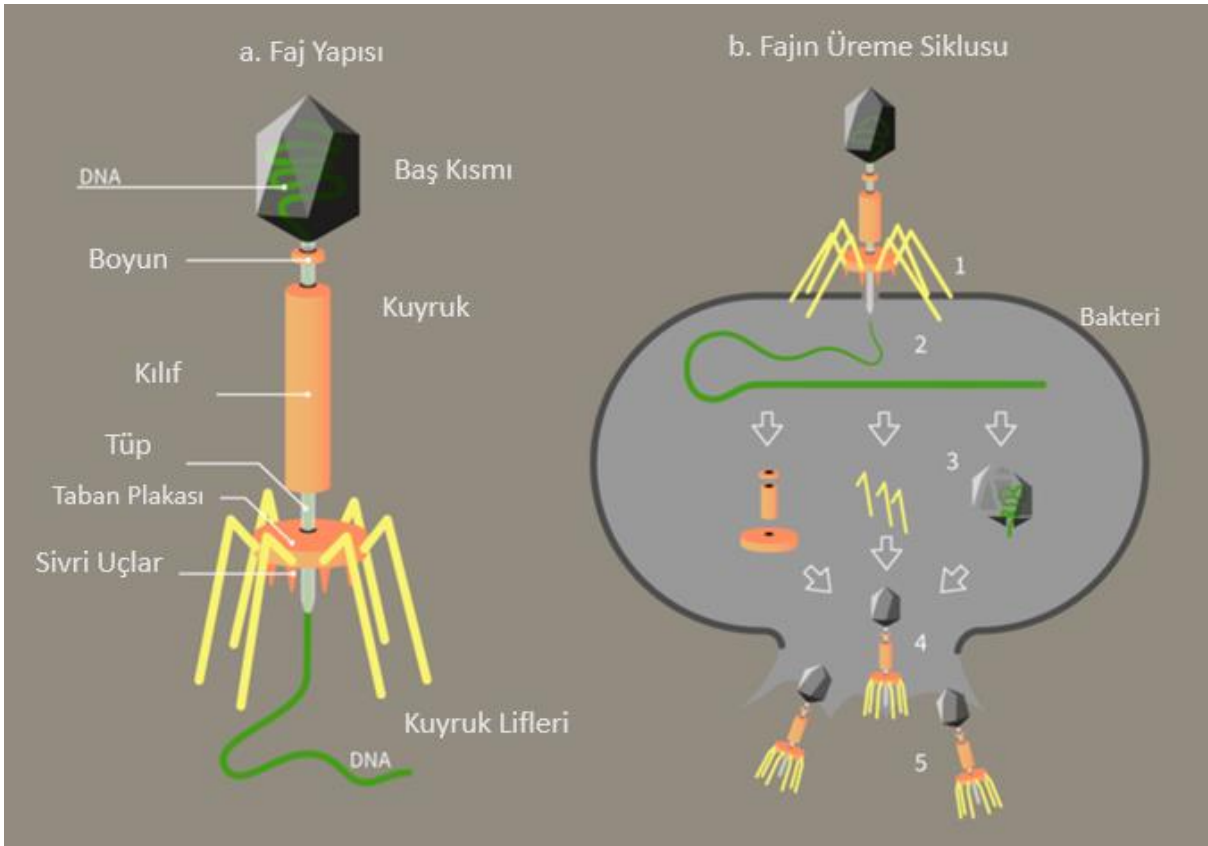

Çoğul antibiyotik dirençli mikroorganizmaların giderek artması, tedavide etkili antimikrobiyal alternatiflerinin azalmasına yol açmıştır. Dünya Sağlık Örgütü, 2017 yılında yeni antibiyotiğe ihtiyaç olan küresel dirençli patojenler listesi yayınlamıştır (10). Özellikle hastane kaynaklı ESKAPEE patojenleri olarak adlandırılan vankomisin dirençli *Enterococcus faecium*, metilisin ve vankomisin dirençli *Staphylococcus aureus*, karbapenem dirençli *Klebsiella pneumoniae*, *Acinetobacter baumannii*, *Pseudomonas aeruginosa*, *Enterobacter spp.* ve karbapenem dirençli *Escherichia coli* etkenleri, yeni uygulanabilir alternatif tedavi seçenekleri için arayışları zorlamaktadır. Ayrıca, bazı bakterilerin oluşturduğu biyofilmler, antibiyotiklerin etkinliğini engelleyebilir. Biyofilm oluşumu, çoğu bakteri türleri tarafından hayatta kalmak için antibiyotiklere ve konak bağışıklık sistemine karşı direnci arttırmayı sağlayan önemli bir mekanizmadır (11,12). Fajlar, biyofilme ilişkili enfeksiyonların tedavisinde geleneksel antimikrobiyalere göre çeşitli avantajlar sağlarlar (13,14). Fajların üretilmesi basittir ve antibiyotiklere göre daha ucuzdur. Mikrobiyotanın korunmasına yardımcı olur ve enfeksiyon etkeni tamamen öldürüldüğünde işlevini durdurur. Antibiyotik alerjisi olan hastalar için kullanılabilir ve ökaryot hücreleri üzerinde litik etkisi yoktur. Ayrıca fajların etkisini artırmak için faj-antibiyotik kombinasyonları veya faj kokteylleri kullanılabilir (15,16).

Antibiyotiklerin, bakteri enfeksiyonlarının tedavisinde uzun süreli, yaygın ve geliş güzel kullanımlarından dolayı etkinlikleri azalmıştır (17). Son yıllarda, yeni antibiyotik geliştirilmediği için, antimikrobiyal dirençli mikroorganizmaların oluşturduğu enfeksiyonlarda tedavi olanakları azalmaktadır. Bundan dolayı farklı etki mekanizmalarına sahip, yeni terapötik ajanların araştırılması gerekmektedir (18). Faj tedavisi, şu anda karşı karşıya olunan bakteriyel direnç çağıyla mücadele etmek için önemli bir tedavi alternatifi olabilir. Bu derleme, günümüzde bakteriyofaj aracılı enfeksiyon hastalıklarının tedavilerine ışık tutmak ve önemini gündeme getirmek amacıyla yazılmıştır.

### Bakteriyofaj Yapısı ve Mekanizması

Basit bir faj partikülü, içerisinde genetik materyali bulunan bir baş, boyun, kuyruk ve kuyruk liflerinden oluşmaktadır. Baş kısmı, tek tip bir nükleik asitten (DNA veya RNA) ve genetik materyali koruyan protein yapıda kasılabilen kapsid kılıftan oluşur (Şekil 1) (19). Baş bölgesini kuyruk kısmına bağlayan kısa bir boyun bulunur. Fajların büyük çoğunluğu, konak bakterinin yüzeyindeki spesifik bir reseptörün tanınmasını ve hücre yüzeyine bağlanmasını sağlayan taban plakasına ve kuyruk liflerine sahiptir. Kuyruk, enfeksiyon sırasında nükleik asidin aktarıldığı bir tüptür (20). Faj kapsidine bağlı olan bu fibrin yapıdaki kuyruk, bakteri hücre yüzeyindeki spesifik reseptörüne bağlanmak amacıyla kullanılır (21).

**Şekil 1.** a. Faj Yapısı, b. Fajın Üreme Siklusunu; 1: Faj kuyruk liflerinin bir bakteriyeye bağlanması, 2: DNA enjeksiyonu, 3: Faj yapı taşlarının oluşması, 4: Yeni virionların oluşması, 5: Bakteri lizisi ve virionların hücreden salınması (19)

Fajlar, litik ve lizojenik olmak üzere iki viral replikasyon siklusuna sahiptirler. Litik fajlar bakteri hücrelerini parçalayarak etki gösterirken, lizojenik fajlar hücre içinde latent kalır ve hücreyi hemen eritmezler (22). Litik bir faj enfeksiyonu, fajın kuyruk fibrillerini bakterilerin hücre yüzeyindeki spesifik reseptörlerine adsorbe etmesiyle başlar. Bakteri hücre yapısında çok çeşitli reseptör bulunmasına rağmen, fajlar esas olarak bakteri hücre duvarının bileşenleri üzerinde bulunan hücre yüzeyi yapıları, örneğin, porinler, efluks pompaları, lipopolisakarit ve peptidoglikan gibi yapılara bağlanır (23). Fajlar, konak hücre reseptörüne bağlanarak genomunu bakteri sitoplazmasına aktarırlar. Transkripsiyon, translasyon ve replikasyon yoluyla kendi yapı taşlarının sitoplazma içerisinde oluşmasını sağlarlar. Bu yapı taşlarının bir araya gelmesiyle virionlar oluşur ve hücrenin lizisine yol açarlar. Serbest kalan yeni litik bakteriyofajlar, yeni bakteri hücrelerini enfekte ederler. Litik bakteriyofajlara benzer şekilde, lizojenik bakteriyofajlar da doğada oldukça yaygındır. Lizojenik bakteriyofaj genomu, konak bakteri tarafından alındıktan sonra konak hücre genomuna entegre olur. Faj genomu, konak hücre genomu ile birleştiği için yeni faj yapı taşları ve virionlar oluşturulmaz. Bundan dolayı faj tedavisinde lizojenik fajlar kullanılmaz sadece litik fajlar kullanılır (24).

#### **Faj Tedavisi Uygulamaları**

Faj tedavisi bir asır öncesinden beri kullanılmaktadır. Çoğul antibiyotik dirençli bakterilerin ortaya çıkışı, yeni tedavilere ihtiyaç duyulmasına yol açmıştır. Fajların, kısa replikasyon süresi ve dolayısıyla çok sayıda yeni fajı (virion) hızla oluşturabilme yetenekleri, ökaryot hücrelerde bilinen hiçbir yan etkilerinin olmaması, hızlı ve düşük maliyetli üretimleri enfeksiyon hastalıklarının tedavisinde önemli alternatifler olmasını sağlamıştır (25).

Fajların, patojen bakterilerin meydana getirdiği enfeksiyonları engellemelerinin yanı sıra bir diğer önemli özelliği, biyofilm oluşturan patojen mikroorganizmaların neden olduğu enfeksiyonların tedavisinde antibakteriyel olarak kullanılmasıdır. Bir diğer yaklaşım ise fajların, özellikle tıbbi alanlarda veya klinik cihazlarda kontaminasyonları ortadan kaldıran dezenfektan olarak kullanılmasıdır.

İki veya daha fazla farklı fajın oluşturduğu faj kokteylleri, tedavide geniş etki spektrumu sağlar ve direncin ortaya çıkışını geciktirir/engeller. Böylece tedavilerde daha uzun süre, etkili şekilde kullanımları mümkün olur. Ayrıca bakteriyofaj kokteyllerinin, *E. coli*, *Salmonella enterica* veya *Listeria* cinsi bakterileri uzaklaştırarak gıdaların dekontamine edildiği gösterilmiştir (26,27).

### **Bakteriyofaj Kokteyl Tedavisi**

Bakteriyofaj monoterapisinin dar spektrumlu olması sorunundan dolayı tek bir faj tedaviyi sağlayamayabilir. Bundan dolayı tedavilerde faj kokteylleri önerilmektedir. Faj kokteyllerinin, monofaj tedavisine kıyasla faja dirençli bakteriyel mutantların ortaya çıkışını azalttığı da gösterilmiştir. Mikroorganizma, tedavi kokteylindeki fajlardan birine karşı direnç geliştirirse, diğer faj antimikrobiyal etkiyi koruyarak bakteriyi enfekte etmeye devam eder. Bir faj kendi spesifik konak reseptörüne bağlandığında, bakteri hücresi bu reseptörün yapısını değiştirerek fajların bağlanma kapasitesini azaltabilir veya engelleyebilir (28). Ayrıca, direnç mekanizmaları faj replikasyon döngüsünün herhangi bir aşamasında da ortaya çıkabilir (29).

Bakteriyofaj kokteyl tedavisi kavramı genişletilebilir; yani her bakteriyofaj, bir kokteylde diğer bakteriyofajlarla birlikte değil sırayla kullanılabilir. Sürekli uygulama sayesinde direnç oluşsa bile direnç geliştirmemiş diğer bakteriyofajlar etki göstermeye devam edecektir. Hayvanlarla yapılan çalışmalarda, bakteriyofaj kokteyllerinin sıralı uygulanması ile, bakteri popülasyonlarını ve bakteriyofaj direncini azaltmada umut verici sonuçları elde edilmiştir (30). Esmael ve ark. (31), yaptıkları çalışmada çoklu ilaca dirençli *Proteus mirabilis* suşunu enfekte eden üç yeni bakteriyofajı izole etmiştir ve çoklu ilaca dirençli *P. mirabilis*'in biyofilme ilişkili enfeksiyonlarını kontrol etmek ve ortadan kaldırmak için faj kokteylinin bireysel fajlardan daha geniş bir spektrum gösterdiğini bildirmişlerdir.

### **Bakteriyofaj ve Antibiyotik Kombinasyonu**

Faj terapisi ilk olarak 1900'lü yılların başında uygulanmış olsa da fajların terapötik potansiyellerinin tam olarak ortaya çıkarılması zaman almıştır. Başlangıçta, batı dünyasında terk edilmesine rağmen, antibiyotik direncindeki artış, faj tedavisinin yeniden gündeme gelmesine yol açmıştır (32). Klinik olarak, tedavilerde bir antibiyotik kullanımını bazen yeterli olmayabilir. Sinerjistik etkili antibiyotik kombinasyon tedavisi, monoterapiden daha güçlü tedavi etkisine sahiptir (33). Dirençli enfeksiyonları tedavi etmek için bakteriyofajlar ve antibiyotiklerin kombinasyonu umut vericidir. Faj-antibiyotik kombinasyon tedavisi, hastalığa neden olan bakterilerin antibiyotiklere dirençli olduğu veya antibiyotiklerin enfekte bölgeye yayılımının yeterli olmadığı durumlarda özellikle tercih edilebildiği bildirilmektedir. Fajların bakteriyel etkileşimi sonucunda, bakterinin antibiyotikle etkileşimi azalır ve böylece antibiyotiğe dirençli bakterilerin ortaya çıkışı gecikir/engellenir. Ancak, çalışmalarda daha fazla klinik veri elde edilmedikçe, fajların antibiyotik yerine kullanılması mümkün olmadığı bildirilmektedir (18).

Comeau ve ark. (34), faj-antibiyotik sinerjistik etkileşimini (FAS), litik bakteriyofajların hızla çoğalmasına ve antibiyotiklerin öldürücü olmayan, düşük konsantrasyonuna (sub-lethal konsantrasyon) bağlamıştır. Yapılan bu çalışmada, antibiyotik sub-lethal konsantrasyonunun, bakteri hücrelerinin biyosentez kapasitesini arttırabildiği bildirilmiştir. Böylece litik fajların hızla çoğalması ve hücrelerin hızla parçalanarak fajların antibakteriyel etkinliklerinin artması sağlanır. Aynı çalışmada, bir sefalosporin olan sefotaksim düşük dozda, üropatojenik bir *E. coli* suşunun wMEP faj üretimini 7 kattan daha fazla arttırdığı rapor edilmiştir. Buna benzer etkileşimin T4 benzeri fajların birlikte olduğu B-laktam, kinolon ve mitomisin C gibi antibiyotiklerin ölüm dozu altındaki konsantrasyonlarındaki çeşitli bakteri-faj sistemlerinde de gözlemlenmiştir. Bu durumun fajlara önemli bir avantaj sağladığı bildirilmiştir.

Yapılan bir çalışmada, nozokomiyal kaynaklı biyofilm oluşturmuş *Pseudomonas aeruginosa* suşu üzerinde faj-antibiyotik etkisi incelenmiştir. Kombine faj-streptomisin tedavisinin, tekli tedaviye kıyasla bakteri yoğunluğunda önemli ölçüde bir azalmaya neden olarak sinerjistik etkileşimi saptanmıştır (35).

Chhibber ve ark. (36), litik bakteriyofajlar ve linezolid kombinasyonunun, diyabetik ayak ülserlerinde antimikrobiyal dirençli enfeksiyonların tedavisinde monoterapiden daha etkili olduğunu bildirmiştir. Oechslin ve ark. (37), siprofloksasin ve bakteriyofaj kokteyllerinin bir kombinasyonunun sıçanlarda deneysel endokardit üzerinde sinerjistik bir etkiye sahip olduğunu bildirmişlerdir.

### **Bakteriyofajların Anti-biyofilm Etkileşimleri**

Biyofilm oluşturabilen nozokomiyal patojenlerle oluşan enfeksiyonların sayısı giderek artmaktadır. Biyofilm içindeki bakteriler, genellikle biyosit ve antibiyotik gibi maddelere karşı yüksek düzeyde direnç gösterebilirler (12,38). Biyofilm matriksinin geçirimsiz olması nedeniyle, biyofilmlerin bakteriyofajlara direnç sağladığı sıklıkla varsayılabilir da birçok bakteriyofajın, biyofilmler içindeki bakterileri enfekte edebildiği bildirilmiştir (39). Fajlar, biyofilmin parçalanmasını sağlayan depolimerazlar, endolizinler gibi enzimler üretirler (11). Ayrıca, fajlar tarafından üretilen enzimler biyofilmin dış kısmındaki bakterileri yok ettiğinde, biyofilmin iç kısmındaki mikroorganizmalar metabolik olarak daha aktif hale gelir (artan oksijenizasyon ve besin nedeniyle) ve böylece, bu mikroorganizmalar fajların ve antibiyotiklerin etkisine daha duyarlı hale gelirler (39,40). Ali ve ark. (41), yaptıkları bir çalışmada *Proteus spp.* suşlarına etki eden RP6 ve RP7 fajlarını izole ederek bu fajların özellikle *P. mirabilis* suşunun kristalin biyofilm üretimine etki ettiğini göstermişlerdir. Aynı çalışmada izole edilen fajların, geniş bir pH aralığında (4-10) hem asidik hem de alkali koşullarda iyi bir stabilite gösterdiği bildirilmiştir. Ayrıca fajın pH değerlerinin dalgalanma yaptığı yerlerde etkili bir terapötik ajan

olabilmesi için, geniş bir pH aralığını tolere etmesi gerektiği, böylece başarılı bir anti-biyofilm ve antibakteriyel etkili olabildiği de gösterilmiştir (41).

## SONUÇ

Sonuç olarak, günümüzde bakteriyofaj araştırmalarında büyük ilerlemeler kaydedilmiştir. Bakteriyofaja dayanan tedavi seçeneklerinin, gelecekte antimikrobiyal ajanlara dirençli enfeksiyonların tedavilerinde önemli bir alternatif haline gelebileceği düşünülmektedir. Daha fazla araştırma yapılması gereğine rağmen, bakteriyofajların antibiyotiklerle kombinasyonu, sınırlı tedavi seçeneği olan veya antimikrobiyal tedavi imkânı olmayan mikroorganizmaların eradikasyonunda önemli bir tedavi seçeneği olabilir. Bu yaklaşım antibiyotik dozunun düşürülmesini sağlayabilir. Böylece tedavi sırasında antibiyotik direncinin ortaya çıkma potansiyelini de azaltabilir.

## ORAL PRESENTATION

### Analysis of *nDart1-0* DNA transposon by qRT-PCR in rice cultivars under drought stress

#### Abstract

Stress can be defined as factors that alter or disrupt metabolic homeostasis in plants, causing any change in the growth and development of the plant in its habitat. Stress conditions adversely affect the physiological functions of plants, leading to a decrease in their biosynthesis capacity, changes in their normal functions and causing great damage that can cause the death of the plant. Drought, which is one of the abiotic stress factors, is defined as "the lack of necessary and sufficient moisture for a plant to complete its normal growth and life cycle" and is considered to be the most destructive stress factor that reduces crop productivity in agricultural production compared to other environmental stresses. Transposons are sequences that can move to different locations in the genome of a cell through a process called transposition. Transposons are activated by various biotic and abiotic stresses and it has been determined that these activated transposons are associated with reactions that trigger the biosynthesis of secondary metabolites in the plant defence system, stimulation of signalling pathways. In this study, the gene expression level of *nDart1-0* DNA transposon, which is one of the transposons with important effects on gene function and genome, was analysed by qRT-PCR in Osmancık-97 and Halilbey wheat cultivars, which were drought tolerant and sensitive to drought stress, respectively, in order to understand the mechanism of drought stress. In the qRT-PCR study, it was observed that the gene level of *nDart1-0* DNA transposon increased and this transposon was active in Osmancık-97 and Halilbey rice varieties as a result of drought stress. In addition, the presence of this transposon in rice before is thought to be a transition between these species. In order to further understand the activity of these transposons, it will be more efficient to investigate them in different species.

**Keywords:** Drought, gene expression, *Oryza sativa*, transposon

#### INTRODUCTION

Since the optimum environmental requirements for the growth, development and survival of each plant species are different, the survival of plants under stressful conditions is possible by providing optimum conditions. Every abnormal change in the environmental conditions in which plants live adversely affects plant growth and development and gives rise to the concept of stress. Stress can be defined as factors that alter or disrupt metabolic homeostasis in plants and cause any change in the growth and development of the plant in its habitat (Shulaev et al., 2008). Stress conditions can negatively affect the physiological functions of plants, reducing their biosynthesis capacity, altering their normal functions and causing plant death. cause damages (Lichtenhaler, 1996). Drought, which is one of the abiotic stress factors, is defined as "the lack of necessary and sufficient moisture for a plant to complete its normal growth and life cycle" and is considered to be the most destructive stress factor that reduces crop productivity in agricultural production compared to other environmental stresses (Lambers et al., 2008). The negative impact of drought on the plant depends not only on the severity and duration of the drought, but also on the stage of development of the drought-exposed plant. While the growth and development of plants exposed to drought at the young stage is affected, crop yield is affected in plants exposed to drought during flowering or seed setting (Çırak and Esendal, 2006). Drought stimulates many adaptive physiological, molecular and biochemical responses in plants depending on its duration, its relationship with other types of stress, the genotype and developmental stage of the stressed plant. The elucidation of molecular control mechanisms related to drought stress is based on the expression of specific stress-related genes (Wang et al., 2003). These genes can be broadly classified as early and late induced genes. Early genes are induced as soon as the stress signal is detected and are generally expressed for a short period of time. Many transcription factors, protein kinases, phospholipases and phospholipases are included in

the group of early genes and the induction of these genes does not require new protein synthesis and signaling compounds are always readily available. Genes that are activated very slowly by stress belong to the group of late-induced genes and their expression is usually continuous. Water channel proteins, enzymes involved in the biosynthesis of osmotic protectors (sugars, proline, glycine betaine), LEA (late embryogenesis abundant) proteins, chaperones, proteins that protect macromolecules and membranes such as mRNA binding proteins, proteases, detoxification enzymes (Cramer et al., 2007, Verelst et al., 2013, Todaka et al., 2015).

Transposons are sequences that can move to different locations in a cell's genome through a process called transposition. Transposons change the expression of genes in their new locations on chromosomes. As a result, they affect existing genetic data and cause significant changes in gene expression. In addition, DNA transposons and retrotransposons, which proliferate by replication, lead to genome expansion. Transposons induce events such as insertions, inversions, deletions and duplications, leading to mutations and the formation of new alleles. These new formations are seen as an effective mechanism for the emergence of new species in the evolutionary process (Mao et al., 2015). Transposons regulate gene expression both through the influence of methyl groups on neighboring regions and by interfering with transcription through the RNAi (RNA interference) mechanism. Through this epigenetic gene regulation, transposons are involved in many mechanisms ranging from tissue differentiation during embryonic development to the maintenance of differentiation of different tissues in the adult (Jurka, 2008). In addition, some transposons were found to be activated by various biotic and abiotic stresses and it was revealed that these activated transposons were related to the plant defense system, stimulation of signaling pathways and reactions that trigger the biosynthesis of secondary metabolites.

Rice (*Oryza sativa* L.) is the plant from which rice, the most important staple food worldwide, is obtained. It is a member of the Wheat family (Poaceae). With an annual production of 400 million tons, it is the most widely cultivated irrigated cereal in the world. Rice provides 21% of global per capita human caloric needs and 15% of per capita protein. There is a rich genetic diversity in cultivated rice varieties, but this alone is not sufficient for yield increase. For this reason, it is important to study and understand DNA transposons that can alter the organization of the genome in order to increase productivity and to identify and develop rice varieties resistant to abiotic and biotic stresses (Baloch et al., 2015). Recently, a lot of focus has been placed on DNA transposons that result in changeable alleles in plants and how to use transposon tagging as a functional genomic tool to clarify the function of key genes (Kunze and Weil, 2002). A large part of the rice genome is composed of transposons. Since active excision/reintegration of these mobile elements may result in harmful genetic changes, many transposons are maintained in a genetically or epigenetically inactivated state. However, some non-autonomous DNA transposons of the *nDart1-3* subgroup, including *nDart1-0*, actively transpose in specific rice lines, such as *pyl-v* which carries an active autonomous element, *aDart1-27*, on chromosome 6.

The aim of this study was to investigate the expression level of *nDart1-0* DNA transposon in drought-tolerant Osmancık-97 and drought-sensitive Halilbey rice cultivars in leaf tissues under drought stress by qRT-PCR.

## MATERIALS AND METHODS

### Plant Material

Pots measuring 14x13 cm were cleaned and sanitized before being used to grow seeds of two distinct varieties of rice (Osmancık-97 and Halilbey). The seeds of the genotypes were sterilized three times with deionized water (dI-H<sub>2</sub>O) after being exposed to 5% sodium hypochlorite for 10 minutes. Three-wheeled plastic pots measuring 30 x 50 inches in diameter and filled with 1 kilogram of soil were used to plant the seeds of the different types. After all, until the period of 6-7 leaves, germination of the seeds was irrigated at the field's capacity. Irrigation was stopped so that the group may receive a therapy for drought stress. When the control group began to exhibit signs of stress after two weeks of watering at the field capacity, the irrigation group stopped. At the end of the 15th day of the stress application, leaf samples were taken randomly from 3 different pots containing both control and treatment plants and placed in separate transparent bags, quickly preserved in liquid nitrogen and the materials were placed in -80°C deep freezer for RNA isolation studies.

## RNA Isolation Method

RNA isolation from leaf tissues was performed according to the TRIzol method. 1 ml TRIzol reagent was added to 2 ml ependorf tubes and kept ready at 4°C. Approximately 100 mg of each root and leaf sample was taken and crushed in sterile mortars using liquid nitrogen and the powdered samples were quickly transferred to the tubes. The tubes were mixed by turning the tubes up and down rapidly and a homogeneous mixture was obtained. The tubes were kept at room temperature for 10 min. For 1 ml TRIzol, 0.2 ml chloroform was added to the tubes. The tubes were well capped and mixed by shaking vigorously by hand for 15 sec. After 5 min at room temperature, the mixture was centrifuged at 15,000 rpm for 17 min at 4°C. After transferring the upper liquid phase to new tubes, 500 µl of isopropyl alcohol (half the amount of TRIzol) was added to these tubes for RNA precipitation. After 10 min at room temperature, the tubes were centrifuged at 12,000 rpm for 10 min at 4°C and the supernatant was discarded. Precipitated RNA was washed with 1 ml of 75% ethanol. Samples were centrifuged at 10,000 rpm for 5 min at 4°C. The supernatant was discarded and the bottom RNA precipitate was allowed to dry. 30-70 µl ddH<sub>2</sub>O was added to the tubes and kept in the heat block at 57°C for 10 min to dissolve the RNAs. The quality and quantity of isolated RNAs were checked on 2% agarose gel and nano-drop spectrophotometer. The RNA samples were then removed to -80°C for use.

## cDNA Synthesis and qRT-PCR Analysis

Fermentas Kit (Fermentas, Ontario, Canada) was used to obtain cDNA from RNA extracted from leaf tissue to determine the expression level of the *nDart1-0* transposon by simultaneous qRT-PCR. To start the study with equal amounts of RNA, the amount of RNA to be used was calculated as 1000 ng of total RNA from each sample. For 1X (1 sample), 1 µl Oligo dT, 1000 ng RNA and water were added to a total volume of 11 µL and the tubes were incubated in the PCR device at 65°C for 5 min. After this time, the tubes were immediately buried in ice and kept on ice for 2 min. Then, 4 µL 5X Buffer, 2 µL 10 mM dNTP, 1 µL RNase out, 2 µL Reverse Transcriptase enzyme were added to each tube and the total volume was completed to 20 µL. The PCR device was placed at 37°C for 60 min, 70°C for 5 min and the reaction was terminated at 4°C. Then, PCR optimization of all cDNAs generated with 18S rRNA primers was performed and the formation of cDNAs was checked by running on a 1.5% agarose gel. After controlling the cDNA reaction, the single-stranded cDNAs were amplified in the Thermo Scientific PikoReal Real-Time PCR System using primers, SYBR Green I Master Mix (Roche Applied Science, Penzberg, Germany) and after each cycle of PCR, the signals given by the fluorescent dye increasing in proportion to the amount of product formed were analyzed. Each sample was prepared in triplicate to minimize experimental errors. The 18S gene was used as a control for normalization of the expression levels of the samples. For qRT-PCR assay 1X, 18 µL of the mixture prepared using 0.1 µL forward primer, 0.1 µL reverse primer, 10 µL 2X Fast SYBR Green Master Mix (Roche, Cat no: 4385612) and 7.8 µL nuclease-free water was placed separately in each reaction well of the 96-well plate, 2 µL of the cDNA products to be measured were added and placed in the qRT-PCR device.

## RESULTS and DISCUSSION

In general, transposons are divided into two groups, retrotransposons and DNA transposons, according to their mechanism of transposition in the genome. Retrotransposons are restricted to LTR ("Long Terminal Repeat") sequences, while DNA transposons are restricted to TIR ("Terminal Inverted Repeat") sequences and play an important role in transposition. Considerable attention has recently been given to DNA transposons causing mutable alleles in plants for utilizing transposon tagging as a functional genomic tool to elucidate the function of genes of interest (Johzuka-Hisatomi et al. 2008). While endogenous active DNA transposons, which are free from somaclonal variation because no tissue culture is involved in generating insertion mutants, have been extensively used for gene tagging in maize, snapdragon, petunia, and morning glories, only a few active endogenous DNA transposons, *mPing*, *nDart1*, *dTok*, and *nDaiZ*, have been identified in rice (Huang et al., 2009).

In this study, expression levels of *nDart1-0* DNA transposon in drought-tolerant Osmancık-97 and drought-sensitive Halilbey rice cultivars were analyzed under drought stress and its relationship with drought mechanism was examined. Drought stress conditions were applied and increases were observed in the expression level of *nDart1-0* transposon in the treatment group Osmancık-97 and Halilbey varieties due to drought stress compared to the control group (Figure 1).

**Figure 1.** Expression level of *nDart1-0* DNA transposon in Osmancık 97 and Halilbey rice varieties (O=Osmancık 97, H=Halilbey, C=Control, T=Treated)

## CONCLUSION

Understanding the molecular, cellular and physiological adaptation to drought and high temperature conditions is possible by revealing the signal transduction mechanisms in plants, the perception of stress signals, the activation of many transcription factors and other regulators, and the expression products of genes. Drought and high temperature stress tolerance is a complex event in which structural and functional changes in the cell membrane, tissue water content, composition of proteins, lipids, primary and secondary metabolites are controlled by the participation of many genes. Transposons are mobile elements that provide considerable dynamism to the genome and make up the bulk of the genome. In their new locations on the chromosomes they cause significant changes in the expression of genes. It is thought that the information obtained as a result of this study will make important contributions in terms of determining the molecular mechanism of abiotic stress tolerance in plants, identifying the related genes and molecular markers and using these markers in advanced plant breeding studies.

#### Abstract

The production of bio-based chemicals based on renewable resources has become increasingly important in recent years. Chemicals synthesized based on raw materials produced from fossil resources necessitated the search for new resources and production technologies in terms of both the limitation of the reserve and the negative effects of the production process on the environment. Lignocellulosic biomass is seen as an important raw material due to their abundance and economical nature. Hydrothermal decomposition of glucose and fructose which is one of the building blocks of cellulose and hemicellulose, which are basic components of biomass, under subcritical conditions of water into valuable chemicals is one of the important methods. In this study, Jerusalem artichoke, which is lignocellulosic biomass rich in inulin, was used as raw material. Hydrothermal decomposition experiments were carried out in batch-operated stirred reactors and in a temperature-programmed (heating speed adjustable PID unit) system. In experimental studies, the effect of reaction time, and catalyst on the conversion of the platform chemicals in the presence of mineral acid (HNO<sub>3</sub>) was investigated. Liquid products determined in HPLC device; levulinic acid, hydroxymethyl furfural, acetic acid, and formic acid. The product yields were calculated by determining the amounts of these compounds and sugar monomers (glucose, fructose, arabinose, rhamnose, cellobiose, sucrose, mannose, xylose, galactose). It was determined that nitric acid was effective in hydrolyzing lignocellulosic biomass, but the organic acid yield was low.

**Keywords:** Jerusalem artichoke, levulinic acid, biomass decomposition, hydrolysis, HNO<sub>3</sub>

#### INTRODUCTION

The rapid decrease in fossil fuel resources such as oil, natural gas and coal and the environmental pollution resulting from the use of these fuels have accelerated the search for renewable alternative energy sources and the production of valuable chemicals from these resources. Lignocellulosic biomass; It is one of the alternative energy sources as it is abundant, cheap and renewable. Only 5% of all chemicals produced today are obtained from renewable sources. Only 3-4% of the biomass produced in the world is consumed in food and non-food areas. The energy content of the unused part is 8 times the total energy consumed in the world. Intensive studies are being carried out on converting this great potential into liquid and gaseous fuels and various chemicals through chemical and biochemical processes. It is thought that biomass may be an alternative to fossil-based raw materials in the future.

Biomasses mainly contain cellulose, hemicellulose and lignin. With the hydrolysis, dehydration and rehydration of cellulose and hemicellulose in lignocellulosic biomass in acidic environment, many chemical substances are formed depending on the reaction conditions, especially 5-HMF, levulinic acid (LA), furfural and formic acid (D.W. and W.O. 2011; Signoretto et al. 2019; Werpy and Petersen 2004).

BASE. Department of Energy (DOE) studies have identified 300 candidate chemicals that can be produced from lignocellulosic biomass. By examining their production processes, the number of potentially important chemicals was reduced to 30, and a list of 12 leading chemicals (Building Blocks) was subsequently published in 2004. These chemicals will form the basis of biorefineries, which are planned to replace petrochemical refineries in the very near future. One of these 12 chemicals is stated as Levulinic Acid (LA).

Among some polysaccharides and monosaccharides, the highest efficiency in the conversion process to 5-HMF by acidic hydrolysis was achieved in studies conducted with fructose. Inulin, as an oligofructosaccharide (polysaccharide), can be converted first into 5-HMF and then into Levulinic acid with an easier and higher

conversion compared to cellulose. Inulin-rich biomass has a significant potential for levulinic acid production (Bedzo, Mandegari, and Görgens 2020; Fachri, Rasrendra, and Heeres 2015; Qiu et al. 2018; Sarchami and Rehmann 2015; Wang et al. 2015).

## MATERIALS AND METHODS

Jerusalem artichoke was obtained and pre-dried for 3 days at 40°C in a Fischer Brand air circulating tray dryer in order to clean, roughen, dry and then make the samples suitable for grinding in the mill. Dried samples were ground in an MF-IKA Brand rotor grinder, and samples ground to <1 mm grain size by sieve analysis were reserved for use in subsequent studies. The samples, which were pre-dried and grinded, were first subjected to moisture analysis. In this context, the process was continued until a constant weight was reached in the oven kept at 105°C and the amount of moisture was determined. In addition, the samples were burned in a muffle furnace using the standard ash determination method and their ash content was determined. Lignocellulosic biomass has been used to obtain valuable water-soluble organic compounds under subcritical water conditions (below 374°C and 221 atm).

Hydrothermal cracking experiments were carried out in batch-operated stirred reactors. Feed solution of different concentrations was placed in reactors with an internal volume of 50 cm<sup>3</sup>, tightly closed and purged with nitrogen gas. The reactors were heated to the desired reaction temperature in a temperature-programmed system (with a PID unit with adjustable heating rate), and were kept at this temperature for a 120 minutes' reaction time, and samples were taken to be analyzed at different time periods.

**Figure 1.** Batch, stirred and temperature-controlled reactor system

The purpose of selecting Jerusalem artichoke as a biomass source for valuable chemical production is the high inulin content that belongs to extractive part as displayed in Table 1. Inulin is a naturally occurring polysaccharide found in many plants, particularly in the roots or tubers of certain species like chicory, Jerusalem artichoke, and dandelion. It is composed of linear chains of fructose molecules linked together by  $\beta(2\rightarrow1)$  glycosidic bonds, with a terminal glucose unit. Inulin content can vary widely among plant species and even within different parts of the same plant. In general, plants that are known for their high inulin content, such as chicory and Jerusalem artichoke, can have inulin levels ranging from 15% to 20% or more in their dry biomass. However, this can vary significantly.

Inulin can be hydrolyzed and further processed to produce levulinic acid. Levulinic acid is a platform chemical that has applications in the production of biofuels, pharmaceuticals, and as a building block for various chemicals and plastics (Bhagia et al. 2017; Galletti et al. 2012; Gunnarsson et al. 2014; Sarchami and Rehmann 2015; Vassilev et al. 2010; Viet Bui et al. n.d.).

## RESULTS and DISCUSSION

Jerusalem artichoke decomposition in the presence of HNO<sub>3</sub> was investigated in this study. Biomass/solvent ratio is selected as parameter and runs were carried out at three concentration levels of 1g/22 mL (0.0454 g/ml), 1.5 g/22 mL (0.068 g/mL) and 2 g/22mL (0.091 g/mL). The yields of the compounds in the aqueous product were determined by HPLC instrument. The methods conditions are given in Table 2. Samples were taken in during the reaction to evaluate the effect of reaction time as 20, 40, 60 and 120 min. The variation of the yields of the compounds are represented in Figure 3 and Figure 4. The biomass/solvent ratio effects the organic acid and 5-HMF yields, the highest total organic acid and 5-HMF yield decreased as the concentration increases slightly and the the highest yields are reached at different times. For the most diluted feed medium, 11.5 % total organic acid yields were obtained at 60 min while at moderate concentrated medium 11.0 % was achieved at 120 min of reaction time. The yields are lower in the high concentration run for organic acids (D.W. and W.O. 2011; Kang, Fu, and Zhang 2018; Mukherjee, Dumont, and Raghavan 2015) . Sugar compounds are the main products since they have 51.8 % total yield as highest in the most diluted feedstock run in the earlier times of reaction (20 min) and decreases while the reaction proceeds but still had high yields of sugar compounds. This shows a further decomposition of the sugar compounds exist in the reaction medium required to obtain organic acids in higher yields. It was determined that nitric acid was effective in hydrolyzing lignocellulosic biomass, but the organic acid yield was low. This decrease in the yield of target chemicals is due to the fact that the isomerization and conversion of sugars to fructose do not occur effectively in the presence of nitric acid.

**Figure 2.** Variation of the yields sugar compounds in the liquid product as a result of the hydrothermal decomposition of Jerusalem artichoke at 180°C and pH=0.5 in the presence of HNO<sub>3</sub>, according to the feed solution concentration and time.

**Figure 3.** Variation of the yields of organic acid, furfural in the liquid product as a result of the hydrothermal decomposition of Jerusalem artichoke at 180°C and pH=0.5 in the presence of HNO<sub>3</sub>, according to the feed solution concentration and time.

## CONCLUSION

Jerusalem artichoke is decomposed to sugar compounds and organic acids, and 5-HMF in varying yields at 180°C and 0.5 pH level, various feedstock concentrations. To conclude, the levulinic acid was not effectively produced at this conditions as targeted while HNO<sub>3</sub> is successful in hydrolyzing the biomass into sugar compounds. It may be suggested that the study be carried out in two stages in order to benefit from the biomass solubilization effect of nitric acid but also to increase the yield of organic acids. In this sense, in the first stage, lignocellulosic biomass is first treated with nitric acid and solubilized, and sugar solution can be obtained. This process can be carried out at low temperatures. Afterwards, nitric acid can be neutralized by adding base to the

medium, and after the mixture is brought to the appropriate pH with Brönsted acids, the transformation of sugars into organic acids can be examined at higher temperatures.

## ACKNOWLEDGEMENTS

We gratefully thank to Ege University and Office of Scientific Research Projects for their financial support during the project studies in project titled “From Lignocellulosic Biomasses Investigation Of Levulinic Acid Production” and Number: FGA-2019-20183. We also thank to MSc. student Nazlıcan Atik for her contributions in the experimental studies.

#### Abstract

Over the past two decades, there has been a distinct and notable trend towards the widespread adoption of natural approaches for safeguarding human health. This trend has manifested through the utilization of various strategies, including probiotics, functional foods, biological stimulators, and regulators, among others. Each food categorized as a functional food undergoes a comprehensive evaluation that encompasses its nutritional content, caloric density, taste attributes, and its impact on human health. Specifically, these assessments consider the food's potential to support overall well-being and its capacity to contribute to the healing process in the event of illness. Among the emerging functional foods in the market, foods and beverages containing probiotics are widely recognized as future foods that enjoy substantial acceptance among consumers. This trend has led to a remarkable surge in the global market value, reaching 42.55 billion USD in 2017 and is anticipated to reach 94.48 billion USD by 2024. Within the wide array of probiotic foods available, there is a notable emphasis on producing and consuming fermented dairy products that contain live microorganisms. This category holds significant interest within the realm of probiotics. In recent years, non-dairy probiotic foods have garnered substantial attention from the research community, reflecting an evolving consumer demand and an expanding market for such alternatives. This review paper attempts to extensively provide insights into innovative probiotic-based foods and beverages.
